

### FEATURES

- 10 kΩ and 100 kΩ resistance options**
- Resistor tolerance: 8% maximum**
- Wiper current: ±6 mA**
- Low temperature coefficient: 35 ppm/°C**
- Wide bandwidth: 3 MHz**
- Fast start-up time < 75 μs**
- Linear gain setting mode**
- Single- and dual-supply operation**
- Independent logic supply: 1.8 V to 5.5 V**
- Wide operating temperature: -40°C to +125°C**
- 3 mm × 3 mm LFCSP package**
- 4 kV ESD protection**

### APPLICATIONS

- Portable electronics level adjustment**
- LCD panel brightness and contrast controls**
- Programmable filters, delays, and time constants**
- Programmable power supplies**

### GENERAL DESCRIPTION

The AD5121/AD5141 potentiometers provide a nonvolatile solution for 128-/256-position adjustment applications, offering guaranteed low resistor tolerance errors of ±8% and up to ±6 mA current density in the A, B, and W pins.

The low resistor tolerance and low nominal temperature coefficient simplify open-loop applications as well as applications requiring tolerance matching.

The linear gain setting mode allows independent programming of the resistance between the digital potentiometer terminals, through R<sub>AW</sub> and R<sub>WB</sub> string resistors, allowing very accurate resistor matching.

The high bandwidth and low total harmonic distortion (THD) ensure optimal performance for ac signals, making it suitable for filter design.

The low wiper resistance of only 40 Ω at the ends of the resistor array allows for pin-to-pin connection.

The wiper values can be set through an SPI-/I<sup>2</sup>C-compatible digital interface that is also used to read back the wiper register and EEPROM contents.

The AD5121/AD5141 is available in a compact, 16-lead, 3 mm × 3 mm LFCSP. The parts are guaranteed to operate over the extended industrial temperature range of -40°C to +125°C.

Parameter	Symbol	Test Conditions/Comments	Min	Typ <sup>1</sup>	Max	Unit
<b>DYNAMIC CHARACTERISTICS<sup>9</sup></b>						
Bandwidth	BW	–3 dB R <sub>AB</sub> = 10 kΩ R <sub>AB</sub> = 100 kΩ		3 0.43		MHz MHz
Total Harmonic Distortion	THD	V <sub>DD</sub> /V <sub>SS</sub> = ±2.5 V, V <sub>A</sub> = 1 V rms, V <sub>B</sub> = 0 V, f = 1 kHz R <sub>AB</sub> = 10 kΩ R <sub>AB</sub> = 100 kΩ		–80 –90		dB dB
Resistor Noise Density	e <sub>N_WB</sub>	Code = half scale, T <sub>A</sub> = 25°C, f = 10 kHz R <sub>AB</sub> = 10 kΩ R <sub>AB</sub> = 100 kΩ		7 20		nV/√Hz nV/√Hz
V <sub>W</sub> Settling Time	t <sub>s</sub>	V <sub>A</sub> = 5 V, V <sub>B</sub> = 0 V, from zero scale to full scale, ±0.5 LSB error band R <sub>AB</sub> = 10 kΩ R <sub>AB</sub> = 100 kΩ		2 12		μs μs
Endurance <sup>10</sup>		T <sub>A</sub> = 25°C	100	1		Mcycles kcycles
Data Retention <sup>11</sup>				50		Years

<sup>1</sup> Typical values represent average readings at 25°C, V<sub>DD</sub> = 5 V, V<sub>SS</sub> = 0 V, and V<sub>LOGIC</sub> = 5 V.

<sup>2</sup> Resistor integral nonlinearity (R-INL) error is the deviation from an ideal value measured between the maximum resistance and the minimum resistance wiper positions. R-DNL measures the relative step change from ideal between successive tap positions. The maximum wiper current is limited to (0.7 × V<sub>DD</sub>)/R<sub>AB</sub>.

<sup>3</sup> Guaranteed by design and characterization, not subject to production test.

<sup>4</sup> INL and DNL are measured at V<sub>WB</sub> with the RDAC configured as a potentiometer divider similar to a voltage output DAC. V<sub>A</sub> = V<sub>DD</sub> and V<sub>B</sub> = 0 V. DNL specification limits of ±1 LSB maximum are guaranteed monotonic operating conditions.

<sup>5</sup> Resistor Terminal A, Resistor Terminal B, and Resistor Terminal W have no limitations on polarity with respect to each other. Dual-supply operation enables ground referenced bipolar signal adjustment.

<sup>6</sup> Different from operating current; supply current for EEPROM program lasts approximately 30 ms.

<sup>7</sup> Different from operating current; supply current for EEPROM read lasts approximately 20 μs.

<sup>8</sup> P<sub>DISS</sub> is calculated from (I<sub>DD</sub> × V<sub>DD</sub>) + (I<sub>LOGIC</sub> × V<sub>LOGIC</sub>).

<sup>9</sup> All dynamic characteristics use V<sub>DD</sub>/V<sub>SS</sub> = ±2.5 V, and V<sub>LOGIC</sub> = 2.5 V.

<sup>10</sup> Endurance is qualified to 100,000 cycles per JEDEC Standard 22, Method A117 and measured at –40°C to +125°C.

<sup>11</sup> Retention lifetime equivalent at junction temperature (T<sub>J</sub>) = 125°C per JEDEC Standard 22, Method A117. Retention lifetime, based on an activation energy of 1 eV, derates with junction temperature in the Flash/EE memory.

t <sub>7</sub>		10			ns	$\overline{\text{SYNC}}$ rising edge to next SCLK fall ignored
t <sub>8</sub> <sup>2</sup>		20			ns	Minimum $\overline{\text{SYNC}}$ high time
t <sub>9</sub> <sup>3</sup>			50		ns	SCLK rising edge to SDO valid
t <sub>10</sub>				500	ns	$\overline{\text{SYNC}}$ rising edge to SDO pin disable

<sup>1</sup> All input signals are specified with  $t_r = t_f = 1 \text{ ns/V}$  (10% to 90% of  $V_{\text{DD}}$ ) and timed from a voltage level of  $(V_{\text{IL}} + V_{\text{IH}})/2$ .

<sup>2</sup> Refer to  $t_{\text{EEPROM\_PROGRAM}}$  and  $t_{\text{EEPROM\_READBACK}}$  for memory commands operations (see Table 6).

<sup>3</sup>  $R_{\text{PULL\_UP}} = 2.2 \text{ k}\Omega$  to  $V_{\text{DD}}$  with a capacitance load of 168 pF.

**Table 5. I<sup>2</sup>C Interface**

Parameter <sup>1</sup>	Test Conditions/Comments	Min	Typ	Max	Unit	Description
f <sub>SCL</sub> <sup>2</sup>	Standard mode			100	kHz	Serial clock frequency
	Fast mode			400	kHz	
t <sub>1</sub>	Standard mode	4.0			$\mu\text{s}$	SCL high time, $t_{\text{HIGH}}$
	Fast mode	0.6			$\mu\text{s}$	
t <sub>2</sub>	Standard mode	4.7			$\mu\text{s}$	SCL low time, $t_{\text{LOW}}$
	Fast mode	1.3			$\mu\text{s}$	
t <sub>3</sub>	Standard mode	250			ns	Data setup time, $t_{\text{SU; DAT}}$
	Fast mode	100			ns	
t <sub>4</sub>	Standard mode	0	3.45		$\mu\text{s}$	Data hold time, $t_{\text{HD; DAT}}$
	Fast mode	0	0.9		$\mu\text{s}$	
t <sub>5</sub>	Standard mode	4.7			$\mu\text{s}$	Setup time for a repeated start condition, $t_{\text{SU; STA}}$
	Fast mode	0.6			$\mu\text{s}$	
t <sub>6</sub>	Standard mode	4			$\mu\text{s}$	Hold time (repeated) for a start condition, $t_{\text{HD; STA}}$
	Fast mode	0.6			$\mu\text{s}$	
t <sub>7</sub>	Standard mode	4.7			$\mu\text{s}$	Bus free time between a stop and a start condition, $t_{\text{BUF}}$
	Fast mode	1.3			$\mu\text{s}$	
t <sub>8</sub>	Standard mode	4			$\mu\text{s}$	Setup time for a stop condition, $t_{\text{SU; STO}}$
	Fast mode	0.6			$\mu\text{s}$	
t <sub>9</sub>	Standard mode			1000	ns	Rise time of SDA signal, $t_{\text{RDA}}$
	Fast mode	$20 + 0.1 C_L$		300	ns	
t <sub>10</sub>	Standard mode			300	ns	Fall time of SDA signal, $t_{\text{FDA}}$
	Fast mode	$20 + 0.1 C_L$		300	ns	
t <sub>11</sub>	Standard mode			1000	ns	Rise time of SCL signal, $t_{\text{RCL}}$
	Fast mode	$20 + 0.1 C_L$		300	ns	
t <sub>11A</sub>	Standard mode			1000	ns	Rise time of SCL signal after a repeated start condition and after an acknowledge bit, $t_{\text{RCL1}}$ (not shown in Figure 3)
	Fast mode	$20 + 0.1 C_L$		300	ns	

Parameter <sup>1</sup>	Test Conditions/Comments	Min	Typ	Max	Unit	Description
t <sub>12</sub>	Standard mode			300	ns	Fall time of SCL signal, t <sub>FCL</sub>
	Fast mode	20 + 0.1 C <sub>L</sub>		300	ns	
t <sub>SP</sub> <sup>3</sup>	Fast mode	0		50	ns	Pulse width of suppressed spike (not shown in Figure 3)

<sup>1</sup> Maximum bus capacitance is limited to 400 pF.

<sup>2</sup> The SDA and SCL timing is measured with the input filters enabled. Switching off the input filters improves the transfer rate; however, it has a negative effect on the EMC behavior of the part.

<sup>3</sup> Input filtering on the SCL and SDA inputs suppresses noise spikes that are less than 50 ns for fast mode.

**Table 6. Control Pins**

Parameter	Min	Typ	Max	Unit	Description
t <sub>1</sub>	1			μs	End command to $\overline{\text{LRDAC}}$ falling edge
t <sub>2</sub>	50			ns	Minimum $\overline{\text{LRDAC}}$ low time
t <sub>3</sub>	0.1		10	μs	$\overline{\text{RESET}}$ low time
t <sub>EEPROM_PROGRAM</sub> <sup>1</sup>		15	50	ms	Memory program time (not shown in Figure 6)
t <sub>EEPROM_READBACK</sub>		7	30	μs	Memory readback time (not shown in Figure 6)
t <sub>POWER_UP</sub> <sup>2</sup>			75	μs	Power-on EEPROM restore time (not shown in Figure 6)
t <sub>RESET</sub>		30		μs	Reset EEPROM restore time (not shown in Figure 6)

<sup>1</sup> EEPROM program time depends on the temperature and EEPROM write cycles. Higher timing is expected at lower temperatures and higher write cycles.

<sup>2</sup> Maximum time after V<sub>DD</sub> – V<sub>SS</sub> is equal to 2.3 V.

## ABSOLUTE MAXIMUM RATINGS

$T_A = 25^\circ\text{C}$ , unless otherwise noted.

Table 7.

Parameter	Rating
$V_{DD}$ to GND	$-0.3\text{ V to }+7.0\text{ V}$
$V_{SS}$ to GND	$+0.3\text{ V to }-7.0\text{ V}$
$V_{DD}$ to $V_{SS}$	7 V
$V_{\text{LOGIC}}$ to GND	$-0.3\text{ V to }V_{DD} + 0.3\text{ V}$ or $+7.0\text{ V}$ (whichever is less)
$V_A, V_W, V_B$ to GND	$V_{SS} - 0.3\text{ V}, V_{DD} + 0.3\text{ V}$ or $+7.0\text{ V}$ (whichever is less)
$I_A, I_W, I_B$	
Pulsed <sup>1</sup>	
Frequency > 10 kHz	
$R_{AW} = 10\text{ k}\Omega$	$\pm 6\text{ mA/d}^2$
$R_{AW} = 100\text{ k}\Omega$	$\pm 1.5\text{ mA/d}^2$
Frequency $\leq 10\text{ kHz}$	
$R_{AW} = 10\text{ k}\Omega$	$\pm 6\text{ mA}/\sqrt{d^2}$
$R_{AW} = 100\text{ k}\Omega$	$\pm 1.5\text{ mA}/\sqrt{d^2}$
Digital Inputs	$-0.3\text{ V to }V_{\text{LOGIC}} + 0.3\text{ V}$ or $+7\text{ V}$ (whichever is less)
Operating Temperature Range, $T_A$ <sup>3</sup>	$-40^\circ\text{C to }+125^\circ\text{C}$
Maximum Junction Temperature, $T_J$ Maximum	$150^\circ\text{C}$
Storage Temperature Range	$-65^\circ\text{C to }+150^\circ\text{C}$
Reflow Soldering	
Peak Temperature	$260^\circ\text{C}$
Time at Peak Temperature	20 sec to 40 sec
Package Power Dissipation	$(T_J \text{ max} - T_A)/\theta_{JA}$

<sup>1</sup> Maximum terminal current is bounded by the maximum current handling of the switches, maximum power dissipation of the package, and maximum applied voltage across any two of the A, B, and W terminals at a given resistance.

<sup>2</sup>  $d$  = pulse duty factor.

<sup>3</sup> Includes programming of EEPROM memory.

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

### THERMAL RESISTANCE

$\theta_{JA}$  is defined by the JEDEC JESD51 standard, and the value is dependent on the test board and test environment.

Table 8. Thermal Resistance

Package Type	$\theta_{JA}$	$\theta_{JC}$	Unit
16-Lead LFCSP	89.5 <sup>1</sup>	3	$^\circ\text{C/W}$

<sup>1</sup> JEDEC 252P test board, still air (0 m/sec airflow).

### ESD CAUTION

**ESD (electrostatic discharge) sensitive device.** Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

## PIN CONFIGURATION AND FUNCTION DESCRIPTIONS

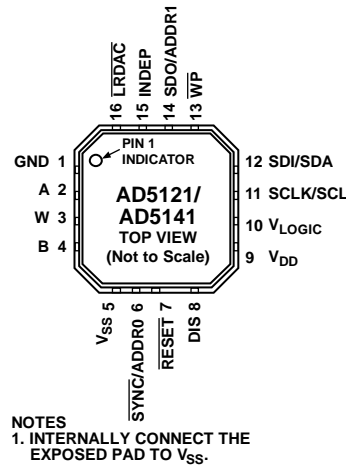

Figure 7. Pin Configuration

Table 9. Pin Function Descriptions

Pin No.	Mnemonic	Description
1	GND	Ground Pin, Logic Ground Reference.
2	A	Terminal A of RDAC. $V_{SS} \leq V_A \leq V_{DD}$ .
3	W	Wiper terminal of RDAC. $V_{SS} \leq V_W \leq V_{DD}$ .
4	B	Terminal B of RDAC. $V_{SS} \leq V_B \leq V_{DD}$ .
5	V <sub>SS</sub>	Negative Power Supply. Decouple this pin with 0.1 μF ceramic capacitors and 10 μF capacitors.
6	SYNC/ADDR0	Programmable Address (ADDR0) for Multiple Package Decoding, DIS = 1. Synchronization Data Input, Active Low. When $\overline{\text{SYNC}}$ returns high, data is loaded into the RDAC register, DIS = 0.
7	RESET	Hardware Reset Pin. Refresh the RDAC registers from EEPROM. $\overline{\text{RESET}}$ is activated at logic low. If this pin is not used, tie $\overline{\text{RESET}}$ to V <sub>LOGIC</sub> .
8	DIS	Digital Interface Select (SPI/I <sup>2</sup> C Select). SPI when DIS = 0 (GND), I <sup>2</sup> C when DIS = 1 (V <sub>LOGIC</sub> ). This pin cannot be left floating.
9	V <sub>DD</sub>	Positive Power Supply. Decouple this pin with 0.1 μF ceramic capacitors and 10 μF capacitors.
10	V <sub>LOGIC</sub>	Logic Power Supply; 1.8 V to V <sub>DD</sub> . Decouple this pin with 0.1 μF ceramic capacitors and 10 μF capacitors.
11	SCLK/SCL	SPI Serial Clock Line (SCLK). Data is clocked in at logic low transition. I <sup>2</sup> C Serial Clock Line (SCL). Data is clocked in at logic low transition.
12	SDI/SDA	Serial Data Input/Output (SDA), When DIS = 1. Serial Data Input (SDI), When DIS = 0.
13	WP	Optional Write Protect. This pin prevents any changes to the present RDAC and EEPROM contents, except when reloading the content of the EEPROM into the RDAC register. WP is activated at logic low. If this pin is not used, tie WP to V <sub>LOGIC</sub> .
14	SDO/ADDR1	Programmable Address (ADDR1) for Multiple Package Decoding, When DIS = 1. Serial Data Output (SDO). This is an open-drain output pin, and it needs an external pull-up resistor when DIS = 0.
15	INDEP	Linear Gain Setting Mode at Power-Up. Each string resistor is loaded from its associate memory location. If INDEP is enabled, it cannot be disabled by the software.
16	LRDAC	Load RDAC. Transfers the contents of the input register to the RDAC register. This allows asynchronous RDAC update. LRDAC is activated low. If this pin is not used, tie LRDAC to V <sub>LOGIC</sub> .
	EPAD	Internally Connect the Exposed Pad to V <sub>SS</sub> .

## THEORY OF OPERATION

The [AD5121/AD5141](#) digital programmable potentiometers are designed to operate as true variable resistors for analog signals within the terminal voltage range of  $V_{SS} < V_{TERM} < V_{DD}$ . The resistor wiper position is determined by the RDAC register contents. The RDAC register acts as a scratchpad register that allows unlimited changes of resistance settings. A secondary register (the input register) can be used to preload the RDAC register data.

The RDAC register can be programmed with any position setting using the I<sup>2</sup>C or SPI interface (depending on the model). When a desirable wiper position is found, this value can be stored in the EEPROM memory. Thereafter, the wiper position is always restored to that position for subsequent power-ups. The storing of EEPROM data takes approximately 18 ms; during this time, the device is locked and does not acknowledge any new command, preventing any changes from taking place.

### RDAC REGISTER AND EEPROM

The RDAC register directly controls the position of the digital potentiometer wiper. For example, when the RDAC register is loaded with 0x80 ([AD5141](#), 256 taps), the wiper is connected to half scale of the variable resistor. The RDAC register is a standard logic register; there is no restriction on the number of changes allowed.

It is possible to both write to and read from the RDAC register using the digital interface (see Table 16).

The contents of the RDAC register can be stored to the EEPROM using Command 9 (see Table 16). Thereafter, the RDAC register always sets at that position for any future on-off-on power supply sequence. It is possible to read back data saved into the EEPROM with Command 3 (see Table 16).

Alternatively, the EEPROM can be written to independently using Command 1 (see Table 16).

### INPUT SHIFT REGISTER

For the [AD5121/AD5141](#), the input shift register is 16 bits wide, as shown in Figure 2. The 16-bit word consists of four control bits, followed by four address bits and by eight data bits

If the [AD5121](#) RDAC or EEPROM registers are read from or written to the lowest data bit (Bit 0) is ignored.

Data is loaded MSB first (Bit 15). The four control bits determine the function of the software command, as listed in Table 11 and Table 16.

### SERIAL DATA DIGITAL INTERFACE SELECTION, DIS

The [AD5121/AD5141](#) LFSCP provides the flexibility of a selectable interface. When the digital interface select (DIS) pin is tied low, the SPI mode is engaged. When the DIS pin is tied high, the I<sup>2</sup>C mode is engaged.

### SPI SERIAL DATA INTERFACE

The [AD5121/AD5141](#) contain a 4-wire, SPI-compatible digital interface (SDI, SYNC, SDO, and SCLK). The write sequence begins by bringing the SYNC line low. The SYNC pin must be held low until the complete data-word is loaded from the SDI pin. Data is loaded in at the SCLK falling edge transition, as shown in Figure 4. When SYNC returns high, the serial data-word is decoded according to the instructions in Table 16.

The [AD5121/AD5141](#) do not require a continuous SCLK when SYNC is high. To minimize power consumption in the digital input buffers when the part is enabled, operate all serial interface pins close to the V<sub>LOGIC</sub> supply rails.

#### SYNC Interruption

In a standalone write sequence for the [AD5121/AD5141](#), the SYNC line is kept low for 16 falling edges of SCLK, and the instruction is decoded when SYNC is pulled high. However, if the SYNC line is kept low for less than 16 falling edges of SCLK, the input shift register content is ignored, and the write sequence is considered invalid.

#### SDO Pin

The serial data output pin (SDO) serves two purposes: to read back the contents of the control, EEPROM, RDAC, and input registers using Command 3 (see Table 11 and Table 16), and to connect the [AD5121/AD5141](#) to daisy-chain mode.

The SDO pin contains an internal open-drain output that needs an external pull-up resistor. The SDO pin is enabled when SYNC is pulled low, and the data is clocked out of SDO on the rising edge of SCLK.

**Daisy-Chain Connection**

Daisy chaining minimizes the number of port pins required from the controlling IC. As shown in Figure 39, the SDO pin of one package must be tied to the SDI pin of the next package. The clock period may need to be increased because the propagation delay of the line between subsequent devices. When two AD5121/AD5141 devices are daisy chained, 32 bits of data are required. The first 16 bits assigned to U2, and the second 16 bits assigned to U1, as shown in Figure 40. Keep the SYNC pin low until all 32 bits are clocked into their respective serial registers. The SYNC pin is then pulled high to complete the operation. A typical connection is shown in Figure 39.

To prevent data from mislocking (for example, due to noise) the part includes an internal counter, if the clock falling edges count is not a multiple of 8, the part ignores the command. A valid clock count is 16, 24, or 32. The counter resets when SYNC returns high.

Figure 39. Daisy-Chain Configuration

Figure 40. Daisy-Chain Diagram

## I<sup>2</sup>C SERIAL DATA INTERFACE

The AD5141 has 2-wire, I<sup>2</sup>C-compatible serial interface. These devices can be connected to an I<sup>2</sup>C bus as a slave device, under the control of a master device. See Figure 3 for a timing diagram of a typical write sequence.

The AD5141 supports standard (100 kHz) and fast (400 kHz) data transfer modes. Support is not provided for 10-bit addressing and general call addressing.

The 2-wire serial bus protocol operates as follows:

1. The master initiates a data transfer by establishing a start condition, which is when a high-to-low transition on the SDA line occurs while SCL is high. The following byte is the address byte, which consists of the 7-bit slave address and an R/W bit. The slave device corresponding to the transmitted address responds by pulling SDA low during the ninth clock pulse (this is called the acknowledge bit). At this stage, all other devices on the bus remain idle while the selected device waits for data to be written to, or read from, its shift register.  
If the R/W bit is set high, the master reads from the slave device. However, if the R/W bit is set low, the master writes to the slave device.
2. Data is transmitted over the serial bus in sequences of nine clock pulses (eight data bits followed by an acknowledge bit). The transitions on the SDA line must occur during the low period of SCL and remain stable during the high period of SCL.

3. When all data bits have been read from or written to, a stop condition is established. In write mode, the master pulls the SDA line high during the tenth clock pulse to establish a stop condition. In read mode, the master issues a no acknowledge for the ninth clock pulse (that is, the SDA line remains high). The master then brings the SDA line low before the tenth clock pulse, and then high again during the tenth clock pulse to establish a stop condition.

## I<sup>2</sup>C ADDRESS

The AD5141 has two different pin address options available, as shown in Table 10.

**Table 10. 24-Lead LFCSP Device Address Selection**

ADDR0 Pin	ADDR1 Pin	7-Bit I <sup>2</sup> C Device Address
V <sub>LOGIC</sub>	V <sub>LOGIC</sub>	0100000

## ADVANCED CONTROL MODES

The AD5121/AD5141 digital potentiometers include a set of user programming features to address the wide number of applications for these universal adjustment devices (see Table 16 and Table 18).

Key programming features include the following:

- Input register
- Linear gain setting mode
- Low wiper resistance feature
- Linear increment and decrement instructions
- $\pm 6$  dB increment and decrement instructions
- Burst mode (I<sup>2</sup>C only)
- Reset
- Shutdown mode

### Input Register

The AD5121/AD5141 include one input register per RDAC register. This register allows preloading of the value for the associated RDAC register.

This feature allows a synchronous and asynchronous update of one or all the RDAC registers at the same time.

These registers can be written to using Command 2 and read back from using Command 3 (see Table 16).

The transfer from the input register to the RDAC register is done asynchronously by the LRDAC pin or synchronously by Command 8 (see Table 16).

If new data is loaded in an RDAC register, this RDAC register automatically overwrites the associated input register.

### Linear Gain Setting Mode

The patented architecture of the AD5121/AD5141 allows the independent control of each string resistor,  $R_{AW}$  and  $R_{WB}$ . To enable this feature, use Command 16 (see Table 16) to set Bit D2 of the control register (see Table 18).

This mode of operation can control the potentiometer as two independent rheostats connected at a single point, W terminal, as opposed to potentiometer mode where each resistor is complementary,  $R_{AW} = R_{AB} - R_{WB}$ .

This feature enables a second input and an RDAC register per channel, as shown in Table 16; however, the actual RDAC contents remain unchanged. The same operations are valid for potentiometer and linear gain setting modes.

If the INDEP pin is pulled high, the device powers up in linear gain setting mode and loads the values stored in the associated memory locations for each channel (see Table 17). The INDEP pin and D2 bit are connected internally to a logic OR gate, if any or both are 1, the parts cannot operate in potentiometer mode.

### Low Wiper Resistance Feature

The AD5121/AD5141 include two commands to reduce the wiper resistance between the terminals when they achieve full scale or zero scale. These extra positions are called bottom scale, BS, and top scale, TS. The resistance between Terminal A and Terminal W at top scale is specified as  $R_{TS}$ . Similarly, the bottom scale resistance between Terminal B and Terminal W is specified as  $R_{BS}$ .

The contents of the RDAC registers are unchanged by entering in these positions. There are two ways to exit from top scale and bottom scale: by using Command 12 or Command 13 (see Table 16); or by loading new data in an RDAC register, which includes increment/decrement operations and a shutdown command.

Table 12 and Table 13 show the truth tables for the top scale position and the bottom scale position, respectively, when linear gain setting mode is enabled.

**Table 12. Top Scale Truth Table**

Linear Gain Setting Mode		Potentiometer Mode	
$R_{AW}$	$R_{WB}$	$R_{AW}$	$R_{WB}$
$R_{AB}$	$R_{AB}$	$R_{TS}$	$R_{AB}$

**Table 13. Bottom Scale Truth Table**

Linear Gain Setting Mode		Potentiometer Mode	
$R_{AW}$	$R_{WB}$	$R_{AW}$	$R_{WB}$
$R_{TS}$	$R_{BS}$	$R_{AB}$	$R_{BS}$

### Linear Increment and Decrement Instructions

The increment and decrement commands (Command 4 and Command 5 in Table 16) are useful for linear step adjustment applications. These commands simplify microcontroller software coding by allowing the controller to send an increment or decrement command to the device. The adjustment can be individual or in a ganged potentiometer arrangement, where all wiper positions are changed at the same time.

For an increment command, executing Command 4 automatically moves the wiper to the next resistance segment position. This command can be executed in a single channel or multiple channels.

### $\pm 6$ dB Increment and Decrement Instructions

Two programming instructions produce logarithmic taper increment or decrement of the wiper position control by an individual potentiometer or by a ganged potentiometer arrangement where all RDAC register positions are changed simultaneously. The +6 dB increment is activated by Command 6, and the -6 dB decrement is activated by Command 7 (see Table 16). For example, starting with the zero-scale position and executing Command 6 ten times moves the wiper in 6 dB steps to the full-scale position. When the wiper position is near the maximum setting, the last 6 dB increment instruction causes the wiper to go to the full-scale position (see Table 14).

Incrementing the wiper position by +6 dB essentially doubles the RDAC register value, whereas decrementing the wiper position by -6 dB halves the register content. Internally, the AD5121/AD5141 use shift registers to shift the bits left and right to achieve a  $\pm 6$  dB increment or decrement. These functions are useful for various audio/video level adjustments, especially for white LED brightness settings in which human visual responses are more sensitive to large adjustments than to small adjustments.

**Table 14. Detailed Left Shift and Right Shift Functions for the  $\pm 6$  dB Step Increment and Decrement**

Left Shift (+6 dB/Step)	Right Shift (-6 dB/Step)

0100 0000	0000 0001
1000 0000	0000 0000
1111 1111	0000 0000

#### Burst Mode (I<sup>2</sup>C Only)

By enabling the burst mode, multiple data bytes can be sent to the part consecutively. After the command byte, the part interprets the consecutive bytes as data bytes for the first command.

A new command can be sent by generating a repeat start or by a stop and start condition.

The burst mode is activated by setting Bit D3 of the control register (see Table 18), and if a reset or power-down is performed, it automatically resets.

#### Reset

The AD5121/AD5141 can be reset through software by executing Command 14 (see Table 16) or through hardware on the low pulse of the RESET pin. The reset command loads the RDAC register with the contents of the EEPROM and takes approximately 30  $\mu$ s. The EEPROM is preloaded to midscale at the factory, and initial power-up is, accordingly, at midscale. Tie RESET to V<sub>DD</sub> if the RESET pin is not used.

#### Shutdown Mode

The AD5121/AD5141 can be placed in shutdown mode by executing the software shutdown command, Command 15 (see Table 16); and by setting the LSB (D0) to 1. This feature places the RDAC in a special state. The contents of the RDAC register are unchanged by entering shutdown mode. However, all commands listed in Table 16 are supported while in shutdown mode. Execute Command 15 (see Table 16) and set the LSB (D0) to 0 to exit shutdown mode.

**Table 15. Truth Table for Shutdown Mode**

A2	Linear Gain Setting Mode		Potentiometer Mode	
	AW	WB	AW	WB
0	N/A <sup>1</sup>	Open	Open	R <sub>BS</sub>
1	Open	N/A <sup>1</sup>	N/A <sup>1</sup>	N/A <sup>1</sup>

<sup>1</sup> N/A = not applicable.

#### EEPROM OR RDAC REGISTER PROTECTION

The EEPROM and RDAC registers can be protected by disabling any update to these registers. This can be done by using software or by using hardware. If these registers are protected by software, set Bit D0 and/or Bit D1 (see Table 18), which protects the RDAC and EEPROM registers independently.

If the registers are protected by hardware, pull the  $\overline{\text{WP}}$  pin low. If the  $\overline{\text{WP}}$  pin is pulled low when the part is executing a command, the protection is not enabled until the command is completed.

When RDAC is protected, the only operation allowed is to copy the EEPROM into the RDAC register.

#### LOAD RDAC INPUT REGISTER (LRDAC)

LRDAC software or hardware transfers data from the input register to the RDAC register (and therefore updates the wiper position). By default, the input register has the same value as the RDAC register; therefore, only the input register that has been updated using Command 2 is updated.

Software LRDAC, Command 8, allows updating of a single RDAC register or all of the channels at once (see Table 16). This is a synchronous update.

The hardware LRDAC is completely asynchronous and copies the content of all the input registers into the associated RDAC registers. If a command is executed, to avoid data corruption, any transition in the LRDAC pin is ignored by the part.

#### INDEP PIN

If the INDEP pin is pulled high at power-up, the part operates in linear gain setting mode, loading each string resistor, R<sub>AW</sub> and R<sub>WB</sub>, with the value stored into the EEPROM (see Table 17). If the pin is pulled low, the part powers up in potentiometer mode.

The INDEP pin and the D2 bit are connected internally to a logic OR gate, if any or both are 1, the part cannot operate in potentiometer mode (see Table 18).

Table 16. Advance Commands Operation Truth Table

D3	Burst mode (I <sup>2</sup> C only) 0 = disabled (default) 1 = enabled (no disable after stop or repeat start condition)

**RDAC ARCHITECTURE**

To achieve optimum performance, Analog Devices, Inc., has patented the RDAC segmentation architecture for all the digital potentiometers. In particular, the AD5121/AD5141 employ a three-stage segmentation approach, as shown in Figure 41. The AD5121/AD5141 wiper switch is designed with the transmission gate CMOS topology and with the gate voltage derived from  $V_{DD}$  and  $V_{SS}$ .

Figure 41. AD5121/AD5141 Simplified RDAC Circuit

**Top Scale/Bottom Scale Architecture**

In addition, the AD5121/AD5141 include new positions to reduce the resistance between terminals. These positions are called bottom scale and top scale. At bottom scale, the typical wiper resistance decreases from 130  $\Omega$  to 60  $\Omega$  ( $R_{AB} = 100$  k $\Omega$ ). At top scale, the resistance between Terminal A and Terminal W is decreased by 1 LSB, and the total resistance is reduced to 60  $\Omega$  ( $R_{AB} = 100$  k $\Omega$ ).

**PROGRAMMING THE VARIABLE RESISTOR**

**Rheostat Operation— $\pm 8\%$  Resistor Tolerance**

The AD5121/AD5141 operate in rheostat mode when only two terminals are used as a variable resistor. The unused terminal can be floating, or it can be tied to Terminal W, as shown in Figure 42.

Figure 42. Rheostat Mode Configuration

The nominal resistance between Terminal A and Terminal B,  $R_{AB}$ , is 10 k $\Omega$  or 100 k $\Omega$ , and has 128/256 tap points accessed by the wiper terminal. The 7-bit/8-bit data in the RDAC latch is decoded to select one of the 128/256 possible wiper settings. The general equations for determining the digitally programmed output resistance between Terminal W and Terminal B are

AD5121:

$$R_{WB}(D) = \frac{D}{128} \times R_{AB} + R_W \quad \text{From 0x00 to 0x7F} \quad (1)$$

AD5141:

$$R_{WB}(D) = \frac{D}{256} \times R_{AB} + R_W \quad \text{From 0x00 to 0xFF} \quad (2)$$

where:

$D$  is the decimal equivalent of the binary code in the 7-bit/8-bit RDAC register.

$R_{AB}$  is the end-to-end resistance.

$R_W$  is the wiper resistance.

In potentiometer mode, similar to the mechanical potentiometer, the resistance of the RDAC between Terminal W and Terminal A also produces a digitally controlled complementary resistance,  $R_{WA}$ .  $R_{WA}$  also gives a maximum of 8% absolute resistance error.  $R_{WA}$  starts at the maximum resistance value and decreases as the data loaded into the latch increases. The general equations for this operation are

AD5121:

$$R_{AW}(D) = \frac{128 - D}{128} \times R_{AB} + R_W \quad \text{From 0x00 to 0x7F} \quad (3)$$

AD5141:

$$R_{AW}(D) = \frac{256 - D}{256} \times R_{AB} + R_W \quad \text{From 0x00 to 0xFF} \quad (4)$$

where:

$D$  is the decimal equivalent of the binary code in the 7-bit/8-bit RDAC register.

$R_{AB}$  is the end-to-end resistance.

$R_W$  is the wiper resistance.

If the part is configured in linear gain setting mode, the resistance between Terminal W and Terminal A is directly proportional to the code loaded in the associate RDAC register. The general equations for this operation are

AD5121:

$$R_{AW}(D) = \frac{D}{128} \times R_{AB} + R_W \quad \text{From 0x00 to 0x7F} \quad (5)$$

AD5141:

$$R_{AW}(D) = \frac{D}{256} \times R_{AB} + R_W \quad \text{From 0x00 to 0xFF} \quad (6)$$

where:

$D$  is the decimal equivalent of the binary code in the 7-bit/8-bit RDAC register.

$R_{AB}$  is the end-to-end resistance.

$R_W$  is the wiper resistance.

In the bottom scale condition or top scale condition, a finite total wiper resistance of 40 Ω is present. Regardless of which setting the part is operating in, limit the current between Terminal A to Terminal B, Terminal W to Terminal A, and Terminal W to Terminal B, to the maximum continuous current of ±6 mA or to the pulse current specified in Table 7. Otherwise, degradation or possible destruction of the internal switch contact can occur.

**Calculate the Actual End-to-End Resistance**

The resistance tolerance is stored in the internal memory during factory testing. Therefore, the actual end-to-end resistance can be calculated (which is valuable for calibration, tolerance matching, and precision applications).

The resistance tolerance (in percentage) is stored in fixed point format, using a 16-bit sign magnitude binary. The sign bit (0 = negative and 1 = positive) and the integer part are located in Address 0x02, as shown in Table 19. Address 0x03 contains the fractional part, as shown in Table 19.

**Table 19. End-to-End Resistance Tolerance Bytes**

Memory Map Address	Data Byte							
	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0x02	Sign	2 <sup>6</sup>	2 <sup>5</sup>	2 <sup>4</sup>	2 <sup>3</sup>	2 <sup>2</sup>	2 <sup>1</sup>	2 <sup>0</sup>
0x03	2 <sup>-1</sup>	2 <sup>-2</sup>	2 <sup>-3</sup>	2 <sup>-4</sup>	2 <sup>-5</sup>	2 <sup>-6</sup>	2 <sup>-7</sup>	2 <sup>-8</sup>

That is, if the data readback from Address 0x02 is 00000010, and the data readback from Address 0x03 is 10110000, the end-to-end resistance can be calculated as follows.

For Memory Map Address 0x02, DB[7] = 0 = negative, and DB[6:0] = 0000010 = 2.

For Memory Map Address 0x03, DB[7:0] = 10110000 = 176 × 2<sup>-8</sup> = 0.6875, and therefore, tolerance = -2.6875%, and  $R_{AB}$  = 9.731 kΩ.

**PROGRAMMING THE POTENTIOMETER DIVIDER**

**Voltage Output Operation**

The digital potentiometer easily generates a voltage divider at wiper-to-B and wiper-to-A that is proportional to the input voltage at A to B, as shown in Figure 43.

Figure 43. Potentiometer Mode Configuration

Connecting Terminal A to 5 V and Terminal B to ground produces an output voltage at the Wiper W to Terminal B ranging from 0 V to 5 V. The general equation defining the output voltage at  $V_W$  with respect to ground for any valid input voltage applied to Terminal A and Terminal B is

$$V_W(D) = \frac{R_{WB}(D)}{R_{AB}} \times V_A + \frac{R_{AW}(D)}{R_{AB}} \times V_B \quad (7)$$

where:

$R_{WB}(D)$  can be obtained from Equation 1 and Equation 2.

$R_{AW}(D)$  can be obtained from Equation 3 and Equation 4.

Operation of the digital potentiometer in the divider mode results in a more accurate operation over temperature. Unlike the rheostat mode, the output voltage is dependent mainly on the ratio of the internal resistors,  $R_{AW}$  and  $R_{WB}$ , and not the absolute values. Therefore, the temperature drift reduces to 5 ppm/°C.

### TERMINAL VOLTAGE OPERATING RANGE

The AD5121/AD5141 are designed with internal ESD diodes for protection. These diodes also set the voltage boundary of the terminal operating voltages. Positive signals present on Terminal A, Terminal B, or Terminal W that exceed  $V_{DD}$  are clamped by the forward-biased diode. There is no polarity constraint between  $V_A$ ,  $V_W$ , and  $V_B$ , but they cannot be higher than  $V_{DD}$  or lower than  $V_{SS}$ .

Figure 44. Maximum Terminal Voltages Set by  $V_{DD}$  and  $V_{SS}$

### POWER-UP SEQUENCE

Because there are diodes to limit the voltage compliance at Terminal A, Terminal B, and Terminal W (see Figure 44), it is important to power up  $V_{DD}$  first before applying any voltage to Terminal A, Terminal B, and Terminal W. Otherwise, the diode is forward-biased such that  $V_{DD}$  is powered unintentionally. The ideal power-up sequence is  $V_{SS}$ ,  $V_{DD}$ ,  $V_{LOGIC}$ , digital inputs, and  $V_A$ ,  $V_B$ , and  $V_W$ . The order of powering  $V_A$ ,  $V_B$ ,  $V_W$ , and digital inputs is not important as long as they are powered after  $V_{SS}$ ,  $V_{DD}$ , and  $V_{LOGIC}$ . Regardless of the power-up sequence and the ramp rates of the power supplies, once  $V_{LOGIC}$  is powered, the power-on preset activates, which restores EEPROM values to the RDAC registers.

### LAYOUT AND POWER SUPPLY BIASING

It is always a good practice to use a compact, minimum lead length layout design. Ensure that the leads to the input are as direct as possible with a minimum conductor length. Ground paths should have low resistance and low inductance. It is also good practice to bypass the power supplies with quality capacitors. Apply low equivalent series resistance (ESR)  $1\ \mu\text{F}$  to  $10\ \mu\text{F}$  tantalum or electrolytic capacitors at the supplies to minimize any transient disturbance and to filter low frequency ripple. Figure 45 illustrates the basic supply bypassing configuration for the AD5121/AD5141.

### Вы можете приобрести в компании MosChip.

Для оперативного оформления запроса Вам необходимо перейти по данной ссылке:

<http://moschip.ru/get-element>

Вы можете разместить у нас заказ для любого Вашего проекта, будь то серийное производство или разработка единичного прибора.

В нашем ассортименте представлены ведущие мировые производители активных и пассивных электронных компонентов.

Нашей специализацией является поставка электронной компонентной базы двойного назначения, продукции таких производителей как XILINX, Intel (ex.ALTERA), Vicor, Microchip, Texas Instruments, Analog Devices, Mini-Circuits, Amphenol, Glenair.

Сотрудничество с глобальными дистрибьюторами электронных компонентов, предоставляет возможность заказывать и получать с международных складов практически любой перечень компонентов в оптимальные для Вас сроки.

На всех этапах разработки и производства наши партнеры могут получить квалифицированную поддержку опытных инженеров.

Система менеджмента качества компании отвечает требованиям в соответствии с ГОСТ Р ИСО 9001, ГОСТ РВ 0015-002 и ЭС РД 009
