GENERAL DESCRIPTION

The XRT83L38 is a fully integrated Octal (eight channel) long-haul and short-haul line interface unit for T1 (1.544Mbps) 100Ω, E1 (2.048Mbps) 75Ω or 120Ω, or J1 110Ω applications.

In long-haul applications the XRT83L38 accepts signals that have been attenuated from 0 to 36dB at 772kHz in T1 mode (equivalent of 0 to 6000 feet of cable loss) or 0 to 43dB at 1024kHz in E1 mode.

In T1 applications, the XRT83L38 can generate five transmit pulse shapes to meet the short-haul Digital Cross-Connect (DSX-1) template requirements as well as for Channel Service Units (CSU) Line Build Out (LBO) filters of 0dB, -7.5dB -15dB and -22.5dB as required by FCC rules. It also provides programmable transmit pulse generators for each channel that can be used for output pulse shaping allowing performance improvement over a wide variety of conditions (The arbitrary pulse generators are available in both T1 and E1 modes).

The XRT83L38 provides both a parallel **Host** microprocessor interface as well as a **Hardware** mode for programming and control.

Both the B8ZS and HDB3 encoding and decoding functions are selectable as well as AMI. An on-chip crystal-less jitter attenuator with a 32 or 64 bit FIFO can be placed either in the receive or the transmit path with loop bandwidths of less than 3Hz. The XRT83L38 provides a variety of loop-back and diagnostic features as well as transmit driver short circuit detection and receive loss of signal monitoring. It supports internal impedance matching for 75Ω, 100Ω, 110Ω and 120Ω for both transmitter and receiver. In the absence of the power supply, the transmit outputs and receive inputs are tri-stated allowing for redundancy applications The chip includes an integrated programmable clock multiplier that can synthesize T1 or E1 master clocks from a variety of external clock sources.

APPLICATIONS

- T1 Digital Cross-Connects (DSX-1)
- ISDN Primary Rate Interface
- CSU/DSU E1/T1/J1 Interface
- T1/E1/J1 LAN/WAN Routers
- Public switching Systems and PBX Interfaces
- T1/E1/J1 Multiplexer and Channel Banks

Features (See Page 2)

FIGURE 1. BLOCK DIAGRAM OF THE XRT83L38 T1/E1/J1 LIU (HOST MODE)

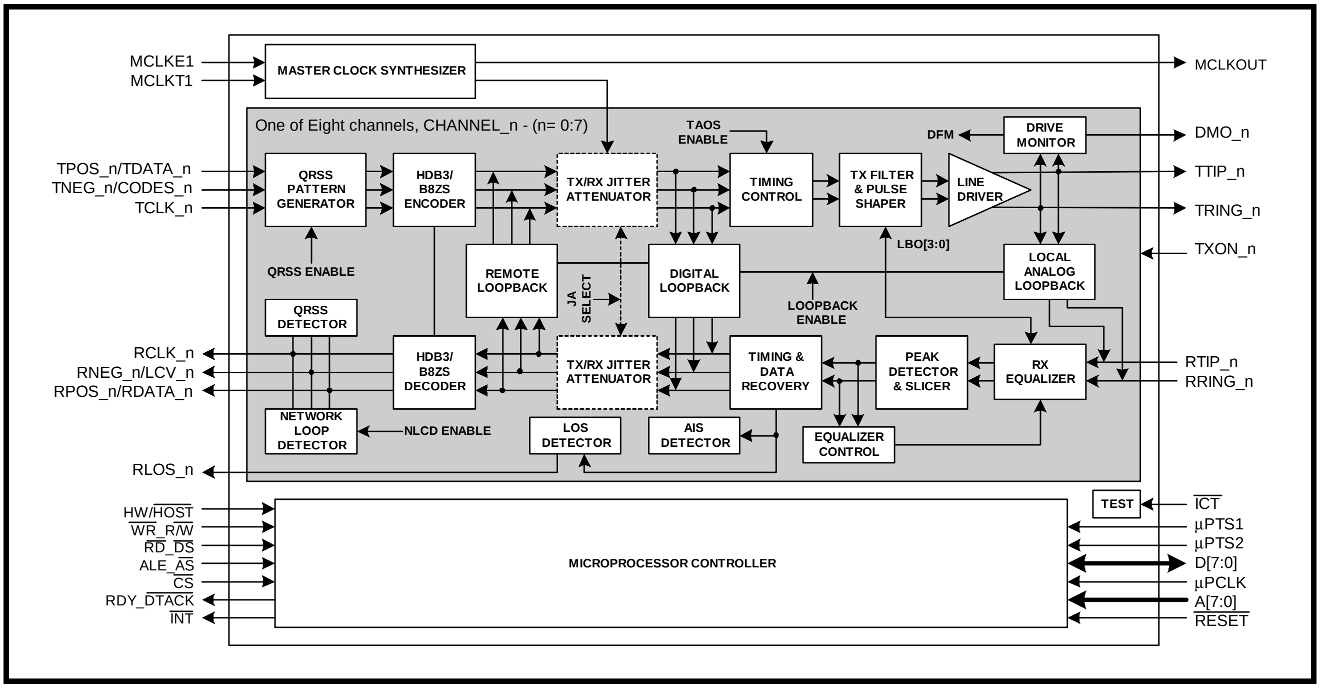

FIGURE 2. BLOCK DIAGRAM OF THE XRT83L38 T1/E1/J1 LIU (HARDWARE MODE)

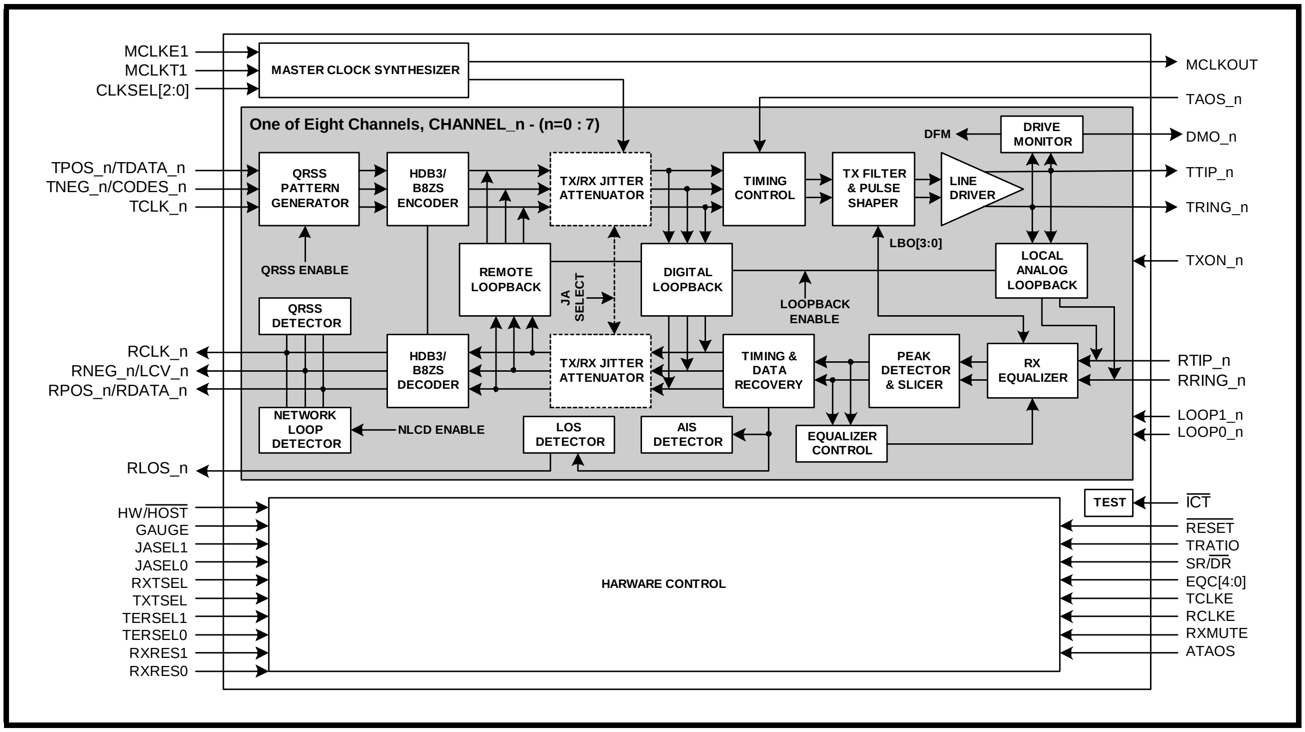

FEATURES

- Fully integrated eight channel long-haul or short-haul transceivers for E1,T1 or J1 applications
- Adaptive Receive Equalizer for up to 36dB cable attenuation
- Programable Transmit Pulse Shaper for E1,T1 or J1 short-haul interfaces
- Five fixed transmit pulse settings for T1 short-haul applications plus a fully programmable waveform generator for transmit output pulse shaping available for both T1 and E1 modes
- Transmit Line Build-Outs (LBO) for T1 long-haul application from 0dB to -22.5dB in three 7.5dB steps
- Selectable receiver sensitivity from 0 to 36dB cable loss for T1 @772kHz and 0 to 43dB for E1 @1024kHz
- Receive monitor mode handles 0 to 29dB resistive attenuation along with 0 to 6dB of cable attenuation for E1 and 0 to 3dB of cable attenuation for T1 modes
- Supports 75Ω and 120Ω (E1), 100Ω (T1) and 110Ω (J1) applications
- Internal and/or external impedance matching for 75Ω, 100Ω, 110Ω and 120Ω
- Tri-State transmit output and receive input capability for redundancy applications
- Provides High Impedance for Tx and Rx during power off
- Transmit return loss meets or exceeds ETSI 300-166 standard
- On-chip digital clock recovery circuit for high input jitter tolerance
- Crystal-less digital jitter attenuator with 32-bit or 64-bit FIFO selectable either in transmit or receive path
- On-chip frequency multiplier generates T1 or E1 Master clocks from variety of external clock sources
- High receiver interference immunity
- On-chip transmit short-circuit protection and limiting, and driver fail monitor output (DMO)
- Receive loss of signal (RLOS) output

- On-chip HDB3/B8ZS/AMI encoder/decoder functions
- QRSS pattern generator and detection for testing and monitoring
- Error and Bipolar Violation Insertion and Detection
- Receiver Line Attenuation Indication Output in 1dB steps
- Network Loop-Code Detection for automatic Loop-Back Activation/Deactivation
- Transmit All Ones (TAOS) and In-Band Network Loop Up and Down code generators
- Supports Local Analog, Remote, Digital and Dual Loop-Back Modes
- Meets or exceeds T1 and E1 short-haul and long-haul network access specifications in ITU G.703, G.775, G.736 and G.823; TR-TSY-000499; ANSI T1.403 and T1.408; ETSI 300-166 and AT&T Pub 62411
- Supports both **Hardware** and **Host** (parallel Microprocessor) interface for programming
- Programmable Interrupt
- Low power dissipation
- Logic inputs accept either 3.3V or 5V levels
- Single 3.3V Supply Operation
- 225 ball BGA package
- -40°C to +85°C Temperature Range

TABLE OF CONTENTS

PIN DESCRIPTION BY FUNCTION

RECEIVE SECTIONS

SIGNAL NAME	LEAD #	TYPE	DESCRIPTION
RLOS_0	C3	**O**	**Receiver Loss of Signal for Channel_ 0:** This output signal goes “High” for at least one RCLK_0 cycle to indicate loss of signal at the receive 0 input. RLOS will remain “High” for the entire duration of the Loss of Signal detected by the receiver logic. **SEE”RECEIVER LOSS OF SIGNAL (RLOS)” ON PAGE 24.**
RLOS_1	H4		**Receiver Loss of Signal for Channel _1**
RLOS_2	H15		**Receiver Loss of Signal for Channel _2**
RLOS_3	A16		**Receiver Loss of Signal for Channel _3**
RLOS_4	V3		**Receiver Loss of Signal for Channel _4**
RLOS_5	L2		**Receiver Loss of Signal for Channel_ 5**
RLOS_6	J15		**Receiver Loss of Signal for Channel _6**
RLOS_7	T15		**Receiver Loss of Signal for Channel _7**
RCLK_0	B3	**O**	**Receiver Clock Output for Channel _0**
RCLK_1	H3		**Receiver Clock Output for Channel _1**
RCLK_2	H16		**Receiver Clock Output for Channel _2**
RCLK_3	A17		**Receiver Clock Output for Channel _3**
RCLK_4	U3		**Receiver Clock Output for Channel _4**
RCLK_5	L3		**Receiver Clock Output for Channel _5**
RCLK_6	M15		**Receiver Clock Output for Channel _6**
RCLK_7	U16		**Receiver Clock Output for Channel _7**
RNEG_0	A2	**O**	**Receiver Negative Data Output for Channel_0 - Dual-Rail mode** This signal is the receive negative-rail output data.
LCV_0	A2		**Line Code Violation Output for Channel_0 - Single-Rail mode** This signal goes “High” for one RCLK_0 cycle to indicate a code violation is detected in the received data of Channel _0. If AMI coding is selected, every bipolar violation received will cause this pin to go “High”.
RNEG_1	H2		**Receiver Negative Data Output for Channel _1**
LCV_1			**Line Code Violation Output for Channel _1**
RNEG_2	H18		**Receiver Negative Data Output for Channel _2**
LCV_2			**Line Code Violation Output for Channel _2**
RNEG_3	B16		**Receiver Negative Data Output for Channel _3**
LCV_3			**Line Code Violation Output for Channel _3**
RNEG_4	T4		**Receiver Negative Data Output for Channel _4**
LCV_4			**Line Code Violation Output for Channel _4**
RNEG_5	M4		**Receiver Negative Data Output for Channel _5**
LCV_5			**Line Code Violation Output for Channel _5**
RNEG_6	M16		**Receiver Negative Data Output for Channel _6**
LCV_6			**Line Code Violation Output for Channel _6**
RNEG_7	V17		**Receiver Negative Data Output for Channel _7**
LCV_7			**Line Code Violation Output for Channel _7**

SIGNAL NAME	LEAD #	TYPE	DESCRIPTION
RPOS_0	B2	**O**	**Receiver Positive Data Output for Channel _0 - Dual-Rail mode**
			This signal is the receive positive-rail output data sent to the Framer.
			Receiver NRZ Data Output for Channel _0 - Single-Rail mode
RDATA_0	B2		This signal is the receive output data.
			Receiver Positive Data Output for Channel _1
RPOS_1	G2		**Receiver NRZ Data Output for Channel _1**
RDATA_1			**Receiver Positive Data Output for Channel _2**
RPOS_2	D15		**Receiver NRZ Data Output for Channel _2**
RDATA_2			**Receiver Positive Data Output for Channel _3**
RPOS_3	B17		**Receiver NRZ Data Output for Channel _3**
RDATA_3			**Receiver Positive Data Output for Channel _4**
RPOS_4	U2		**Receiver NRZ Data Output for Channel _4**
RDATA_4			**Receiver Positive Data Output for Channel _5**
RPOS_5	M3		**Receiver NRZ Data Output for Channel _5**
RDATA_5			**Receiver Positive Data Output for Channel _6**
RPOS_6	L17		**Receiver NRZ Data Output for Channel 6**
RDATA_6			**Receiver Positive Data Output for Channel _7**
RPOS_7	T17		**Receiver NRZ Data Output for Channel _7**
RDATA_7			
RTIP_0	C1	**I**	**Receiver Differential Tip Input for Channel _0**
			Positive differential receive input from the line
RTIP_1	G1		**Receiver Differential Tip Input for Channel _1**
RTIP_2	G18		**Receiver Differential Tip Input for Channel _2**
RTIP_3	C18		**Receiver Differential Tip Input for Channel _3**
RTIP_4	U1		**Receiver Differential Tip Input for Channel _4**
RTIP_5	L1		**Receiver Differential Tip Input for Channel _5**
RTIP_6	L18		**Receiver Differential Tip Input for Channel _6**
RTIP_7	T18		**Receiver Differential Tip Input for Channel _7**
RRING_0	D1	**I**	**Receiver Differential Ring Input for Channel _0**
			Negative differential receive input from the line
RRING_1	F1		**Receiver Differential Ring Input for Channel _1**
RRING_2	F18		**Receiver Differential Ring Input for Channel _2**
RRING_3	D18		**Receiver Differential Ring Input for Channel _3**
RRING_4	T1		**Receiver Differential Ring Input for Channel _4**
RRING_5	M1		**Receiver Differential Ring Input for Channel _5**
RRING_6	M18		**Receiver Differential Ring Input for Channel _6**
RRING_7	R18		**Receiver Differential Ring Input for Channel _7**
RXMUTE	T12	**I**	**Receive Data Muting** When a LOS condition occurs, the outputs RPOS_n/RNEG_n will be muted, (forced to ground) to prevent data chattering. Tie this pin "Low" to disable the muting function. ***NOTES:*** 1. *This pin is internally pulled "High" with a 50kΩ resistor.* 2. *In **Hardware mode**, all receive channels share the same RXMUTE control function.*

CLOCK SYNTHESIZER

SIGNAL NAME	LEAD #	TYPE	DESCRIPTION
MCLKOUT	H1	**O**	**Synthesized Master Clock Output** This signal is the output of the Master Clock Synthesizer PLL which is at T1 or E1 rate based upon the mode of operation.
MCLKT1	K1	**I**	**T1 Master Clock Input** This signal is an independent 1.544MHz clock for T1 systems with accuracy better than ±50ppm and duty cycle within 40% to 60%. MCLKT1 is used in the T1 mode. **NOTES:** 1. *All channels of the XRT83L38 must be operated at the same clock rate, either T1, E1 or J1.* 2. *See pin 26 description for further explanation for the usage of this pin.* 3. *Internally pulled “Low” with a 50kΩ resistor.*
MCLKE1	J1	**I**	**E1 Master Clock Input** A 2.048MHz clock for with an accuracy of better than ±50ppm and a duty cycle of 40% to 60% can be provided at this pin. In systems that have only one master clock source available (E1 or T1), that clock should be connected to both MCLKE1 and MCLKT1 inputs for proper operation. **NOTES:** 1. *All channels of the XRT83L38 must be operated at the same clock rate, either T1, E1 or J1.* 2. *Internally pulled “Low” with a 50kΩ resistor.*

SIGNAL NAME	LEAD #	TYPE	DESCRIPTION
CLKSEL0 **CLKSEL1** **CLKSEL2**	A8 B8 C8	**I**	**Clock Select inputs for Master Clock Synthesizer - Hardware mode** CLKSEL[2:0] are input signals to a programmable frequency synthesizer that can be used to generate a master clock from an external accurate clock source according to the table below. In **Hardware mode,** the MCLKRATE control signal is generated from the state of EQC[4:0] inputs. In **Host mode,** the state of these pins are ignored and the master frequency PLL is controlled by the corresponding interface bits. See **Table 36** register address 10000001

ALARM FUNCTIONS/REDUNDANCY SUPPORT

SIGNAL NAME	LEAD #	TYPE	DESCRIPTION
GAUGE	J18	**I**	**Twisted Pair Cable Wire Gauge Select - Hardware Mode** Connect this pin “High” to select 26 Gauge wire. Connect this pin “Low” to select 22 and 24 gauge wire for all channels. ***NOTE:*** *Internally pulled “Low” with a 50kΩ resistor.*
DMO_0	D5	**O**	**Driver Failure Monitor Channel _0:** This pin transitions “High” if a short circuit condition is detected in the transmit driver of Channel _0, or no transmit output pulse is detected for more than 128 TCLK_0 cycles.
DMO_1	D4		**Driver Failure Monitor Channel _1**
DMO_2	C15		**Driver Failure Monitor Channel _2**
DMO_3	C13		**Driver Failure Monitor Channel _3**
DMO_4	R5		**Driver Failure Monitor Channel _4**
DMO_5	P4		**Driver Failure Monitor Channel _5**
DMO_6	U17		**Driver Failure Monitor Channel _6**
DMO_7	V14		**Driver Failure Monitor Channel _7**
ATAOS	T13	**I**	**Automatic Transmit “All Ones” Pattern - Hardware Mode** A "High" level on this pin enables the automatic transmission of an "All Ones" AMI pattern from the transmitter of any channel that the receiver of that channel has detected an LOS condition. A "Low" level on this pin disables this function. *Note: All channels share the same ATAOS control function.*
µPCLK	T13		**Microprocessor Clock Input - Host mode** **SEE”MICROPROCESSOR CLOCK INPUT - HOST MODE:” ON PAGE 13.** ***NOTE:*** *This pin is internally pulled “Low” for asynchronous microprocessor interface when no clock is present.*
TRATIO	L16	**I**	**Transmitter Transformer Ratio Select - Hardware mode** In **external termination mode** (TXTSEL = 0), setting this pin “High” selects a transformer ratio of 1:2 for the transmitter. A “Low” on this pin sets the transmitter transformer ratio to 1:2.45. In the **internal termination mode** the transmitter transformer ratio is permanently set to 1:2 and the state of this pin is ignored.
$\overline{\text{INT}}$	L16	**O**	**Interrupt Output - Host mode** This pin is asserted “Low” to indicate an alarm condition. **SEE”INTERRUPT OUTPUT - HOST MODE” ON PAGE 13.** ***NOTE:*** *This pin is an open drain output and requires an external 10kΩ pull-up resistor.*
$\overline{\text{RESET}}$	T8	**I**	**Hardware Reset (Active “Low”):** When this pin is tied “Low” for more than 10µs, the device is put in the reset state. **Exar recommends initiating a Harware reset upon power up.** ***NOTE:*** *This pin is internally pulled “High” with a 50kΩ resistor.*
SR/$\overline{\text{DR}}$	K4	**I**	**Single-Rail/Dual-Rail Data Format:** Connect this pin “Low” to select transmit and receive data format in **Dual-Rail mode**. In this mode, HDB3 or B8ZS encoder and decoder are not available. Connect this pin “High” to select **single-rail data format**. ***NOTE:*** *Internally pulled “Low” with a 50kΩ resistor.*

FUNCTIONAL DESCRIPTION

The XRT83L38 is a fully integrated long-haul and short-haul transceiver intended for T1, J1 or E1 systems. Simplified block diagrams of the chip are shown in Figure 1, **Host** mode and Figure 2, **Hardware** mode. The XRT83L38 can receive signals that have been attenuated from 0 to 36dB at 772kHz (0 to 6000 feet cable loss) for T1 and from 0 to 43dB at 1024kHz for E1 systems.

In T1 applications, the XRT83L38 can generate five transmit pulse shapes to meet the short-haul Digital Cross-connect (DSX-1) template requirement as well as four CSU Line Build-Out (LBO) filters of 0dB, -7.5dB, -15dB and -22.5dB as required by FCC rules. It also provides programmable transmit output pulse generators for each channel that can be used for output pulse shaping allowing performance improvement over a wide variety of conditions (The arbitrary pulse generators are available in both T1 and E1). The operation and configuration of the XRT83L38 can be controlled through a parallel microprocessor **Host** interface or **Hardware** control.

MASTER CLOCK GENERATOR

Using a variety of external clock sources, the on-chip frequency synthesizer generates the T1 (1.544MHz) or E1 (2.048MHz) master clocks necessary for the transmit pulse shaping and receive clock recovery circuit.

There are two master clock inputs MCLKE1 and MCLKT1. In systems where both T1 and E1 master clocks are available these clocks can be connected to the respective pins. All channels of a given XRT83l38 must be operated at the same clock rate, either T1, E1 or J1 modes.

In systems that have only one master clock source available (E1 or T1), that clock should be connected to both MCLKE1 and MCLKT1 inputs for proper operation. T1 or E1 master clocks can be generated from 8kHz, 16kHz, 56kHz, 64kHz, 128kHz and 256kHz external clocks under the control of CLKSEL[2:0] inputs according to Table 1.

NOTE: *EQC[4:0] determine the T1/E1 operating mode. See Table 5 for details.*

FIGURE 4. TWO INPUT CLOCK SOURCE

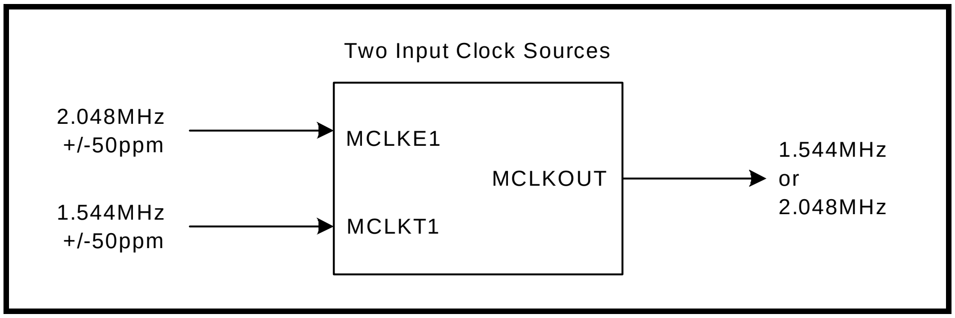

FIGURE 5. ONE INPUT CLOCK SOURCE

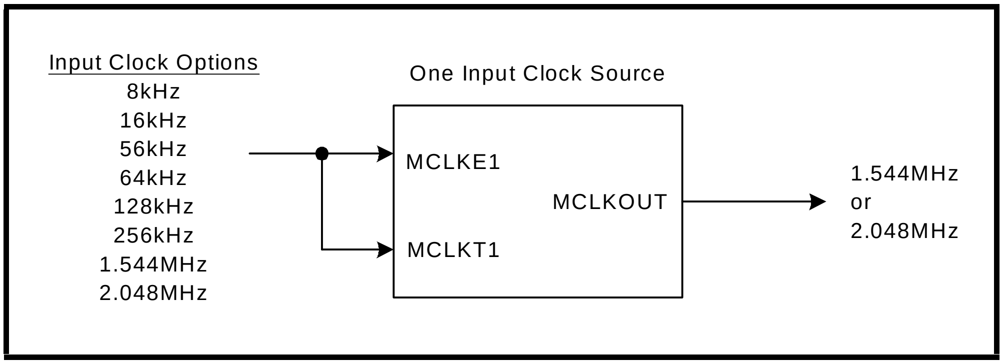

TABLE 1: MASTER CLOCK GENERATOR

MCLKE1 KHZ	MCLKT1 KHZ	CLKSEL2	CLKSEL1	CLKSEL0	MCLKRATE	MASTER CLOCK KHZ
2048	2048	0	0	0	0	2048
2048	2048	0	0	0	1	1544
2048	1544	0	0	0	0	2048
1544	1544	0	0	1	1	1544
1544	1544	0	0	1	0	2048
2048	1544	0	0	1	1	1544
8	x	0	1	0	0	2048
8	x	0	1	0	1	1544
16	x	0	1	1	0	2048
16	x	0	1	1	1	1544
56	x	1	0	0	0	2048
56	x	1	0	0	1	1544
64	x	1	0	1	0	2048
64	x	1	0	1	1	1544
128	x	1	1	0	0	2048
128	x	1	1	0	1	1544
256	x	1	1	1	0	2048
256	x	1	1	1	1	1544

In **Host** mode the programming is achieved through the corresponding interface control bits, the state of the CLKSEL[2:0] control bits and the state of the MCLKRATE interface control bit.

RECEIVER

RECEIVER INPUT

At the receiver input, a cable attenuated AMI signal can be coupled to the receiver through a capacitor or a 1:1 transformer. The input signal is first applied to a selective equalizer for signal conditioning. The maximum equalizer gain is up to 36dB for T1 and 43dB for E1 modes. The equalized signal is subsequently applied to a peak detector which in turn controls the equalizer settings and the data slicer. The slicer threshold for both E1 and T1 is typically set at 50% of the peak amplitude at the equalizer output. After the slicers, the digital representation of the AMI signals are applied to the clock and data recovery circuit. The recovered data subsequently goes through the jitter attenuator and decoder (if selected) for HDB3 or B8ZS decoding before being applied to the RPOS_n/RDATA_n and RNEG_n/LCV_n pins. Clock recovery is accomplished by a digital phase-locked loop (DPLL) which does not require any external components and can tolerate high levels of input jitter that meets or exceeds the ITU-G.823 and TR-TSY000499 standards.

RECEIVE MONITOR MODE

In applications where Monitor mode is desired, the equalizer can be configured in a gain mode which handles input signals attenuated resistively up to 29dB, along with 0 to 6dB cable attenuation for both T1 and E1 applications, refer to **Table 5** for details. This feature is available in both **Hardware** and **Host** modes.

RECEIVER LOSS OF SIGNAL (RLOS)

For compatibility with ITU G.775 requirements, the RLOS monitoring function is implemented using both analog and digital detection schemes. If the analog RLOS condition occurs, a digital detector is activated to count for 32 consecutive zeros in E1 (4096 bits in Extended Los mode, EXLOS = “1”) or 175 consecutive zeros in T1 before RLOS is asserted. RLOS is cleared when the input signal rises +3dB (built in hysteresis) above the point at which it was declared and meets 12.5% ones density of 4 ones in a 32 bit window, with no more than 16 consecutive zeros for E1. In T1 mode, RLOS is cleared when the input signal rises +3dB (built in hysteresis) above the point at which it was declared and contains 16 ones in a 128 bit window with no more than 100 consecutive zeros in the data stream. When loss of signal occurs, RLOS register indication and register status will change. If the RLOS register enable is set high (enabled), the alarm will trigger an interrupt causing the interrupt pin ($\overline{\text{INT}}$) to go low. Once the alarm status register has been read, it will automatically reset upon read (RUR), and the $\overline{\text{INT}}$ pin will return high.

Analog RLOS

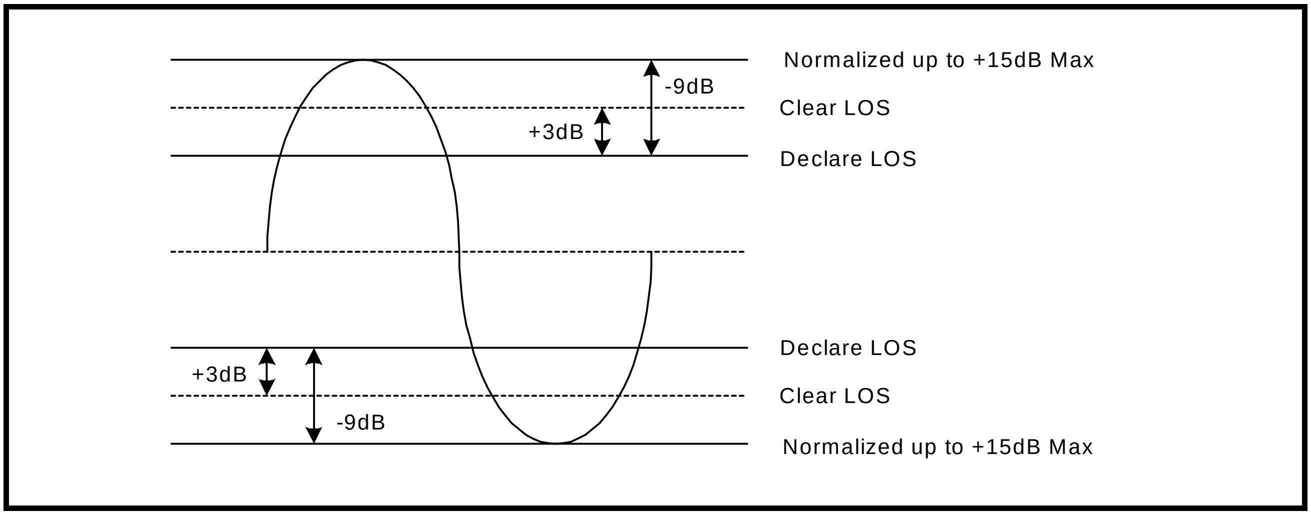
Setting the Receiver Inputs to -15dB T1/E1 Short Haul Mode

By setting the receiver inputs to -15dB T1/E1 short haul mode, the equalizer will detect the incoming amplitude and make adjustments by adding gain up to a maximum of +15dB normalizing the T1/E1 input signal.

NOTE: *This is the only setting that refers to cable loss (frequency), not flat loss (resistive).*

Once the T1/E1 input signal has been normalized to 0dB by adding the maximum gain (+15dB), the receiver will declare RLOS if the signal is attenuated by an additional -9dB. The total cable loss at RLOS declaration is typically -24dB (-15dB + -9dB). A 3dB hysteresis was designed so that transients will not trigger the RLOS to clear. Therefore, the RLOS will typically clear at a total cable attenuation of -21dB. See **Figure 6** for a simplified diagram.

FIGURE 6. SIMPLIFIED DIAGRAM OF -15dB T1/E1 SHORT HAUL MODE AND RLOS CONDITION



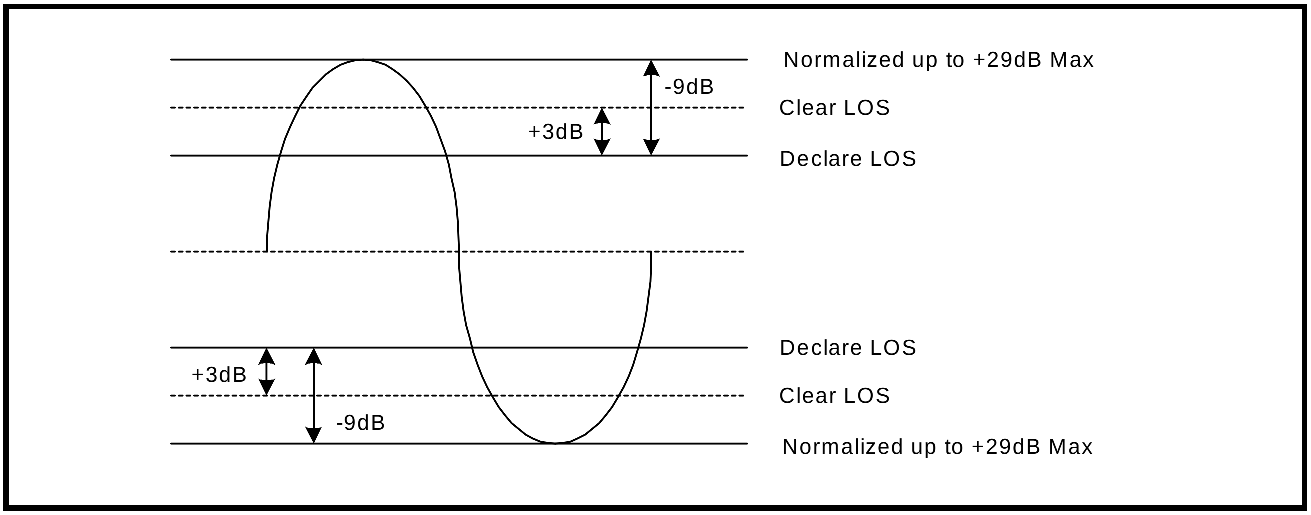
Setting the Receiver Inputs to -29dB T1/E1 Gain Mode

By setting the receiver inputs to -29dB T1/E1 gain mode, the equalizer will detect the incoming amplitude and make adjustments by adding gain up to a maximum of +29dB normalizing the T1/E1 input signal.

NOTE: *This is the only setting that refers to flat loss (resistive). All other modes refer to cable loss (frequency).*

Once the T1/E1 input signal has been normalized to 0dB by adding the maximum gain (+29dB), the receiver will declare RLOS if the signal is attenuated by an additional -9dB. The total cable loss at RLOS declaration is typically -38dB (-29dB + -9dB). A 3dB hysteresis was designed so that transients will not trigger the RLOS to clear. Therefore, the RLOS will typically clear at a total flat loss of -35dB. See Figure 7 for a simplified diagram.

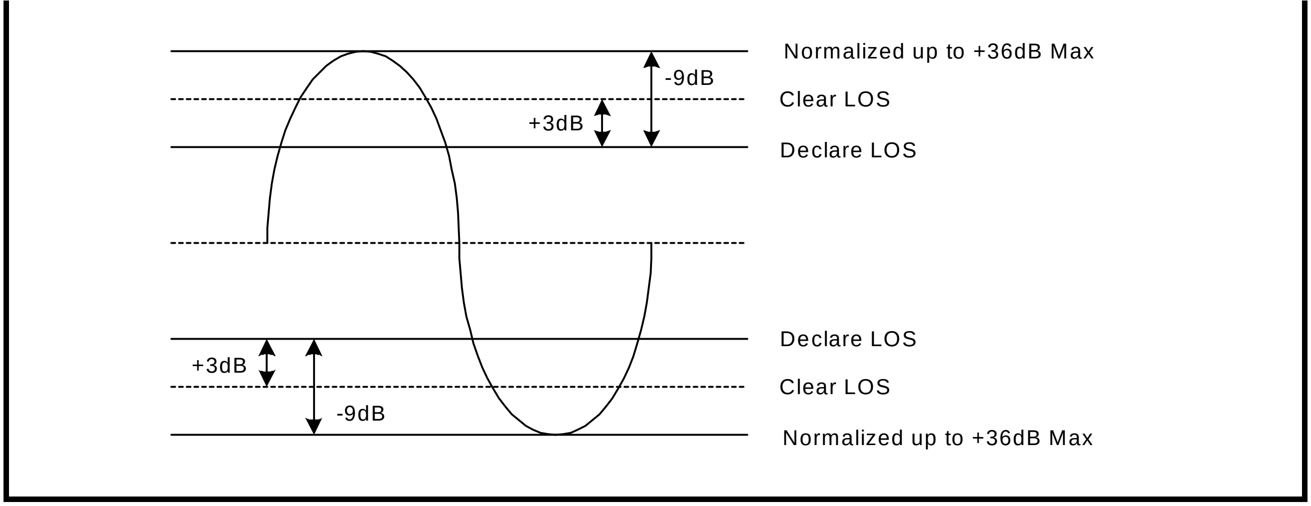
FIGURE 7. SIMPLIFIED DIAGRAM OF -29dB T1/E1 GAIN MODE AND RLOS CONDITION



Setting the Receiver Inputs to -36dB T1/E1 Long Haul Mode

By setting the receiver inputs to -36dB T1/E1 long haul mode, the equalizer will detect the incoming amplitude and make adjustments by adding gain up to a maximum of +36dB normalizing the T1 input signal. This setting refers to cable loss (frequency), not flat loss (resistive). Once the T1/E1 input signal has been normalized to 0dB by adding the maximum gain (+36dB), the receiver will declare RLOS if the signal is attenuated by an additional -9dB. The total cable loss at RLOS declaration is typically -45dB (-36dB + -9dB). A 3dB hysteresis was designed so that transients will not trigger the RLOS to clear. Therefore, the RLOS will typically clear at a total cable attenuation of -42dB. See Figure 8 for a simplified diagram.

FIGURE 8. SIMPLIFIED DIAGRAM OF -36dB T1/E1 LONG HAUL MODE AND RLOS CONDITION

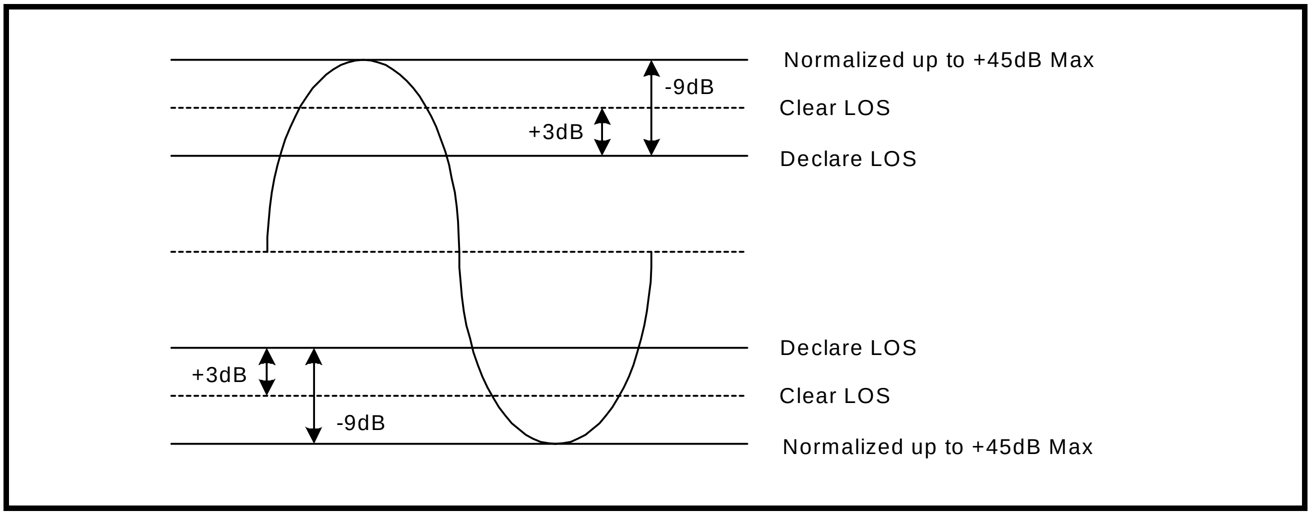


E1 Extended RLOS

E1: Setting the Receiver Inputs to Extended RLOS

By setting the receiver inputs to extended RLOS, the equalizer will detect the incoming amplitude and make adjustments by adding gain up to a maximum of +43dB normalizing the E1 input signal. This setting refers to cable loss (frequency), not flat loss (resistive). Once the E1 input signal has been normalized to 0dB by adding the maximum gain (+43dB), the receiver will declare RLOS if the signal is attenuated by an additional -9dB. The total cable loss at RLOS declaration is typically -52dB (-43dB + -9dB). A 3dB hysteresis was designed so that transients will not trigger the RLOS to clear. Therefore, the RLOS will typically clear at a total cable attenuation of -49dB. See **Figure 9** for a simplified diagram.

FIGURE 9. SIMPLIFIED DIAGRAM OF EXTENDED RLOS MODE (E1 ONLY)



RECEIVE HDB3/B8ZS DECODER

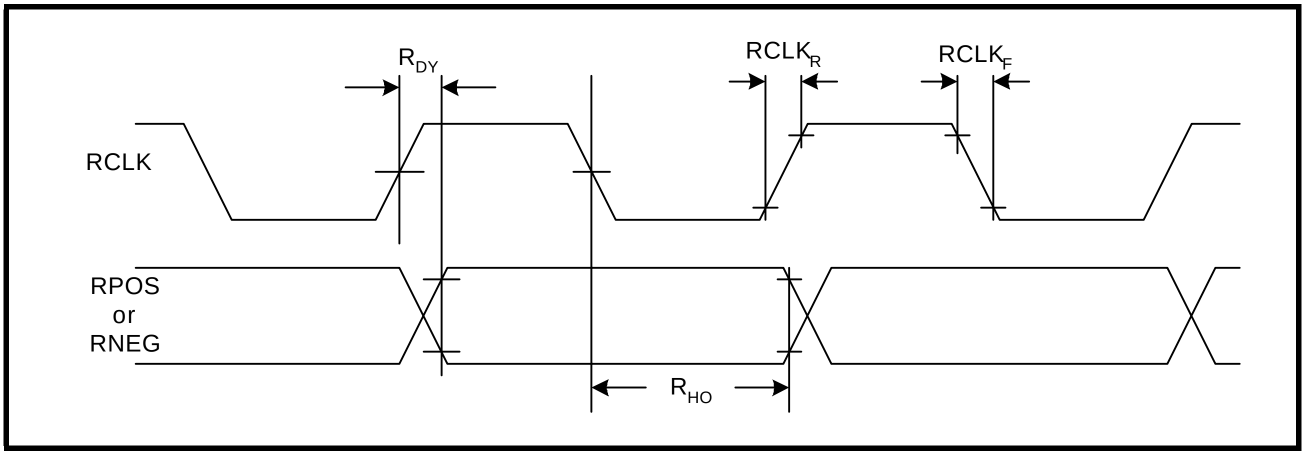
The Decoder function is available in both **Hardware** and **Host** modes on a per channel basis by controlling the TNEG_n/CODES_n pin or the CODES_n interface bit. The decoder function is only active in single-rail Mode. When selected, receive data in this mode will be decoded according to HDB3 rules for E1 and B8ZS for T1 systems. Bipolar violations that do not conform to the coding scheme will be reported as Line Code Violation at the RNEG_n/LCV_n pin of each channel. The length of the LCV pulse is one RCLK cycle for each code violation. In E1mode only, an excessive number of zeros in the receive data stream is also reported as an error at the same output pin. If AMI decoding is selected in single rail mode, every bipolar violation in the receive data stream will be reported as an error at the RNEG_n/LCV_n pin.

RECOVERED CLOCK (RCLK) SAMPLING EDGE

This feature is available in both **Hardware** and **Host** modes on a global basis. In **Host** mode, the sampling edge of RCLK output can be changed through the interface control bit RCLKE. If a “1” is written in the RCLKE interface bit, receive data output at RPOS_n/RDATA_n and RNEG_n/LCV_n are updated on the falling edge of

RCLK for all eight channels. Writing a “0” to the RCLKE register, updates the receive data on the rising edge of RCLK. In **Hardware** mode the same feature is available under the control of the RCLKE pin.

FIGURE 10. RECEIVE CLOCK AND OUTPUT DATA TIMING



JITTER ATTENUATOR

To reduce phase and frequency jitter in the recovered clock, the jitter attenuator can be placed in the receive signal path. The jitter attenuator uses a data FIFO (First In First Out) with a programmable depth that can vary between 2x32 and 2x64. The jitter attenuator can also be placed in the transmit signal path or disabled altogether depending upon system requirements. The jitter attenuator, other than using the master clock as reference, requires no external components. With the jitter attenuator selected, the typical throughput delay from input to output is 16 bits for 32 bit FIFO size or 32 bits for 64 bit FIFO size. When the read and write pointers of the FIFO in the jitter attenuator are within two bits of over-flowing or under-flowing, the bandwidth of the jitter attenuator is widened to track the short term input jitter, thereby avoiding data corruption. When this situation occurs, the jitter attenuator will not attenuate input jitter until the read/write pointer's position is outside the two bits window. Under normal condition, the jitter transfer characteristic meets the narrow bandwidth requirement as specified in ITU- G.736, ITU- I.431 and AT&T Pub 62411 standards.

In T1 mode the Jitter Attenuator Bandwidth is always set to 3Hz. In E1 mode, the bandwidth can be reduced through the JABW control signal. When JABW is set “High” the bandwidth of the jitter attenuator is reduced from 10Hz to 1.5Hz. Under this condition the FIFO length is automatically set to 64 bits and the 32 bits FIFO length will not be available in this mode. Jitter attenuator controls are available on a per channel basis in the **Host** mode and on a global basis in the **Hardware** mode.

GAPPED CLOCK (JA MUST BE ENABLED IN THE TRANSMIT PATH)

The XRT83L38 LIU is ideal for multiplexer or mapper applications where the network data crosses multiple timing domains. As the higher data rates are de-multiplexed down to T1 or E1 data, stuffing bits are removed which can leave gaps in the incoming data stream. If the jitter attenuator is enabled in the transmit path, the 32-Bit or 64-Bit FIFO is used to smooth the gapped clock into a steady T1 or E1 output. The maximum gap width of the 8-Channel LIU is shown in Table 2.

TABLE 2: MAXIMUM GAP WIDTH FOR MULTIPLEXER/MAPPER APPLICATIONS

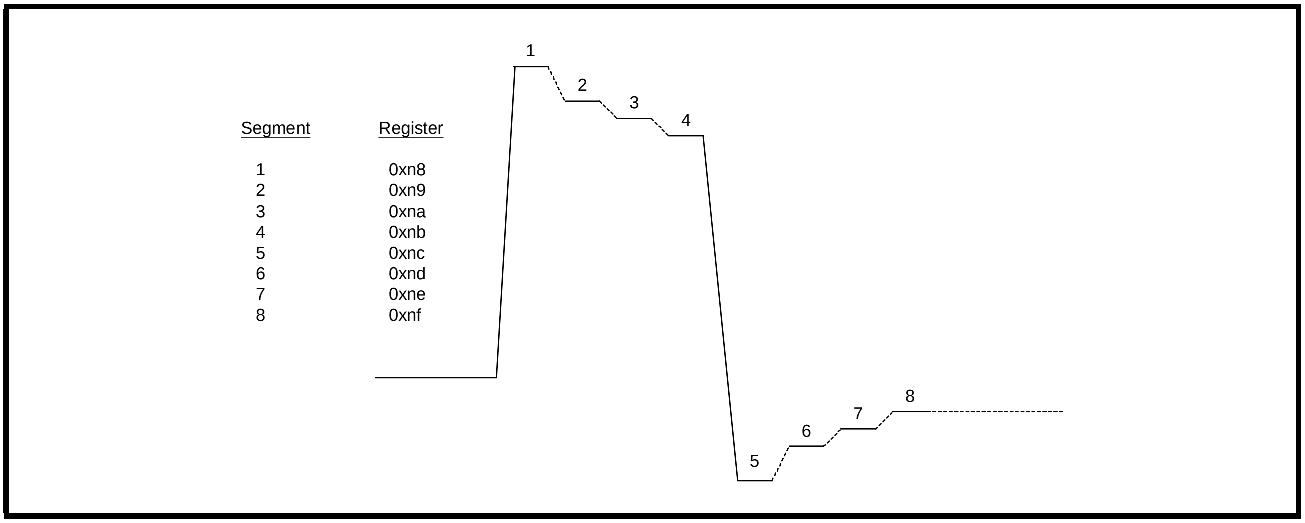
FIFO DEPTH	MAXIMUM GAP WIDTH
32-Bit	20 UI
64-Bit	50 UI

NOTE: *If the LIU is used in a loop timing system, the jitter attenuator should be enabled in the receive path.*

ARBITRARY PULSE GENERATOR FOR T1 AND E1

The arbitrary pulse generator divides the pulse into eight individual segments. Each segment is set by a 7-Bit binary word by programming the appropriate channel register. This allows the system designer to set the overshoot, amplitude, and undershoot for a unique line build out. The MSB (bit 7) is a sign-bit. If the sign-bit is set to "1", the segment will move in a positive direction relative to a flat line (zero) condition. If this sign-bit is set to "0", the segment will move in a negative direction relative to a flat line condition. A pulse with numbered segments is shown in **Figure 11**.

FIGURE 11. ARBITRARY PULSE SEGMENT ASSIGNMENT



Segment	Register
1	0xn8
2	0xn9
3	0xna
4	0xnb
5	0xnc
6	0xnd
7	0xne
8	0xnf

NOTE: *By default, the arbitrary segments are programmed to 0x00h. The transmitter outputs will result in an all zero pattern to the line. For E1 arbitrary mode, see global register 0xC0h.*

TRANSMITTER

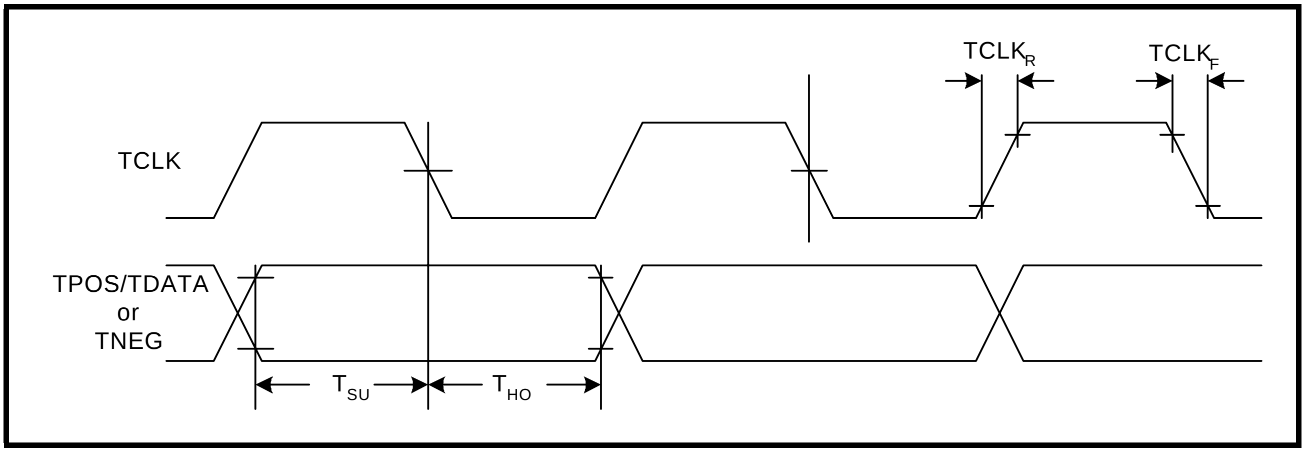
DIGITAL DATA FORMAT

Both the transmitter and receiver can be configured to operate in dual or single-rail data formats. This feature is available under both **Hardware** and **Host** control modes, on a global basis. The dual or single-rail data format is determined by the state of the SR/$\overline{\text{DR}}$ pin in **Hardware** mode or SR/$\overline{\text{DR}}$ interface bit in the **Host** mode. In single-rail mode, transmit clock and NRZ data are applied to TCLK_n and TPOS_n/TDATA_n pins respectively. In single-rail and **Hardware** mode the TNEG_n/CODES_n input can be used as the CODES function. With TNEG_n/CODES_n tied "Low", HDB3 or B8ZS encoding and decoding are enabled for E1 and T1 modes respectively. With TNEG_n/CODES_n tied "High", the AMI coding scheme is selected. In both dual or single-rail modes of operations, the transmitter converts digital input data to a bipolar format before being transmitted to the line.

TRANSMIT CLOCK (TCLK) SAMPLING EDGE

Serial transmit data at TPOS_n/TDATA_n and TNEG_n/CODES_n are clocked into the XRT83L38 under the synchronization of TCLK_n. With a "0" written to the TCLKE interface bit, or by pulling the TCLKE pin "Low", input data is sampled on the falling edge of TCLK_n. The sampling edge is inverted with a "1" written to TCLKE interface bit, or by connecting the TCLKE pin "High".

FIGURE 12. TRANSMIT CLOCK AND INPUT DATA TIMING



TRANSMIT HDB3/B8ZS ENCODER

The Encoder function is available in both **Hardware** and **Host** modes on a per channel basis by controlling the TNEG_n/CODES_n pin or CODES interface bit. The encoder is only available in single-rail mode. In E1 mode and with HDB3 encoding selected, any sequence with four or more consecutive zeros in the input serial data from TPOS_n/TDATA_n, will be removed and replaced with 000V or B00V, where “B” indicates a pulse conforming with the bipolar rule and “V” representing a pulse violating the rule. An example of HDB3 Encoding is shown in **Table 3**. In a T1 system, an input data sequence with eight or more consecutive zeros will be removed and replaced using the B8ZS encoding rule. An example of Bipolar with 8 Zero Substitution (B8ZS) encoding scheme is shown in **Table 4**. Writing a “1” into the CODES_n interface bit or connecting the TNEG_n/CODES_n pin to a “High” level selects the AMI coding for both E1 or T1 systems.

B8ZS		000VB0VB
AMI Output	-	000- +0+ -

DRIVER FAILURE MONITOR (DMO)

The driver monitor circuit is used to detect transmit driver failure by monitoring the activities at TTIP and TRING outputs. Driver failure may be caused by a short circuit in the primary transformer or system problems at the transmit input. If the transmitter of a channel has no output for more than 128 clock cycles, the corresponding DMO pin goes "High" and remains "High" until a valid transmit pulse is detected. In **Host** mode, the failure of the transmit channel is reported in the corresponding interface bit. If the DMOIE bit is also enabled, any transition on the DMO interface bit will generate an interrupt. The driver failure monitor is supported in both **Hardware** and **Host** modes on a per channel basis.

TRANSMIT PULSE SHAPER & LINE BUILD OUT (LBO) CIRCUIT

The transmit pulse shaper circuit uses the high speed clock from the Master timing generator to control the shape and width of the transmitted pulse. The internal high-speed timing generator eliminates the need for a tightly controlled transmit clock (TCLK) duty cycle. With the jitter attenuator not in the transmit path, the transmit output will generate no more than 0.025Unit Interval (UI) peak-to-peak jitter. In **Hardware** mode, the state of the A[4:0]/EQC[4:0] pins determine the transmit pulse shape for all eight channels. In **Host** mode transmit pulse shape can be controlled on a per channel basis using the interface bits EQC[4:0]. The chip supports five fixed transmit pulse settings for T1 Short-haul applications plus a fully programmable waveform generator for arbitrary transmit output pulse shapes (The arbitrary pulse generators are available for both T1 and E1). Transmit Line Build-Outs for T1 long-haul application are supported from 0dB to -22.5dB in three 7.5dB steps. The choice of the transmit pulse shape and LBO under the control of the interface bits are summarized in Table 5. For CSU LBO transmit pulse design information, refer to ANSI T1.403-1993 Network-to-Customer Installation specification, Annex-E.

NOTE: *EQC[4:0] determine the T1/E1 operating mode of the XRT83L38. When EQC4 = "1" and EQC3 = "1", the XRT83L38 is in the E1 mode, otherwise it is in the T1/J1 mode. For details on how to enable the E1 arbitrary mode, see global register 0xC0h.*

TRANSMIT AND RECEIVE TERMINATIONS

The XRT83L38 is a versatile LIU that can be programmed to use one Bill of Materials (BOM) for worldwide applications for T1, J1 and E1. For specific applications the internal terminations can be disabled to allow the use of existing components and/or designs.

RECEIVER (CHANNELS 0 - 7)

INTERNAL RECEIVE TERMINATION MODE

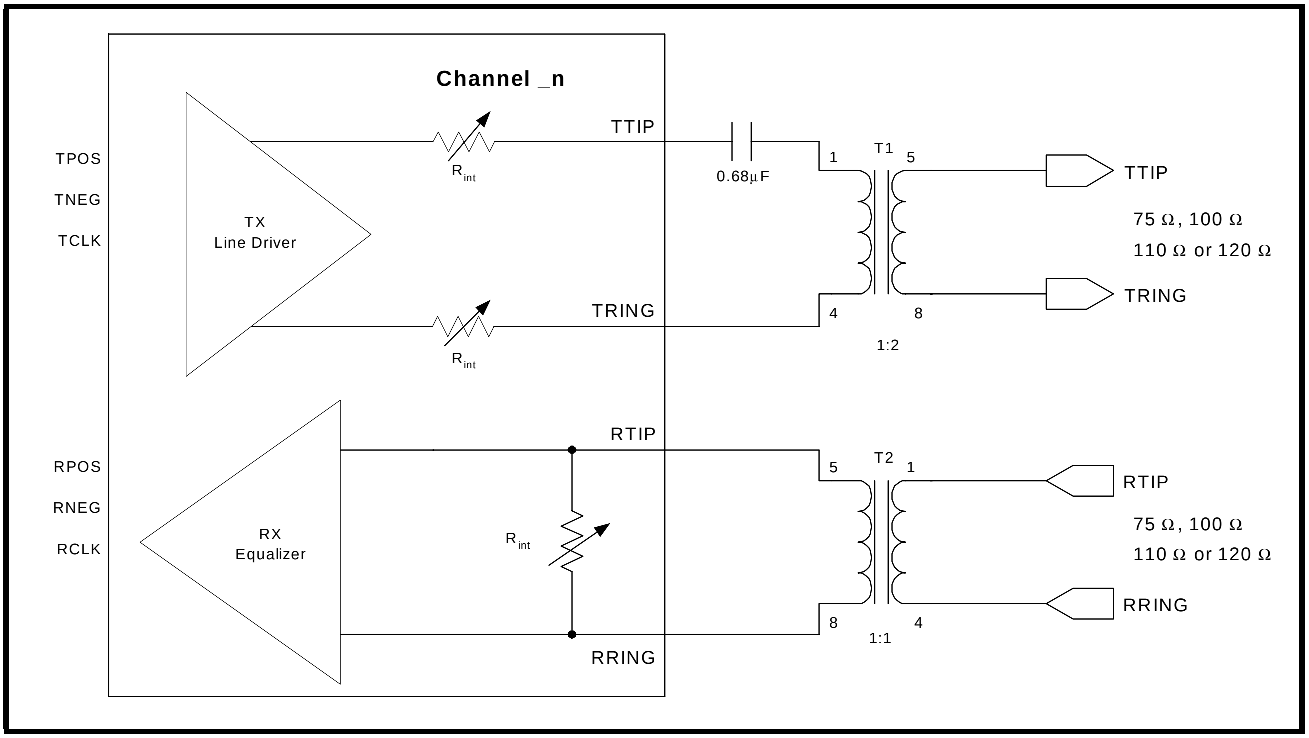
In **Hardware** mode, RXTSEL (Pin 83) can be tied "High" to select internal termination mode for all receive channels or tied "Low" to select external termination mode. Individual channel control can only be done in **Host** mode. By default the XRT83L38 is set for external termination mode at power up or at **Hardware** reset.

TABLE 6: RECEIVE TERMINATION CONTROL

RXTSEL	RX TERMINATION
0	EXTERNAL
1	INTERNAL

In **Host** mode, bit 7 in the appropriate channel register, (**Table 20, "Microprocessor Register #1, Bit Description," on page 51**), is set "High" to select the internal termination mode for that specific receive channel.

FIGURE 13. SIMPLIFIED DIAGRAM FOR THE INTERNAL RECEIVE AND TRANSMIT TERMINATION MODE



If the internal termination mode (RXTSEL = "1") is selected, the effective impedance for E1, T1 or J1 can be achieved either with an internal resistor or a combination of internal and external resistors as shown in **Table 7**.

*NOTE: In **Hardware** mode, pins RXRES[1:0] control all channels.*

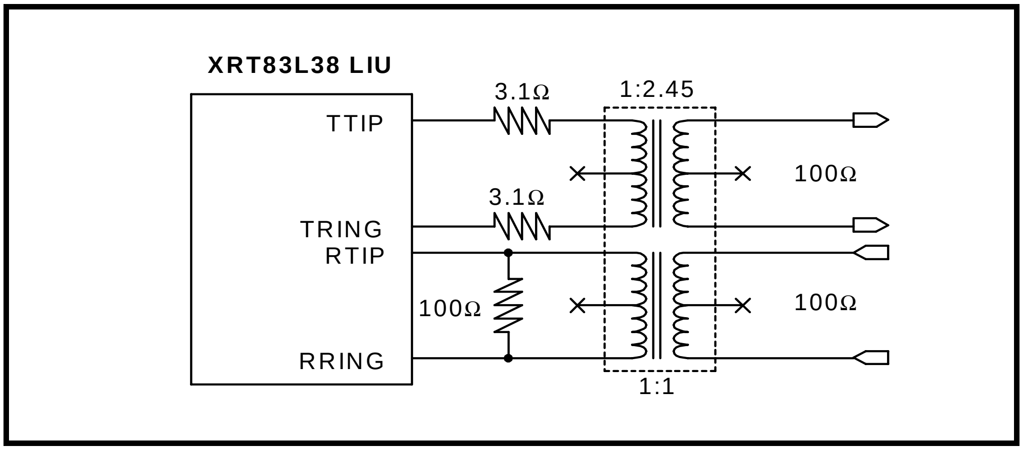

FIGURE 15. SIMPLIFIED DIAGRAM FOR E1 IN EXTERNAL TERMINATION MODE (RXTSEL= 0)

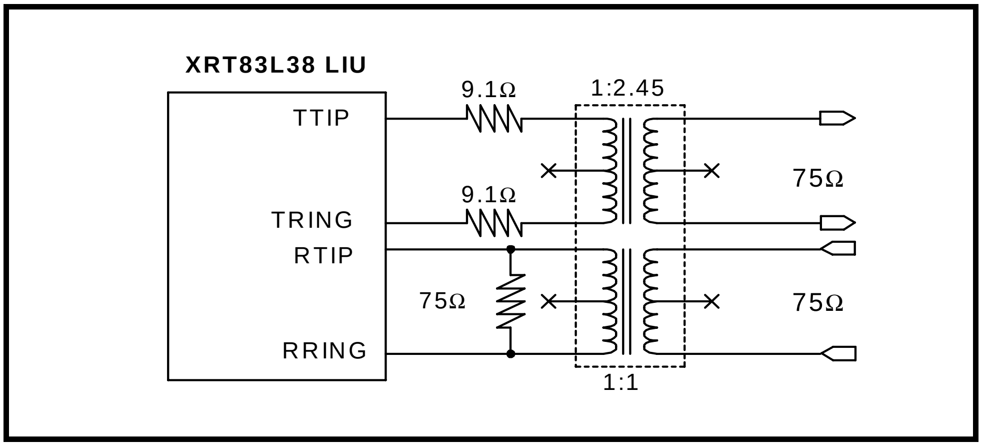

TRANSMITTER (CHANNELS 0 - 7)

TRANSMIT TERMINATION MODE

In **Hardware** mode, TXTSEL (Pin 84) can be tied “High” to select internal termination mode for all transmit channels or tied “Low” for external termination. Individual channel control can be done only in **Host** mode. In **Host** mode, bit 6 in the appropriate register for a given channel is set “High” to select the internal termination mode for that specific transmit channel, see **Table 20, “Microprocessor Register #1, Bit Description,” on page 51**.

TABLE 8: TRANSMIT TERMINATION CONTROL

TXTSEL	TX TERMINATION	TX TRANSFORMER RATIO
0	EXTERNAL	1:2.45
1	INTERNAL	1:2

In internal mode, no external resistors are used. An external capacitor of 0.68µF is used for proper operation of the internal termination circuitry, see **Figure 13**.

EXTERNAL TRANSMIT TERMINATION MODE

By default the XRT83L38 is set for external termination mode at power up or at **Hardware** reset.

When external transmit termination mode is selected, the internal termination circuitry is disabled. The value of the external resistors is chosen for a specific application according to the turns ratio selected by TRATIO (Pin 127) in **Hardware** mode or bit 0 in the appropriate register for a specific channel in **Host** mode, see **Table 10** and **Table 22, “Microprocessor Register #3, Bit Description,” on page 55**. **Figure 14** is a simplified block diagram for T1 (100Ω) in the external termination mode. **Figure 15** is a simplified block diagram for E1 (75Ω) in the external termination mode.

REDUNDANCY APPLICATIONS

Telecommunication system design requires signal integrity and reliability. When a T1/E1 primary line card has a failure, it must be swapped with a backup line card while maintaining connectivity to a backplane without losing data. System designers can achieve this by implementing common redundancy schemes with the XRT83L38 Line Interface Unit (LIU). The XRT83L38 offers features that are tailored to redundancy applications while reducing the number of components and providing system designers with solid reference designs. These features allow system designers to implement redundancy applications that ensure reliability. The Internal Impedance mode eliminates the need for external relays when using the 1:1 and 1+1 redundancy schemes.

PROGRAMMING CONSIDERATIONS

In many applications switching the control of the transmitter outputs and the receiver line impedance to **hardware** control will provide faster transmitter ON/OFF switching.

In **Host** Mode, there are two bits in register 130 (82H) that control the transmitter outputs and the Rx line impedance select, TXONCNTL (Bit 7) and TERCNTL (Bit 6).

Setting bit-7 (TXONCNTL) to a “1” transfers the control of the Transmit On/Off function to the TXON_n **Hardware** control pins. (Pins 90 through 93 and pins 169 through 172).

Setting bit-6 (TERCNTL) to a “1” transfers the control of the Rx line impedance select (RXTSEL) to the RXTSEL **Hardware** control pin (pin 83).

Either mode works well with redundancy applications. The user can determine which mode has the fastest switching time for a unique application.

TYPICAL REDUNDANCY SCHEMES

- ·1:1 One backup card for every primary card (Facility Protection)
- ·1+1 One backup card for every primary card (Line Protection)
- ·N+1One backup card for N primary cards

1:1 REDUNDANCY

A 1:1 facility protection redundancy scheme has one backup card for every primary card. When using 1:1 redundancy, the backup card has its transmitters tri-stated and its receivers in high impedance. This eliminates the need for external relays and provides one bill of materials for all interface modes of operation. The transmit and receive sections of the LIU device are described separately.

1+1 REDUNDANCY

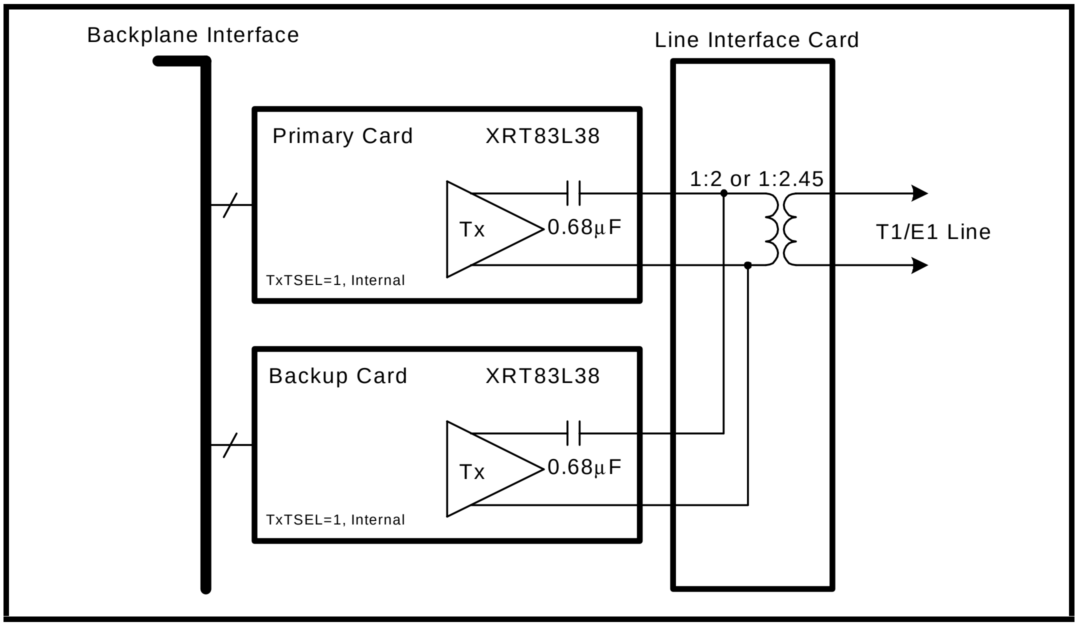
A 1+1 line protection redundancy scheme has one backup card for every primary card, and the receivers on the backup card are monitoring the receiver inputs. Therefore, the receivers on both cards need to be active. The transmit outputs require no external resistors. The transmit and receive sections of the LIU device are described separately.

TRANSMIT 1:1 & 1+1 REDUNDANCY

For 1:1 and 1+1 redundancy, the transmitters on the primary and backup card should be programmed for Internal Impedance mode. The transmitters on the backup card should be tri-stated. Select the appropriate impedance for the desired mode of operation, T1/E1/J1. A 0.68uF capacitor is used in series with TTIP for blocking DC bias. See **Figure 16** for a simplified block diagram of the transmit section for 1:1 and 1+1 redundancy scheme.

NOTE: *For simplification, the over voltage protection circuitry was omitted.*

FIGURE 16. SIMPLIFIED BLOCK DIAGRAM OF THE TRANSMIT SECTION FOR 1:1 & 1+1 REDUNDANCY

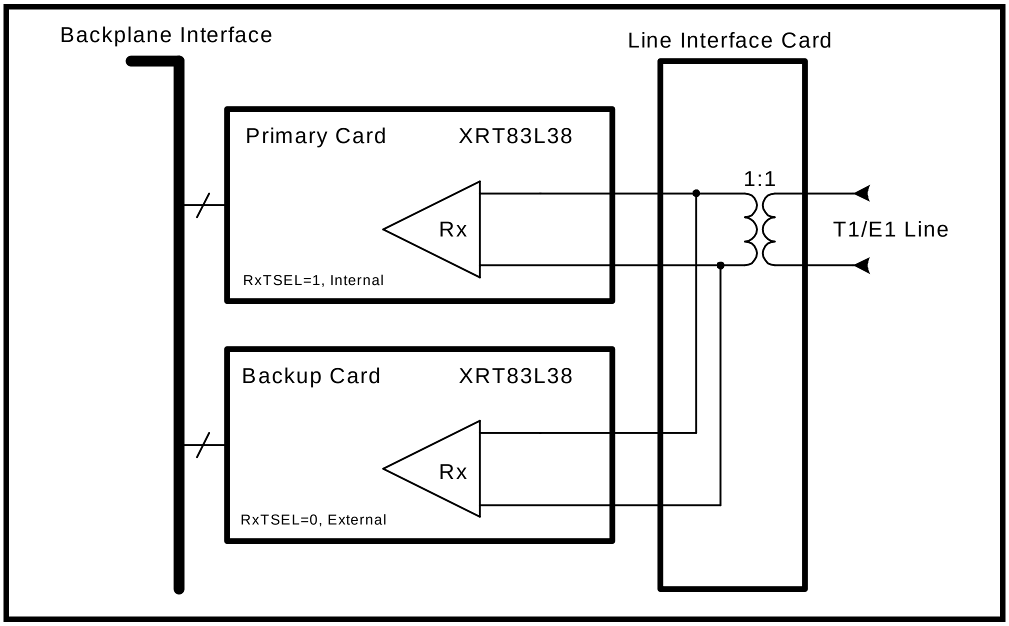


RECEIVE 1:1 & 1+1 REDUNDANCY

For 1:1 and 1+1 redundancy, the receivers on the primary card should be programmed for Internal Impedance mode. The receivers on the backup card should be programmed for External Impedance mode. Since there is no external resistor in the circuit, the receivers on the backup card will be high impedance. This key design feature eliminates the need for relays and provides one bill of materials for all interface modes of operation. Select the impedance for the desired mode of operation, T1/E1/J1. To swap the primary card, set the backup card to Internal Impedance mode, then the primary card to External Impedance mode. See **Figure 17** for a simplified block diagram of the receive section for a 1:1 and 1+1 redundancy scheme.

NOTE: *For simplification, the over voltage protection circuitry was omitted.*

FIGURE 17. SIMPLIFIED BLOCK DIAGRAM - RECEIVE SECTION FOR 1:1 AND 1+1 REDUNDANCY



N+1 REDUNDANCY

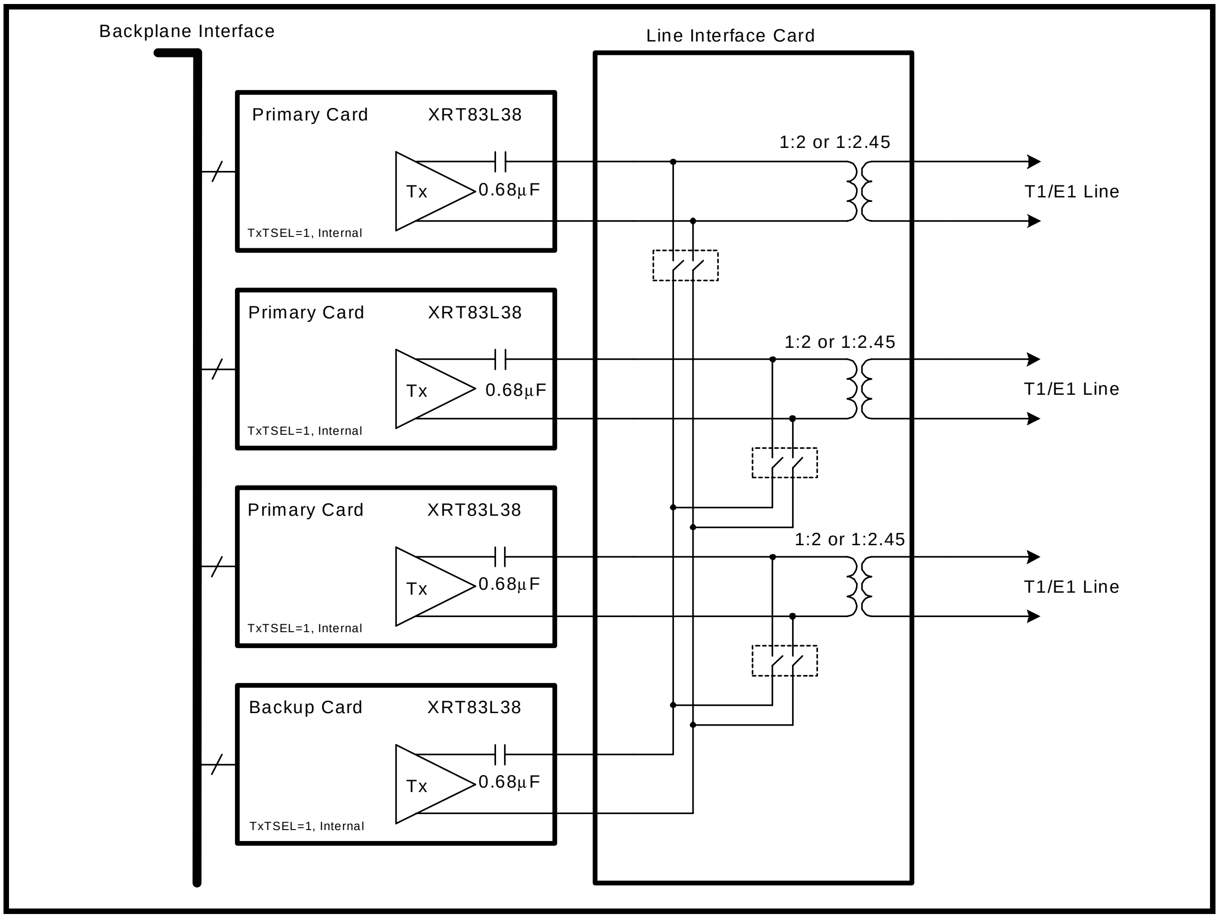
N+1 redundancy has one backup card for N primary cards. Due to impedance mismatch and signal contention, external relays are necessary when using this redundancy scheme. The advantage of relays is that they create complete isolation between the primary cards and the backup card. This allows all transmitters and receivers on the primary cards to be configured in internal impedance mode, providing one bill of materials for all interface modes of operation. The transmit and receive sections of the XRT83L38 are described separately.

TRANSMIT

For N+1 redundancy, the transmitters on all cards should be programmed for internal impedance mode providing one bill of materials for T1/E1/J1. The transmitters on the backup card do not have to be tri-stated. To swap the primary card, close the desired relays, and tri-state the transmitters on the failed primary card. A 0.68µF capacitor is used in series with TTIP for blocking DC bias. See **Figure 18** for a simplified block diagram of the transmit section for an N+1 redundancy scheme.

NOTE: *For simplification, the over voltage protection circuitry was omitted.*

FIGURE 18. SIMPLIFIED BLOCK DIAGRAM - TRANSMIT SECTION FOR N+1 REDUNDANCY

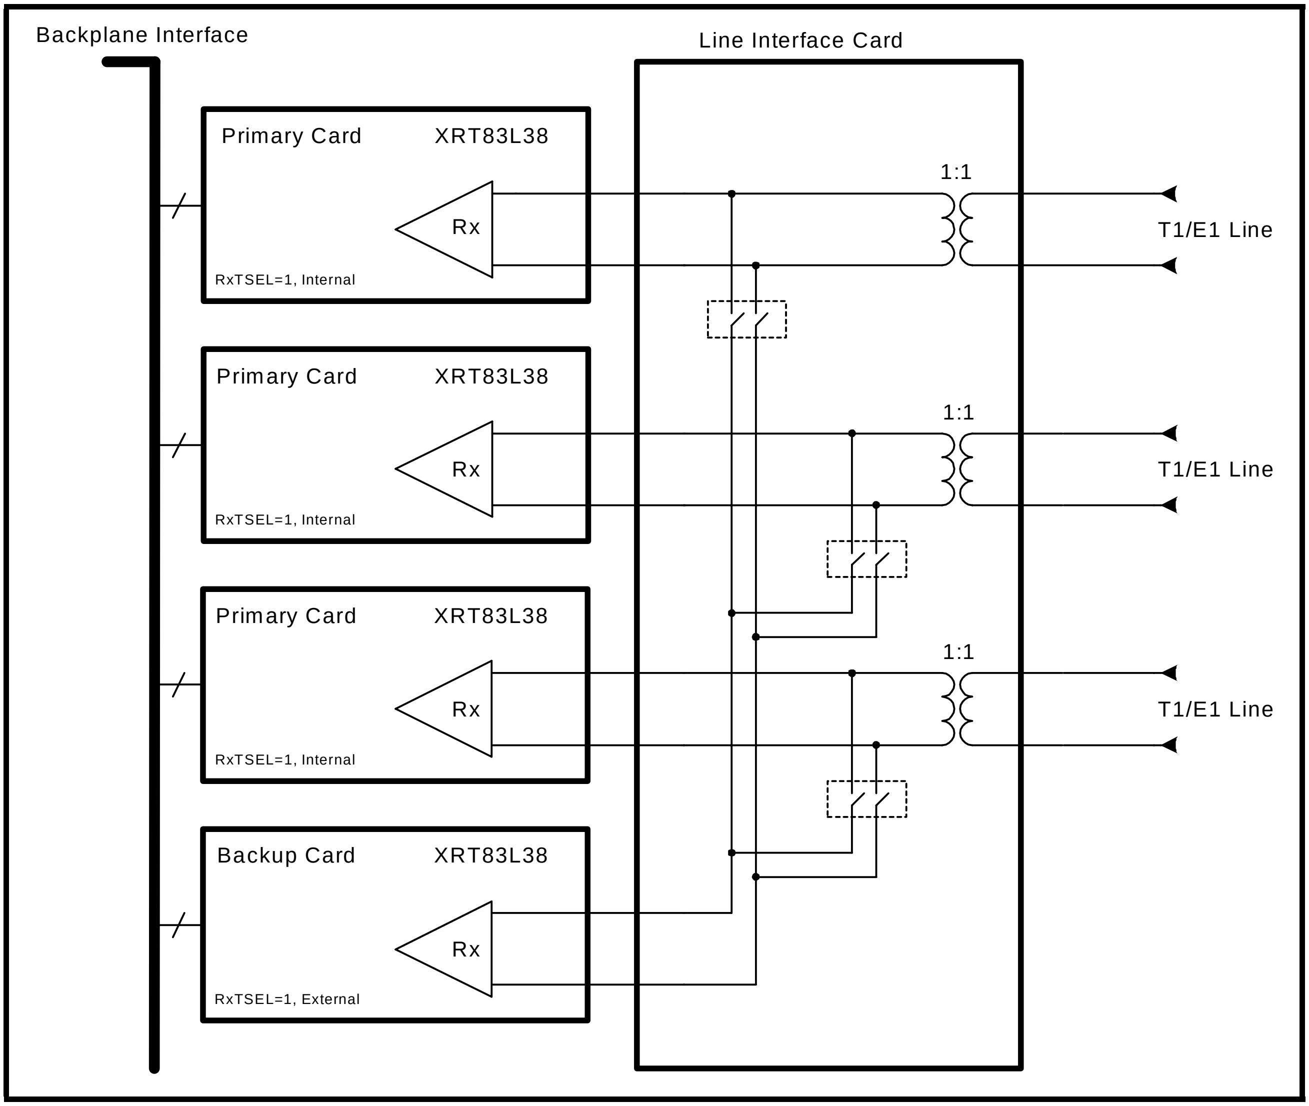


RECEIVE

For N+1 redundancy, the receivers on the primary cards should be programmed for internal impedance mode. The receivers on the backup card should be programmed for external impedance mode. Since there is no external resistor in the circuit, the receivers on the backup card will be high impedance. Select the impedance for the desired mode of operation, T1/E1/J1. To swap the primary card, set the backup card to internal impedance mode, then the primary card to external impedance mode. See **Figure 19**. for a simplified block diagram of the receive section for a N+1 redundancy scheme.

NOTE: *For simplification, the over voltage protection circuitry was omitted.*

FIGURE 19. SIMPLIFIED BLOCK DIAGRAM - RECEIVE SECTION FOR N+1 REDUNDANCY



PATTERN TRANSMIT AND DETECT FUNCTION

Several test and diagnostic patterns can be generated and detected by the chip. In **Hardware** mode each channel can be independently programmed to transmit an All Ones pattern by applying a "High" level to the corresponding TAOS_n pin. In **Host** mode, the three interface bits TXTEST[2:0] control the pattern generation and detection independently for each channel according to **Table 12**.

TABLE 12: PATTERN TRANSMISSION CONTROL

TXTEST2	TXTEST1	TXTEST0	TEST PATTERN
0	x	x	None
1	0	0	TDQRSS
1	0	1	TAOS
1	1	0	TLUC
1	1	1	TLDC

TRANSMIT ALL ONES (TAOS)

This feature is available in both **Hardware** and **Host** modes. With the TAOS_n pin connected to a "High" level or when interface bits TXTEST2="1", TXTEST1="0" and TXTEST0="1" the transmitter ignores input from TPOS_n/TDATA_n and TNEG_n/CODES_n pins and sends a continuous AMI encoded all "Ones" signal to the line, using TCLK_n clock as the reference. In addition, when the **Hardware** pin and interface bit ATAOS is activated, the chip will automatically transmit the All "Ones" data from any channel that detects an RLOS condition. This feature is not available on a per channel basis. TCLK_n must NOT be tied "Low".

NETWORK LOOP CODE DETECTION AND TRANSMISSION

This feature is available in **Host** mode only. When the interface bits TXTEST2="1", TXTEST1="1" and TXTEST0="0" the chip is enabled to transmit the "00001" Network Loop-Up Code from the selected channel requesting a Loop-Back condition from the remote terminal. Simultaneously setting the interface bits NLCDE1="0" and NLCDE0="1" enables the Network Loop-Up code detection in the receiver. If the "00001" Network Loop-Up code is detected in the receive data for longer than 5 seconds, the NLCD bit in the interface register is set indicating that the remote terminal has activated remote Loop-Back and the chip is receiving its own transmitted data. When the interface bits TXTEST2="1", TXTEST1="1" and TXTEST0="1" the chip is enabled to transmit the Network Loop-Down Code (TLDC) "001" from the selected channel requesting the remote terminal the removal of the Loop-Back condition.

In the **Host** mode each channel is capable of monitoring the contents of the receive data for the presence of Loop-Up or Loop-Down code from the remote terminal. In the **Host** mode the two interface bits NLCDE[1:0] control the Loop-Code detection independently for each channel according to **Table 13**.

TABLE 13: LOOP-CODE DETECTION CONTROL

NLCDE1	NLCDE0	CONDITION
0	0	Disable Loop-Code Detection
0	1	Detect Loop-Up Code in Receive Data
1	0	Detect Loop-Down Code in Receive Data
1	1	Automatic Loop-Code detection and Remote Loop-Back Activation

Setting the interface bits to NLCDE1="0" and NLCDE0="1" activates the detection of the Loop-Up code in the receive data. If the "00001" Network Loop-Up code is detected in the receive data for longer than 5 seconds, the NLCD interface bit is set to "1" and stays in this state for as long as the receiver continues to receive the

Network Loop-Up Code. In this mode if the NLCD interrupt is enabled, the chip will initiate an interrupt on every transition of NLCD. The host has the option to ignore the request from the remote terminal, or to respond to the request and manually activate Remote Loop-Back. The host can subsequently activate the detection of the Loop-Down Code by setting NLCDE1=”1” and NLCDE0=”0”. In this case, receiving the “001” Loop-Down Code for longer than 5 seconds will set the NLCD bit to “1” and if the NLCD interrupt is enabled, the chip will initiate an interrupt on every transition of NLCD. The host can respond to the request from the remote terminal and remove Loop-Back condition. In the manual Network Loop-Up (NLCDE1=”0” and NLCDE0=”1”) and Loop-Down (NLCDE1=”1” and NLCDE0=”0”) Code detection modes, the NLCD interface bit will be set to “1” upon receiving the corresponding code in excess of 5 seconds in the receive data. The chip will initiate an interrupt any time the status of the NLCD bit changes and the Network Loop-code interrupt is enabled.

In the **Host** mode, setting the interface bits NLCDE1=”1” and NLCDE0=”1” enables the automatic Loop-Code detection and Remote Loop-Back activation mode if, TXTEST[2:0] is NOT equal to “110”. As this mode is initiated, the state of the NLCD interface bit is reset to “0” and the chip is programmed to monitor the receive input data for the Loop-Up Code. If the “00001” Network Loop-Up Code is detected in the receive data for longer than 5 seconds in addition to the NLCD bit in the interface register being set, Remote Loop-Back is automatically activated. The chip stays in remote Loop-Back even if it stops receiving the “00001” pattern. After the chip detects the Loop-Up code, sets the NLCD bit and enters Remote Loop-Back, it automatically starts monitoring the receive data for the Loop-Down code. In this mode however, the NLCD bit stays set even if the receiver stops receiving the Loop-Up code, which is an indication to the host that the Remote Loop-Back is still in effect. Remote Loop-Back is removed if the chip detects the “001” Loop-Down code for longer than 5 seconds. Detecting the “001” code also results in resetting the NLCD interface bit and initiating an interrupt. The Remote Loop-Back can also be removed by taking the chip out of the Automatic detection mode by programming it to operate in a different state. The chip will not respond to remote Loop-Back request if Local Analog Loop-Back is activated locally. When programmed in Automatic detection mode the NLCD interface bit stays “High” for the whole time the Remote Loop-Back is activated and initiates an interrupt any time the status of the NLCD bit changes provided the Network Loop-code interrupt is enabled.

TRANSMIT AND DETECT QUASI-RANDOM SIGNAL SOURCE (TDQRSS)

Each channel of XRT83L38 includes a QRSS pattern generation and detection block for diagnostic purposes that can be activated only in the **Host** mode by setting the interface bits TXTEST2=”1”, TXTEST1=”0” and TXTEST0=”0”. For T1 systems, the QRSS pattern is a 2^{20}-1pseudo-random bit sequence (PRBS) with no more than 14 consecutive zeros. For E1 systems, the QRSS pattern is 2^{15} -1 PRBS with an inverted output. With QRSS and Analog Local Loop-Back enabled simultaneously, and by monitoring the status of the QRPD interface bit, all main functional blocks within the transceiver can be verified.

When the receiver achieves QRSS synchronization with fewer than 4 errors in a 128 bits window, QRPD changes from “Low” to “High”. After pattern synchronization, any bit error will cause QRPD to go “Low” for one clock cycle. If the QRPDIE bit is enabled, any transition on the QRPD bit will generate an interrupt.

With TDQRSS activated, a bit error can be inserted in the transmitted QRSS pattern by transitioning the INSBER interface bit from “0” to “1”. Bipolar violation can also be inserted either in the QRSS pattern, or input data when operating in the single-rail mode by transitioning the INSBPV interface bit from “0” to “1”. The state of INSBER and INSBPV bits are sampled on the rising edge of the TCLK_n. To insure the insertion of the bit error or bipolar violation, a “0” should be written in these bit locations before writing a “1”.

LOOP-BACK MODES

The XRT83L38 supports several Loop-Back modes under both **Hardware** and **Host** control. In **Hardware** mode the two LOOP[1:0] pins control the Loop-Back functions for each channel independently according to **Table 14**.

TABLE 14: LOOP-BACK CONTROL IN HARDWARE MODE

LOOP1	LOOP0	LOOP-BACK MODE
0	0	None
0	1	Analog
1	0	Remote
1	1	Digital

In **Host** mode the Loop-Back functions are controlled by the three LOOP[2:0] interface bits. Each channel can be programmed independently according to **Table 15**.

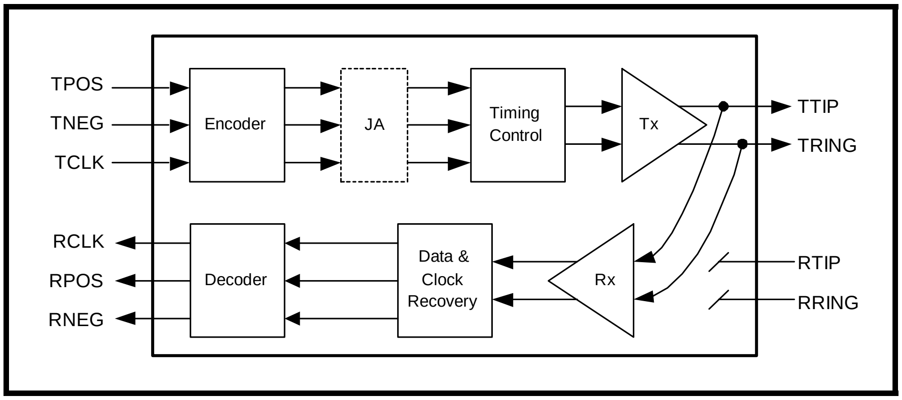
TABLE 15: LOOP-BACK CONTROL IN HOST MODE

LOOP2	LOOP1	LOOP0	LOOP-BACK MODE
0	X	X	None
1	0	0	Dual
1	0	1	Analog
1	1	0	Remote
1	1	1	Digital

LOCAL ANALOG LOOP-BACK (ALOOP)

With Local Analog Loop-Back activated, the transmit data at TTIP and TRING are looped-back to the analog input of the receiver. External inputs at RTIP/RRING in this mode are ignored while valid transmit data continues to be sent to the line. Local Analog Loop-Back exercises most of the functional blocks of the XRT83L38 including the jitter attenuator which can be selected in either the transmit or receive paths. Local Analog Loop-Back is shown in **Figure 20**.

FIGURE 20. LOCAL ANALOG LOOP-BACK SIGNAL FLOW

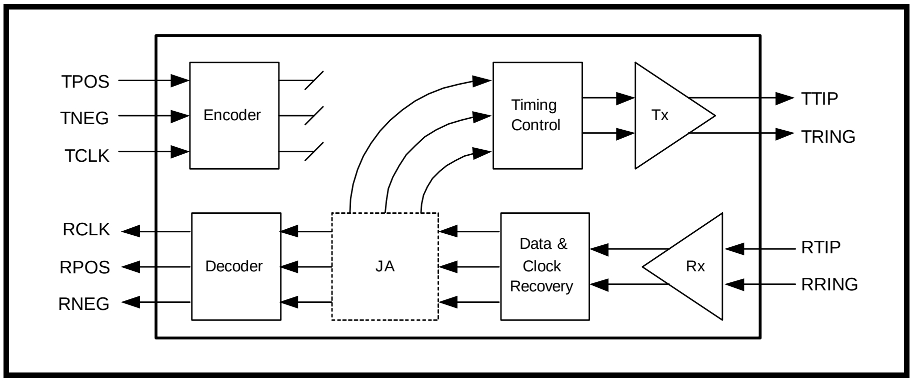


In this mode, the jitter attenuator (if selected) can be placed in the transmit or receive path.

REMOTE LOOP-BACK (RLOOP)

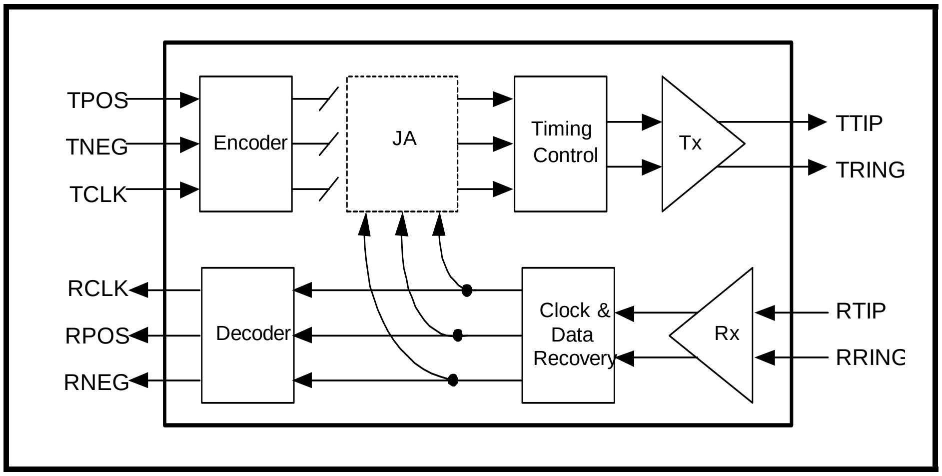
With Remote Loop-Back activated, receive data after the jitter attenuator (if selected in the receive path) is looped back to the transmit path using RCLK as transmit timing. In this mode transmit clock and data are ignored, while RCLK and receive data will continue to be available at their respective output pins. Remote Loop-Back with jitter attenuator selected in the receive path is shown in **Figure 21**.

FIGURE 21. REMOTE LOOP-BACK MODE WITH JITTER ATTENUATOR SELECTED IN RECEIVE PATH



In the Remote Loop-Back mode if the jitter attenuator is selected in the transmit path, the receive data from the Clock and Data Recovery block is looped back to the transmit path and is applied to the jitter attenuator using RCLK as transmit timing. In this mode the transmit clock and data are also ignored, while RCLK and received data will continue to be available at their respective output pins. Remote Loop-Back with the jitter attenuator selected in the transmit path is shown in **Figure 22**.

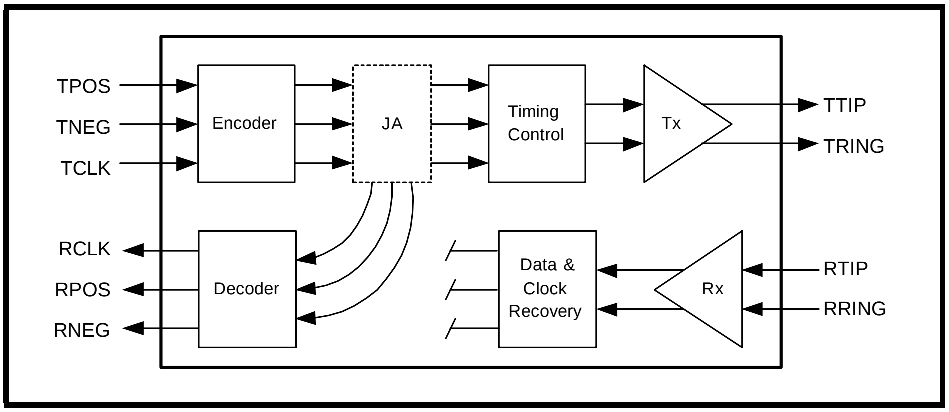
FIGURE 22. REMOTE LOOP-BACK MODE WITH JITTER ATTENUATOR SELECTED IN TRANSMIT PATH



DIGITAL LOOP-BACK (DLOOP)

Digital Loop-Back or Local Loop-Back allows the transmit clock and data to be looped back to the corresponding receiver output pins through the encoder/decoder and jitter attenuator. In this mode, receive data and clock are ignored, but the transmit data will be sent to the line uninterrupted. This loop back feature allows users to configure the line interface as a pure jitter attenuator. The Digital Loop-Back signal flow is shown in **Figure 23**.

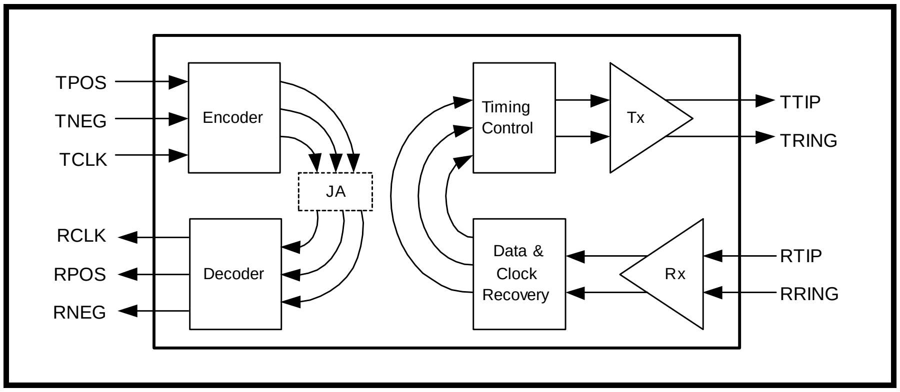
FIGURE 23. DIGITAL LOOP-BACK MODE WITH JITTER ATTENUATOR SELECTED IN TRANSMIT PATH



DUAL LOOP-BACK

Figure 24 depicts the data flow in dual-loopback. In this mode, selecting the jitter attenuator in the transmit path will have the same result as placing the jitter attenuator in the receive path. In dual Loop-Back mode the recovered clock and data from the line are looped back through the transmitter to the TTIP and TRING without passing through the jitter attenuator. The transmit clock and data are looped back through the jitter attenuator to the RCLK and RPOS/RDATA and RNEG pins.

FIGURE 24. SIGNAL FLOW IN DUAL LOOP-BACK MODE



MICROPROCESSOR PARALLEL INTERFACE

XRT83L38 is equipped with a microprocessor interface for easy device configuration. The parallel port of the XRT83L38 is compatible with both Intel and Motorola address and data buses. The XRT83L38 has an 8-bit address A[7:0] input and 8-bit bi-directional data bus D[7:0]. The signals required for a generic microprocessor to access the internal registers are described in **Table 16**.

TABLE 16: MICROPROCESSOR INTERFACE SIGNAL DESCRIPTION

<table>
<tr><td>D[7:0]</td><td>Data Input (Output): 8 bits bi-directional Read/Write data bus for register access.</td></tr>
<tr><td>A[7:0]</td><td>Address Input: 8 bit address to select internal register location.</td></tr>

<tr><td>RDY_$\overline{\text{DTACK}}$</td><td>Ready Output (Data Transfer Acknowledge Output):
-Intel bus timing, RDY is asserted “High” to indicate the XRT83L38 has completed a read or write operation.
-Motorola bus timing, $\overline{\text{DTACK}}$ is asserted “Low” to indicate the XRT83L38 has completed a read or write operation.</td></tr>
<tr><td>$\overline{\text{INT}}$</td><td>Interrupt Output: This pin is asserted “Low” to indicate an interrupt caused by an alarm condition in the device status registers. The activation of this pin can be blocked by setting the GIE bit to “0” in the Command Control register.</td></tr>
</table>

MICROPROCESSOR REGISTER TABLES

The microprocessor interface consists of 256 addressable locations. Each channel uses 16 dedicated 8 byte registers for independent programming and control. There are four additional registers for global control of all channels and two registers for device identification and revision numbers. The remaining registers are for factory test and future expansion. The control register map and the function of the individual bits are summarized in **Table 17** and **Table 18** respectively.

TABLE 17: MICROPROCESSOR REGISTER ADDRESS

TDQRSS (Transmit/Detect Quasi-Random Signal): This condition when activated enables Quasi-Random Signal Source generation and detection for the selected channel number n. In a T1 system QRSS pattern is a 2^{20}-1 pseudo-random bit sequence (PRBS) with no more than 14 consecutive zeros. In a E1 system, QRSS is a 2^{15}-1 PRBS pattern.
TAOS (Transmit All Ones): Activating this condition enables the transmission of an All Ones Pattern from the selected channel number n.
TLUC (Transmit Network Loop-Up Code): Activating this condition enables the Network Loop-Up Code of “00001” to be transmitted to the line for the selected channel number n. When Network Loop-Up code is being transmitted, the XRT83L38 will ignore the Automatic Loop-Code detection and Remote Loop-Back activation (NLCDE1 =“1”, NLCDE0 =“1”, if activated) in order to avoid activating Remote Digital Loop-Back automatically when the remote terminal responds to the Loop-Back request.
TLDC (Transmit Network Loop-Down Code): Activating this condition enables the network Loop-Down Code of “001” to be transmitted to the line for the selected channel number n.</td><td>R/W</td><td>0</td></tr>

<tr><td>D7</td><td>NLCDE1_n</td><td>Network Loop Code Detection Enable Bit 1:
This bit together with NLCDE0_n control the Loop-Code detection of each channel.
<table>
<tr><th>NLCDE1</th><th>NLCDE0</th><th>Function</th></tr>
<tr><td>0</td><td>0</td><td>Disable Loop-code detection</td></tr>
<tr><td>0</td><td>1</td><td>Detect Loop-Up code in receive data</td></tr>
<tr><td>1</td><td>0</td><td>Detect Loop-Down code in receive data</td></tr>
<tr><td>1</td><td>1</td><td>Automatic Loop-Code detection</td></tr>
</table>
When NLCDE1 =”0” and NLCDE0 = “1” or NLCDE1 = “1” and NLCDE0 = “0”, the chip is manually programmed to monitor the receive data for the Loop-Up or Loop-Down code respectively.When the presence of the “00001” or “001” pattern is detected for more than 5 seconds, the status of the NLCD bit is set to “1” and if the NLCD interrupt is enabled, an interrupt is initiated.The Host has the option to control the Loop-Back function manually.
Setting the NLCDE1 = “1” and NLCDE0 = “1” enables the Automatic Loop-Code detection and Remote Loop-Back activation mode. As this mode is initiated, the state of the NLCD interface bit is reset to “0” and the chip is programmed to monitor the receive data for the Loop-Up code. If the “00001” pattern is detected for longer than 5 seconds, the NLCD bit is set “1”, Remote Loop-Back is activated and the chip is automatically programmed to monitor the receive data for the Loop-Down code. The NLCD bit stays set even after the chip stops receiving the Loop-Up code. The Remote Loop-Back condition is removed when the chip receives the Loop-Down code for more than 5 seconds or if the Automatic Loop-Code detection mode is terminated.</td><td>R/W</td><td>0</td></tr>
<tr><td>D6</td><td>NLCDE0_n</td><td>Network Loop Code Detection Enable Bit 0:
See description of D7 for function of this bit.</td><td>R/W</td><td>0</td></tr>
<tr><td>D5</td><td>CODES_n</td><td>Encoding and Decoding Select:
Writing a “0” to this bits selects HDB3 or B8ZS encoding and decoding for channel number n. Writing “1” selects an AMI coding scheme. This bit is only active when single rail mode is selected.</td><td>R/W</td><td>0</td></tr>

TABLE 23: MICROPROCESSOR REGISTER #4, BIT DESCRIPTION

D7	Reserved		RO	0
D6	DMOIE_n	**DMO Interrupt Enable:** Writing a “1” to this bit enables DMO interrupt generation, writing a “0” masks it.	R/W	0
D5	FLSIE_n	**FIFO Limit Status Interrupt Enable:** Writing a “1” to this bit enables interrupt generation when the FIFO limit is within to 3 bits, writing a “0” to masks it.	R/W	0
D4	LCVIE_n	**Line Code Violation Interrupt Enable:** Writing a “1” to this bit enables Line Code Violation interrupt generation, writing a “0” masks it.	R/W	0
D3	NLCDIE_n	**Network Loop-Code Detection Interrupt Enable:** Writing a “1” to this bit enables Network Loop-code detection interrupt generation, writing a “0” masks it.	R/W	0
D2	AISDIE_n	**AIS Interrupt Enable:** Writing a “1” to this bit enables Alarm Indication Signal detection interrupt generation, writing a “0” masks it.	R/W	0
D1	RLOSIE_n	**Receive Loss of Signal Interrupt Enable:** Writing a “1” to this bit enables Loss of Receive Signal interrupt generation, writing a “0” masks it.	R/W	0
D0	QRPDIE_n	**QRSS Pattern Detection Interrupt Enable:** Writing a “1” to this bit enables QRSS pattern detection interrupt generation, writing a “0” masks it.	R/W	0

TABLE 24: MICROPROCESSOR REGISTER #5, BIT DESCRIPTION

REGISTER ADDRESS 00000101 00010101 00100101 00110101 01000101 01010101 01100101 01110101	CHANNEL_n CHANNEL_0 CHANNEL_1 CHANNEL_2 CHANNEL_3 CHANNEL_4 CHANNEL_5 CHANNEL_6 CHANNEL_7	FUNCTION	REGISTER TYPE	RESET VALUE
BIT #	NAME			
D7	Reserved		RO	0
D6	DMO_n	**Driver Monitor Output:** This bit is set to a “1” to indicate transmit driver failure is detected. The value of this bit is based on the current status of DMO for the corresponding channel. If the DMOIE bit is enabled, any transition on this bit will generate an Interrupt.	RO	0
D5	FLS_n	**FIFO Limit Status:** This bit is set to a “1” to indicate that the jitter attenuator read/write FIFO pointers are within +/- 3 bits. If the FLSIE bit is enabled, any transition on this bit will generate an Interrupt.	RO	0
D4	LCV_n	**Line Code Violation:** This bit is set to a “1” to indicate that the receiver of channel n is currently detecting a Line Code Violation or an excessive number of zeros in the B8ZS or HDB3 modes. If the LCVIE bit is enabled, any transition on this bit will generate an Interrupt.	RO	0

TABLE 24: MICROPROCESSOR REGISTER #5, BIT DESCRIPTION

D3	NLCD_n	**Network Loop-Code Detection:** This bit operates differently in the Manual or the Automatic Network Loop-Code detection modes. **In the Manual Loop-Code detection mode**, (NLCDE1 = "0" and NLCDE0 = "1" or NLCDE1 = "1" and NLCDE0 = "0") this bit gets set to "1" as soon as the Loop-Up ("00001") or Loop-Down ("001") code is detected in the receive data for longer than 5 seconds. The NLCD bit stays in the "1" state for as long as the chip detects the presence of the Loop-code in the receive data and it is reset to "0" as soon as it stops receiving it. In this mode, if the NLCD interrupt is enabled, the chip will initiate an interrupt on every transition of the NLCD. **When the Automatic Loop-code detection mode,** (NLCDE1 = "1" and NLCDE0 ="1") is initiated, the state of the NLCD interface bit is reset to "0" and the chip is programmed to monitor the receive input data for the Loop-Up code. This bit is set to a "1" to indicate that the Network Loop Code is detected for more than 5 seconds. Simultaneously the Remote Loop-Back condition is automatically activated and the chip is programmed to monitor the receive data for the Network Loop Down code. The NLCD bit stays in the "1" state for as long as the Remote Loop-Back condition is in effect even if the chip stops receiving the Loop-Up code. Remote Loop-Back is removed if the chip detects the "001" pattern for longer than 5 seconds in the receive data.Detecting the "001" pattern also results in resetting the NLCD interface bit and initiating an interrupt provided the NLCD interrupt enable bit is active. **When programmed in Automatic detection mode,** the NLCD interface bit stays "High" for the entire time the Remote Loop-Back is active and initiate an interrupt anytime the status of the NLCD bit changes. In this mode, the **Host** can monitor the state of the NLCD bit to determine if the Remote Loop-Back is activated.	RO	0
D2	AISD_n	**Alarm Indication Signal Detect:** This bit is set to a "1" to indicate All Ones Signal is detected by the receiver. The value of this bit is based on the current status of Alarm Indication Signal detector of channel n. If the AISDIE bit is enabled, any transition on this bit will generate an Interrupt.	RO	0
D1	RLOS_n	**Receive Loss of Signal:** This bit is set to a "1" to indicate that the receive input signal is lost. The value of this bit is based on the current status of the receive input signal of channel n. If the RLOSIE bit is enabled, any transition on this bit will generate an Interrupt.	RO	0
D0	QRPD_n	**Quasi-random Pattern Detection:** This bit is set to a "1" to indicate the receiver is currently in synchronization with QRSS pattern. The value of this bit is based on the current status of Quasi-random pattern detector of channel n. If the QRPDIE bit is enabled, any transition on this bit will generate an Interrupt.	RO	0

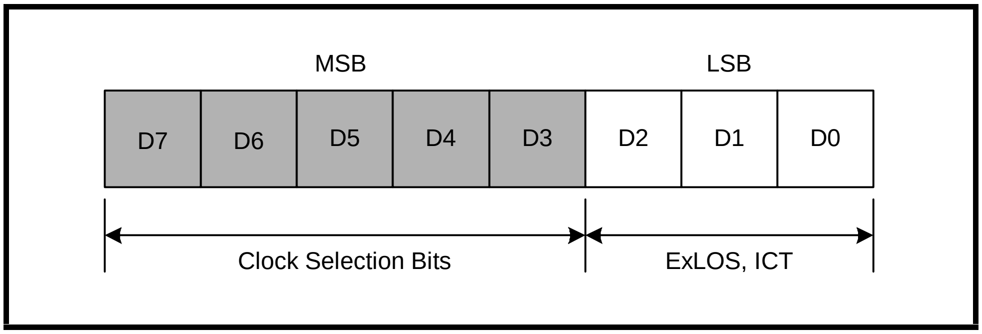
TABLE 35: MICROPROCESSOR REGISTER #128, BIT DESCRIPTION

REGISTER ADDRESS 10000000	NAME	FUNCTION	REGISTER TYPE	RESET VALUE
BIT #				
D7	SR/$\overline{DR}$	**Single-rail/Dual-rail Select:** Writing a “1” to this bit configures all 8 channels in the XRT83L38 to operate in the Single-rail mode. Writing a “0” configures the XRT83L38 to operate in Dual-rail mode.	R/W	0
D6	ATAOS	**Automatic Transmit All Ones Upon RLOS:** Writing a “1” to this bit enables the automatic transmission of All "Ones" data to the line for the channel that detects an RLOS condition. Writing a “0” disables this feature.	R/W	0
D5	RCLKE	**Receive Clock Edge:** Writing a “1” to this bit selects receive output data of all channels to be updated on the negative edge of RCLK. Wring a “0” selects data to be updated on the positive edge of RCLK.	R/W	0
D4	TCLKE	**Transmit Clock Edge:** Writing a “0” to this bit selects transmit data at TPOS_n/TDATA_n and TNEG_n/CODES_n of all channels to be sampled on the falling edge of TCLK_n. Writing a “1” selects the rising edge of the TCLK_n for sampling.	R/W	0
D3	DATAP	**DATA Polarity:** Writing a “0” to this bit selects transmit input and receive output data of all channels to be active “High”. Writing a “1” selects an active “Low” state.	R/W	0
D2	Reserved			0
D1	GIE	**Global Interrupt Enable:** Writing a “1” to this bit globally enables interrupt generation for all channels. Writing a “0” disables interrupt generation.	R/W	0
D0	SRESET	**Software Reset µP Registers:** Writing a “1” to this bit longer than 10µs initiates a device reset through the microprocessor interface. All internal circuits are placed in the reset state with this bit set to a “1” except the microprocessor register bits.	R/W	0

CLOCK SELECT REGISTER

The input clock source is used to generate all the necessary clock references internally to the LIU. The microprocessor timing is derived from a PLL output which is chosen by programming the Clock Select Bits and the Master Clock Rate in register 0x81h. Therefore, if the clock selection bits or the MCLRATE bit are being programmed, the frequency of the PLL output will be adjusted accordingly. During this adjustment, it is important to "Not" write to any other bit location within the same register while selecting the input/output clock frequency. For best results, register 0x81h can be broken down into two sub-registers with the MSB being bits D[7:3] and the LSB being bits D[2:0] as shown in **Figure 25**. Note: Bit D[7] is a reserved bit.

FIGURE 25. REGISTER 0X81H SUB REGISTERS



Programming Examples:

Example 1: Changing bits D[7:3]

If bits D[7:3] are the only values within the register that will change in a WRITE process, the microprocessor only needs to initiate ONE write operation.

Example 2: Changing bits D[2:0]

If bits D[2:0] are the only values within the register that will change in a WRITE process, the microprocessor only needs to initiate ONE write operation.

Example 3: Changing bits within the MSB and LSB

In this scenario, one must initiate TWO write operations such that the MSB and LSB do not change within ONE write cycle. It is recommended that the MSB and LSB be treated as two independent sub-registers. One can either change the clock selection (MSB) and then change bits D[2:0] (LSB) on the SECOND write, or vice-versa. No order or sequence is necessary.

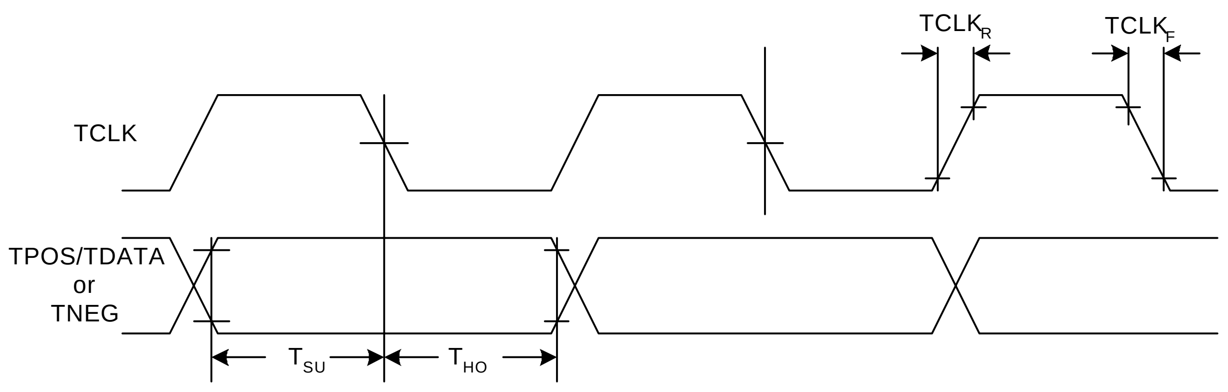

FIGURE 29. RECEIVE CLOCK AND OUTPUT DATA TIMING

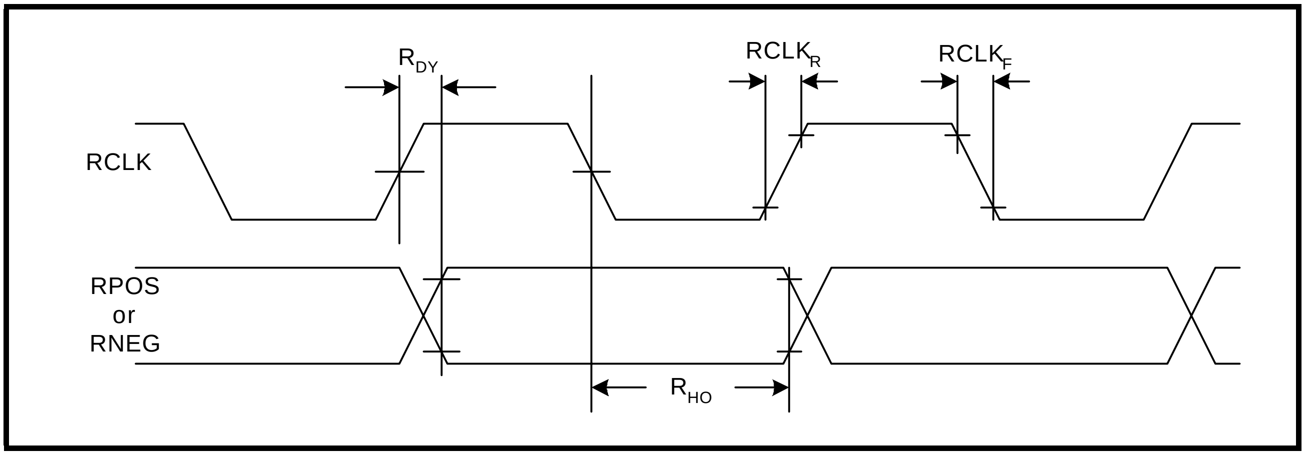

MICROPROCESSOR INTERFACE I/O TIMING

INTEL INTERFACE TIMING - ASYNCHRONOUS

The signals used for the Intel microprocessor interface are: Address Latch Enable (ALE), Read Enable ($\overline{RD}$), Write Enable ($\overline{WR}$), Chip Select ($\overline{CS}$), Address and Data bits. The microprocessor interface uses minimum external glue logic and is compatible with the timings of the 8051 or 80C188 with an 8-16 MHz clock frequency, and with the timings of x86 or i960 family or microprocessors. The interface timing shown in **Figure 30** and **Figure 32** is described in **Table 51**.

FIGURE 30. INTEL ASYNCHRONOUS PROGRAMMED I/O INTERFACE TIMING

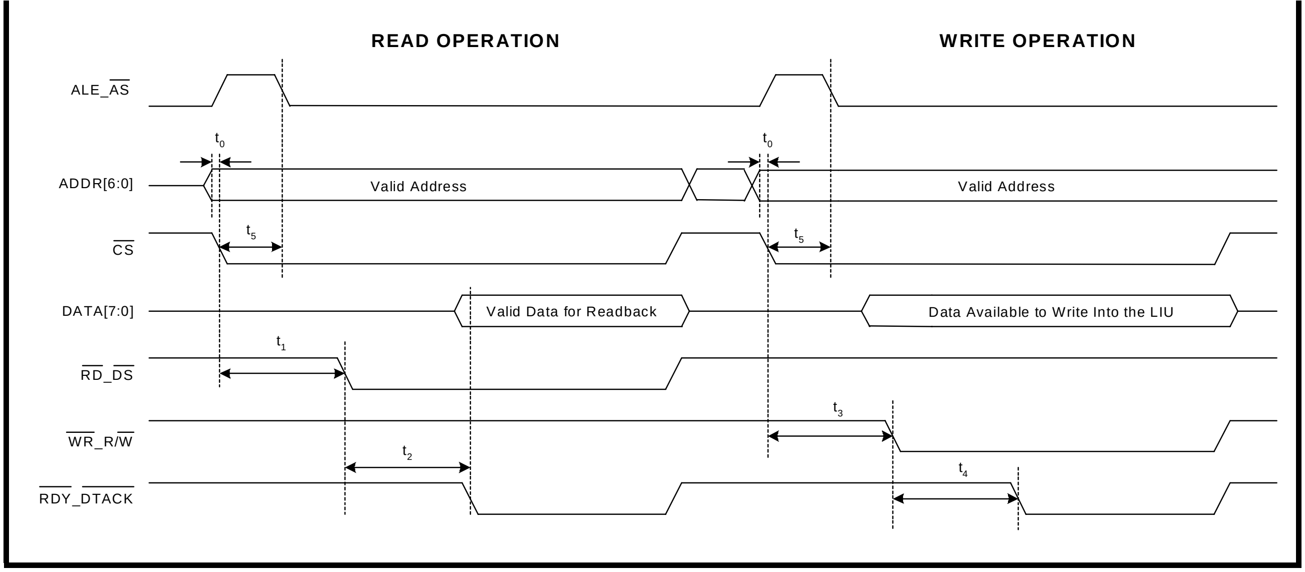

TABLE 51: ASYNCHRONOUS MODE 1 - INTEL 8051 AND 80188 INTERFACE TIMING

SYMBOL	PARAMETER	MIN	MAX	UNITS
t_0	Valid Address to $\overline{CS}$ Falling Edge	0	-	ns
t_1	$\overline{CS}$ Falling Edge to $\overline{RD}$ Assert	20	-	ns
t_2	$\overline{RD}$ Assert to $\overline{RDY}$ Assert	-	135	ns
NA	$\overline{RD}$ Pulse Width (t2)	135	-	ns
t_3	$\overline{CS}$ Falling Edge to $\overline{WR}$ Assert	20	-	ns
t_4	$\overline{WR}$ Assert to RDY Assert	-	135	ns
NA	$\overline{WR}$ Pulse Width (t2)	135	-	ns
t_5	$\overline{CS}$ Falling Edge to AS Falling Edge	0	-	ns
Reset pulse width - both Motorola and Intel Operations (see Figure 32)				
t_9	$\overline{Reset}$ pulse width	10		µs

MOTOROLA ASYCHRONOUS INTERFACE TIMING

The signals used in the Motorola microprocessor interface mode are: Address Strobe (AS), Data Strobe ($\overline{\text{DS}}$), Read/Write Enable (R/$\overline{\text{W}}$), Chip Select ($\overline{\text{CS}}$), Address and Data bits. The interface is compatible with the timing of a Motorola 68000 microprocessor family with up to 16.67 MHz clock frequency. The interface timing is shown in **Figure 31** and **Figure 32**. The I/O specifications are shown in **Table 52**.

FIGURE 31. MOTOROLA 68K ASYNCHRONOUS PROGRAMMED I/O INTERFACE TIMING

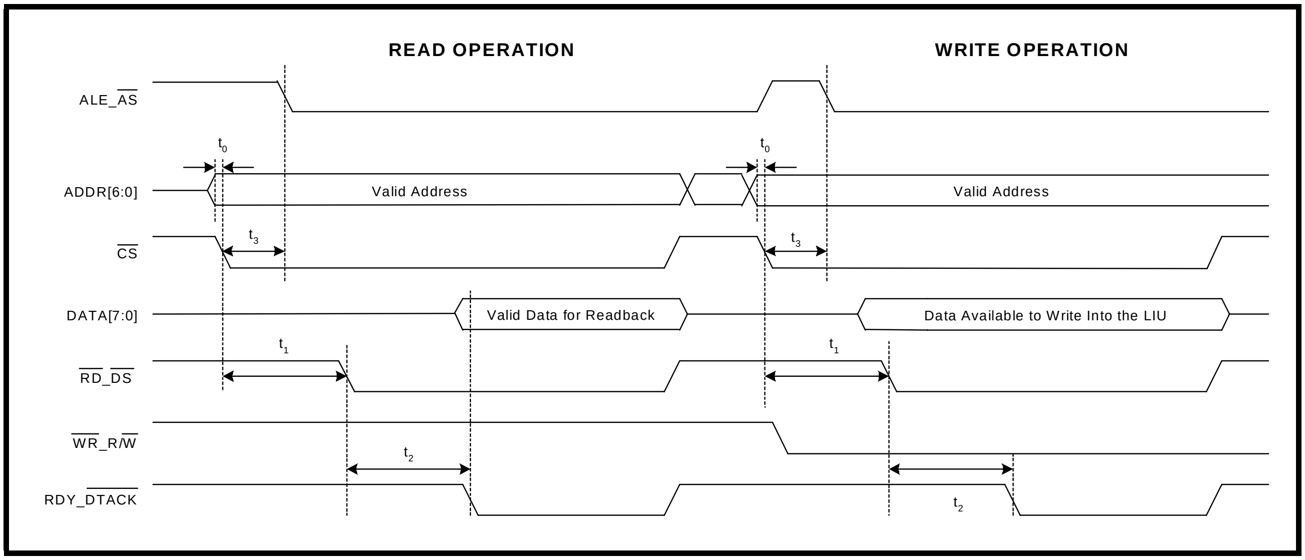

TABLE 52: ASYNCHRONOUS - MOTOROLA 68K - INTERFACE TIMING SPECIFICATION

SYMBOL	PARAMETER	MIN	MAX	UNITS
t_0	Valid Address to $\overline{\text{CS}}$ Falling Edge	0	-	ns
t_1	$\overline{\text{CS}}$ Falling Edge to $\overline{\text{DS}}$ Assert	20	-	ns
t_2	$\overline{\text{DS}}$ Assert to $\overline{\text{DTACK}}$ Assert	-	135	ns
NA	$\overline{\text{DS}}$ Pulse Width (t2)	135	-	ns
t_3	$\overline{\text{CS}}$ Falling Edge to $\overline{\text{AS}}$ Falling Edge	0	-	ns
Reset pulse width - both Motorola and Intel Operations (see Figure 32)				
t_9	$\overline{\text{Reset}}$ pulse width	10		µs

ORDERING INFORMATION

PART NUMBER	PACKAGE	OPERATING TEMPERATURE RANGE
XRT83L38IB	225 Ball BGA	-40°C to +85°C

REVISIONS

REVISION #	DATE	DESCRIPTION
1.0.0	06/04	Final Release. Fixed the typo RNEG1 Pin Number for the BGA Package to H2.
1.0.1	06/06	Added sentence to $\overline{\text{RESET}}$ pin (Exar recommends initiating a Hardware reset upon power up.) Changed t9 in table 51 and 52 to 10 (µs). Changed format to new Exar logo.
1.0.2	06/07	Remove XRT83L38IV product info.

Адрес: 105318, г.Москва, ул.Щербаковская д.3, офис 1107

Данный компонент на территории Российской Федерации

Вы можете приобрести в компании MosChip.

Для оперативного оформления запроса Вам необходимо перейти по данной ссылке:

http://moschip.ru/get-element

Вы можете разместить у нас заказ для любого Вашего проекта, будь то серийное производство или разработка единичного прибора.

В нашем ассортименте представлены ведущие мировые производители активных и пассивных электронных компонентов.

Нашей специализацией является поставка электронной компонентной базы двойного назначения, продукции таких производителей как XILINX, Intel (ex.ALTERA), Vicor, Microchip, Texas Instruments, Analog Devices, Mini-Circuits, Amphenol, Glenair.

Сотрудничество с глобальными дистрибьюторами электронных компонентов, предоставляет возможность заказывать и получать с международных складов практически любой перечень компонентов в оптимальные для Вас сроки.

На всех этапах разработки и производства наши партнеры могут получить квалифицированную поддержку опытных инженеров.

Система менеджмента качества компании отвечает требованиям в соответствии с ГОСТ Р ИСО 9001, ГОСТ РВ 0015-002 и ЭС РД 009
