## Easy!

### Easy Adjustment

**Realtime autotuning sets the optimum gain.**

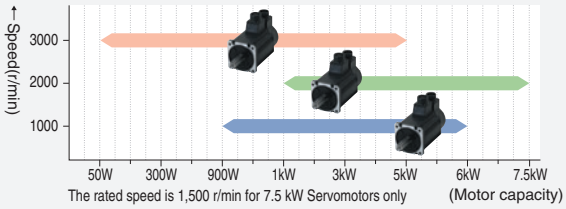

An autotuning function calculates the device load in realtime and automatically sets the optimum gain, simplifying the adjustment procedure.

### Select the Optimum Motor

**A wide range of Servomotors is available to meet application needs.**

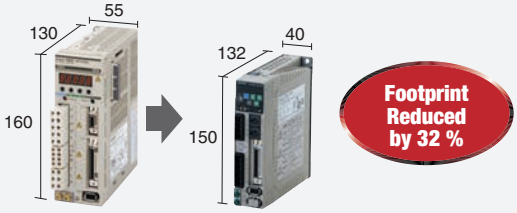

You can select a suitable Servomotor from a wide range of Servomotor capacities to cater to various applications.

### Reduce Control Panel Installation Space

**Even Smaller Servo Drives.**

The footprint of the Servo Drives has been reduced by 32% compared to previous OMRON models, helping to reduce control panel size.

## Advanced Performance!

### Reduce Tact Time

**Significantly better speed response frequency.**

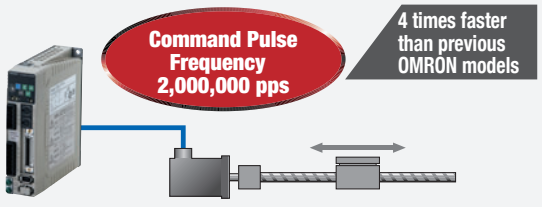

The speed response frequency has been improved by a factor of 2.5 compared to previous OMRON models. The stabilization time has been reduced, increasing machine speed and response performance.

### Reduce Tact Time

**Fast positioning with improved command pulse frequency performance.**

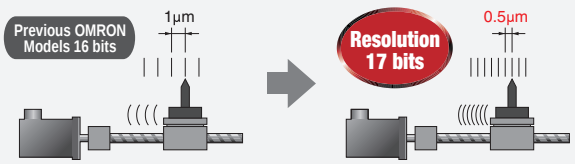

The command pulse frequency is 4 times faster than previous OMRON models. This enables fast, accurate control.

### Improve Processing Accuracy

**All Servomotors contain a 17-bit encoder*1 for greater accuracy.**

Positioning is twice as accurate as previous OMRON models*2 for submicron accuracy. This enables stable control in the low speed range.

*1 For Servomotors with absolute encoders.
*2 Compared to previous OMRON models. (Servomotors with absolute encoders, 750 W max.)

# Servo Drives with Increased Machine Improved Response and Vibration Control

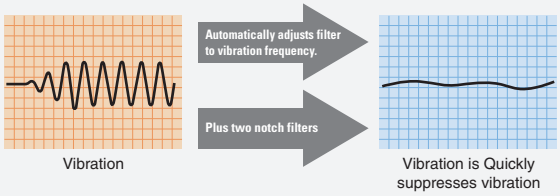

Achieve Maximum Machine Performance with the G Series

# Advanced Functionality!

## Reduce Mechanical Vibration

### Quick suppression of vibration with an adaptive filter.

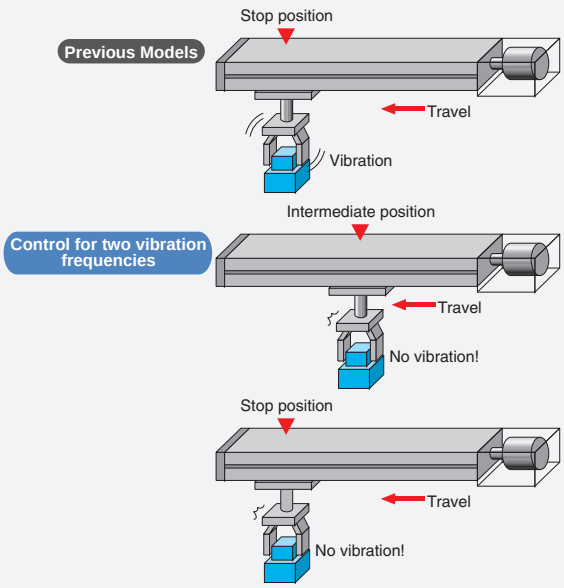

Even if the resonant frequency changes, realtime evaluation automatically follows the changes to reduce the effect of vibration due to low mechanical rigidity, such as for conveyer belts.

## Reduce Tact Time

### Reduce mechanical vibration with the vibration control function.

By removing the vibration frequency components between the stop position and the intermediate position, vibration that occurs due to low mechanical rigidity can be suppressed. (Control for two vibration frequencies)

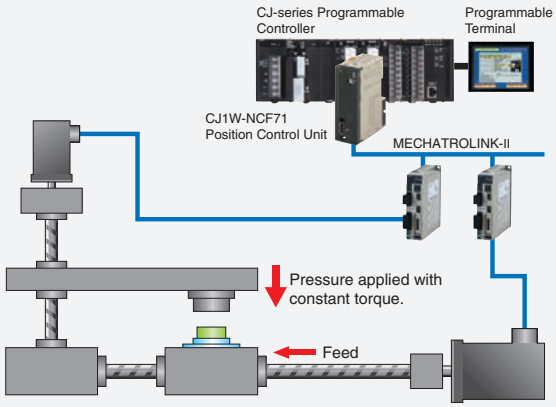

## Flexible Application

### Change the command control mode as required by the application.

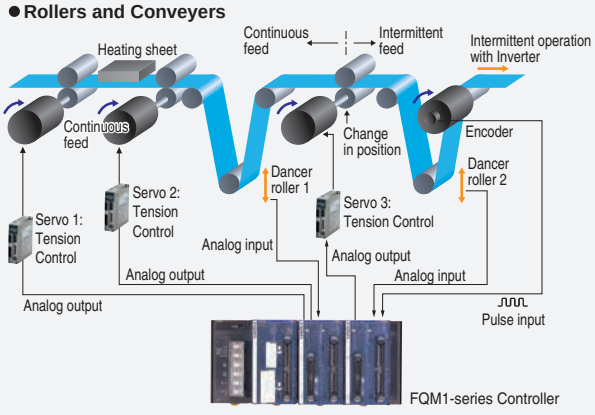

Select from position control, speed control, and torque control for use in applications such as the pressing, tension, and injection.

**Application Examples**

- **Attaching Parts, Pressing, and Tightening Screws**

- **Rollers and Conveyers**

# The optimum combination can be found from to handle various applications.

## Functions

**Pulse train**: The speed and travel distance are input to the Servo as pulse trains.

**Analog**: The speed and torque are input to the Servo as analog signals.

**ML2**: MECHATROLINK-II high-speed Servo communications motion network. (See note.)

**Position control**: Control is applied to move to the target position and then stop at the target position.

**Speed control**: Control is applied to change the linear or rotational speed. For example, speed control is used for applications such as turning grindstones, controlling welding speeds, and controlling feeding speeds.

**Torque control**: Control is applied to adjust the rotational force. Torque control is suitable for applications such as parts insertion, pressing, and screw tightening.

**Command control mode switching**: Switching is possible between any two of the three control modes: position control, speed control, and torque control.

**Vibration control function**: Vibration is suppressed by automatically setting a filter for the vibration frequency.

**Autotuning**: The motor is moved according to a command pattern automatically generated by the Servo Drive, then estimates the load inertia from the torque required at that time to automatically set the optimum

**Fit gain**: The rigidity for the realtime autotuning for position control is set automatically. By repeatedly inputting a specific operation pattern, the optimum rigidity is set automatically.

**Absolute output**: When the Controller power supply is turned ON, the Controller reads the Servo absolute position data to restore the absolute position.

**Incremental output**: When the Controller power supply is turned ON, operation is always started from the origin point.

**Adaptive filter**: The machine load inertia is calculated in realtime and the result is used to automatically set the optimum gain.

**Torque limit**: Switching is possible between the first torque limit and the second torque limit to limit the Servomotor output torque.

## Functions

INC/ABS **Incremental/absolute output**: The Servomotor can be switched between an incremental output and an absolute output. When an absolute output is selected and the Controller power supply is turned ON, the Controller reads the Servo absolute position data to restore the absolute position.

G-series AC Servomotors/Servo Drives with General-purpose Pulse-string or Analog Inputs

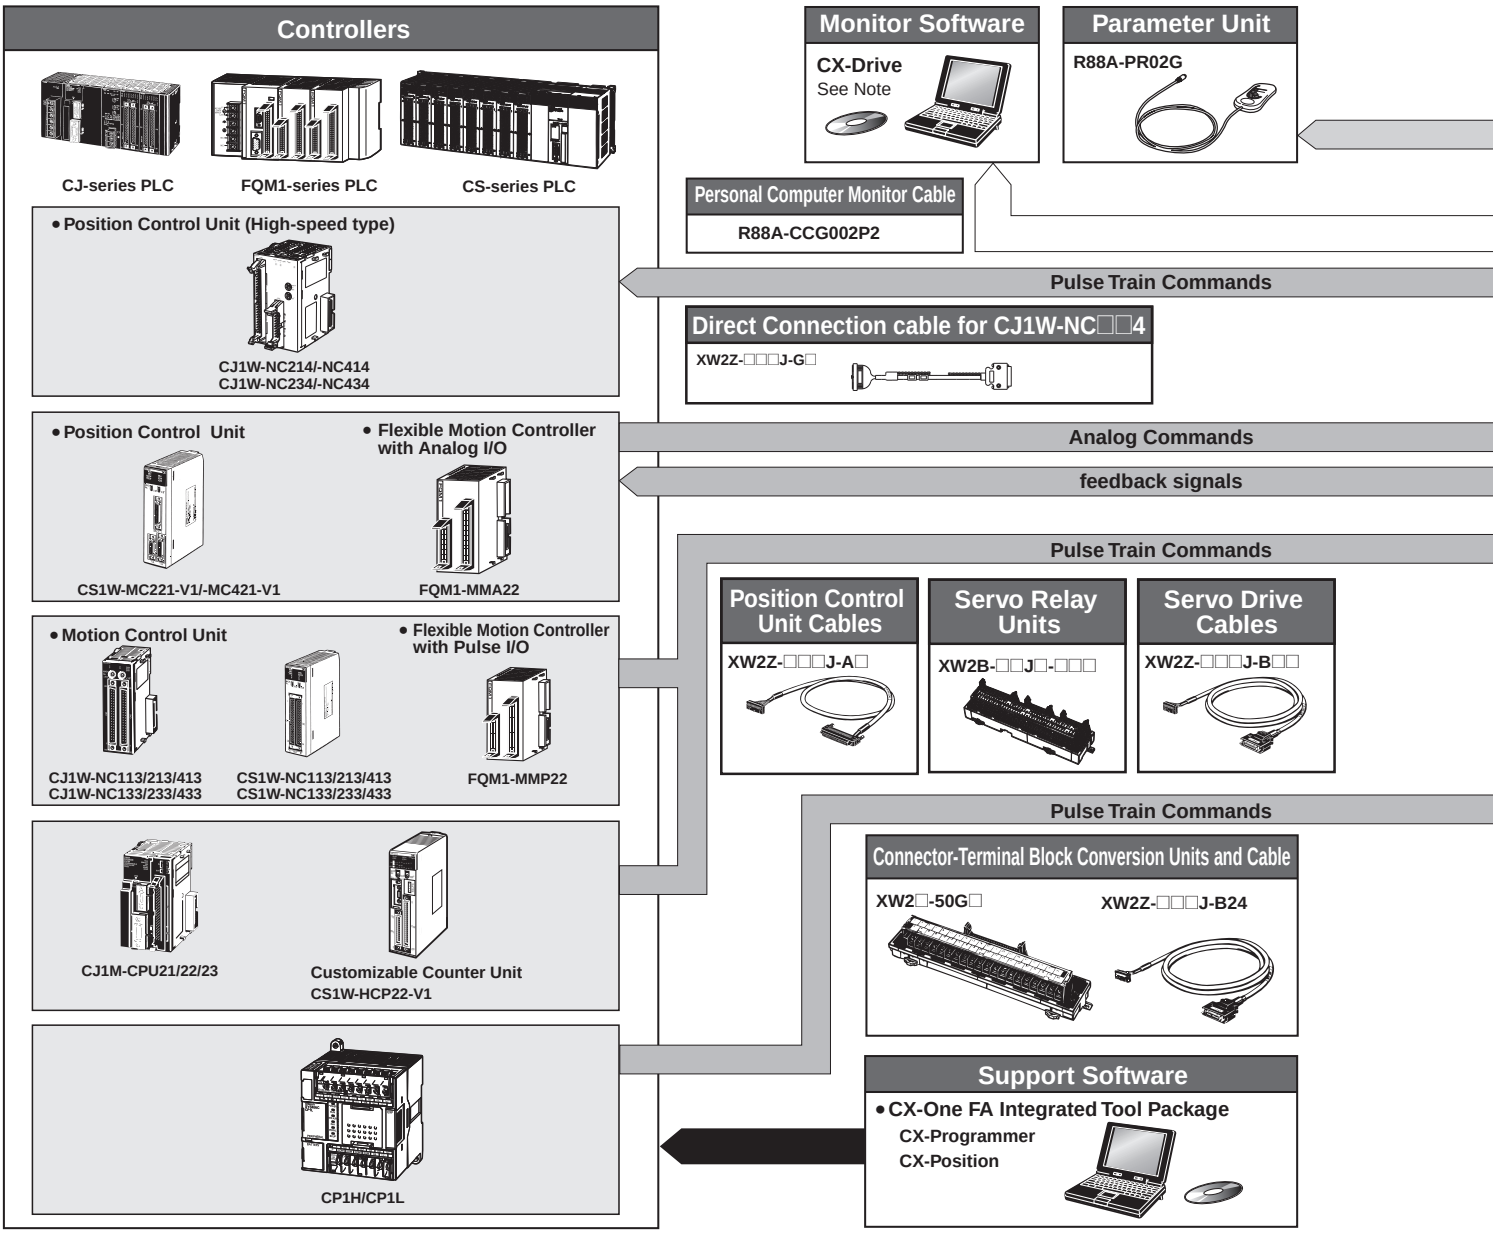

# R88M-G/R88D-GT

## Support for a Wide Range of Applications with Position Control, Speed Control, Torque Control.

- High-speed Response
  The G-series AC Servomotors and Servo Drives have achieved high-speed response capabilities, with a high-response frequency of 1 kHz.
- Suppressing Vibration of Low-rigidity Mechanisms during Acceleration/Deceleration
  The damping control function suppresses vibration of low-rigidity mechanisms or devices whose ends tend to vibrate. Two damping filters are provided to enable switching the vibration frequency automatically according to the direction of rotation and also via an external signal. In addition, the settings can be made easily merely by setting the vibration frequency and filter values, and you are assured of stable operation even if the settings are inappropriate.
- High-speed Positioning via Resonance Suppression Control
  The realtime autotuning function automatically estimates the load inertia of the machine in realtime and sets the optimal gain. The adaptive filter automatically suppresses vibration caused by resonance. Also, two independent notch filters make it possible to reduce vibration of a mechanism with multiple resonance frequencies.

## System Configuration

**Note:** CX-Drive (version 1.61) support for G-series Servo Drives can be obtained by using the CX-One V2 auto-update function from May 30, 2008.

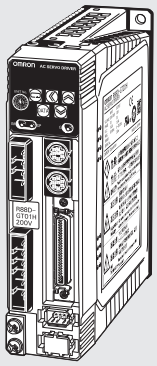

- Command Control Mode Switching
  Operation can be performed by switching between two of the following control modes: Position control, speed control (including internal speed) and torque control. Therefore, a variety of applications can be supported by one Servo Drive.
- Simplified Speed Control with Internal Speed Settings
  Eight internal speed settings allow you to change the speed easily by using external signals.

**Note: 1.** The above items reflect individual evaluation testing. The results may differ under compound conditions.
**Note: 2.** Always disconnect all connections to the Servo Drive before you perform insulation resistance tests on it. If you perform an insulation resistance test while the Servo Drive is connected, the Servo Drive may be damaged.
Never perform dielectric strength tests on the Servo Drive. Failure to follow this precaution may result in damaging internal elements.
**Note: 3.** Depending on the operating conditions, some Servo Drive parts will require maintenance.
**Note: 4.** The service life of the Servo Drive is 28,000 hours at an average ambient temperature of 55°C at 100% of the rated torque.

*1. The amplitude may be amplified by mechanical resonance. Do not exceed 80% of the specified value for extended periods of time.

**Note: 1.** Do not use the cable when it is laying in oil or water.
**Note: 2.** Do not expose the cable outlet or connections to stress due to bending or the weight of the cable itself.
**Note: 3.** Always disconnect all connections to the Servo Drive before you perform insulation resistance tests on it. If you perform an insulation resistance test while the Servo Drive is connected, the Servo Drive may be damaged.
Never perform dielectric strength tests on the Servo Drive. Failure to follow this precaution may result in damaging internal elements.

*1. These are the values when the Servomotor is combined with a Servo Drive at room temperature (20°C, 65%). The maximum momentary torque shown above indicates the standard value.

*2. Applicable Load Inertia:
- The operable load inertia ratio (load inertia/rotor inertia) depends on the mechanical configuration and its rigidity. For a machine with high rigidity, operation is possible even with high load inertia. Select an appropriate motor and confirm that operation is possible.
- If the dynamic brake is activated frequently with high load inertia, the dynamic brake resistor may burn. Do not repeatedly turn the Servomotor ON and OFF while the dynamic brake is enabled.
- The dynamic brake is designed only for emergency stops. Design the system so that the Servomotor remains stopped for at least 3 minutes after applying the dynamic brake. Otherwise the dynamic brake circuits may fail.

*3. The allowable radial and thrust loads are the values determined for a service life of 20,000 hours at normal operating temperatures. The allowable radial loads are applied as shown in the following diagram.

*4. This is an OFF brake. (It is reset when excitation voltage is applied).

*5. The operation time is the value (reference value) measured with a surge suppressor (CR50500 manufactured by Okaya Electric Industries Co., Ltd.).

*1. These are the values when the Servomotor is combined with a Servo Drive at room temperature (20°C, 65%). The maximum momentary torque shown above indicates the standard value.

*2. Applicable Load Inertia:
- The operable load inertia ratio (load inertia/rotor inertia) depends on the mechanical configuration and its rigidity. For a machine with high rigidity, operation is possible even with high load inertia. Select an appropriate motor and confirm that operation is possible.
- If the dynamic brake is activated frequently with high load inertia, the dynamic brake resistor may burn. Do not repeatedly turn the Servomotor ON and OFF while the dynamic brake is enabled.
- The dynamic brake is designed only for emergency stops. Design the system so that the Servomotor remains stopped for at least 3 minutes after applying the dynamic brake. Otherwise the dynamic brake circuits may fail.

*3. The allowable radial and thrust loads are the values determined for a service life of 20,000 hours at normal operating temperatures. The allowable radial loads are applied as shown in the following diagram.

*4. This is an OFF brake. (It is reset when excitation voltage is applied).

*5. The operation time is the value (reference value) measured with a surge suppressor (CR50500 manufactured by Okaya Electric Industries Co., Ltd.).

G-series AC Servomotors/Servo Drives with Built-in MECHATROLINK-II Communications

# R88M-G/R88D-GN□-ML2

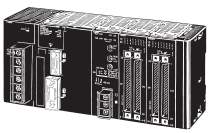

## Saves Space and Enables MECHATROLINK-II Communications with the Controller.

- Data transfer using MECHATROLINK-Ⅱ (See Note 1) Communications:
  All control data that can be interfaced between the Servo Driver and the Controller is transmitted using data communications. This enables maximizing the Servomotor performance without restricting the transmission performance of the control signals.
- Having a communications module built into the Servo Driver significantly saves space in the control panel.

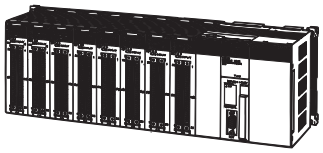

**Note: 1.** MECHATROLINK-II is a registered trademark of the MECHATROLINK Members Association.
**Note: 2.** CX-Drive (version 1.62) support for G-series Servo Drivers with MECHATROLINK-II Communications can be obtained by using the CX-One V2/V3 auto-update function from July 31, 2008.

*1. These are the values when the Servomotor is combined with a Servo Drive at room temperature (20°C, 65%). The maximum momentary torque shown above indicates the standard value.

*2. Applicable Load Inertia:
- The operable load inertia ratio (load inertia/rotor inertia) depends on the mechanical configuration and its rigidity. For a machine with high rigidity, operation is possible even with high load inertia. Select an appropriate motor and confirm that operation is possible.
- If the dynamic brake is activated frequently with high load inertia, the dynamic brake resistor may burn. Do not repeatedly turn the Servomotor ON and OFF while the dynamic brake is enabled.
- The dynamic brake is designed only for emergency stops. Design the system so that the Servomotor remains stopped for at least 3 minutes after applying the dynamic brake. Otherwise the dynamic brake circuits may fail.

*3. The allowable radial and thrust loads are the values determined for a service life of 20,000 hours at normal operating temperatures. The allowable radial loads are applied as shown in the following diagram.

*4. This is an OFF brake. (It is reset when excitation voltage is applied).

*5. The operation time is the value (reference value) measured with a surge suppressor (CR50500 manufactured by Okaya Electric Industries Co., Ltd.).

*2. Applicable Load Inertia:
- The operable load inertia ratio (load inertia/rotor inertia) depends on the mechanical configuration and its rigidity. For a machine with high rigidity, operation is possible even with high load inertia. Select an appropriate motor and confirm that operation is possible.
- If the dynamic brake is activated frequently with high load inertia, the dynamic brake resistor may burn. Do not repeatedly turn the Servomotor ON and OFF while the dynamic brake is enabled.
- The dynamic brake is designed only for emergency stops. Design the system so that the Servomotor remains stopped for at least 3 minutes after applying the dynamic brake. Otherwise the dynamic brake circuits may fail.

*3. The allowable radial and thrust loads are the values determined for a service life of 20,000 hours at normal operating temperatures. The allowable radial loads are applied as shown in the following diagram.

*4. This is an OFF brake. (It is reset when excitation voltage is applied).

*5. The operation time is the value (reference value) measured with a surge suppressor (CR50500 manufactured by Okaya Electric Industries Co., Ltd.).
