Pin Description

PIN #	PIN NAME	TYPE	DESCRIPTION
1	PCI0/CR#_A	I/O	3.3V PCI clock output or Clock Request control A for either SRC0 or SRC2 pair The power-up default is PCI0 output, but this pin may also be used as a Clock Request control of SRC pair 0 or SRC pair 2 via SMBus. Before configuring this pin as a Clock Request Pin, the PCI output must first be disabled in byte 2, bit 0 of SMBus address space . After the PCI output is disabled (high-Z), the pin can then be set to serve as a Clock Request pin for either SRC pair 2 or pair 0 using the CR#_A_EN bit located in byte 5 of SMBUs address space. Byte 5, bit 7 0 = PCI0 enabled (default) 1 = CR#_A enabled. Byte 5, bit 6 controls whether CR#_A controls SRC0 or SRC2 pair Byte 5, bit 6 0 = CR#_A controls SRC0 pair (default), 1 = CR#_A controls SRC2 pair

NOTES on DIF Output AC Specs: (unless otherwise noted, guaranteed by design and characterization, not 100% tested in production).

- ¹Measurement taken for single ended waveform on a component test board (not in system)
- ²Measurement taken from differential waveform on a component test board. (not in system)
- ³Slew rate emasured through V_{swing} voltage range centered about differential zero
- ⁴Vcross is defined at the voltage where Clock = Clock#, measured on a component test board (not in system)
- ⁵Only applies to the differential rising edge (Clock rising, Clock# falling)
- ⁶Total distributed intentional SRC to SRC skew. PCIe Gen2 outputs (SRC3, 4, 6 and 7) will have 0 nominal skew. Maximum allowable interpair skew is 150 ps.
- ⁷The max voltage including overshoot.
- ⁸The min voltage including undershoot.
- ⁹The total variation of all Vcross measurements in any particular system. Note this is a subset of V_{cross} min/mas (V_{Cross} absolute) allowed. The intent is to limit Vcross induced modulation by setting C_{cross_delta} to be smaller than V_{Cross} absolute.
- ¹⁰Matching applies to rising edge rate for Clock and falling edge rate for Clock#. It is measured using a +/-75mV window centered on the average cross point where Clock rising meets Clock# falling. The median cross point is used to calculate the voltage thresholds the oscilloscope is to use for the edge rate calculations.

NOTES on DIF Output Jitter: (unless otherwise noted, guaranteed by design and characterization, not 100% tested in production).

- ¹Jitter specs are specified as measured on a clock characterization board. System designers need to take special care not to use these numbers, as the in-system performance will be somewhat degraded. The receiver EMTS (chispet or CPU) will have the receiver jitter specs as measured in a real system.
- ²Phase jitter requirement: The designated Ge2 outputs will meet the reference clock jitter requirements from the PCI Express Gen2 Base Spec. The test is performed on a component test board under quiet conditions with all outputs on. Jitter analysis is performed using the standardized tool provided by the PCI SIG.
