Specification RT-220
This Issue: Issue 3
Date: July 20, 1997
Replaces: Issue 2

THERMOFIT® RT-220 TUBING Flexible, Heat-Shrinkable, Flame-Retarded Modified Fluoropolymer - Low Outgassing

1. SCOPE

This specification covers the requirements for flexible electrical insulating, extruded tubing whose diameter will reduce to a predetermined size upon the application of heat in excess of 150°C (302°F).

Tubing shall be flame retarded and shall be black or white.

2. APPLICABLE DOCUMENTS

This specification takes precedence over documents referenced herein. Unless otherwise specified, the latest issue of reference documents applies. The following documents form a part of this specification to the extent specified herein.

2.1 GOVERNMENT-FURNISHED DOCUMENTS

<u>Military</u>	
MIL-G-5572	Gasoline, Aviation, Grades 80/87, 100/130, and 115/145
MIL-H-5606	Hydraulic Fluid, Petroleum Base, Aircraft, Missile and Ordnance
MIL-T-5624	Turbine Fuel, Aviation, Grades JP-4 and JP-5
MIL-L-23699	Lubricating Oil, Aircraft Turbine Engine, Synthetic Base
MIL-STD-104	Limits for Electrical Insulation Color

2.2 OTHER PUBLICATIONS

American Socie	ty for Testing and Materials (ASTM)
D 2671	Standard Methods of Testing Heat-Shrinkable Tubing for Electrical Use
D 3032	Method of Testing Hookup Wire Insulation
E 595	Test Method for Total Mass Loss and Collected Volatile Condensable Materials from
	Outgassing in a Vacuum Environment
G 21	Standard Recommended Practice for Determining Resistance of Synthetic Polymeric
	Materials to Fungi

Page 2 SPECIFICATION RT-220 ISSUE 3

3. REQUIREMENTS

3.1 MATERIALS

The tubing shall be fabricated from thermally stabilized, modified fluoropolymer and shall be crosslinked by irradiation. It shall be homogeneous and essentially free from flaws, defects, pinholes, bubbles, seams, cracks, and inclusions.

3.2 PROPERTIES

The tubing shall meet the requirements of Table 3.

4. QUALITY ASSURANCE PROVISIONS

4.1 CLASSIFICATION OF TESTS

4.1.1 Qualification Tests

Qualification tests are those performed on tubing submitted for qualification as a satisfactory product and shall consist of all tests listed in this specification.

4.1.2 <u>Acceptance Tests</u>

Acceptance tests are those performed on tubing submitted for acceptance under contract. Acceptance tests shall consist of the following: dimensions, concentricity, longitudinal change, recovery angle, tensile strength, ultimate elongation, secant modulus, flammability, and heat shock.

4.2 SAMPLING INSTRUCTIONS

4.2.1 Qualification Test Samples

Qualification test samples shall consist of 50 feet (15 m) of tubing. Qualification of any size within each size range specified below shall qualify all sizes within that size range.

Range of Sizes 3/64 through 1/4 3/8 through 1

For Dynamic Cut-Through test, size 3/16 shall qualify all sizes. For Fungus Resistance test, any size shall qualify all sizes.

4.2.2 <u>Acceptance Test Samples</u>

Acceptance test samples shall consist of not less than 16 feet (5 m) of tubing selected at random from each lot. A lot shall consist of all tubing of the same size from the same production run and offered for inspection at the same time.

4.3 TEST PROCEDURES

Unless otherwise specified, tests shall be performed on specimens which have been fully recovered by conditioning for 3 minutes in a $200 \pm 5^{\circ}\text{C}$ ($392 \pm 9^{\circ}F$) oven. Prior to all testing, the test specimens (and measurement gauges, when applicable) shall be conditioned for 3 hours at $23 \pm 3^{\circ}\text{C}$ ($73 \pm 5^{\circ}F$) and 50 ± 5 percent relative humidity. All ovens shall be of the mechanical convection type in which air passes the specimens at a velocity of 100 to 200 feet (30 to 60 m) per minute.

4.3.1 Dimensions and Longitudinal Change

Three 6-inch (150-mm) specimens of tubing, as supplied, shall be measured for length

 \pm 1/32 inch (\pm 1 mm), and inside diameter in accordance with ASTM D 2671, conditioned for

3 minutes in a $200 \pm 5^{\circ}$ C $(392 \pm 9^{\circ}F)$ oven, cooled to $23 \pm 3^{\circ}$ C $(73 \pm 5^{\circ}F)$ and then remeasured. Prior to and after conditioning, the dimensions of the tubing shall be in accordance with

Table 1 and the longitudinal change shall be in accordance with Table 3. The longitudinal change shall be calculated as follows:

$$C = \frac{L_1 - L_0}{L_0} \times 100$$

Where: C =Longitudinal Change [Percent]

 $L_0 = Length Before Conditioning$

 L_1 = Length After Conditioning

4.3.2 <u>Concentricity as Supplied</u>

Three 6-inch (150-mm) specimens of tubing, as supplied, shall be measured for minimum and maximum wall thickness. Concentricity shall be calculated as follows:

$$C = \frac{W_{min}}{W_{max}} x 100$$

Where: C = Concentricity [Percent]

W_{min} = Minimum Wall Thickness W_{max} = Maximum Wall Thickness

4.3.3 Weight Per Length

A $12 \pm 1/32$ inch $(305 \pm 0.8 \text{ mm})$ length of tubing, as supplied, shall be weighed. The weight shall be multiplied by 100 and reported as pounds/100 ft (kg/100 m).

4.3.4 Recovery Angle

A length of tubing shall be cut such that the end of the tubing is 90 degrees to the longitudinal axis. The tubing shall be recovered in accordance with Section 4.3, and by means of an optical comparitor or equivalent, the angle between the end and the longitudinal axis shall be measured. The deviation from 90 degrees shall be reported as the recovery angle.

4.3.5 Tensile Strength and Ultimate Elongation

The tensile strength and ultimate elongation of the tubing shall be determined in accordance with ASTM D 2671 using 1-inch (25-mm) bench marks and a 1-inch (25-mm) initial jaw separation. The speed of jaw separation shall be 20 ± 2 inches (500 ± 50 mm) per minute.

Page 4 SPECIFICATION RT-220 ISSUE 3

4.3.6 <u>Low Temperature Flexibility</u>

For tubing of expanded diameter 1/4 inch (6 mm) or greater, three strip specimens, 1/4 inch (6 mm) wide and 12 inches (300 mm) long, shall be cut from the expanded tubing. For tubing of expanded diameter less than 1/4 inch (6 mm) three tubular specimens, 12 inches (300 mm) long, shall be cut from the expanded tubing. The specimens shall be recovered in accordance with Section 4.3 and conditioned with appropriate mandrels for 4 hours at $-55 \pm 2^{\circ}$ C $(-67 \pm 4^{\circ}F)$. The mandrel diameter shall be 10 times the specimen thickness, \pm 10 percent. For tubular specimens, the specimen thickness shall be equivalent to the outside diameter. While at the specified temperature, and without removing the specimens from the cold chamber, the specimens shall be wrapped 360 degrees around the mandrel in approximately 2 seconds. Any side cracking, caused by flattening of the specimens on the mandrel, shall be disregarded.

4.3.7 Heat Shock

Three 6-inch (150-mm) specimens of tubing shall be conditioned for 4 hours in a $250 \pm 5^{\circ}\text{C}$ (482 ± 9°F) oven. The specimens shall be removed from the oven, cooled to $23 \pm 3^{\circ}\text{C}$ (73 ± 5°F), wrapped 180 degrees around a mandrel selected in accordance with Table 2, and then visually examined for evidence of dripping, flowing, or cracking. Any side cracking caused by flattening of the specimen on the mandrel shall not constitute failure.

4.3.8 <u>Dynamic Cut-Through at Temperature</u>

Two 6-inch (150-mm) lengths of size 3/16-inch tubing shall each be recovered on a 7-inch (175-mm) length of 3/32-inch (2.38-mm) oil hardened drill rod, by placing in a $200 \pm 5^{\circ}$ C (392 ± 9°F) mechanical convection oven for 3 minutes. The cut-through tests shall be performed at $135 \pm 3^{\circ}$ C (275 ± 5°F) in accordance with ASTM D 3032 using the optional cutting edge. Four readings shall be taken on each of the assemblies.

4.3.9 <u>Heat Resistance</u>

Specimens in accordance with Section 4.3.5 shall be conditioned for 336 hours in a $225 \pm 3^{\circ}$ C $(437 \pm 5^{\circ}F)$ oven. The specimens shall be removed from the oven, cooled to $23 \pm 3^{\circ}$ C $(73 \pm 5^{\circ}F)$ and tested for elongation in accordance with Section 4.3.5.

4.3.10 <u>Copper Stability</u>

Three 6-inch (150-mm) specimens of tubing shall be slid over a snug-fitting, straight, clean, bare copper conductor. For tubing sizes 1/4 and smaller, a solid conductor shall be used; for tubing sizes 3/8 and larger, a solid or tubular conductor shall be used. The specimens on the conductors shall be conditioned for 24 hours in a desiccator or similar humidity chamber at 90 to 95 percent relative humidity and $23 \pm 3^{\circ}$ C ($73 \pm 5^{\circ}$ F). The specimens on the conductors then shall be conditioned for 168 hours in a $180 \pm 3^{\circ}$ C ($73 \pm 5^{\circ}$ F) oven. After conditioning, the specimens shall be removed from the oven and cooled to $23 \pm 3^{\circ}$ C ($73 \pm 5^{\circ}$ F). The copper conductor then shall be removed from the tubing, and the tubing and conductor shall be examined. Darkening of the copper due to normal air oxidation shall not be cause for rejection. The tubing shall be tested for elongation in accordance with 4.3.5.

4.3.11 Corrosive Effect

4.3.11.1 Copper Mirror Corrosion

The tubing shall be tested for copper mirror corrosion in accordance with ASTM D 2671, Procedure A, for 16 hours at 160 ± 3 °C $(320 \pm 5$ °F). For tubing sizes 1/8 and larger, specimens shall consist of 1/4 x 1 inch (6 x 25 mm) strips cut longitudinally. Evidence of corrosion shall be the removal of copper from a mirror, leaving an area of transparency greater than 5 percent of its total area.

4.3.11.2 Corrosion in Contact with Copper

The tubing shall be tested for corrosion in contact with copper for 16 hours at $175 \pm 3^{\circ}\text{C}$ (347 ± 5°F) in accordance with ASTM D 2671, Procedure B.

4.3.12 Fluid Resistance

Six 6-inch (150-mm) specimens of tubing, prepared and measured in accordance with ASTM D 2671 solvent resistance, shall be completely immersed in each listed fluid for 24 ± 2 hours at 50 ± 3 °C (122 ± 5 °F). The volume of the fluid shall be not less than 20 times that of the specimens. After immersion, the specimens shall be lightly wiped and air-dried for 30 to 60 minutes at room temperature. Three specimens then shall be tested for dielectric strength and the other three for tensile strength.

4.3.13 <u>Vacuum Outgassing</u>

Three $0.5 \pm .05$ gram specimens shall be recovered for 3 minutes at 200° C and then tested for percent total weight loss and percent volatile condensable materials. The conditions for testing are: exposure time, 24 hours; sample temperature $125 \pm 3^{\circ}$ C; condensing surface temperature,

 18 ± 3 °C; and pressure, not greater than 1×10^{-5} torr. The vacuum shall be provided by a diffusion pump, liquid nitrogen trap vacuum system. The apparatus shall consist of a glass sample chamber, refluxing liquid heat source and a polished stainless steel plate in close contact with a copper cold finger cooled internally by circulating water. The axis of the exit of the sample chamber shall be perpendicular to and approximately 15-mm from the cooled condensing plate. A Cahn RG micro balance or equivalent shall be used for weighing. The specimen shall be weighed before and after conditioning and total weight loss calculated and the condensing plate shall be weighed before and after to calculate percent volatile condensable material.

4.4 REJECTION AND RETEST

Failure of any sample of tubing to conform to any one of the requirements of this specification shall be cause for rejection of the lot represented. Tubing which has been rejected may be replaced or reworked to correct the defects and resubmitted for acceptance. Before resubmitting, full particulars concerning previous rejection and action taken to correct the defects shall be furnished to the inspector.

5. PREPARATION FOR DELIVERY

5.1 FORM

The tubing shall be supplied on spools, unless otherwise specified.

ПОСТАВКА ЭЛЕКТРОННЫХ КОМПОНЕНТОВ

многоканальный

Общество с ограниченной ответственностью «МосЧип» ИНН 7719860671 / КПП 771901001 Адрес: 105318, г.Москва, ул.Щербаковская д.3, офис 1107

Данный компонент на территории Российской Федерации Вы можете приобрести в компании MosChip.

Для оперативного оформления запроса Вам необходимо перейти по данной ссылке:

http://moschip.ru/get-element

Вы можете разместить у нас заказ для любого Вашего проекта, будь то серийное производство или разработка единичного прибора.

В нашем ассортименте представлены ведущие мировые производители активных и пассивных электронных компонентов.

Нашей специализацией является поставка электронной компонентной базы двойного назначения, продукции таких производителей как XILINX, Intel (ex.ALTERA), Vicor, Microchip, Texas Instruments, Analog Devices, Mini-Circuits, Amphenol, Glenair.

Сотрудничество с глобальными дистрибьюторами электронных компонентов, предоставляет возможность заказывать и получать с международных складов практически любой перечень компонентов в оптимальные для Вас сроки.

На всех этапах разработки и производства наши партнеры могут получить квалифицированную поддержку опытных инженеров.

Система менеджмента качества компании отвечает требованиям в соответствии с ГОСТ Р ИСО 9001, ГОСТ РВ 0015-002 и ЭС РД 009
