

4 x 50 W MOSFET quad bridge power amplifier

Datasheet - production data

- Internally fixed gain (26 dB)
- Protections:
 - Output short circuit to GND, to Vs, across the load
 - Very inductive loads
 - Overrating chip temperature with soft thermal limiter
 - Output DC offset detection
 - Load dump
 - Fortuitous open GND
 - Reversed battery
 - ESD
 - Capable to operate down to 6 V (e.g. “Startstop”)

Features

- Multipower BCD technology
- High output power capability:
 - 4 x 50 W/4 Ω Max.
 - 4 x 28 W/4 Ω @ 14.4 V, 1 kHz, 10 %
 - 4 x 72 W/2 Ω Max.
- MOSFET output power stage
- 2 Ω driving capability
- Hi-Fi class distortion
- Low output noise
- High immunity to RF noise injection
- Standby function
- Mute function
- Automute at min. supply voltage detection
- Low external component count

Description

The STPA001 is a breakthrough MOSFET technology class AB audio power amplifier designed for high power car radio. The fully complementary P-Channel/N-Channel output structure allows a rail to rail output voltage swing which, combined with high output current and minimized saturation losses sets new power references in the car-radio field, with unparalleled distortion performances.

The STPA001 can operate down to 6 V and this makes the IC compliant to the most recent OEM specifications for low voltage operation (so called 'start-stop' battery profile during engine stop), helping car manufacturers to reduce the overall emissions and thus contributing to environment protection.

1 Overview

The STPA001 is a complementary quad audio power amplifier. It is available in three different packages, Flexiwatt25 (vertical), Flexiwatt25 (horizontal) and Flexiwatt27. It embeds four independent amplifiers working in class AB, a standby and a mute pin, a clipping detector and diagnostics output and, only for the Flexiwatt27 package, an offset detector pin. The amplifier is fully operational down to a battery voltage of 6 V, without producing pop noise and continuing to play during battery transitions.

The STPA001 can drive 2 Ω loads and has a very high immunity to disturbs without need of external components or compensation. It is protected against any kind of short or open circuit, over-voltage and over-temperature.

4 General information

4.1 Operation

The STPA001's inputs are ground-compatible. If the standard value for the input capacitors (0.22 μF) is adopted, the low frequency cut-off will amount to 16 Hz. The input capacitors should be 1/4 of the capacitor connected to AC-GND pin for optimum pop performances (see [Figure 2: Application circuit \(STPA001\)](#)).

Standby and mute pins are both CMOS compatible.

RC cells at both mute and stand-by pins have always to be used in order to smooth the transitions for preventing any audible transient noise.

In case muting and stand-by functions are not used, they could steadily be connected to V_S , but a 470 k Ω resistance should be present between the power supply and the pins.

The capacitance on SVR sets the start-up and shut-down times and helps to have pop-noise free transitions. Its minimum recommended value is 10 μF . However, to have a fast start-up time, the internal resistor on SVR pin, used to set the time constant, is reduced from 50 k Ω to 3 k Ω till voltage on SVR reaches $V_{CC}/4 - 2V_{BE}$ and then released. In this way the capacitor on SVR is charged very quickly to $V_{CC}/4$, as shown in the following figure. The time constant to be assigned to the standby pin in order to obtain a virtually pop-free transition has to be slower than 2.5 V/ms.

Figure 20. SVR charge diagram

SVR pin accomplishes multiple functions:

- it is used as a reference voltage for input pins ($V_{CC}/4$)
- the capacitor connected to SVR helps the supply voltage ripple rejection
- it is used as a reference to generate the half supply voltage for the output

When the amplifier goes in standby mode or goes out from this condition, it is suggested to put the amplifier in mute to ensure the absence of audible noise. Then the stand-by pin can be set to the appropriate value (ground or $> 2.6\text{ V}$) and the capacitance on SVR pin is discharged or charged consequently.

4.2 Battery variations

4.2.1 Low voltage operation

The most recent OEM specifications are require automatic stop of car engine at traffic lights, in order to reduce emissions of polluting substances. The STPA001, thanks to its innovating

design, allows a continuous operation when battery falls down. At 6 V it is still fully operational, only the maximum output power is reduced accordingly to the available voltage supply.

If the battery voltage drops below the minimum operating voltage of 6V the amplifier is fast muted, the capacitor on SVR is discharged and the amplifier restarts when the battery voltage returns to the correct voltage.

4.2.2 Cranks

STPA001 can sustain worst case cranks from 16 V to 6 V, continuing to play and without producing any pop noise.

Examples of battery cranking curves are shown below, indicating the shape and duration of allowed battery transitions.

Figure 21. Battery cranking curve example 1

$V1 = 16\text{ V}; V2 = 6\text{ V}; V3 = 7\text{ V}; V4 = 8\text{ V}$

$t1 = 2\text{ ms}; t2 = 50\text{ ms}; t3 = 5\text{ ms}; t4 = 300\text{ ms}; t5 = 10\text{ ms}; t6 = 1\text{ s}; t7 = 2\text{ ms}$

Figure 22. Battery cranking curve example 2

$V1 = 16\text{ V}; V2 = 6\text{ V}; V3 = 7\text{ V}$

$t1 = 2\text{ ms}; t2 = 5\text{ ms}; t3 = 15\text{ ms}; t5 = 1\text{ s}; t6 = 50\text{ ms}$

4.2.3 Advanced battery management (hybrid vehicles)

In addition to compatibility with low V_{batt} , the STPA001 is able to sustain upwards fast battery transitions without causing unwanted audible effects, like pop noise, and without any sound interruption thanks to the innovative circuit topology. In fact, in hybrid vehicles, the engine ignition causes a fast increase of battery voltage which can reach 16 V in less than 10 ms.

Figure 23. Upwards fast battery transitions diagram

4.3 Protections

4.3.1 Short circuits and open circuit operation

When the IC detects a short circuit to ground, to V_s or across the load, the output of the amplifier is put in three-state (high impedance condition). The power stage remains in this condition until the short is removed.

In case of short circuit to ground or V_{cc} , the amplifier exits from the three-state condition only when the output returns inside the limits imposed by an internal voltage comparator.

When a short across the load is present, the power stage sees an over-current and is brought in protection mode for 100 μs . After this time, if the short circuit condition is removed the amplifier returns to play, otherwise the high impedance state is maintained and the check is repeated every 100 μs .

Disconnection of load (open load condition) doesn't damage the amplifier, which continues to play.

4.3.2 Over-voltage and load dump protection

When the battery voltage is higher than 19 V, the amplifier is switched to a high impedance state. It stops to playing till the supply voltage returns in the permitted range.

The amplifier is protected against load dump surges having amplitude as high as 50 V and a rising time lower than 5 ms (see *Figure 24*).

Figure 24. Load dump protection diagram

4.3.3 Thermal protection

If the junction temperature of the IC reaches $T_j = 150\text{ }^\circ\text{C}$, a smooth mute is applied to reduce output power and limit power dissipation. If this is not enough and the junction temperature continues to increase, the amplifier is switched off when reaches the maximum temperature of $170\text{ }^\circ\text{C}$.

Figure 25. Thermal protection diagram

4.4 Warnings

4.4.1 DC offset detection (OD pin)

The STPA001 integrates a DC offset detector to avoid that an anomalous input DC offset is multiplied by the amplifier gain producing a dangerous large offset at the output. In fact an output offset may lead to speakers damage for overheating. The detector works with the amplifier un-muted and no signal at the inputs.

When the differential output voltage is out of a window comparator with thresholds $\pm 2V$ (typ), the OD pin is pulled down.

4.4.2 Clipping detection and diagnostics (CD-DIAG pin)

When clipping occurs, the output signal is distorted. If the signal distortion on one of the output channels exceeds 1%, the CD-DIAG pin is pulled down. This information can be sent to an audio processor in order to reduce the input signal of the amplifier and reduce the clipping. Thanks to a particular internal circuitry, the clip detector is always functional till 6.5 V.

A short to ground and short to V_{cc} is pointed out by CD-DIAG. This pin is pulled down to 0 V till these shorts are present to inform the user a protection occurred.

CD-DIAG acts also as thermal warning. In fact every time T_j exceeds 140 °C, it is pulled down to notify this occurrence.

Figure 26. Audio section waveforms

4.5 Heat sink definition

Assuming we have a maximum dissipated power of 26 W (e.g. in the worst case situation of frequent clipping occurrence), considering T_j max is 150°C and assuming ambient temperature is 70 °C, the available temperature gap for a correct dissipation is 80 °C. This means the thermal resistance of the system R_{Th} has to be $80 \text{ °C}/26 \text{ W} = 3 \text{ °C/W}$.

The junction to case thermal resistance is 1 °C/W. So the heat sink thermal resistance should be approximately 2 °C/W. This would avoid any thermal shutdown occurrence even after long-term and full-volume operation.

5 Package information

In order to meet environmental requirements, ST offers these devices in different grades of ECOPACK® packages, depending on their level of environmental compliance. ECOPACK® specifications, grade definitions and product status are available at: www.st.com.

ECOPACK® is an ST trademark.

6 Revision history

Table 6. Document revision history

Date	Revision	Changes
03-Apr-2012	1	Initial release.
10-Sep-2012	2	Updated <i>Table 3: Absolute maximum ratings on page 9.</i>
14-Nov-2012	3	Updated: <i>Features on page 1;</i> <i>Section 1.1: Block diagram and application circuit;</i> <i>Section 3.3: Electrical characteristics;</i> <i>Section 4.4.2: Clipping detection and diagnostics (CD-DIAG pin) on page 19;</i> Added <i>Section 3.4: Electrical characteristics curves.</i>
05-Sep-2013	4	Updated <i>Figure 17 & 18.</i>
18-Sep-2013	5	Updated Disclaimer.
05-Sep-2014	6	Updated <i>Table 1: Device summary on page 1.</i> Added <i>Figure 30: Flexiwatt25 (horizontal) mechanical data and package dimensions on page 24.</i>
27-Oct-2014	7	Updated <i>Table 1: Device summary on page 1.</i> Added <i>Figure 28: Flexiwatt27 (horizontal) mechanical data and package dimensions on page 22</i>

IMPORTANT NOTICE – PLEASE READ CAREFULLY

STMicroelectronics NV and its subsidiaries ("ST") reserve the right to make changes, corrections, enhancements, modifications, and improvements to ST products and/or to this document at any time without notice. Purchasers should obtain the latest relevant information on ST products before placing orders. ST products are sold pursuant to ST's terms and conditions of sale in place at the time of order acknowledgement.

Purchasers are solely responsible for the choice, selection, and use of ST products and ST assumes no liability for application assistance or the design of Purchasers' products.

No license, express or implied, to any intellectual property right is granted by ST herein.

Resale of ST products with provisions different from the information set forth herein shall void any warranty granted by ST for such product.

Вы можете приобрести в компании MosChip.

Для оперативного оформления запроса Вам необходимо перейти по данной ссылке:

<http://moschip.ru/get-element>

Вы можете разместить у нас заказ для любого Вашего проекта, будь то серийное производство или разработка единичного прибора.

В нашем ассортименте представлены ведущие мировые производители активных и пассивных электронных компонентов.

Нашей специализацией является поставка электронной компонентной базы двойного назначения, продукции таких производителей как XILINX, Intel (ex.ALTERA), Vicor, Microchip, Texas Instruments, Analog Devices, Mini-Circuits, Amphenol, Glenair.

Сотрудничество с глобальными дистрибьюторами электронных компонентов, предоставляет возможность заказывать и получать с международных складов практически любой перечень компонентов в оптимальные для Вас сроки.

На всех этапах разработки и производства наши партнеры могут получить квалифицированную поддержку опытных инженеров.

Система менеджмента качества компании отвечает требованиям в соответствии с ГОСТ Р ИСО 9001, ГОСТ РВ 0015-002 и ЭС РД 009

Офис по работе с юридическими лицами:
