

Powerful Sensing Solutions for a Better Life

CXTILT02EC

HIGH ACCURACY, DIGITAL SERIES

The CXTILT-Series two-axis inclinometers offer an outstanding combination of resolution, dynamic response and measurement accuracy. The integration of MEMS sensing elements and digital signal processing yields a system that requires no user calibration. Resolution and settling time are programmable, allowing the performance to be optimized for a variety of applications.

Precision Tilt Measurements

The CXTILT-Series inclinometers measure the tilt angle (roll and pitch) of an object with respect to the horizontal axis in a static environment. These high performance sensors incorporate two micro-machined low-g accelerometers, one oriented along the X-axis and one along the Y-axis.

The CXTILT02EC provides superior performance in demanding measurement applications, where high accuracy must be maintained over a wide temperature range.

Serial Commands

Command	Function Description/Response
R	Reset. Resets the CXTILT firmware to default settings. An ASCII 'H' (72) is sent in response.
G	Get Angle Data Packet. The CXTILT returns its current angular position. The data is in a 6 byte packet (see content of data packet table).
N<0-9>	Set Resolution Level. A 2byte command sequence that configures the CXTILT's internal digital filter. The second byte, an integer of value 0-9, sets the level of filtering (see filter settings table).
C	Continuous Mode: Transfers packet continuously at maximum rate.
S	Stop Continuous Mode

Content of Data Packet

Byte	Description
0	Header (always 255)
1	Pitch MSB (0-255)
2	Pitch LSB (0-255)
3	Roll MSB (0-255)
4	Roll LSB (0-255)
5	Checksum (8-bit sum of bytes 1-4)

Note: Angles are represented as two's complement 16 bit numbers. +90° corresponds to 32,767, -90° corresponds to -32,768. The 16-bit signed angle can be obtained by this simple "C" expression: (int) Roll LSB + (int) 256 * Roll MSB
