0	0b RW	I/O Space Enable (IOSE): When set, I/O cycles within the range specified by the I/O base and limit registers can be forwarded to the PCI-Express device. When cleared, these cycles are master aborted on the backbone..

23.6.3 Revision ID;Class Code (RID_CC)—Offset 8h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

RID_CC: [B:0, D:28, F:0] + 8h

Power Well: Core

Default: 06040000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	1	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
BCC				SCC				RID

Bit Range	Default & Access	Description
31:24	06h RO	Base Class Code (BCC): Indicates the device is a bridge device.
23:16	04h RO/V	Sub-Class Code (SCC): The default indicates the device is a PCI-to-PCI bridge.
15:8	00h RO/V	Programming Interface (PI): The value reported in this register is a function of the Decode Control.Subtractive Decode Enable (SDE) register. SDE Value reported in this register 0: 00h 1: 01h
7:0	00h RO/V	Revision ID (RID): Indicates the revision of the bridge.

23.6.4 Cache Line Size; Primary Latency Timer; Header Type (CLS_PLT_HTYPE)—Offset Ch

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

CLS_PLT_HTYPE: [B:0, D:28, F:0] + Ch

Power Well: Core

Default: 00810000h

31	28	24	20	16	12	8	4	0
0	0	0	0	1	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
RSVD				MFD	HTYPE		CT	RSVD_1
							LS	

Bit Range	Default & Access	Description
31:24	00h RO	Reserved (RSVD): Reserved
23	1b RO	Multi-function Device (MFD): This bit is '1' to indicate a multi-function device.
22:16	01h RO/V	Header Type (HTYPE): The default mode identifies the header layout of the configuration space, which is a PCI-to-PCI bridge.
15:11	00h RO	Latency Count (CT): Reserved per PCI-Express spec
10:8	000b RO	Reserved (RSVD_1): Reserved
7:0	00h RW	Line Size (LS): This is read/write but contains no functionality, per PCI-Express spec

23.6.5 Bus Numbers; Secondary Latency Timer (BNUM_SLT)—Offset 18h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

BNUM_SLT: [B:0, D:28, F:0] + 18h

Power Well: Core

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
SLT	SBBN	SCBN	PBN					

Bit Range	Default & Access	Description
31:24	00h RW/V	Secondary Latency Timer (SLT): For PCI Bus Emulation Mode compatibility, if the DC.PCIBEM register is set, this register is a RW register; else this register is RO and returns 0. This register does not affect the behavior of any HW logic.
23:16	00h RW	Subordinate Bus Number (SBBN): Indicates the highest PCI bus number below the bridge.
15:8	00h RW	Secondary Bus Number (SCBN): Indicates the bus number the port.
7:0	00h RW	Primary Bus Number (PBN): Indicates the bus number of the backbone.

23.6.6 I/O Base and Limit; Secondary Status (IOBL_SSTS)—Offset 1Ch

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

IOBL_SSTS: [B:0, D:28, F:0] + 1Ch

Power Well: Core

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
DPE	RSE	RMA	RTA	STA	SDTS	DPD	SFBC	RSVD
								SC66
								RSVD_1
								IOLA
								IOLC
								IOBA
								IOBC

Bit Range	Default & Access	Description
31	0b RW/C	Detected Parity Error (DPE): Set when the port receives a poisoned TLP.
30	0b RW/C	Received System Error (RSE): Set when the port receives an ERR_FATAL or ERR_NONFATAL message from the device.
29	0b RW/C	Received Master Abort (RMA): Set when the port receives a completion with 'Unsupported Request' status from the device.
28	0b RW/C	Received Target Abort (RTA): Set when the port receives a completion with 'Completion Abort' status from the device.
27	0b RW/C	Signaled Target Abort (STA): Set when the port generates a completion with 'Completion Abort' status to the device.
26:25	00b RO/V	Secondary DEVSEL# Timing Status (SDTS): Reserved per PCI-Express spec For PCI Bus Emulation Mode compatibility, if the PCIBEM register is set, this register returns a value of 01b when read, else this register returns a value of 00b.
24	0b RW/C	Data Parity Error Detected (DPD): Set when the BCTRL.PERE, and either of the following two conditions occurs: Port receives completion marked poisoned. Port poisons a write request to the secondary side.

Bit Range	Default & Access	Description
23	0b RO/V	Secondary Fast Back to Back Capable (SFBC): Reserved per PCI Express spec For PCI Bus Emulation Mode compatibility, if the PCIBEM register is set, this register returns a value of 1b when read, else this register returns a value of 0b.
22	0b RO	Reserved (RSVD): Reserved
21	0b RO	Secondary 66 MHz Capable (SC66): Reserved per PCI Express spec
20:16	00h RO	Reserved (RSVD_1): Reserved
15:12	0h RW	I/O Address Limit (IOLA): I/O Base bits corresponding to address lines 15:12 for 4KB alignment. Bits 11:0 are assumed to be padded to FFFh.
11:8	0h RO	I/O Limit Address Capability (IOLC): Indicates that the bridge does not support 32-bit I/O addressing.
7:4	0h RW	I/O Base Address (IOBA): I/O Base bits corresponding to address lines 15:12 for 4KB alignment. Bits 11:0 are assumed to be padded to 000h.
3:0	0h RO	I/O Base Address Capability (IOBC): Indicates that the bridge does not support 32-bit I/O addressing.

23.6.7 Memory Base and Limit (MBL)—Offset 20h

Accesses that are within the ranges specified in this register will be sent to the attached device if CMD.MSE is set. Accesses from the attached device that are outside the ranges specified will be forwarded to the backbone if CMD.BME is set. The comparison performed is MB [gt]= AD[lb]31:20[rb] [lt]= ML.

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

MBL: [B:0, D:28, F:0] + 20h

Power Well: Core

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0

0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
ML				RSVD	MB			RSVD_1

Bit Range	Default & Access	Description
31:20	000h RW	Memory Limit (ML): These bits are compared with bits 31:20 of the incoming address to determine the upper 1MB aligned value of the range.
19:16	0h RO	Reserved (RSVD): Reserved
15:4	000h RW	Memory Base (MB): These bits are compared with bits 31:20 of the incoming address to determine the lower 1MB aligned value of the range.
3:0	0h RO	Reserved (RSVD_1): Reserved

23.6.8 Prefetchable Memory Base and Limit (PMBL)—Offset 24h

Accesses that are within the ranges specified in this register will be sent to the device if CMD.MSE is set. Accesses from the device that are outside the ranges specified will be forwarded to the backbone if CMD.BME is set. The comparison performed is $PMBU32:PMB[gt] = AD[1b]63:32[rb]:AD[1b]31:20[rb]$ $[lt] = PMLU32:PML$.

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

PMBL: [B:0, D:28, F:0] + 24h

Power Well: Core

Default: 00010001h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	1
PML				I64L	PMB			

Bit Range	Default & Access	Description
31:20	000h RW	Prefetchable Memory Limit (PML): These bits are compared with bits 31:20 of the incoming address to determine the upper 1MB aligned value of the range.
19:16	1h RO	64-bit Indicator (I64L): Indicates support for 64-bit addressing.
15:4	000h RW	Prefetchable Memory Base (PMB): These bits are compared with bits 31:20 of the incoming address to determine the lower 1MB aligned value of the range.
3:0	1h RO	64-bit Indicator (I64B): Indicates support for 64-bit addressing.

23.6.9 Prefetchable Memory Base Upper 32 Bits (PMBU32)—Offset 28h

Size: 32 bits

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

PMBU32: [B:0, D:28, F:0] + 28h

Power Well: Core

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
PMBU								

Bit Range	Default & Access	Description
31:0	00000000h RW	Prefetchable Memory Base Upper Portion (PMBU): Upper 32-bits of the prefetchable address base.

23.6.12 Interrupt Information; Bridge Control (INTR_BCTRL)—Offset 3Ch

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

INTR_BCTRL: [B:0, D:28, F:0] + 3Ch

Power Well: Core

Default: 00000000h

31				28				24				20				16				12				8				4				0			
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0			
RSVD				DTSE		DTS		SDT		PDT		FBE		SBR		MAM		V16		VE		IE		SE		PERE		IPIN				ILINE			

Bit Range	Default & Access	Description
31:28	0h RO	Reserved (RSVD): Reserved
27	0b RW/V	Discard Timer SERR# Enable (DTSE): Reserved per PCI-Express spec. For PCI Bus Emulation Mode compatibility, if the DC.PCIBEM register is set, this register is RW else it is RO. This register is only maintained for SW compatibility and has no functionality within the port.
26	0b RO	Discard Timer Status (DTS): Reserved per PCI-Express spec. For PCI Bus Emulation Mode compatibility, this register can remain RO as no secondary discard timer exists that will ever cause it to be set.
25	0b RW/V	Secondary Discard Timer (SDT): Reserved per Express spec. For PCI Bus Emulation Mode compatibility, if the DC.PCIBEM register is set, this register is RW else it is RO. This register is only maintained for SW compatibility and has no functionality within the port.
24	0b RW/V	Primary Discard Timer (PDT): Reserved per Express spec. For PCI Bus Emulation Mode compatibility, if the DC.PCIBEM register is set, this register is RW else it is RO. This register is only maintained for SW compatibility and has no functionality within the port.
23	0b RO	Fast Back to Back Enable (FBE): Reserved per Express spec.
22	0b RW	Secondary Bus Reset (SBR): Triggers a Hot Reset on the PCI-Express port.
21	0b RW/V	Master Abort Mode (MAM): Reserved per Express spec. For PCI Bus Emulation Mode compatibility, if the DC.PCIBEM register is set, this register is RW else it is RO. This register is only maintained for SW compatibility and has no functionality within the port.
20	0b RW	VGA 16-Bit Decode (V16): When set, indicates that the I/O aliases of the VGA range (see BCTRL:VE definition below), are not enabled. 0: Execute 10-bit address decode on VGA I/O accesses. 1: Execute 16-bit address decode on VGA I/O accesses.
19	0b RW	VGA Enable (VE): When set, the following ranges will be claimed off the backbone by the root port: Memory ranges A0000h-BFFFFh I/O ranges 3B0h 3BBh and 3C0h 3DFh, and all aliases of bits 15:10 in any combination of 1's
18	0b RW	ISA Enable (IE): This bit only applies to I/O addresses that are enabled by the I/O Base and I/O Limit registers and are in the first 64KB of PCI I/O space. If this bit is set, the root port will block any forwarding from the backbone to the device of I/O transactions addressing the last 768 bytes in each 1KB block (offsets 100h to 3FFh).
17	0b RW	SERR# Enable (SE): When set, ERR_COR, ERR_NONFATAL, and ERR_FATAL messages received are forwarded to the backbone. When cleared, they are not.
16	0b RW	Parity Error Response Enable (PERE): When set, poisoned write TLPs and completions indicating poisoned TLPs will set the SSTS.DPD.

23.6.14 Device Capabilities (DCAP)—Offset 44h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

DCAP: [B:0, D:28, F:0] + 44h

Power Well: Core

Default: 00008000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
RSVD	FLRC	CSPS	CSPV	RSVD_1	RBER	RSVD_2	RSVD_3	RSVD_4
					E1AL	E0AL	ETFS	PFS
								MPS

Bit Range	Default & Access	Description
31:29	000b RO	Reserved (RSVD): Reserved
28	0b RO	Function Level Reset Capable (FLRC): Not supported in Root Ports
27:26	00b RO	Captured Slot Power Limit Scale (CSPS): Not supported
25:18	00h RO	Captured Slot Power Limit Value (CSPV): Not supported
17:16	00b RO	Reserved (RSVD_1): Reserved
15	1b RO	Role Based Error Reporting (RBER): When Set, this bit indicates that the Function implements the functionality originally defined in the Error Reporting ECN for PCI Express Base Specification, Revision 1.0a, and later incorporated into PCI Express Base Specification, Revision 1.1. This bit must be Set by all Functions conforming to the ECN, PCI Express Base Specification, Revision 1.1., or subsequent PCI Express Base Specification revisions.
14	0b RO	Reserved (RSVD_2): Reserved. On previous version of the specification this was Power Indicator Present (PIP)
13	0b RO	Reserved (RSVD_3): Reserved. On previous version of the specification this was Attention Indicator Present (AIP)
12	0b RO	Reserved (RSVD_4): Reserved. On previous version of the specification this was Attention Button Present (ABP)
11:9	000b RO	Endpoint L1 Acceptable Latency (E1AL): Reserved for root ports.
8:6	000b RO	Endpoint L0 Acceptable Latency (E0AL): Reserved for Root port.
5	0b RO	Extended Tag Field Supported (ETFS): The root port never needs to initiate a transaction as a Requester with the Extended Tag bits being set. This bit does not affect the root port's ability to forward requests as a bridge as the root port always supports forwarding requests with extended tags.
4:3	00b RO	Phantom Functions Supported (PFS): No phantom functions supported

Type: PCI Configuration Register
(Size: 32 bits)

Power Well: Core

31				28				24				20				16				12				8				4				0			
0	0	0	0	0	0	0	0	0	0	1	1	0	0	0	1	0	0	0	0	1	1	0	0	0	0	0	0	0	0	1	0				
PN								RSVD				LBNC	LARC	SDERC	CPM	EL1				ELO				APMS				MLW				SLS			

Bit Range	Default & Access	Description
23:22	00b RO	Reserved (RSVD): Reserved
21	1b RO	Link Bandwidth Notification Capability (LBNC): This port supports Link Bandwidth Notification status and interrupt mechanisms.
20	1b RO	Link Active Reporting Capable (LARC): This port supports the optional capability of reporting the DL_Active state of the Data Link Control and Management State Machine.
19	0b RO	Surprise Down Error Reporting Capable (SDERC): Set to '0' to indicate the root port does not support Surprise Down Error Reporting
18	0b RO	Clock Power Management (CPM): '0' Indicates that root ports do not support the CLKREQ# mechanism.
17:15	010b RW/O	L1 Exit Latency (EL1): Indicates an exit latency of 2us to 4us. 000b - Less than 1 us 001b - 1 us to less than 2 us 010b - 2 us to less than 4 us 011b - 4 us to less than 8 us 100b - 8 us to less than 16 us 101b - 16 us to less than 32 us 110b - 32 us to 64 us 111b - More than 64 us Note: If PXP PLL shutdown is enabled, BIOS should program this latency to comprehend PLL lock latency.
14:12	000b RO/V	L0s Exit Latency (ELO): Indicates an exit latency based upon common-clock configuration.
11:10	11b RW/O	Active State Link PM Support (APMS): Indicates the level of active state power management on this link Bits Definition 00 (Reserved) 01 L0s Entry supported 10 Reserved 11 Both L0s and L1 supported Note: If STRPFUSECFG.ASPMDIS is 1, the default of this field is '01'. Otherwise, the default of this field is '11'. If STRPFUSECFG.ASPMDIS is 1, BIOS writing '11' to this field will have the same effect as writing '01'. '01' will be reflected on this register when read and the register will turn to Read-Only once written once.
9:4	000000b RO/V	Maximum Link Width (MLW): For the root ports, several values can be taken, based upon the value of the chipset configuration register field RPC.PC1 for ports 1-4: Port # Value of PN field RPC.PC1 00 01 10 11 1 01h 02h 02h 04h 2 01h 01h 01h 01h 3 01h 01h 02h 01h 4 01h 01h 01h 01h
3:0	2h RO/V	Supported Link Speeds (SLS): Indicates the supported link speeds of the Root Port. 0001b 2.5 GT/s Link speed supported 0010b 5.0 GT/s and 2.5GT/s Link speeds supported This register reports a value of 0001b if the Root Port Gen2 Disable Fuse is set, else this register reports a value of 0010b.

23.6.17 Link Control; Link Status (LCTL_LSTS)—Offset 50h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

LCTL_LSTS: [B:0, D:28, F:0] + 50h

Power Well: Core

Default: 00010000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
LABS	LBMS	LA	SCC	LT	RSVD	NLW	CLS	RSVD_1
LABIE	LBMIE	HAWD	ECPM	ES	CCC	RL	LD	RCBC
RSVD_2	ASPM							

Bit Range	Default & Access	Description
31	0b RW/C	Link Autonomous Bandwidth Status (LABS): This bit is Set by hardware to indicate that hardware has autonomously changed Link speed or width, without the Port transitioning through DL_Down status, for reasons other than to attempt to correct unreliable Link operation. This bit must be set if the Physical Layer reports a speed or width change was initiated by the Downstream component that was indicated as an autonomous change. The default value of this bit is 0b.
30	0b RW/C	Link Bandwidth Management Status (LBMS): This bit is Set by hardware to indicate that either of the following has occurred without the Port transitioning through DL_Down status: - A Link retraining has completed following a write of 1b to the Retrain Link bit. Note: This bit is Set following any write of 1b to the Retrain Link bit, including when the Link is in the process of retraining for some other reason. - Hardware has changed Link speed or width to attempt to correct unreliable Link operation, either through an LTSSM timeout or a higher level process. This bit must be set if the Physical Layer reports a speed or width change was initiated by the Downstream component that was not indicated as an autonomous change. The default value of this bit is 0b.
29	0b RO/V	Link Active (LA): Set to 1b when the Data Link Control and Management State Machine is in the DL_Active state, 0b otherwise.
28	0b RO/V	Slot Clock Configuration (SCC): In normal mode, root port uses the same reference clock as on the platform and does not generate its own clock.
27	0b RO/V	Link Training (LT): The root port sets this bit whenever link training is occurring, or that 1b was written to the Retrain Link bit but Link training has not yet begun. It clears the bit upon completion of link training.
26	0b RO	Reserved (RSVD): Reserved. Previously this was defined as Link Training Error (LTE) but support for this bit was removed from subsequent versions of the PCI Express specification.
25:20	00h RO/V	Negotiated Link Width (NLW): For the root ports, this register could take on several values: Port # Value of PN field RPC.PC1 00 01 10 11 1 01h 02h 02h 04h 2 01h 01h 01h 01h 3 01h 01h 02h 01h 4 01h 01h 01h 01h The value of this register is undefined if the link has not successfully trained.
19:16	1h RO/V	Current Link Speed (CLS): 0001b Link is 2.5Gb/s Link 0010b 5.0 GT/s Link The value of this field is undefined if the link is not up.
15:12	0h RO	Reserved (RSVD_1): Reserved
11	0b RW	Link Autonomous Bandwidth Interrupt Enable (LABIE): Link Autonomous Bandwidth Interrupt Enable - When Set, this bit enables the generation of an interrupt to indicate that the Link Autonomous Bandwidth Status bit has been Set.
10	0b RW	Link Bandwidth Management Interrupt Enable (LBMIE): When Set, this bit enables the generation of an interrupt to indicate that the Link Bandwidth Management Status bit has been Set. This bit is not applicable and is reserved for Endpoints, PCI Express-to-PCI/PCI-X bridges, and Upstream Ports of Switches. Functions that do not implement the Link Bandwidth Notification Capability must hardwire this bit to 0b. Default value of this bit is 0b.
9	0b RW	Hardware Autonomous Width Disable (HAWD): When Set, this bit disables hardware from changing the Link width for reasons other than attempting to correct unreliable Link operation by reducing Link width. Default value of this bit is 0b.
8	0b RO	Enable Clock Power Management (ECPM): Reserved. Not supported on Root Ports.
7	0b RW	Extended Synch (ES): When set, forces extended transmission of FTS ordered sets in FTS and extra TS2 at exit from L1 prior to entering L0.
6	0b RW	Common Clock Configuration (CCC): Reserved.

Access Method

SLCTL SLSTS: [B:0, D:28, F:0] + 58h

Power Well: Core

Default: 00000000h

Bit Range	Default & Access	Description
31:25	00h RO	Reserved (RSVD): Reserved
24	0b RW/C	Data Link Layer State Changed (DLLSC): This bit is set when the value reported in Data Link Layer Link Active field of the Link Status register is changed. In response to a Data Link Layer State Changed event, software must read Data Link Layer Link Active field of the Link Status register to determine if the link is active before initiating configuration cycles to the hot plugged device.
23	0b RO	Electromechanical Interlock Status (EMIS): Reserved as this port does not support and electromechanical interlock.
22	0b RO/V	Presence Detect State (PDS): If XCAP.SI is set (indicating that this root port spawns a slot), then this bit indicates whether a device is connected ('1') or empty ('0'). If XCAP.SI is cleared, this bit is a '1'.
21	0b RO	MRL Sensor State (MS): Reserved as the MRL sensor is not implemented.

Bit Range	Default & Access	Description
20	0b RO	Command Completed (CC): This register is RO as this port does not implement a Hot Plug Controller..
19	0b RW/C	Presence Detect Changed (PDC): This bit is set by the root port when the SLSTS.PDS bit changes state.
18	0b RO	MRL Sensor Changed (MSC): Reserved as the MRL sensor is not implemented.
17	0b RO	Power Fault Detected (PFD): Reserved as a power controller is not implemented.
16	0b RO	Attention Button Pressed (ABP): This register is RO as this port does not implement an attention button
15:13	000b RO	Reserved (RSVD_1): Reserved
12	0b RW	Data Link Layer State Changed Enable (DLLSCE): When set, this field enables generation of a hot plug interrupt when the Data Link Layer Link Active field is changed
11	0b RO	Electromechanical Interlock Control (EMIC): Reserved as this port does not support an Electromechanical Interlock.
10	0b RO	Power Controller Control (PCC): This bit has no meaning for module based hot plug.
9:8	00b RO	Power Indicator Control (PIC): This register is RO as this port does not implement a Hot Plug Controller..
7:6	00b RO	Attention Indicator Control (AIC): This register is RO as this port does not implement a Hot Plug Controller..
5	0b RW	Hot Plug Interrupt Enable (HPE): When set, enables generation of a hot plug interrupt on enabled hot plug events.
4	0b RO	Command Completed Interrupt Enable (CCE): This register is RO as this port does not implement a Hot Plug Controller..
3	0b RW	Presence Detect Changed Enable (PDE): When set, enables the generation of a hot plug interrupt or wake message when the presence detect logic changes state.
2	0b RO	MRL Sensor Changed Enable (MSE): This register is RO as this port does not implement a Hot Plug Controller..
1	0b RO	Power Fault Detected Enable (PFE): This register is RO as this port does not implement a Hot Plug Controller...
0	0b RO	Attention Button Pressed Enable (ABE): This register is RO as this port does not implement a Hot Plug Controller..

23.6.20 Root Control (RCTL)—Offset 5Ch

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

RCTL: [B:0, D:28, F:0] + 5Ch

31:16	0000h RO	Reserved (RSVD): Reserved
15:4	000h RO	Reserved (RSVD_1): Reserved
3	0b RW	PME Interrupt Enable (PIE): When set, enables interrupt generation when RSTS.PS is in a set state (either due to a '0' to '1' transition, or due to this bit being set with RSTS.PS already set).
2	0b RW	System Error on Fatal Error Enable (SFE): When set, an SERR# will be generated if a fatal error is reported by any of the devices in the hierarchy of this root port, including fatal errors in this root port. This register is not dependent on CMD.SEE being set.
1	0b RW	System Error on Non-Fatal Error Enable (SNE): When set, an SERR# will be generated if a non-fatal error is reported by any of the devices in the hierarchy of this root port, including non-fatal errors in this root port. This register is not dependent on CMD.SEE being set.
0	0b RW	System Error on Correctable Error Enable (SCE): When set, an SERR# will be generated if a correctable error is reported by any of the devices in the hierarchy of this root port, including correctable errors in this root port. This register is not dependent on CMD.SEE being set.

23.6.21 Root Status (RSTS)—Offset 60h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

RSTS: [B:0, D:28, F:0] + 60h

Power Well: Core

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
RSVD				PP	PS	RID		

Bit Range	Default & Access	Description
31:18	0000h RO	Reserved (RSVD): Reserved
17	0b RO/V	PME Pending (PP): Indicates another PME is pending when the PME status bit is set. When the original PME is cleared by software, it will be set again, the requestor ID will be updated, and this bit will be cleared. Root ports have a one deep PME pending queue.
16	0b RW/C	PME Status (PS): Indicates that PME was asserted by the requestor ID in RID. Subsequent PMEs are kept pending until this bit is cleared.
15:0	0000h RO/V	PME Requestor ID (RID): Indicates the PCI requestor ID of the last PME requestor. Valid only when PS is set. Root ports are capable of storing the requestor ID for two PM_PME messages, with one active (this register) and a one deep pending queue. Subsequent PM_PME messages will be dropped.

23.6.22 Device Capabilities 2 (DCAP2)—Offset 64h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

DCAP2: [B:0, D:28, F:0] + 64h

Power Well: Core

Default: 00080816h

31				28				24				20				16				12				8				4				0			
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	1	0	0	0	0	1	0					
RSVD												OBFS	RSVD_1				LTRMS	RSVD_2				CTDS	CTRS												

Bit Range	Default & Access	Description
31:20	000h RO	Reserved (RSVD): Reserved
19:18	10b RW/O	Optimized Buffer Flush/Fill Supported (OBFFS): 00b - OBFF is not supported. 01b - OBFF is supported using Message signaling only. 10b - OBFF is supported using WAKE# signaling only. 11b - OBFF is supported using WAKE# and Message signaling. BIOS should program this field to 00b or 10b during system initialization to advertise the level of hardware OBFF support to software. BIOS should never program this field to 01b or 11b since OBFF messaging is not supported.
17:12	00h RO	Reserved (RSVD_1): Reserved
11	1b RW/O	LTR Mechanism Supported (LTRMS): A value of 1b indicates support for the optional Latency Tolerance Reporting (LTR) mechanism capability. BIOS must write to this register with either a '1' or a '0' to enable/disable the root port from declaring support for the LTR capability.
10:5	00h RO	Reserved (RSVD_2): Reserved
4	1b RO	Completion Timeout Disable Supported (CTDS): A value of 1b indicates support for the Completion Timeout Disable mechanism.
3:0	6h RO	Completion Timeout Ranges Supported (CTRS): This field indicates device support for the optional Completion Timeout programmability mechanism. This mechanism allows system software to modify the Completion Timeout value. This field is applicable only to Root Ports, Endpoints that issue requests on their own behalf, and PCI Express to PCI/PCI-X Bridges that take ownership of requests issued on PCI Express. For all other devices this field is reserved and must be hardwired to 0000b. Four time value ranges are defined: Range A: 50us to 10ms Range B: 10ms to 250ms Range C: 250ms to 4s Range D: 4s to 64s Bits are set according to the table below to show timeout value ranges supported. 0000b Completion Timeout programming not supported. 0001b Range A 0010b Range B 0011b Ranges A [amp] B 0110b Ranges B [amp] C [It]-- This is supported 0111b Ranges A, B [amp] C 1110b Ranges B, C [amp] D 1111b Ranges A, B, C [amp] D All other values are reserved.

23.6.23 Device Control 2; Device Status 2 (DCTL2_DSTS2)—Offset 68h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

DCTL2 DSTS2: [B:0, D:28, F:0] + 68h

Power Well: Core

Default: 00000000h

31				28				24				20				16				12				8				4				0			
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0					
RSVD																RSVD_1	OBFFEN		RSVD_2	LTREN	RSVD_3				CTD	CTV									

Bit Range	Default & Access	Description
31:16	0000h RO	Reserved (RSVD): Reserved
15	0b RO	Reserved (RSVD_1): Reserved
14:13	00b RW	Optimized Buffer Flush/Fill Enable (OBFFEN): 00b Disable OBFF mechanism. 01b Enable OBFF mechanism using Message signaling (Variation A). 10b Enable OBFF mechanism using Message signaling (Variation B). 11b Enable OBFF using WAKE# signaling. Note: Only encoding 00b and 11b are supported. The encoding of 01b or 10b would be aliased to 00b. If DCAP2.OBFFS is clear, programming this field to any non-zero values will have no effect.
12:11	00b RO	Reserved (RSVD_2): Reserved
10	0b RW	LTR Mechanism Enable (LTREN): When Set to 1b, this bit enables the Latency Tolerance Reporting (LTR) mechanism. For Downstream Ports, this bit must be reset to the default value if the Port goes to DL_Down status. If DCAP2.LTRMS is clear, programming this field to any non-zero values will have no effect.
9:5	00h RO	Reserved (RSVD_3): Reserved
4	0b RW	Completion Timeout Disable (CTD): When set to 1b, this bit disables the Completion Timeout mechanism. This field is required for all devices that support the Completion Timeout Disable Capability. Software is permitted to set or clear this bit at any time. When set, the Completion Timeout detection mechanism is disabled. If there are outstanding requests when the bit is cleared, it is permitted but not required for hardware to apply the completion timeout mechanism to the outstanding requests. If this is done, it is permitted to base the start time for each request on either the time this bit was cleared or the time each request was issued.
3:0	0h RW	Completion Timeout Value (CTV): In Devices that support Completion Timeout programmability, this field allows system software to modify the Completion Timeout value. This field is applicable to Root Ports, Endpoints that issue requests on their own behalf, and PCI Express to PCI/PCI-X Bridges that take ownership of requests issued on PCI Express. For all other devices this field is reserved and must be hardwired to 0000b. A Device that does not support this optional capability must hardwire this field to 0000b and is required to implement a timeout value in the range 50us to 50ms. Devices that support Completion Timeout programmability must support the values given below corresponding to the programmability ranges indicated in the Completion Timeout Values Supported field. The root port targeted configurable ranges are listed below, along with the range allowed by the PCI Express 2.0 specification. Defined encodings: 0000b Default range: 40-50ms (spec range 50us to 50ms) Values available if Range B (10ms to 250ms) programmability range is supported: 0101b 40-50ms (spec range is 16ms to 55ms) 0110b 160-170ms (spec range is 65ms to 210ms) Values available if Range C (250ms to 4s) programmability range is supported: 1001b 400-500ms (spec range is 260ms to 900ms) 1010b 1.6-1.7s (spec range is 1s to 3.5s) Values not defined above are Reserved. Software is permitted to change the value in this field at any time. For requests already pending when the Completion Timeout Value is changed, hardware is permitted to use either the new or the old value for the outstanding requests, and is permitted to base the start time for each request either when this value was changed or when each request was issued.

23.6.24 Link Capabilities 2 (LCAP2)—Offset 6Ch

Size:32 bits

Bit Range	Default & Access	Description
22:20	000b RW	Multiple Message Enable (MME): These bits are RW for software compatibility, but only one message is ever sent by the root port.
19:17	000b RO	Multiple Message Capable (MMC): Only one message is required.
16	0b RW	MSI Enable (MSIE): If set, MSI is enabled and traditional interrupt pins are not used to generate interrupts. CMD.BME must be set for an MSI to be generated. If CMD.BME is cleared, and this bit is set, no interrupts (not even pin based) are generated.
15:8	90h RW/O	Next Pointer (NEXT): Indicates the location of the next capability in the list. The default value of this register is 90h which points to the Subsystem Vendor capability structure. BIOS can determine which capabilities will be exposed by including or removing them from the capability linked list. As this register is RWO, BIOS must write a value to this register, even if it is to re-write the default value.
7:0	05h RO	Capability ID (CID): Capabilities ID indicates MSI.

23.6.29 Message Signaled Interrupt Message Address (MA)—Offset 84h

Type: PCI Configuration Register
(Size: 32 bits)

MA: [B:0, D:28, F:0] + 84h

Power Well: Core

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
								RS/D

Bit Range	Default & Access	Description
31:2	00000000h RW	Address (ADDR): Lower 32 bits of the system specified message address, always DW aligned.
1:0	00b RO	Reserved (RSVD): Reserved

23.6.30 Message Signaled Interrupt Message Data (MD)—Offset 88h

Type: PCI Configuration Register
(Size: 32 bits)

MD: [B:0, D:28, F:0] + 88h

Power Well: Core

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
RSD/D				DATA				

Bit Range	Default & Access	Description
31:16	0000h RW/O	Subsystem Identifier (SID): Indicates the subsystem as identified by the vendor. This field is write once and is locked down until a bridge reset occurs (not the PCI bus reset).
15:0	0000h RW/O	Subsystem Vendor Identifier (SVID): Indicates the manufacturer of the subsystem. This field is write once and is locked down until a bridge reset occurs (not the PCI bus reset).

23.6.33 Power Management Capability; PCI Power Management Capabilities (PMCAP_PMC)—Offset A0h

Size: 32 bits

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

PMCAP_PMC: [B:0, D:28, F:0] + A0h

Power Well: Core

Default: C8030001h

31	28	24	20	16	12	8	4	0
1	1	0	0	1	0	0	0	1
PMES	D2S	D1S	AC	DSI	RSVD	PMEC	VS	CID

Bit Range	Default & Access	Description
31:27	11001b RO	PME Support (PMES): Indicates PME# is supported for states D0, D3HOT and D3COLD. The root port does not generate PME#, but reporting that it does is necessary for legacy Microsoft operating systems to enable PME# in devices connected behind this root port.
26	0b RO	D2_Support (D2S): The D2 state is not supported.
25	0b RO	D1_Support (D1S): The D1 state is not supported.
24:22	000b RO	Aux_Current (AC): Reports 0mA (self-powered), as use of this controller does not add to suspend well power consumption.
21	0b RO	Device Specific Initialization (DSI): Indicates that no device-specific initialization is required.
20	0b RO	Reserved (RSVD): Reserved
19	0b RO	PME Clock (PMEC): Indicates that PCI clock is not required to generate PME#.
18:16	011b RO	Version (VS): Indicates support for Revision 1.2 of the PCI Power Management Specification.
15:8	00h RO	Next Capability (NEXT): Indicates this is the last item in the list.
7:0	01h RO	Capability Identifier (CID): Value of 01h indicates this is a PCI power management capability.

23.6.35 Manufacturer's ID (MANID)—Offset F8h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

MANID: [B:0, D:28, F:0] + F8h

Power Well: Core

Default: 00000F00h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
RSVD	DPID	SID	MID	PD				

Bit Range	Default & Access	Description
31:28	0h RO	Reserved (RSVD): Reserved
27:24	0h RO/V	Dot portion of Process ID (DPID): The value of this field is SoC specific. Example: Process/Dot (PD) is 1265.8. Indicates the dot as .8.
23:16	00h RO/V	Stepping Identifier (SID): This field is incremented for each stepping of the part. Note that this field can be used by software to differentiate steppings when the Revision ID may not change. A single Manufacturing Stepping ID can be implemented that is readable from all functions in the chip because all of them are incremented in lock-step.
15:8	0Fh RO	Manufacturing Identifier (MID): 0Fh = Intel
7:0	00h RO/V	Process/Dot (PD): Indicates the current process. The value of this field is SoC specific. Example: Process/Dot (PD) is 1265.8. Indicates the Process (1265).

23.6.36 Advanced Error Reporting Capability Header (AECH)—Offset 100h

The AER capability can optionally be included or excluded from the capabilities list. The full AER is supported.

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

AECH: [B:0, D:28, F:0] + 100h

Power Well: Core

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
NCO								

Bit Range	Default & Access	Description
31:20	000h RO	Next Capability Offset (NCO): Set to 000h as this is the last capability in the list.

Bit Range	Default & Access	Description
11:6	00h RO	Reserved (RSVD_1): Reserved
5	0b RO	Surprise Down Error Status (SDE): Surprise Down is not supported.
4	0b RW/1C/P	Data Link Protocol Error Status (DLPE): Indicates a data link protocol error occurred.
3:1	000b RO	Reserved (RSVD_2): Reserved
0	0b RO	Training Error Status (TE): Not supported.

23.6.38 Uncorrectable Error Mask (UEM)—Offset 108h

When set, the corresponding error in the UES register is masked, and the logged error will cause no action. When cleared, the corresponding error is enabled. This register is only reset by a loss of core power.

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

UEM: [B:0, D:28, F:0] + 108h

Power Well: Core

Default: 00000000h

Bit Range	Default & Access	Description
31:22	000h RO	Reserved (RSVD): Reserved
21	0b RO	ACS Violation Status (AVS): Reserved. Access Control Services are not supported
20	0b RW/P	Unsupported Request Error Mask (URE): Mask for uncorrectable errors.
19	0b RO	ECRC Error Mask (EE): ECRC is not supported.
18	0b RW/P	Malformed TLP Mask (MT): Mask for malformed TLPs
17	0b RW/P	Receiver Overflow Mask (RO): Mask for receiver overflows.
16	0b RW/P	Unexpected Completion Mask (UC): Mask for unexpected completions.
15	0b RW/P	Completer Abort Mask (CM): Mask for completer abort.

Bit Range	Default & Access	Description
14	0b RW/P	Completion Timeout Mask (CT): Mask for completion timeouts.
13	0b RO	Flow Control Protocol Error Mask (FCPE): Not supported.
12	0b RW/P	Poisoned TLP Mask (PT): Mask for poisoned TLPs.
11:6	00h RO	Reserved (RSVD_1): Reserved
5	0b RO	Surprise Down Error Mask (SDE): Surprise Down is not supported.
4	0b RW/P	Data Link Protocol Error Mask (DLPE): Mask for data link protocol errors.
3:1	000b RO	Reserved (RSVD_2): Reserved
0	0b RO	Training Error Mask (TE): Not supported.

23.6.39 Uncorrectable Error Severity (UEV)—Offset 10Ch

This register gives the option to make an uncorrectable error fatal or non-fatal. An error is fatal if the bit is set. An error is non-fatal if the bit is cleared. This register is only reset by a loss of core power.

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

UEV: [B:0, D:28, F:0] + 10Ch

Power Well: Core

Default: 00060011h

LTSMSTATE				RSVD	LNKSTAT	REPLAYNUM	DLLRETRY	LANESTAT
								NXTTXSEQUENUM

Bit Range	Default & Access	Description
31:24	00h RO/V	LTSM State (LTSMSTATE): Indicates the LTSM present state. 00000: DETECTQUIET 00001: DETECTACTIVE 00010: POLLINGACTIVE 00011: POLLINGCOMPLIANCE 00100: POLLINGCONFIGURATION 00101: POLLINGSPEED 00110: CONFIGRCVRCFG 00111: CONFIGRCVRCFGLPBK 01000: CONFIGIDLE 01001: L0 01010: LOWAIT 01011: RECOVERYRCVRLOCK 01100: RECOVERYRCVRCFG 01101: RECOVERYIDLE 01110: RECOVERYIDLELPBK 01111: L1ENTRY 10000: L1IDLE 10001: L2IDLE 10010: LINKCONTROLRESET 10011: LOOPBACKENTRY 10100: LOOPBACKACTIVE 10101: LOOPBACKEXITM 10110: LOOPBACKEXITS 10111: DISABLED Note: This register field could be used by REUT software to monitor the link LTSSM substates.
23	0b RO	Reserved (RSVD): Reserved
22:19	0000b RO/V	Link Status (LNKSTAT): During Link initialization the Link will always traverse this list of state from the top (0000) to the bottom of the list (0111). One or more power management states may be skipped, but the direction of list traversal will remain the same. 0000 Link Down 0001 : Link Retrain 0011 : L1 0100 : L2 0101 : L3 0111 : L0 (Link Up) 1000 : L0s (Transmit [amp] Receive) 1001 : L0s (Transmit only) 1010 : L0s (Receive only) All others reserved
18:17	00b RO/V	Replay Number (REPLAYNUM): Number of times the Retry Buffer has been replayed since the last Link initialization / re-training. When the Data Link Layer has replayed the contents of the Retry Buffer four times a Link re-training will be initiated which will reset this value back to zero.

Bit Range	Default & Access	Description
16	0b RO/V	Data Link Layer Retry (DLLRETRY): Indicates when the Data Link Layer has received a corrupted TLP or has detected a dropped packet and is currently waiting for the remote agent to re-transmit the corrupted/dropped packet. The value of Next Receive Sequence Number will be the sequence number associated with the corrupted packet.
15:12	0h RO/V	Lane Status (LANESTAT): Indicates which lanes are trained. A '1' indicates that the corresponding lane is trained (i.e. bit 0 = '1' means lane 0 is trained).
11:0	000h RO/V	Next Transmitted Sequence Number (NXTTXSEQNUM): This is the sequence number to be applied to and pre-pended to the next outgoing TLP.

23.6.51 PCI Express Status 2 (PCIESTS2)—Offset 32Ch

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

PCIESTS2: [B:0, D:28, F:0] + 32Ch

23.7.1 PCS_DWORD0 (pcs_dword0)—Offset 0h

Access Method

Type: Message Bus Register
(Size: 32 bits)

pcs_dword0: [Port: 0xA6] + (200h + 0h)

Op Codes:

0h - Read, 1h - Write

Default: 00010080h

Bit Range	Default & Access	Description
5	0h RW	reg_tx_laneup: Unused in Tx
4	0h RW	reg_left_txfifo_rst_master2: override enable = reg_lanedeskew_strap_ovrd
3	0h RW	reg_right_txfifo_rst_master2: override enable = reg_lanedeskew_strap_ovrd
2	0h RW	reg_plllinksynch_ovrden: Override enable for reg_pllinsync_ovrd 0 = Use default delay in hardware 1 = Use reg_plllinksynch_ovrd
1	0h RW	reg_plllinksynch_ovrd: override value for plllinksynch
0	0h RW	reg_tx1_cmmdisparity: Sets the initial disparity during Compliance Measurement Mode, used together with pcs_txcompliance pulse. 0 = set negative disparity 1 = set positive disparity

23.7.2 PCS_DWORD1 (pcs_dword1)—Offset 4h

Access Method

Type: Message Bus Register
(Size: 32 bits)

pcs dword1: [Port: 0xA6] + (200h + 4h)

Op Codes:

0h - Read, 1h - Write

Default: 00600060h

								cri_ebptrrst
								cri_comdispfix
								cri_forcebankhit
								cri_kalignmode_1_0
								cri_skpprocdis
								cri_elasticbuffer_maskdis

Bit Range	Default & Access	Description
31:28	0h RW	reg_rxpwrfsm_pibiasoff_delay_3_0: Override value for delay (in 2ns increments) between deassertion of opianclkbufen and opibiasen
27:24	0h RW	cri_sqdbexittimer_override_3_0: Rx squelch exit debounce timer
23:18	0h RW	cri_sqdbentrytimer_override_5_0: Rx squelch entry debounce timer
17:16	0h RW	reg_rxdrcgtsqsel_1_0: Squelch output select
15	0h RW	cri_reut_SlaveSideDataCheckingEn: Enable REUT slave side checking while in loopback slave
14	0h RW	cri_sqdbtimer_ovren: Squelch debounce timer override enable
13	0h RW	cri_rxpwrfsm_timer_ovren: Rx power management fsm timer override enable
12	0h RW	reg_rxidle: Chicken bit to override i_rxidle from controller and keep Rx in P0 or P0s
11	0h RW	cri_rxrawdata_sel: When asserted bypass K-align, 10b/8b decoder and Elastic buffer
10	0h RW	cri_dynkalign_eco3302703_mode: Kalign Mode Override Value When cri_dynkalign_eco3302703_ovren is set, this value selects kalignmode 0 - use register bits cri_kalignmode[1:0] to select kalignmode 1 - select the 4 COM kalign mode'
9	0h RW	cri_dynkalign_eco3302703_ovren: Kalign Mode Override Enable Overrides kalign mode select pin, allowing config bit kalignmode_override_val to select kalignmode.
8	0h RW	reg_rxpwrfsm_pibiasoff_ovrride: When asserted selects reg_rxpwrfsm_pibiasoff_delay[3:0]
7	0h RW	cri_reset_kalignlck: When asserted resets Kalign lock indication and Kalign is performed again. The conditions when this would assert includes and is not restricted to any power management states (L0s, L1) or polling quiet states etc.
6	0h RW	cri_ebptrrst: Global broadcast to all lanes that the Elastic Buffer pointers should be reset. This is a pulse and will be generated when we need to reset the pointers because of collision or various other reasons.
5	0h RW	cri_comdispfix: Chicken bit to force disparity in dynamic K-align mode

Bit Range	Default & Access	Description
4	0h RW	cri_forcebankhit: Chicken bit to enable data appear on NOA post k-align lock although k-align block is not achieving lock. This is only for NOA observeability and not for other purpose
3:2	0h RW	cri_kalignmode_1_0: KALIGN Mode Select 00 = dynamic kalign all the time. Accounts for bit slips on incoming stream which can cause symbol to be detected on different bank 10 = dynamic kalign up to L0 x1 = static kalign (same as GDG). Assumes symbol always detected on same data bank
1	0h RW	cri_skpprocdis: SKIP Ordered-Set Processing Disable When this configuration bit is asserted, then SKIP ordered=sets will be ignored (in EB block). Used in Elastic buffer block. 0 = Normal operation. SKIP ordered=sets will be processed by the Elastic Buffer 1 = SKIP processing disabled.
0	0h RW	cri_elasticbuffer_maskdis: Config bit (chicken bit) to disable the masking logic after elec idle ordered set is seen

23.7.4 PCS_DWORD3 (pcs_dword3)—Offset Ch

Access Method

Type: Message Bus Register
(Size: 32 bits)

pcs_dword3: [Port: 0xA6] + (200h + Ch)

Op Codes:

0h - Read, 1h - Write

Default: 5515ACAAh

23.7.5 PCS_DWORD4 (pcs_dword4)—Offset 10h

Access Method

Bit Range	Default & Access	Description
31	0h RW	cri_dfx_patbuftrain: Pattern Buffer Manual Training When DFXPATBUFTRAINOVR and DFXLCCESTART are asserted, this manually controls whether the Pattern Buffers are in training or have completed training. 0 : Send training patterns (default) 1 : Send contents of DFXPATBUF
30:28	0h RW	cri_dfx_prbspoly_2_0: PRBS Polynomial Select the polynomial to be used by the PRBS in the Pattern Generator and Pattern Checker. PRBS support 10b or 8b, which is indicated by the msb. 000 - $x^{16} + x^5 + x^4 + x^3 + 1$ (USB3/PCIe Scrambler) (8b) 001 - $x^{16} + x^{15} + x^{13} + x^4 + 1$ (SATA scrambler) (8b) 010 - $x^{31} + x^{28} + 1$ (8b) 011 - $x^7 + x^6 + 1$ (8b) 100 - $x^{15} + x^{14} + 1$ (10b) 101 - $x^{23} + x^{18} + 1$ (10b) 110 - $x^{31} + x^{28} + 1$ (10b) 111 - $x^7 + x^6 + 1$ (10b)
27:26	0h RW	cri_dfx_patbufsize_1_0: Pattern Buffer Size Select the size of the Pattern Buffer to use. The MSB will always be bit 79. The LSB will depend on this select and the DFXLCCESTART (10b or 8b mode). 00 : full 80b buffer (Default) 01 : 70b (while in 10b mode), 56b (while in 8b mode) 10 : 40b (while in 10b mode), 32b (while in 8b mode) 11 : 10b (while in 10b mode), 8b (while in 8b mode)
25	0h RW	cri_dfx_patbufloop: Pattern Buffer Looping Enable Enables looping of the Pattern Buffer. By default, the contents of Pattern Buffer will be used once and stop. Alternatively, the Pattern Buffer will continue to loop until the DFXLCCESTART is de-asserted. 0 : Run Pattern Buffer only once (default) 1 : Loop Pattern Buffer until stopped
24	0h RW	cri_dfx_patbufdwidth: Pattern Buffer Data Width Selects between 10 bit or 8 bit data width for the Pattern Buffer. Determines where in the Tx/Rx path the data is inserted/retrieved. 0 : 10b (default) 1 : 8b
23	0h RW	cri_dfx_patbuftrainovr: Pattern Buffer Training Override Enables manual training of the Pattern Buffer instead of the automated coordination between the Pattern Checker and Pattern Generator. When asserted, the DFXPATBUFTRAIN bit will be used to force when training is active and when it is complete. 0 : Automatic Training (default) 1 : Enable Manual Training
22	0h RW	cri_dfx_marginmode: Margin mode Overrides standard setup configurations for use with Eye Width Margining. 0 : Standard Mode (default) 1 : Margin Mode enabled
21	0h RW	cri_dfx_chk_sel: Pattern Checker 8b10b Select This determines where Rx data is compared, either in the 10-bit domain before decode or after 10b-8b decoding. 0: 10b domain 1: 8b domain
20	0h RW	cri_dfx_patchken: Pattern Checker Enable 0 : Disable Pattern Checker (default) 1 : Enable Pattern Checker
19	0h RW	cri_dfx_patgenen: Pattern Generator Enable This will activate the Dfx bypass muxes in the PCS Tx path. 0 : Disable Pattern Generator (default) 1 : Enable Pattern Generator
18	0h RW	cri_dfx_clrerrcnt: Clear Error Counter Resets the Pattern Checker's error counter. 0 : Error Counter allowed to run (default) 1 : Error Counter held in reset
17	0h RW	cri_dfx_lcereset: Local Compare Engine Reset Resets all components of the Local Compare Engine in both the Pattern Generator and the Pattern Checker. 0 : LCE not in reset (default) 1 : LCE in reset
16	0h RW	cri_dfx_lcestart: Local Compare Engine Start Controls the starting and stopping of the LCE. Allows for simultaneous or independent start across lanes. Once stopped, a DFXLCERESET is usually required. 0 : LCE stopped (default) 1 : LCE running
15:8	3Eh RW	cri_dfx_patbuf_7_0: Pattern Buffer Storage In 10b mode, the buffer is read as eight 10b chunks. The first 10 bits should not equal the Comma Symbol: '0011111010' (or its inversion '1100000101'). In 8b mode, the buffer is read as eight 10b chunks, where the 10th bit is unused and the 9th bit is the K-bit indicator. The first 10 bits should not equal the Comma Symbol: 'xx10111100'. DFXPATBUF[78] should not be '1'.
7:0	63h RW	cri_dfx_patbuf_15_8: Pattern Buffer Storage See cri_dfx_patbuf[7:0] description.

23.7.7 PCS_DWORD6 (pcs_dword6)—Offset 18h

Access Method

Type: Message Bus Register
(Size: 32 bits)

pcs_dword6: [Port: 0xA6] + (200h + 18h)

Op Codes:

0h - Read, 1h - Write

Default: FFFFFFFFh

31	28	24	20	16	12	8	4	0
1	1	1	1	1	1	1	1	1
cri_dfx_prbseed_7_0								cri_dfx_prbseed_31_24

Bit Range	Default & Access	Description
31:24	FFh RW	cri_dfx_prbseed_7_0: PRBS Seed Can be used for HVM determinism. The use of all zeroes can result in lockup.
23:16	FFh RW	cri_dfx_prbseed_15_8: PRBS Seed See cri_dfx_prbseed[7:0] description.
15:8	FFh RW	cri_dfx_prbseed_23_16: PRBS Seed See cri_dfx_prbseed[7:0] description.
7:0	FFh RW	cri_dfx_prbseed_31_24: PRBS Seed See cri_dfx_prbseed[7:0] description.

23.7.8 PCS_DWORD7 (pcs_dword7)—Offset 1Ch

Access Method

Type: Message Bus Register
(Size: 32 bits)

pcs_dword7: [Port: 0xA6] + (200h + 1Ch)

Op Codes:

0h - Read, 1h - Write

Default: 00000009h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	1
dfx_cri_errcnt_7_0								cri_dfx_prbstraincnt_3_0

Bit Range	Default & Access	Description
31:24	X RO	dfx_cri_errcnt_7_0: Error Counter Tracks how many bit errors the Pattern Checker has detected. Can be cleared using DFXCLRERRCNT or DFXLCERESSET.
23:16	X RO	dfx_cri_errcnt_15_8: Error Counter Tracks how many bit errors the Pattern Checker has detected. Can be cleared using DFXCLRERRCNT or DFXLCERESSET.
15	X RO	i_rxcaldone: RX Calibration Cycles Complete Indicator
14	X RO	dfx_cri_lcemgnerr: Local Compare Engine Margin Error Indicates that the error counter has reached its max value. This can be used by the Rx upartition during Margin Mode to determine when the eye width has closed.
13	X RO	cri_dfx_patgen2active: Pattern Generator 2 Active status indicator In a lane with two Tx paths, this indicates that the second Pattern Generator is in progress. The DFXPATGENACTIVE will only indicate that the first Pattern Generator is in progress.
12	X RO	dfx_cri_patbufallfail: Pattern Buffer All Fail status indicator Indicates that there has not been a single matching Pattern Buffer pattern. This could signify that an error occurred during training.
11	X RO	dfx_cri_patchkactive: Pattern Checker Active status indicator Indicates that the Pattern Checker is in progress (either Pattern Buffer or PRBS).
10	X RO	dfx_cri_patgenactive: Pattern Generator Active status indicator Indicates that the Pattern Generator is in progress (either Pattern Buffer or PRBS).
9	X RO	dfx_cri_lctraindone: Local Compare Engine Training Done status indicator Indicates that the Pattern Checker training is completed (either Pattern Buffer or PRBS). The Pattern Checker is now synchronized to the Pattern Generator.
8	X RO	dfx_cri_lctrainactive: Local Compare Engine Training Active status indicator Indicates that the Pattern Checker training is in progress (either Pattern Buffer or PRBS).
7	0h RW	reserved501: reserved
6	0h RW	cri_dfx_patgen2en: Pattern Generator 2 Enable In a lane with two Tx paths, this enables the second Pattern Generator. The DFXPATGENEN will enable the first Pattern Generator. 0 : Disable second Pattern Generator (default) 1 : Enable second Pattern Generator
5:4	0h RW	cri_dfx_maxerrcnt_1_0: Maximum Error Count Selectable maximum value that the DFXERRCNT can reach before the Local Compare Engine is automatically stopped. 00 : 2^{16} (default) 01 : 2^{10} 10 : 2^8 11 : 2^4
3:0	9h RW	cri_dfx_prbstraincnt_3_0: PRBS Training Count The number of consecutive cycles that the Pattern Checker's PRBS must be error free before it is considered synchronized. Default is 9.

23.7.9 PCS_DWORD8 (pcs_dword8)—Offset 20h

Access Method

Type: Message Bus Register
(Size: 32 bits)

pcs_dword8: [Port: 0xA6] + (200h + 20h)

Op Codes:

0h - Read, 1h - Write

Default: 000000C4h

31	0h RW	sqelch_shunt_ovrd_en: Squelch Shunt Pulse Duration Override Enable Overrides the hardware default shunt pulse duration value 1: Shunt Pulse Duration Override Enable 0: Shunt Pulse Duration Override Disable
30:28	0h RW	sqelch_shunt_cnt_2_0: Squelch Shunt Pulse Duration Override Value 000 = No shunt pulse generated 001 = 1 susclk cycles ... 111 = 7 susclk cycles
27	0h RW	reserved520: reserved
26	0h RW	i_rxsqfsm_timersel: Squelch FSM Timer Select 0 - Selects 25Mhz values for squelch timer and shunt pulse generation . 1 - Selects 100Mhz values for squelch timer and shunt pulse generation. This register is applicable to synchronous squelch startup mode.
25	0h RW	i_rxsq_asyncmode_h: Squelch Async Startup Mode This squelch startup mode is power state independent. When enabled, the squelchen signal sent to Modphy will asynchronously enable the squelch detector circuit. Once enabled, the squelch detector circuit will asynchronously send an unfiltered/unqualified squelch indication signal out of Modphy. The squelch indication signal will initially be unstable, so it is up to the consumer of this signal to filter/qualify it accordingly. The asynchronous squelch startup mode is beneficial because it significantly reduces the squelch startup latency. This decrease in latency does come at the cost of slightly higher power when squelch is not enabled as the IREF and Squelch Keeper circuits must remain enabled. When disabled, the squelch startup sequence is synchronous in nature and the squelch indication signal sent out of Modphy is stable/filtered.
24	1h RW	i_rxsquelchstby_h: Fast Squelch Enable Mode Bit to keep the IREF (ivrefen) on during P2 and reduce squelch startup time.

Bit Range	Default & Access	Description
16	1h RW	cri_lanereset_clkgatectl: 1: The assertion of lane reset will have the effect of gating the susclk and de-asserting the internal laneclkreq. This mode is only valid when the data lane dynamic clock gating mode is set to a non-zero value (i.e. 01, 10, and 11). 0: The assertion of lane reset will have no effect on the gating of susclk and state of the internal laneclkreq signal.
15	1h RW	cri_lanereqforce: Controls whether the internal laneclkreq will be forced to 1 or 0 when cfg_data_dynclkgate_mode is set to 00 or 10. 1: force laneclkreq high 0: force laneclkreq low. This mode will likely be used when one of the lanes is disabled while other lanes in the family are enabled. In this case the internal laneclkreq of the disabled lane should be de-asserted (not influencing the clk gating decision)
14:10	10h RW	cri_susclkdisable_delay_4_0: This register will control the number of cycles to delay the susclk enable de-assertion, in addition to the de-assertion of the laneclkreq signal sent out of the data lane. The susclk enable must be continuously de-asserted for the duration of this delay in order for the de-asserted state to be captured by the clock gating controller. 5'b00000 - 0 Cycle Delay 5'b00001 - 1 Cycle Delay 5'b00010 - 2 Cycle Delay 5'b11110 - 30 Cycle Delay 5'b11111 - 31 Cycle Delay
9:8	0h RW	cri_data_dynclkgate_mode_1_0: Controls the dynamic clock gating behavior in the data lane. 00 - susclk gating and laneclkreq disabled (Forced to configured value). In this mode the susclk will not be gated under any circumstances and the laneclkreq sent out of the lane will be forced to a programmed value (can be forced high or low) 01 - susclk gating disabled, laneclkreq enabled . In this mode the susclk will not be gated under any circumstances. The laneclkreq sent out of the data lane will toggle based on whether the lane power state, susclk need and the previous lane's laneclkreq signal. 10 - susclk gating enabled, laneclkreq disabled (forced to configured value) - In this mode the susclk will be gated during P2/Slumber when there are no requests to change the TX common mode. The laneclkreq sent out of the lane will be forced to a programmed value (can be forced high or low) 11 - susclk gating and laneclkreq enabled - In this mode the susclk will be gated during P2/Slumber when there are no requests to change the TX common mode. The laneclkreq sent out of the data lane will toggle based on the lane power state, susclk need and the previous lane's laneclkreq signal.

5	1h RW	soft_reset_n: Active low soft reset override
4	0h RW	reg_diginelben: Override for near end digital loopback.
3	0h RW	reg_digifelben: Override for far end digital loopback
2	0h RW	reg_strapgroup_ovrden: Override Enable for Strap Group
1	0h RW	reg_yank_timer_done_b_ovrd: Override for yank_timer_done_b
0	0h RW	reg_yank_timer_done_b_ovrd_en: Override Enable for yank_timer_done_b

23.9.3 PCS_DWORD2 (pcs_dword2)—Offset 8h

Access Method

Type: Message Bus Register
(Size: 32 bits)

pcs_dword2: [Port: 0xA6] + (400h + 8h)

Op Codes:

0h - Read, 1h - Write

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
reg_rxpwrfsm_pibiasoff_delay_3_0	cri_sqdbexittimer_override_3_0	cri_sqdbentrytimer_override_5_0	reg_rxdrcgtsqsel_1_0	cri_reut_SlaveSideDataCheckingEn	cri_sqdbtimer_ovren	cri_rxpwrfsm_timer_ovren	reg_rxidle	cri_rxrawdata_sel
				cri_dynkalign_eco3302703_mode	cri_dynkalign_eco3302703_ovren	reg_rxpwrfsm_pibiasoff_ovrride	cri_reset_kalignlck	cri_ebptrrst
							cri_comdispfix	cri_forcebankhit
							cri_kalignmode_1_0	cri_skpprocdis
								cri_elasticbuffer_maskdis

Bit Range	Default & Access	Description
31:28	0h RW	reg_rxpwrfsm_pibiasoff_delay_3_0: Override value for delay (in 2ns increments) between deassertion of opianclkbufen and opibiasen
27:24	0h RW	cri_sqdbexittimer_override_3_0: Rx squelch exit debounce timer
23:18	0h RW	cri_sqdbentrytimer_override_5_0: Rx squelch entry debounce timer
17:16	0h RW	reg_rxdrcgtsqsel_1_0: Squelch output select
15	0h RW	cri_reut_SlaveSideDataCheckingEn: Enable REUT slave side checking while in loopback slave
14	0h RW	cri_sqdbtimer_ovren: Squelch debounce timer override enable
13	0h RW	cri_rxpwrfsm_timer_ovren: Rx power management fsm timer override enable
12	0h RW	reg_rxidle: Chicken bit to override i_rxidle from controller and keep Rx in P0 or P0s
11	0h RW	cri_rxrawdata_sel: When asserted bypass K-align, 10b/8b decoder and Elastic buffer
10	0h RW	cri_dynkalign_eco3302703_mode: Kalign Mode Override Value When cri_dynkalign_eco3302703_ovren is set, this value selects kalignmode 0 - use register bits cri_kalignmode[1:0] to select kalignmode 1 - select the 4 COM kalign mode'
9	0h RW	cri_dynkalign_eco3302703_ovren: Kalign Mode Override Enable Overrides kalign mode select pin, allowing config bit kalignmode_override_val to select kalignmode.
8	0h RW	reg_rxpwrfsm_pibiasoff_ovrride: When asserted selects reg_rxpwrfsm_pibiasoff_delay[3:0]
7	0h RW	cri_reset_kalignlck: When asserted resets Kalign lock indication and Kalign is performed again. The conditions when this would assert includes and is not restricted to any power management states (L0s, L1) or polling quiet states etc.
6	0h RW	cri_ebptrrst: Global broadcast to all lanes that the Elastic Buffer pointers should be reset. This is a pulse and will be generated when we need to reset the pointers because of collision or various other reasons.
5	0h RW	cri_comdispfix: Chicken bit to force disparity in dynamic K-align mode

Bit Range	Default & Access	Description
4	0h RW	cri_forcebankhit: Chicken bit to enable data appear on NOA post k-align lock although k-align block is not achieving lock. This is only for NOA observeability and not for other purpose
3:2	0h RW	cri_kalignmode_1_0: KALIGN Mode Select 00 = dynamic kalign all the time. Accounts for bit slips on incoming stream which can cause symbol to be detected on different bank 10 = dynamic kalign up to L0 x1 = static kalign (same as GDG). Assumes symbol always detected on same data bank
1	0h RW	cri_skpprocdis: SKIP Ordered-Set Processing Disable When this configuration bit is asserted, then SKIP ordered=sets will be ignored (in EB block). Used in Elastic buffer block. 0 = Normal operation. SKIP ordered=sets will be processed by the Elastic Buffer 1 = SKIP processing disabled.
0	0h RW	cri_elasticbuffer_maskdis: Config bit (chicken bit) to disable the masking logic after elec idle ordered set is seen

23.9.4 PCS_DWORD3 (pcs_dword3)—Offset Ch

Access Method

Type: Message Bus Register
(Size: 32 bits)

pcs_dword3: [Port: 0xA6] + (400h + Ch)

Op Codes:

0h - Read, 1h - Write

Default: 5515ACAAh

31	28	24	20	16	12	8	4	0
0	1	0	1	0	1	0	1	0
0	1	0	1	0	1	0	1	0
cri_dfx_patbuf_55_48	cri_dfx_patbuf_63_56	cri_dfx_patbuf_71_64	cri_dfx_patbuf_79_72					

Bit Range	Default & Access	Description
31:24	55h RW	cri_dfx_patbuf_55_48: Pattern Buffer Storage See cri_dfx_patbuf[7:0] description.
23:16	15h RW	cri_dfx_patbuf_63_56: Pattern Buffer Storage See cri_dfx_patbuf[7:0] description.
15:8	ACh RW	cri_dfx_patbuf_71_64: Pattern Buffer Storage See cri_dfx_patbuf[7:0] description.
7:0	AAh RW	cri_dfx_patbuf_79_72: Pattern Buffer Storage See cri_dfx_patbuf[7:0] description.

23.9.5 PCS_DWORD4 (pcs_dword4)—Offset 10h

Access Method

Bit Range	Default & Access	Description
31	0h RW	cri_dfx_patbuftrain: Pattern Buffer Manual Training When DFXPATBUFTRAINOVR and DFXLCCESTART are asserted, this manually controls whether the Pattern Buffers are in training or have completed training. 0 : Send training patterns (default) 1 : Send contents of DFXPATBUF
30:28	0h RW	cri_dfx_prbspoly_2_0: PRBS Polynomial Select the polynomial to be used by the PRBS in the Pattern Generator and Pattern Checker. PRBS support 10b or 8b, which is indicated by the msb. 000 - $x^{16} + x^5 + x^4 + x^3 + 1$ (USB3/PCIe Scrambler) (8b) 001 - $x^{16} + x^{15} + x^{13} + x^4 + 1$ (SATA scrambler) (8b) 010 - $x^{31} + x^{28} + 1$ (8b) 011 - $x^7 + x^6 + 1$ (8b) 100 - $x^{15} + x^{14} + 1$ (10b) 101 - $x^{23} + x^{18} + 1$ (10b) 110 - $x^{31} + x^{28} + 1$ (10b) 111 - $x^7 + x^6 + 1$ (10b)
27:26	0h RW	cri_dfx_patbufsize_1_0: Pattern Buffer Size Select the size of the Pattern Buffer to use. The MSB will always be bit 79. The LSB will depend on this select and the DFXLCCESTART (10b or 8b mode). 00 : full 80b buffer (Default) 01 : 70b (while in 10b mode), 56b (while in 8b mode) 10 : 40b (while in 10b mode), 32b (while in 8b mode) 11 : 10b (while in 10b mode), 8b (while in 8b mode)
25	0h RW	cri_dfx_patbufloop: Pattern Buffer Looping Enable Enables looping of the Pattern Buffer. By default, the contents of Pattern Buffer will be used once and stop. Alternatively, the Pattern Buffer will continue to loop until the DFXLCCESTART is de-asserted. 0 : Run Pattern Buffer only once (default) 1 : Loop Pattern Buffer until stopped
24	0h RW	cri_dfx_patbufdwidth: Pattern Buffer Data Width Selects between 10 bit or 8 bit data width for the Pattern Buffer. Determines where in the Tx/Rx path the data is inserted/retrieved. 0 : 10b (default) 1 : 8b
23	0h RW	cri_dfx_patbuftrainovr: Pattern Buffer Training Override Enables manual training of the Pattern Buffer instead of the automated coordination between the Pattern Checker and Pattern Generator. When asserted, the DFXPATBUFTRAIN bit will be used to force when training is active and when it is complete. 0 : Automatic Training (default) 1 : Enable Manual Training
22	0h RW	cri_dfx_marginmode: Margin mode Overrides standard setup configurations for use with Eye Width Margining. 0 : Standard Mode (default) 1 : Margin Mode enabled
21	0h RW	cri_dfx_chk_sel: Pattern Checker 8b10b Select This determines where Rx data is compared, either in the 10-bit domain before decode or after 10b-8b decoding. 0: 10b domain 1: 8b domain
20	0h RW	cri_dfx_patchken: Pattern Checker Enable 0 : Disable Pattern Checker (default) 1 : Enable Pattern Checker
19	0h RW	cri_dfx_patgenen: Pattern Generator Enable This will activate the Dfx bypass muxes in the PCS Tx path. 0 : Disable Pattern Generator (default) 1 : Enable Pattern Generator
18	0h RW	cri_dfx_clrerrcnt: Clear Error Counter Resets the Pattern Checker's error counter. 0 : Error Counter allowed to run (default) 1 : Error Counter held in reset
17	0h RW	cri_dfx_lcereset: Local Compare Engine Reset Resets all components of the Local Compare Engine in both the Pattern Generator and the Pattern Checker. 0 : LCE not in reset (default) 1 : LCE in reset
16	0h RW	cri_dfx_lcestart: Local Compare Engine Start Controls the starting and stopping of the LCE. Allows for simultaneous or independent start across lanes. Once stopped, a DFXLCERESET is usually required. 0 : LCE stopped (default) 1 : LCE running
15:8	3Eh RW	cri_dfx_patbuf_7_0: Pattern Buffer Storage In 10b mode, the buffer is read as eight 10b chunks. The first 10 bits should not equal the Comma Symbol: '0011111010' (or its inversion '1100000101'). In 8b mode, the buffer is read as eight 10b chunks, where the 10th bit is unused and the 9th bit is the K-bit indicator. The first 10 bits should not equal the Comma Symbol: 'xx10111100'. DFXPATBUF[78] should not be '1'.
7:0	63h RW	cri_dfx_patbuf_15_8: Pattern Buffer Storage See cri_dfx_patbuf[7:0] description.

23.9.7 PCS_DWORD6 (pcs_dword6)—Offset 18h

Access Method

Type: Message Bus Register
(Size: 32 bits)

pcs_dword6: [Port: 0xA6] + (400h + 18h)

Op Codes:

0h - Read, 1h - Write

Default: FFFFFFFFh

31	28	24	20	16	12	8	4	0
1	1	1	1	1	1	1	1	1
cri_dfx_prbsseed_7_0								cri_dfx_prbsseed_31_24

Bit Range	Default & Access	Description
31:24	FFh RW	cri_dfx_prbsseed_7_0: PRBS Seed Can be used for HVM determinism. The use of all zeroes can result in lockup.
23:16	FFh RW	cri_dfx_prbsseed_15_8: PRBS Seed See cri_dfx_prbsseed[7:0] description.
15:8	FFh RW	cri_dfx_prbsseed_23_16: PRBS Seed See cri_dfx_prbsseed[7:0] description.
7:0	FFh RW	cri_dfx_prbsseed_31_24: PRBS Seed See cri_dfx_prbsseed[7:0] description.

23.9.8 PCS_DWORD7 (pcs_dword7)—Offset 1Ch

Access Method

Type: Message Bus Register
(Size: 32 bits)

pcs_dword7: [Port: 0xA6] + (400h + 1Ch)

Op Codes:

0h - Read, 1h - Write

Default: 00000009h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	1
dfx_cri_errcnt_7_0								cri_dfx_prbstraintcnt_3_0

Bit Range	Default & Access	Description
31:24	X RO	dfx_cri_errcnt_7_0: Error Counter Tracks how many bit errors the Pattern Checker has detected. Can be cleared using DFXCLRERRCNT or DFXLCERESSET.
23:16	X RO	dfx_cri_errcnt_15_8: Error Counter Tracks how many bit errors the Pattern Checker has detected. Can be cleared using DFXCLRERRCNT or DFXLCERESSET.
15	X RO	i_rxcaldone: RX Calibration Cycles Complete Indicator
14	X RO	dfx_cri_lcemgnerr: Local Compare Engine Margin Error Indicates that the error counter has reached its max value. This can be used by the Rx upartition during Margin Mode to determine when the eye width has closed.
13	X RO	cri_dfx_patgen2active: Pattern Generator 2 Active status indicator In a lane with two Tx paths, this indicates that the second Pattern Generator is in progress. The DFXPATGENACTIVE will only indicate that the first Pattern Generator is in progress.
12	X RO	dfx_cri_patbufallfail: Pattern Buffer All Fail status indicator Indicates that there has not been a single matching Pattern Buffer pattern. This could signify that an error occurred during training.
11	X RO	dfx_cri_patchkactive: Pattern Checker Active status indicator Indicates that the Pattern Checker is in progress (either Pattern Buffer or PRBS).
10	X RO	dfx_cri_patgenactive: Pattern Generator Active status indicator Indicates that the Pattern Generator is in progress (either Pattern Buffer or PRBS).
9	X RO	dfx_cri_lctraindone: Local Compare Engine Training Done status indicator Indicates that the Pattern Checker training is completed (either Pattern Buffer or PRBS). The Pattern Checker is now synchronized to the Pattern Generator.
8	X RO	dfx_cri_lctrainactive: Local Compare Engine Training Active status indicator Indicates that the Pattern Checker training is in progress (either Pattern Buffer or PRBS).
7	0h RW	reserved501: reserved
6	0h RW	cri_dfx_patgen2en: Pattern Generator 2 Enable In a lane with two Tx paths, this enables the second Pattern Generator. The DFXPATGENEN will enable the first Pattern Generator. 0 : Disable second Pattern Generator (default) 1 : Enable second Pattern Generator
5:4	0h RW	cri_dfx_maxerrcnt_1_0: Maximum Error Count Selectable maximum value that the DFXERRCNT can reach before the Local Compare Engine is automatically stopped. 00 : 2^{16} (default) 01 : 2^{10} 10 : 2^8 11 : 2^4
3:0	9h RW	cri_dfx_prbstraincnt_3_0: PRBS Training Count The number of consecutive cycles that the Pattern Checker's PRBS must be error free before it is considered synchronized. Default is 9.

23.9.9 PCS_DWORD8 (pcs_dword8)—Offset 20h

Access Method

Type: Message Bus Register
(Size: 32 bits)

pcs_dword8: [Port: 0xA6] + (400h + 20h)

Op Codes:

0h - Read, 1h - Write

Default: 000000C4h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	1	1
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
reg_partial	reg_slumber	reg_tx2_cdr_override_2_0	reg_cdr_override_2_0	reg_ebuffmode	reg_usedclockchannel_1_0	reg_usedclockchannel_ovrride	reg_gbl_ovrride	reg_tx1_pclkon_inp2
								reg_tx2_pclkon_inp2
								reg_tx2_txenable
								cri_rxeb_ptr_init_3_0
								reg_powerfsm_ovrride
								reg_suspend
								reg_pclkcfginput
								reg_useqclock
								cri_rxeb_hiwater_3_0
								cri_rxeb_lowater_3_0

Bit Range	Default & Access	Description
31	0h RW	reg_partial: Override for i_partial
30	0h RW	reg_slumber: Override for i_slumber
29:27	0h RW	reg_tx2_cdr_override_2_0: Override for cdr_override strap for second tx2
26:24	0h RW	reg_cdr_override_2_0: Override for cdr_override strap
23	0h RW	reg_ebuffmode: Override for ebuffmode (no functionality in p1271 phase1 design)
22:21	0h RW	reg_usedclockchannel_1_0: Selects the active clock channel
20	0h RW	reg_usedclockchannel_ovrride: When asserted selects reg_usedclockchannel[1:0]
19	0h RW	reg_gbl_ovrride: Global override select
18	0h RW	reg_tx1_pclkon_inp2: When asserted keeps PCLK running in P2 mode. For DP this is used for Lane1
17	0h RW	reg_tx2_pclkon_inp2: When asserted keeps PCLK running in P2 mode. This is reserved (no impact) for PCIe/DMI and used for DP Lane2
16	0h RW	reg_tx2_txenable: Override for i_txenable for tx2
15:12	0h RW	cri_rxeb_ptr_init_3_0: Config override for initial value of Rx elastic buffer read pointer
11	0h RW	reg_powerfsm_ovrride: When asserted overrides for Tx power fsm are selected
10	0h RW	reg_suspend: Override for suspend
9	0h RW	reg_pclkcfginput: Override for pclkcfginput strap
8	0h RW	reg_useqclock: Override for useqclock; MUX select for I or Q clk for TX clocking
7:4	Ch RW	cri_rxeb_hiwater_3_0: Elastic buffer high watermark based on which SKP is removed

23.9.10 PCS_DWORD9 (pcs_dword9)—Offset 24h

Access Method

Type: Message Bus Register
(Size: 32 bits)

pcs_dword9: [Port: 0xA6] + (400h + 24h)

Op Codes:

0h - Read, 1h - Write

Default: 00000000h

[illegible]

Bit Range	Default & Access	Description
31	0h RW	reserved502: reserved
30:26	0h RW	reg_strapgroup_4_0: Override for i_strapgroup
25:24	0h RW	reg_powerdown_1_0: Override for i_powerdown
23	0h RW	reg_pcs_txcmnkeepdisable_ovrd: Override for ipcs_txcmnkeepdisable input 0: Use value on ipcs_txcmnkeepdisable input pin to determine o_txgohighz state in P2/ slumber 1: Force pcs_txcmnkeepdisable to 0
22:18	0h RW	reg_straplane_5_0: Override for i_straplane
17	0h RW	reg_tx1_powerdown_override: Overrides i_powerdown[1:0] indication from MAC for Tx1 1 : selects reg_powerdown[1:0] 0 : selects i_powerdown[1:0]
16	0h RW	reg_tx2_powerdown_override: Overrides i_powerdown[1:0] indication from MAC for Tx2 1 : selects reg_powerdown[1:0] 0 : selects i_powerdown[1:0]
15	0h RW	reg_txdatavalid: Override for i_txdatavalid (register is NOT used)
14:13	0h RW	reg_txdeemp_1_0: Override for i_txdeemp

Bit Range	Default & Access	Description
12:10	0h RW	reg_txmargin_2_0: Override for i_txmargin
9	0h RW	reg_txswing: Override for i_txswing
8	0h RW	reg_txenable: Override for i_txenable
7:6	0h RW	reg_txterm_vcc_1_0: Override for txterm_vcc strap
5	0h RW	reg_txdetrxlpbk: Override for i_txdetrxlpbk
4	0h RW	reg_txelectidle: Override for i_txelectidle
3	0h RW	reg_txcompliance: Override for i_txcompliance
2	0h RW	reg_txoneszeroes: Override for i_txoneszeroes
1:0	0h RW	reg_latencyoptim_1_0: Override for i_latencyoptim

23.9.11 PCS_DWORD10 (pcs_dword10)—Offset 28h

Access Method

Type: Message Bus Register
(Size: 32 bits)

pcs_dword10: [Port: 0xA6] + (400h + 28h)

Op Codes:

0h - Read, 1h - Write

Default: 00000000h

31	28	24	20	16	12	8	4	0

Bit Range	Default & Access	Description
31	0h RW	squelch_shunt_ovrd_en: Squelch Shunt Pulse Duration Override Enable Overrides the hardware default shunt pulse duration value 1: Shunt Pulse Duration Override Enable 0: Shunt Pulse Duration Override Disable
30:28	0h RW	squelch_shunt_cnt_2_0: Squelch Shunt Pulse Duration Override Value 000 = No shunt pulse generated 001 = 1 susclk cycles ... 111 = 7 susclk cycles
27	0h RW	reserved520: reserved
26	0h RW	i_rxsqfsm_timersel: Squelch FSM Timer Select 0 - Selects 25Mhz values for squelch timer and shunt pulse generation . 1 - Selects 100Mhz values for squelch timer and shunt pulse generation. This register is applicable to synchronous squelch startup mode.
25	0h RW	i_rxsq_asyncmode_h: Squelch Async Startup Mode This squelch startup mode is power state independent. When enabled, the squelchen signal sent to Modphy will asynchronously enable the squelch detector circuit. Once enabled, the squelch detector circuit will asynchronously send an unfiltered/unqualified squelch indication signal out of Modphy. The squelch indication signal will initially be unstable, so it is up to the consumer of this signal to filter/qualify it accordingly. The asynchronous squelch startup mode is beneficial because it significantly reduces the squelch startup latency. This decrease in latency does come at the cost of slightly higher power when squelch is not enabled as the IREF and Squelch Keeper circuits must remain enabled. When disabled, the squelch startup sequence is synchronous in nature and the squelch indication signal sent out of Modphy is stable/filtered.
24	1h RW	i_rxsquelchstby_h: Fast Squelch Enable Mode Bit to keep the IREF (ivrefen) on during P2 and reduce squelch startup time.

Bit Range	Default & Access	Description
31:24	80h RW	rxvrgarcode_7_0: Rx VGA Rcomp Codes These bits are the final binary code used by the Rx VGA. This block only uses the X upper MSBs of this value. Writing to this register will override the rcomp code to the Rx VGA. An LRC Ready pulse must be generated to the Rx VGA target for this value to take effect. [7:n] - compensation code sent to Iref [n-1:0] - remaining LSBs from scaling and offset calculation
23:16	80h RW	rxtermrcode_7_0: Rx Termination Rcomp Codes These bits are the final binary code used by the Rx termination. This block only uses the 7 upper MSBs of this value. Writing to this register will override the rcomp code to Rxterm. An LRC Ready pulse must be generated to the Rxterm target for this value to take effect. [7:1] - compensation code sent to Rxterm [0] - remaining LSB from scaling and offset calculation
15:8	80h RW	txrcode_7_0: Tx Rcomp Codes These bits are the final binary code used by the Tx. This block only uses the 7 upper MSBs of this value. Writing to this register will override the rcomp code to the Tx. An LRC Ready pulse must be generated to the Tx target for this value to take effect. [7:1] - compensation code sent to Tx [0] - remaining LSB from scaling and offset calculation
7:0	80h RW	irefrrcode_7_0: Iref Rcomp Codes These bits are the final binary code used by the Iref block. This block only uses the 6 upper MSBs of this value. Writing to this register will override the rcomp code to the Iref block. An LRC Ready pulse must be generated to the Iref target for this value to take effect. [7:2] - compensation code sent to Iref [1:0] - remaining LSBs from scaling and offset calculation

Bit Range	Default & Access	Description
16	1h RW	cri_lanereset_clkgatectl: 1: The assertion of lane reset will have the effect of gating the susclk and de-asserting the internal laneclkreq. This mode is only valid when the data lane dynamic clock gating mode is set to a non-zero value (i.e. 01, 10, and 11). 0: The assertion of lane reset will have no effect on the gating of susclk and state of the internal laneclkreq signal.
15	1h RW	cri_lanereqforce: Controls whether the internal laneclkreq will be forced to 1 or 0 when cfg_data_dynclkgate_mode is set to 00 or 10. 1: force laneclkreq high 0: force laneclkreq low. This mode will likely be used when one of the lanes is disabled while other lanes in the family are enabled. In this case the internal laneclkreq of the disabled lane should be de-asserted (not influencing the clk gating decision)
14:10	10h RW	cri_susclkdisable_delay_4_0: This register will control the number of cycles to delay the susclk enable de-assertion, in addition to the de-assertion of the laneclkreq signal sent out of the data lane. The susclk enable must be continuously de-asserted for the duration of this delay in order for the de-asserted state to be captured by the clock gating controller. 5'b00000 - 0 Cycle Delay 5'b00001 - 1 Cycle Delay 5'b00010 - 2 Cycle Delay 5'b11110 - 30 Cycle Delay 5'b11111 - 31 Cycle Delay
9:8	0h RW	cri_data_dynclkgate_mode_1_0: Controls the dynamic clock gating behavior in the data lane. 00 - susclk gating and laneclkreq disabled (Forced to configured value). In this mode the susclk will not be gated under any circumstances and the laneclkreq sent out of the lane will be forced to a programmed value (can be forced high or low) 01 - susclk gating disabled, laneclkreq enabled . In this mode the susclk will not be gated under any circumstances. The laneclkreq sent out of the data lane will toggle based on whether the lane power state, susclk need and the previous lane's laneclkreq signal. 10 - susclk gating enabled, laneclkreq disabled (forced to configured value) - In this mode the susclk will be gated during P2/Slumber when there are no requests to change the TX common mode. The laneclkreq sent out of the lane will be forced to a programmed value (can be forced high or low) 11 - susclk gating and laneclkreq enabled - In this mode the susclk will be gated during P2/Slumber when there are no requests to change the TX common mode. The laneclkreq sent out of the data lane will toggle based on the lane power state, susclk need and the previous lane's laneclkreq signal.

22	0h RW	ofrcstrongpden: forces enabling of strong pull-down
21	0h RW	ofrcctxclkrootdis: forces disable of tx-clock output.
20	0h RW	ofrcctxclkrooten: forces tx-clock to operate and drive clock out.
19	0h RO	reserved537: reserved
18	0h RW	ofrcpwrmodel1: when aserted. Forces L1 state
17	0h RW	ofrcpwrmodel0s: when aserted. Forces L0s state
16	0h RW	ofrcpwrmodel0: when aserted. Forces L0 state
15	0h RW	ofrcmkeepadnen: Forces enabling of common-mode keeping of PadN
14	0h RW	ofrcmkeepadpen: Forces enabling of common-mode keeping of PadP
13	0h RW	ofrcmkeepadndis: Forces disabling of common-mode keeping of PadN
12	1h RW	ofrcmkeepadpdis: Forces disabling of common-mode keeping of PadP
11	0h RW	omakedeeperfifo: Make FIFO deeper by 1 symbol clock cycle. Still not implemented. Implementation costs 10 flops in symb clock domain. Implementation is required for 8bits PISO only which is in next phase of products.

Bit Range	Default & Access	Description
10:8	0h RW	ofrclatencyoptim_2_0: Changes the latency from loadgenen assertion to the sampling of 10bits data into fast-clock domain. The latency is determined by Fuses (through i_latencyoptim[1:0]) + ... 0XX =) + 0 (Not changing the latency.) 100 =) - 4UI 101 =) - 2UI 110 =) + 2UI 111 =) + 4UI Important Note: When changing the latency too high or too low is will wrap-around what might cause data loss on beginning or end of transmitting. If you decide to plan with the latency consider changing 'omakedeeperfifo' too
7	0h RO	reserved536: reserved
6	0h RW	ofrcrcvdtcten: force initiation of Tx-detect-Rx procedure
5:4	0h RW	otxrcvdtctclkrate_1_0: determines the clock rate in the flash comparator. 00 - use sus-clock as is (25MHz in phase2) default 01 - use sus-clock by 4 10 - use sus-clock by 2 11 - reserved In phase1 the rate was 2'b10 susfreq125MHz
3	0h RO	reserved535: reserved
2	0h RO	reserved534: reserved
1	0h RO	reserved533: reserved
0	0h RW	oneloopbacken: Near-End LoopBack enable

Type: Message Bus Register
(Size: 32 bits)

tx dword12: [Port: 0xA6] + (480h + 30h)

23.11.1 PCS_DWORD0 (pcs_dword0)—Offset 0h

Access Method

Type: Message Bus Register
(Size: 32 bits)

pcs_dword0: [Port: 0xA6] + (600h + 0h)

Op Codes:

0h - Read, 1h - Write

Default: 00010080h

Bit Range	Default & Access	Description
21	1h RW	cri_rxdigfiltlsq_enable: When 1 enables unsquelch based Rx power up in P0 or P0s
20	0h RW	reg_txfsfm_delay_ovrd: Override enable bit for reg_txfsfm_4us_delay
19:16	0h RW	reg_txfsfm_4us_delay_11_8: Override counter value for 4 us delay in txfsfm lane reset to txbiasen delay
15:14	0h RW	reg_pclk_rate_1_0: Override for pclk_rate 00 = gen1 01 = gen2 10 = gen3 11 = GbE
13:12	0h RW	reg_rate_1_0: Override for i_rate 00 = gen1 01 = gen2 10 = gen3 11 = GbE
11:9	0h RW	reg_phymode_2_0: Override for PHY Mode Selection 000 = PCIE 001 = USB3 010 = GbE 011 = SATA/SAPIS 100 = Display 101 = DMI 110 = CIO 111 =Reserved
8	0h RW	reg_modeovren: When asserted selects register override bits for phymode, datawidth etc
7:6	1h RW	reg_datawidth: Override for Tx data interface width. 00 - Unused 01 - x8/x10 width (default) 10 - x16/x20 width 11 - x32/x40 width
5	1h RW	soft_reset_n: Active low soft reset override
4	0h RW	reg_diginelben: Override for near end digital loopback.
3	0h RW	reg_digifelben: Override for far end digital loopback
2	0h RW	reg_strapgroup_ovrden: Override Enable for Strap Group
1	0h RW	reg_yank_timer_done_b_ovrd: Override for yank_timer_done_b
0	0h RW	reg_yank_timer_done_b_ovrd_en: Override Enable for yank_timer_done_b

23.11.3 PCS_DWORD2 (pcs_dword2)—Offset 8h

Access Method

Type: Message Bus Register
(Size: 32 bits)

pcs_dword2: [Port: 0xA6] + (600h + 8h)

Op Codes:

0h - Read, 1h - Write

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
reg_rxpwrfsm_pibiasoff_delay_3_0	cri_sqdbexittimer_override_3_0	cri_sqdbentrytimer_override_5_0	reg_rxdrcgtsqsel_1_0	cri_reut_SlaveSideDataCheckingEn	cri_sqdbtimer_ovren	cri_rxpwrfsm_timer_ovren	reg_rxidle	cri_rxrawdata_sel
				cri_dynkalign_eco3302703_mode	cri_dynkalign_eco3302703_ovren	reg_rxpwrfsm_pibiasoff_ovrride	cri_reset_kalignlck	cri_ebptrrst
							cri_comdispfix	cri_forcebankhit
							cri_kalignmode_1_0	cri_skpprocdis
								cri_elasticbuffer_maskdis

Bit Range	Default & Access	Description
31:28	0h RW	reg_rxpwrfsm_pibiasoff_delay_3_0: Override value for delay (in 2ns increments) between deassertion of opianclkbufen and opibiasen
27:24	0h RW	cri_sqdbexittimer_override_3_0: Rx squelch exit debounce timer
23:18	0h RW	cri_sqdbentrytimer_override_5_0: Rx squelch entry debounce timer
17:16	0h RW	reg_rxdrcgtsqsel_1_0: Squelch output select
15	0h RW	cri_reut_SlaveSideDataCheckingEn: Enable REUT slave side checking while in loopback slave
14	0h RW	cri_sqdbtimer_ovren: Squelch debounce timer override enable
13	0h RW	cri_rxpwrfsm_timer_ovren: Rx power management fsm timer override enable
12	0h RW	reg_rxidle: Chicken bit to override i_rxidle from controller and keep Rx in P0 or P0s
11	0h RW	cri_rxrawdata_sel: When asserted bypass K-align, 10b/8b decoder and Elastic buffer
10	0h RW	cri_dynkalign_eco3302703_mode: Kalign Mode Override Value When cri_dynkalign_eco3302703_ovren is set, this value selects kalignmode 0 - use register bits cri_kalignmode[1:0] to select kalignmode 1 - select the 4 COM kalign mode'
9	0h RW	cri_dynkalign_eco3302703_ovren: Kalign Mode Override Enable Overrides kalign mode select pin, allowing config bit kalignmode_override_val to select kalignmode.
8	0h RW	reg_rxpwrfsm_pibiasoff_ovrride: When asserted selects reg_rxpwrfsm_pibiasoff_delay[3:0]
7	0h RW	cri_reset_kalignlck: When asserted resets Kalign lock indication and Kalign is performed again. The conditions when this would assert includes and is not restricted to any power management states (L0s, L1) or polling quiet states etc.
6	0h RW	cri_ebptrrst: Global broadcast to all lanes that the Elastic Buffer pointers should be reset. This is a pulse and will be generated when we need to reset the pointers because of collision or various other reasons.
5	0h RW	cri_comdispfix: Chicken bit to force disparity in dynamic K-align mode

Bit Range	Default & Access	Description
4	0h RW	cri_forcebankhit: Chicken bit to enable data appear on NOA post k-align lock although k-align block is not achieving lock. This is only for NOA observeability and not for other purpose
3:2	0h RW	cri_kalignmode_1_0: KALIGN Mode Select 00 = dynamic kalign all the time. Accounts for bit slips on incoming stream which can cause symbol to be detected on different bank 10 = dynamic kalign up to L0 x1 = static kalign (same as GDG). Assumes symbol always detected on same data bank
1	0h RW	cri_skpprocdis: SKIP Ordered-Set Processing Disable When this configuration bit is asserted, then SKIP ordered=sets will be ignored (in EB block). Used in Elastic buffer block. 0 = Normal operation. SKIP ordered=sets will be processed by the Elastic Buffer 1 = SKIP processing disabled.
0	0h RW	cri_elasticbuffer_maskdis: Config bit (chicken bit) to disable the masking logic after elec idle ordered set is seen

23.11.4 PCS_DWORD3 (pcs_dword3)—Offset Ch

Access Method

Type: Message Bus Register
(Size: 32 bits)

pcs_dword3: [Port: 0xA6] + (600h + Ch)

Op Codes:

0h - Read, 1h - Write

Default: 5515ACAAh

cri_dfx_patbufrain				cri_dfx_prbspoly_2_0				cri_dfx_patbufsize_1_0				cri_dfx_patbufdwidth				cri_dfx_patbufrainovr				cri_dfx_marginmode				cri_dfx_chk_sel				cri_dfx_patchken				cri_dfx_patgenen				cri_dfx_clerrcnt				cri_dfx_lcereset				cri_dfx_lcestart				cri_dfx_patbuf_7_0				cri_dfx_patbuf_15_8			

Bit Range	Default & Access	Description
31	0h RW	cri_dfx_patbuftrain: Pattern Buffer Manual Training When DFXPATBUFTRAINOVR and DFXLCCESTART are asserted, this manually controls whether the Pattern Buffers are in training or have completed training. 0 : Send training patterns (default) 1 : Send contents of DFXPATBUF
30:28	0h RW	cri_dfx_prbspoly_2_0: PRBS Polynomial Select the polynomial to be used by the PRBS in the Pattern Generator and Pattern Checker. PRBS support 10b or 8b, which is indicated by the msb. 000 - $x^{16} + x^5 + x^4 + x^3 + 1$ (USB3/PCIe Scrambler) (8b) 001 - $x^{16} + x^{15} + x^{13} + x^4 + 1$ (SATA scrambler) (8b) 010 - $x^{31} + x^{28} + 1$ (8b) 011 - $x^7 + x^6 + 1$ (8b) 100 - $x^{15} + x^{14} + 1$ (10b) 101 - $x^{23} + x^{18} + 1$ (10b) 110 - $x^{31} + x^{28} + 1$ (10b) 111 - $x^7 + x^6 + 1$ (10b)
27:26	0h RW	cri_dfx_patbufsize_1_0: Pattern Buffer Size Select the size of the Pattern Buffer to use. The MSB will always be bit 79. The LSB will depend on this select and the DFXLCCESTART (10b or 8b mode). 00 : full 80b buffer (Default) 01 : 70b (while in 10b mode), 56b (while in 8b mode) 10 : 40b (while in 10b mode), 32b (while in 8b mode) 11 : 10b (while in 10b mode), 8b (while in 8b mode)
25	0h RW	cri_dfx_patbufloop: Pattern Buffer Looping Enable Enables looping of the Pattern Buffer. By default, the contents of Pattern Buffer will be used once and stop. Alternatively, the Pattern Buffer will continue to loop until the DFXLCCESTART is de-asserted. 0 : Run Pattern Buffer only once (default) 1 : Loop Pattern Buffer until stopped
24	0h RW	cri_dfx_patbufdwidth: Pattern Buffer Data Width Selects between 10 bit or 8 bit data width for the Pattern Buffer. Determines where in the Tx/Rx path the data is inserted/retrieved. 0 : 10b (default) 1 : 8b
23	0h RW	cri_dfx_patbuftrainovr: Pattern Buffer Training Override Enables manual training of the Pattern Buffer instead of the automated coordination between the Pattern Checker and Pattern Generator. When asserted, the DFXPATBUFTRAIN bit will be used to force when training is active and when it is complete. 0 : Automatic Training (default) 1 : Enable Manual Training
22	0h RW	cri_dfx_marginmode: Margin mode Overrides standard setup configurations for use with Eye Width Margining. 0 : Standard Mode (default) 1 : Margin Mode enabled
21	0h RW	cri_dfx_chk_sel: Pattern Checker 8b10b Select This determines where Rx data is compared, either in the 10-bit domain before decode or after 10b-8b decoding. 0: 10b domain 1: 8b domain
20	0h RW	cri_dfx_patchken: Pattern Checker Enable 0 : Disable Pattern Checker (default) 1 : Enable Pattern Checker
19	0h RW	cri_dfx_patgenen: Pattern Generator Enable This will activate the Dfx bypass muxes in the PCS Tx path. 0 : Disable Pattern Generator (default) 1 : Enable Pattern Generator
18	0h RW	cri_dfx_clrerrcnt: Clear Error Counter Resets the Pattern Checker's error counter. 0 : Error Counter allowed to run (default) 1 : Error Counter held in reset
17	0h RW	cri_dfx_lcereset: Local Compare Engine Reset Resets all components of the Local Compare Engine in both the Pattern Generator and the Pattern Checker. 0 : LCE not in reset (default) 1 : LCE in reset
16	0h RW	cri_dfx_lcestart: Local Compare Engine Start Controls the starting and stopping of the LCE. Allows for simultaneous or independent start across lanes. Once stopped, a DFXLCERESET is usually required. 0 : LCE stopped (default) 1 : LCE running
15:8	3Eh RW	cri_dfx_patbuf_7_0: Pattern Buffer Storage In 10b mode, the buffer is read as eight 10b chunks. The first 10 bits should not equal the Comma Symbol: '0011111010' (or its inversion '1100000101'). In 8b mode, the buffer is read as eight 10b chunks, where the 10th bit is unused and the 9th bit is the K-bit indicator. The first 10 bits should not equal the Comma Symbol: 'xx10111100'. DFXPATBUF[78] should not be '1'.
7:0	63h RW	cri_dfx_patbuf_15_8: Pattern Buffer Storage See cri_dfx_patbuf[7:0] description.

23.11.7 PCS_DWORD6 (pcs_dword6)—Offset 18h

Access Method

Type: Message Bus Register
(Size: 32 bits)

pcs_dword6: [Port: 0xA6] + (600h + 18h)

Op Codes:

0h - Read, 1h - Write

Default: FFFFFFFFh

31	28	24	20	16	12	8	4	0
1	1	1	1	1	1	1	1	1
cri_dfx_prbseed_7_0								cri_dfx_prbseed_31_24

Bit Range	Default & Access	Description
31:24	FFh RW	cri_dfx_prbseed_7_0: PRBS Seed Can be used for HVM determinism. The use of all zeroes can result in lockup.
23:16	FFh RW	cri_dfx_prbseed_15_8: PRBS Seed See cri_dfx_prbseed[7:0] description.
15:8	FFh RW	cri_dfx_prbseed_23_16: PRBS Seed See cri_dfx_prbseed[7:0] description.
7:0	FFh RW	cri_dfx_prbseed_31_24: PRBS Seed See cri_dfx_prbseed[7:0] description.

23.11.8 PCS_DWORD7 (pcs_dword7)—Offset 1Ch

Access Method

Type: Message Bus Register
(Size: 32 bits)

pcs_dword7: [Port: 0xA6] + (600h + 1Ch)

Op Codes:

0h - Read, 1h - Write

Default: 00000009h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	1
dfx_cri_errcnt_7_0								cri_dfx_prbstraincnt_3_0

Bit Range	Default & Access	Description
31:24	X RO	dfx_cri_errcnt_7_0: Error Counter Tracks how many bit errors the Pattern Checker has detected. Can be cleared using DFXCLRERRCNT or DFXLCERESSET.
23:16	X RO	dfx_cri_errcnt_15_8: Error Counter Tracks how many bit errors the Pattern Checker has detected. Can be cleared using DFXCLRERRCNT or DFXLCERESSET.
15	X RO	i_rxcaldone: RX Calibration Cycles Complete Indicator
14	X RO	dfx_cri_lcemgnerr: Local Compare Engine Margin Error Indicates that the error counter has reached its max value. This can be used by the Rx upartition during Margin Mode to determine when the eye width has closed.
13	X RO	cri_dfx_patgen2active: Pattern Generator 2 Active status indicator In a lane with two Tx paths, this indicates that the second Pattern Generator is in progress. The DFXPATGENACTIVE will only indicate that the first Pattern Generator is in progress.
12	X RO	dfx_cri_patbufallfail: Pattern Buffer All Fail status indicator Indicates that there has not been a single matching Pattern Buffer pattern. This could signify that an error occurred during training.
11	X RO	dfx_cri_patchkactive: Pattern Checker Active status indicator Indicates that the Pattern Checker is in progress (either Pattern Buffer or PRBS).
10	X RO	dfx_cri_patgenactive: Pattern Generator Active status indicator Indicates that the Pattern Generator is in progress (either Pattern Buffer or PRBS).
9	X RO	dfx_cri_lctraindone: Local Compare Engine Training Done status indicator Indicates that the Pattern Checker training is completed (either Pattern Buffer or PRBS). The Pattern Checker is now synchronized to the Pattern Generator.
8	X RO	dfx_cri_lctrainactive: Local Compare Engine Training Active status indicator Indicates that the Pattern Checker training is in progress (either Pattern Buffer or PRBS).
7	0h RW	reserved501: reserved
6	0h RW	cri_dfx_patgen2en: Pattern Generator 2 Enable In a lane with two Tx paths, this enables the second Pattern Generator. The DFXPATGENEN will enable the first Pattern Generator. 0 : Disable second Pattern Generator (default) 1 : Enable second Pattern Generator
5:4	0h RW	cri_dfx_maxerrcnt_1_0: Maximum Error Count Selectable maximum value that the DFXERRCNT can reach before the Local Compare Engine is automatically stopped. 00 : 2^{16} (default) 01 : 2^{10} 10 : 2^8 11 : 2^4
3:0	9h RW	cri_dfx_prbstraincnt_3_0: PRBS Training Count The number of consecutive cycles that the Pattern Checker's PRBS must be error free before it is considered synchronized. Default is 9.

23.11.9 PCS_DWORD8 (pcs_dword8)—Offset 20h

Access Method

Type: Message Bus Register
(Size: 32 bits)

pcs_dword8: [Port: 0xA6] + (600h + 20h)

Op Codes:

0h - Read, 1h - Write

Default: 000000C4h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	1	1
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
reg_partial	reg_slumber	reg_tx2_cdr_override_2_0	reg_cdr_override_2_0	reg_ebuffmode	reg_usedclockchannel_1_0	reg_usedclockchannel_ovrride	reg_gbl_ovrride	reg_tx1_pclkon_inp2
								reg_tx2_pclkon_inp2
								reg_tx2_txenable
								cri_rxeb_ptr_init_3_0
								reg_powerfsm_ovrride
								reg_suspend
								reg_pclkcfginput
								reg_useqclock
								cri_rxeb_hiwater_3_0
								cri_rxeb_lowater_3_0

Bit Range	Default & Access	Description
31	0h RW	reg_partial: Override for i_partial
30	0h RW	reg_slumber: Override for i_slumber
29:27	0h RW	reg_tx2_cdr_override_2_0: Override for cdr_override strap for second tx2
26:24	0h RW	reg_cdr_override_2_0: Override for cdr_override strap
23	0h RW	reg_ebuffmode: Override for ebuffmode (no functionality in p1271 phase1 design)
22:21	0h RW	reg_usedclockchannel_1_0: Selects the active clock channel
20	0h RW	reg_usedclockchannel_ovrride: When asserted selects reg_usedclockchannel[1:0]
19	0h RW	reg_gbl_ovrride: Global override select
18	0h RW	reg_tx1_pclkon_inp2: When asserted keeps PCLK running in P2 mode. For DP this is used for Lane1
17	0h RW	reg_tx2_pclkon_inp2: When asserted keeps PCLK running in P2 mode. This is reserved (no impact) for PCIe/DMI and used for DP Lane2
16	0h RW	reg_tx2_txenable: Override for i_txenable for tx2
15:12	0h RW	cri_rxeb_ptr_init_3_0: Config override for initial value of Rx elastic buffer read pointer
11	0h RW	reg_powerfsm_ovrride: When asserted overrides for Tx power fsm are selected
10	0h RW	reg_suspend: Override for suspend
9	0h RW	reg_pclkcfginput: Override for pclkcfginput strap
8	0h RW	reg_useqclock: Override for useqclock; MUX select for I or Q clk for TX clocking
7:4	Ch RW	cri_rxeb_hiwater_3_0: Elastic buffer high watermark based on which SKP is removed

23.11.10 PCS_DWORD9 (pcs_dword9)—Offset 24h

Access Method

Type: Message Bus Register
(Size: 32 bits)

pcs dword9: [Port: 0xA6] + (600h + 24h)

Op Codes:

0h - Read, 1h - Write

Default: 00000000h

[illegible]

Bit Range	Default & Access	Description
31	0h RW	reserved502: reserved
30:26	0h RW	reg_strapgroup_4_0: Override for i_strapgroup
25:24	0h RW	reg_powerdown_1_0: Override for i_powerdown

30:28	0h RW	sqelch_shunt_cnt_2_0: Squelch Shunt Pulse Duration Override Value 000 = No shunt pulse generated 001 = 1 susclk cycles ... 111 = 7 susclk cycles
27	0h RW	reserved520: reserved
26	0h RW	i_rxsqfsm_timersel: Squelch FSM Timer Select 0 - Selects 25Mhz values for squelch timer and shunt pulse generation . 1 - Selects 100Mhz values for squelch timer and shunt pulse generation. This register is applicable to synchronous squelch startup mode.
25	0h RW	i_rxsq_asyncmode_h: Squelch Async Startup Mode This squelch startup mode is power state independent. When enabled, the squelchen signal sent to Modphy will asynchronously enable the squelch detector circuit. Once enabled, the squelch detector circuit will asynchronously send an unfiltered/unqualified squelch indication signal out of Modphy. The squelch indication signal will initially be unstable, so it is up to the consumer of this signal to filter/qualify it accordingly. The asynchronous squelch startup mode is beneficial because it significantly reduces the squelch startup latency. This decrease in latency does come at the cost of slightly higher power when squelch is not enabled as the IREF and Squelch Keeper circuits must remain enabled. When disabled, the squelch startup sequence is synchronous in nature and the squelch indication signal sent out of Modphy is stable/filtered.
24	1h RW	i_rxsquelchstby_h: Fast Squelch Enable Mode Bit to keep the IREF (ivrefen) on during P2 and reduce squelch startup time.

23:18	0h RW	cri_sqdbentrytimer_override_5_0: Rx squelch entry debounce timer
17:16	0h RW	reg_rxdrcgtsqsel_1_0: Squelch output select
15	0h RW	cri_reut_SlaveSideDataCheckingEn: Enable REUT slave side checking while in loopback slave
14	0h RW	cri_sqdbtimer_ovren: Squelch debounce timer override enable
13	0h RW	cri_rxpwrfsm_timer_ovren: Rx power management fsm timer override enable
12	0h RW	reg_rxidle: Chicken bit to override i_rxidle from controller and keep Rx in P0 or P0s
11	0h RW	cri_rxrawdata_sel: When asserted bypass K-align, 10b/8b decoder and Elastic buffer
10	0h RW	cri_dynkalign_eco3302703_mode: Kalign Mode Override Value When cri_dynkalign_eco3302703_ovren is set, this value selects kalignmode 0 - use register bits cri_kalignmode[1:0] to select kalignmode 1 - select the 4 COM kalign mode'
9	0h RW	cri_dynkalign_eco3302703_ovren: Kalign Mode Override Enable Overrides kalign mode select pin, allowing config bit kalignmode_override_val to select kalignmode.
8	0h RW	reg_rxpwrfsm_pibiasoff_ovrride: When asserted selects reg_rxpwrfsm_pibiasoff_delay[3:0]
7	0h RW	cri_reset_kalignlck: When asserted resets Kalign lock indication and Kalign is performed again. The conditions when this would assert includes and is not restricted to any power management states (L0s, L1) or polling quiet states etc.
6	0h RW	cri_ebptrrst: Global broadcast to all lanes that the Elastic Buffer pointers should be reset. This is a pulse and will be generated when we need to reset the pointers because of collision or various other reasons.
5	0h RW	cri_comdispfix: Chicken bit to force disparity in dynamic K-align mode

Bit Range	Default & Access	Description
4	0h RW	cri_forcebankhit: Chicken bit to enable data appear on NOA post k-align lock although k-align block is not achieving lock. This is only for NOA observeability and not for other purpose
3:2	0h RW	cri_kalignmode_1_0: KALIGN Mode Select 00 = dynamic kalign all the time. Accounts for bit slips on incoming stream which can cause symbol to be detected on different bank 10 = dynamic kalign up to L0 x1 = static kalign (same as GDG). Assumes symbol always detected on same data bank
1	0h RW	cri_skpprocdis: SKIP Ordered-Set Processing Disable When this configuration bit is asserted, then SKIP ordered=sets will be ignored (in EB block). Used in Elastic buffer block. 0 = Normal operation. SKIP ordered=sets will be processed by the Elastic Buffer 1 = SKIP processing disabled.
0	0h RW	cri_elasticbuffer_maskdis: Config bit (chicken bit) to disable the masking logic after elec idle ordered set is seen

23.13.4 PCS_DWORD3 (pcs_dword3)—Offset Ch

Access Method

Type: Message Bus Register
(Size: 32 bits)

pcs_dword3: [Port: 0xA6] + (800h + Ch)

Op Codes:

0h - Read, 1h - Write

Default: 5515ACAAh

23.13.6 PCS_DWORD5 (pcs_dword5)—Offset 14h

Access Method

Type: Message Bus Register
(Size: 32 bits)

pcs_dword5: [Port: 0xA6] + (800h + 14h)

Op Codes:

0h - Read, 1h - Write

Default: 00003E63h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	1	1	0
0	0	0	0	0	0	1	1	0
0	0	0	0	0	0	1	1	0
0	0	0	0	0	0	1	1	0
0	0	0	0	0	0	1	1	0
0	0	0	0	0	0	1	1	0
0	0	0	0	0	0	1	1	0

Bit Range	Default & Access	Description
31	0h RW	cri_dfx_patbuftrain: Pattern Buffer Manual Training When DFXPATBUFTRAINOVR and DFXLCCESTART are asserted, this manually controls whether the Pattern Buffers are in training or have completed training. 0 : Send training patterns (default) 1 : Send contents of DFXPATBUF
30:28	0h RW	cri_dfx_prbspoly_2_0: PRBS Polynomial Select the polynomial to be used by the PRBS in the Pattern Generator and Pattern Checker. PRBS support 10b or 8b, which is indicated by the msb. 000 - $x^{16} + x^5 + x^4 + x^3 + 1$ (USB3/PCIe Scrambler) (8b) 001 - $x^{16} + x^{15} + x^{13} + x^4 + 1$ (SATA scrambler) (8b) 010 - $x^{31} + x^{28} + 1$ (8b) 011 - $x^7 + x^6 + 1$ (8b) 100 - $x^{15} + x^{14} + 1$ (10b) 101 - $x^{23} + x^{18} + 1$ (10b) 110 - $x^{31} + x^{28} + 1$ (10b) 111 - $x^7 + x^6 + 1$ (10b)
27:26	0h RW	cri_dfx_patbufsize_1_0: Pattern Buffer Size Select the size of the Pattern Buffer to use. The MSB will always be bit 79. The LSB will depend on this select and the DFXLCCESTART (10b or 8b mode). 00 : full 80b buffer (Default) 01 : 70b (while in 10b mode), 56b (while in 8b mode) 10 : 40b (while in 10b mode), 32b (while in 8b mode) 11 : 10b (while in 10b mode), 8b (while in 8b mode)
25	0h RW	cri_dfx_patbufloop: Pattern Buffer Looping Enable Enables looping of the Pattern Buffer. By default, the contents of Pattern Buffer will be used once and stop. Alternatively, the Pattern Buffer will continue to loop until the DFXLCCESTART is de-asserted. 0 : Run Pattern Buffer only once (default) 1 : Loop Pattern Buffer until stopped
24	0h RW	cri_dfx_patbufdwidth: Pattern Buffer Data Width Selects between 10 bit or 8 bit data width for the Pattern Buffer. Determines where in the Tx/Rx path the data is inserted/retrieved. 0 : 10b (default) 1 : 8b
23	0h RW	cri_dfx_patbuftrainovr: Pattern Buffer Training Override Enables manual training of the Pattern Buffer instead of the automated coordination between the Pattern Checker and Pattern Generator. When asserted, the DFXPATBUFTRAIN bit will be used to force when training is active and when it is complete. 0 : Automatic Training (default) 1 : Enable Manual Training
22	0h RW	cri_dfx_marginmode: Margin mode Overrides standard setup configurations for use with Eye Width Margining. 0 : Standard Mode (default) 1 : Margin Mode enabled
21	0h RW	cri_dfx_chk_sel: Pattern Checker 8b10b Select This determines where Rx data is compared, either in the 10-bit domain before decode or after 10b-8b decoding. 0: 10b domain 1: 8b domain
20	0h RW	cri_dfx_patchken: Pattern Checker Enable 0 : Disable Pattern Checker (default) 1 : Enable Pattern Checker
19	0h RW	cri_dfx_patgenen: Pattern Generator Enable This will activate the Dfx bypass muxes in the PCS Tx path. 0 : Disable Pattern Generator (default) 1 : Enable Pattern Generator
18	0h RW	cri_dfx_clrerrcnt: Clear Error Counter Resets the Pattern Checker's error counter. 0 : Error Counter allowed to run (default) 1 : Error Counter held in reset
17	0h RW	cri_dfx_lcereset: Local Compare Engine Reset Resets all components of the Local Compare Engine in both the Pattern Generator and the Pattern Checker. 0 : LCE not in reset (default) 1 : LCE in reset
16	0h RW	cri_dfx_lcestart: Local Compare Engine Start Controls the starting and stopping of the LCE. Allows for simultaneous or independent start across lanes. Once stopped, a DFXLCERESET is usually required. 0 : LCE stopped (default) 1 : LCE running
15:8	3Eh RW	cri_dfx_patbuf_7_0: Pattern Buffer Storage In 10b mode, the buffer is read as eight 10b chunks. The first 10 bits should not equal the Comma Symbol: '0011111010' (or its inversion '1100000101'). In 8b mode, the buffer is read as eight 10b chunks, where the 10th bit is unused and the 9th bit is the K-bit indicator. The first 10 bits should not equal the Comma Symbol: 'xx10111100'. DFXPATBUF[78] should not be '1'.
7:0	63h RW	cri_dfx_patbuf_15_8: Pattern Buffer Storage See cri_dfx_patbuf[7:0] description.

23.13.7 PCS_DWORD6 (pcs_dword6)—Offset 18h

Access Method

Type: Message Bus Register
(Size: 32 bits)

pcs_dword6: [Port: 0xA6] + (800h + 18h)

Op Codes:

0h - Read, 1h - Write

Default: FFFFFFFFh

31	28	24	20	16	12	8	4	0
1	1	1	1	1	1	1	1	1
cri_dfx_prbseed_7_0								cri_dfx_prbseed_31_24

Bit Range	Default & Access	Description
31:24	FFh RW	cri_dfx_prbseed_7_0: PRBS Seed Can be used for HVM determinism. The use of all zeroes can result in lockup.
23:16	FFh RW	cri_dfx_prbseed_15_8: PRBS Seed See cri_dfx_prbseed[7:0] description.
15:8	FFh RW	cri_dfx_prbseed_23_16: PRBS Seed See cri_dfx_prbseed[7:0] description.
7:0	FFh RW	cri_dfx_prbseed_31_24: PRBS Seed See cri_dfx_prbseed[7:0] description.

23.13.8 PCS_DWORD7 (pcs_dword7)—Offset 1Ch

Access Method

Type: Message Bus Register
(Size: 32 bits)

pcs_dword7: [Port: 0xA6] + (800h + 1Ch)

Op Codes:

0h - Read, 1h - Write

Default: 00000009h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	1
dfx_cri_errcnt_7_0								cri_dfx_prbstraincnt_3_0

Bit Range	Default & Access	Description
31:24	X RO	dfx_cri_errcnt_7_0: Error Counter Tracks how many bit errors the Pattern Checker has detected. Can be cleared using DFXCLRERRCNT or DFXLCERESSET.
23:16	X RO	dfx_cri_errcnt_15_8: Error Counter Tracks how many bit errors the Pattern Checker has detected. Can be cleared using DFXCLRERRCNT or DFXLCERESSET.
15	X RO	i_rxcaldone: RX Calibration Cycles Complete Indicator
14	X RO	dfx_cri_lcemgnerr: Local Compare Engine Margin Error Indicates that the error counter has reached its max value. This can be used by the Rx upartition during Margin Mode to determine when the eye width has closed.
13	X RO	cri_dfx_patgen2active: Pattern Generator 2 Active status indicator In a lane with two Tx paths, this indicates that the second Pattern Generator is in progress. The DFXPATGENACTIVE will only indicate that the first Pattern Generator is in progress.
12	X RO	dfx_cri_patbufallfail: Pattern Buffer All Fail status indicator Indicates that there has not been a single matching Pattern Buffer pattern. This could signify that an error occurred during training.
11	X RO	dfx_cri_patchkactive: Pattern Checker Active status indicator Indicates that the Pattern Checker is in progress (either Pattern Buffer or PRBS).
10	X RO	dfx_cri_patgenactive: Pattern Generator Active status indicator Indicates that the Pattern Generator is in progress (either Pattern Buffer or PRBS).
9	X RO	dfx_cri_lctraindone: Local Compare Engine Training Done status indicator Indicates that the Pattern Checker training is completed (either Pattern Buffer or PRBS). The Pattern Checker is now synchronized to the Pattern Generator.
8	X RO	dfx_cri_lctrainactive: Local Compare Engine Training Active status indicator Indicates that the Pattern Checker training is in progress (either Pattern Buffer or PRBS).
7	0h RW	reserved501: reserved
6	0h RW	cri_dfx_patgen2en: Pattern Generator 2 Enable In a lane with two Tx paths, this enables the second Pattern Generator. The DFXPATGENEN will enable the first Pattern Generator. 0 : Disable second Pattern Generator (default) 1 : Enable second Pattern Generator
5:4	0h RW	cri_dfx_maxerrcnt_1_0: Maximum Error Count Selectable maximum value that the DFXERRCNT can reach before the Local Compare Engine is automatically stopped. 00 : 2^{16} (default) 01 : 2^{10} 10 : 2^8 11 : 2^4
3:0	9h RW	cri_dfx_prbstraincnt_3_0: PRBS Training Count The number of consecutive cycles that the Pattern Checker's PRBS must be error free before it is considered synchronized. Default is 9.

23.13.9 PCS_DWORD8 (pcs_dword8)—Offset 20h

Access Method

Type: Message Bus Register
(Size: 32 bits)

pcs_dword8: [Port: 0xA6] + (800h + 20h)

Op Codes:

0h - Read, 1h - Write

Default: 000000C4h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	1	1
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
reg_partial	reg_slumber	reg_tx2_cdr_override_2_0	reg_cdr_override_2_0	reg_ebuffmode	reg_usedclockchannel_1_0	reg_usedclockchannel_ovrride	reg_gbl_ovrride	reg_tx1_pclkon_inp2
								reg_tx2_pclkon_inp2
								reg_tx2_txenable
								cri_rxeb_ptr_init_3_0
								reg_powerfsm_ovrride
								reg_suspend
								reg_pclkcfginput
								reg_useqclock
								cri_rxeb_hiwater_3_0
								cri_rxeb_lowater_3_0

Bit Range	Default & Access	Description
31	0h RW	reg_partial: Override for i_partial
30	0h RW	reg_slumber: Override for i_slumber
29:27	0h RW	reg_tx2_cdr_override_2_0: Override for cdr_override strap for second tx2
26:24	0h RW	reg_cdr_override_2_0: Override for cdr_override strap
23	0h RW	reg_ebuffmode: Override for ebuffmode (no functionality in p1271 phase1 design)
22:21	0h RW	reg_usedclockchannel_1_0: Selects the active clock channel
20	0h RW	reg_usedclockchannel_ovrride: When asserted selects reg_usedclockchannel[1:0]
19	0h RW	reg_gbl_ovrride: Global override select
18	0h RW	reg_tx1_pclkon_inp2: When asserted keeps PCLK running in P2 mode. For DP this is used for Lane1
17	0h RW	reg_tx2_pclkon_inp2: When asserted keeps PCLK running in P2 mode. This is reserved (no impact) for PCIe/DMI and used for DP Lane2
16	0h RW	reg_tx2_txenable: Override for i_txenable for tx2
15:12	0h RW	cri_rxeb_ptr_init_3_0: Config override for initial value of Rx elastic buffer read pointer
11	0h RW	reg_powerfsm_ovrride: When asserted overrides for Tx power fsm are selected
10	0h RW	reg_suspend: Override for suspend
9	0h RW	reg_pclkcfginput: Override for pclkcfginput strap
8	0h RW	reg_useqclock: Override for useqclock; MUX select for I or Q clk for TX clocking
7:4	Ch RW	cri_rxeb_hiwater_3_0: Elastic buffer high watermark based on which SKP is removed

23.13.10 PCS_DWORD9 (pcs_dword9)—Offset 24h

Access Method

Type: Message Bus Register
(Size: 32 bits)

pcs_dword9: [Port: 0xA6] + (800h + 24h)

Op Codes:

0h - Read, 1h - Write

Default: 00000000h

[illegible]

Bit Range	Default & Access	Description
31	0h RW	reserved502: reserved
30:26	0h RW	reg_strapgroup_4_0: Override for i_strapgroup
25:24	0h RW	reg_powerdown_1_0: Override for i_powerdown
23	0h RW	reg_pcs_txcmnkeepdisable_ovrd: Override for ipcs_txcmnkeepdisable input 0: Use value on ipcs_txcmnkeepdisable input pin to determine o_txgohighz state in P2/ slumber 1: Force pcs_txcmnkeepdisable to 0
22:18	0h RW	reg_straplane_5_0: Override for i_straplane
17	0h RW	reg_tx1_powerdown_override: Overrides i_powerdown[1:0] indication from MAC for Tx1 1 : selects reg_powerdown[1:0] 0 : selects i_powerdown[1:0]
16	0h RW	reg_tx2_powerdown_override: Overrides i_powerdown[1:0] indication from MAC for Tx2 1 : selects reg_powerdown[1:0] 0 : selects i_powerdown[1:0]
15	0h RW	reg_txdatavalid: Override for i_txdatavalid (register is NOT used)
14:13	0h RW	reg_txdeemp_1_0: Override for i_txdeemp

Bit Range	Default & Access	Description
12:10	0h RW	reg_txmargin_2_0: Override for i_txmargin
9	0h RW	reg_txswing: Override for i_txswing
8	0h RW	reg_txenable: Override for i_txenable
7:6	0h RW	reg_txterm_vcc_1_0: Override for txterm_vcc strap
5	0h RW	reg_txdetrxlpbk: Override for i_txdetrxlpbk
4	0h RW	reg_txelectidle: Override for i_txelectidle
3	0h RW	reg_txcompliance: Override for i_txcompliance

27	0h RW	reserved520: reserved
26	0h RW	i_rxsqfsm_timersel: Squelch FSM Timer Select 0 - Selects 25Mhz values for squelch timer and shunt pulse generation . 1 - Selects 100Mhz values for squelch timer and shunt pulse generation. This register is applicable to synchronous squelch startup mode.
25	0h RW	i_rxsq_asyncmode_h: Squelch Async Startup Mode This squelch startup mode is power state independent. When enabled, the squelchen signal sent to Modphy will asynchronously enable the squelch detector circuit. Once enabled, the squelch detector circuit will asynchronously send an unfiltered/unqualified squelch indication signal out of Modphy. The squelch indication signal will initially be unstable, so it is up to the consumer of this signal to filter/qualify it accordingly. The asynchronous squelch startup mode is beneficial because it significantly reduces the squelch startup latency. This decrease in latency does come at the cost of slightly higher power when squelch is not enabled as the IREF and Squelch Keeper circuits must remain enabled. When disabled, the squelch startup sequence is synchronous in nature and the squelch indication signal sent out of Modphy is stable/filtered.
24	1h RW	i_rxsqelchstby_h: Fast Squelch Enable Mode Bit to keep the IREF (ivrefen) on during P2 and reduce squelch startup time.

24 Serial IO (SIO) Overview

The Serial I/O (SIO) is a collection of hardware blocks that implement simple but key serial I/O interfaces for platform usage. These hardware blocks include:

- SIO - I²C Interface
- SIO - High Speed UART
- SIO - Serial Peripheral Interface (SPI)
- SIO - Pulse Width Modulation (PWM)

24.1 Serial I/O (SIO) Register Map

Refer to [Chapter 3, "Register Access Methods"](#) and [Chapter 4, "Mapping Address Spaces"](#) for additional information.

§

Bit Range	Default & Access	Field Name (ID): Description
7:3	00h RO	Reserved5: Reserved.
2	0h RW	Bus Master Enable (BME): If this bit is 0, Bridge does not generate any new upstream transaction on IOSF as a master.
1	0h RW	Memory Space Enable (MSE): This bit controls Bridge's response to downstream Memory accesses. When set, accesses to memory space of the device is enabled.
0	0h RO	Reserved6: Reserved.

24.2.3 Revision ID and Class Code (REVCLASSCODE)—Offset 8h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:30, F:0] + 8h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
CLASS_CODES							RID	

Bit Range	Default & Access	Field Name (ID): Description
31:8	000000h RO	Class Code (CLASS_CODES): The Class Code register is read-only and used to identify the generic function of the device and, in some cases, a specific register level programming interface. The register is broken into three byte size fields. The upper byte (at offset 0Bh) is a base class code which broadly classifies the type of function the device performs. The middle byte (at offset 0Ah) is a sub-class code which identifies more specifically the function of the device. The lower byte (at offset 09h) identifies a specific register-level programming interface (if any) so that device independent software can interact with the device. This register is tied to a strap at the top level.
7:0	00h RO	Revision ID (RID): Revision ID identifies the revision of particular AHB device. This is tied to a strap at the top level.

24.2.4 Cache Line Latency Header and BIST (CLLATHEADERBIST)—Offset Ch

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:30, F:0] + Ch

Default: 00800000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
Reserved0	MULFNDEV	HEADERTYPE	LATTIMER	CACHELINE_SIZE				

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RO	Reserved0: Reserved.
23	1h RO	Multi Function Device (MULFNDEV): This bit is always 0 for non fabric ports. For Fabric ports it is driven from fabric_mult_function strap. 1 = multifunction device 0 = single function device
22:16	00h RO	Header Type (HEADERTYPE): Implements Type 0 Configuration header.
15:8	00h RO	Latency Timer (LATTIMER): Does not apply to PCI Express. Hardwired to 00h.
7:0	00h RW	Cache Line Size (CACHELINE_SIZE): Doesn't apply to PCI Express. PCI Express spec requires this to be implemented as a R/W register but has no functional impact on the AHB Device connected.

24.2.5 Base Address Register (BAR)—Offset 10h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:30, F:0] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
BASEADDR	SIZEINDICATOR	PREFETCHABLE	TYPE	MESSAGE_SPACE				

Bit Range	Default & Access	Field Name (ID): Description
31:12	00000h RW	Base Address (BASEADDR): Base address of the AHB device memory space. Taken from Strap values as 1.s
11:4	00h RO	Size Indicator Read Only (SIZEINDICATOR): Always returns zero. The size of this register depends on the size of the Memory space. This size is determined by a top level of STRAP values as 0.s. Always will be zero as minimum size is 4K.
3	0h RO	Prefetchable (PREFETCHABLE): Indicates that this BAR is not prefetchable.

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
SUBSYSTEMID				SUBSYSTEMVENDORID				

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW/O	Subsystem ID (SUBSYSTEMID): This register should be implemented for any function that could be instantiated more than once in a given system. The SID register, in combination with the Subsystem Vendor ID register, make it possible for the operating environment to distinguish one audio subsystem from the other. This register is a Read Write Once type register.
15:0	0000h RW/O	Subsystem Vendor ID (SUBSYSTEMVENDORID): This register should be implemented for any function that could be instantiated more than once in a given system. The SVID register, in combination with the Subsystem ID register, enables the operating environment to distinguish one subsystem from the other. This register is a Read Write Once register.

24.2.8 Expansion ROM Base Address (EXPANSION_ROM_BASEADDR)—Offset 30h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:30, F:0] + 30h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
EXPANSION_ROM_BASE								

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	EXPANSION_ROM_BASE: Reserved.

24.2.9 Capabilities Pointer (CAPABILITYPTR)—Offset 34h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:30, F:0] + 34h

Default: 00030001h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	1
PMESUPPORT					Reserved0			VERSION
					NXTCAP			POWER_CAP

Bit Range	Default & Access	Field Name (ID): Description
31:27	00h RO	PME_Support (PMESUPPORT): This 5-bit field indicates the power states in which the function may assert PME#. A value of 0b for any bit indicates that the function is not capable of asserting the PME# signal while in that power state. - bit(11) X XXX1b - PME# can be asserted from D0. - bit(12) X XX1Xb - PME# can be asserted from D1. Bridge does not support this state. - bit(13) X X1XXb - PME# can be asserted from D2. Bridge does not support this state. - bit(14) X 1XXXb - PME# can be asserted from D3hot. - bit(15) 1 XXXXb - PME# can be asserted from D3cold. Bridge does not support this state. This field is taken from the strap strap_pme_support.
26:19	00h RO	Reserved0: Reserved.
18:16	3h RO	Version (VERSION): Indicates support for Revision 1.2 of the PCI Power Management Specification.
15:8	00h RO	Next Capability (NXTCAP): Points to the next capability structure. This points to NULL.
7:0	01h RO	Power Management Capability (POWER_CAP): Indicates this is power management capability.

24.2.12 PME Control and Status Register (PMECTRLSTATUS)—Offset 84h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:30, F:0] + 84h

Default: 00000008h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
Reserved0					PMESTATUS	Reserved1	PMEENABLE	Reserved2
								NO_SOFT_RESET
								Reserved3
								POWERSTATE

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RO	Reserved0: Reserved.

Bit Range	Default & Access	Field Name (ID): Description
15	0h RW/1C	PME Status (PMESTATUS): 0 = Software clears the bit by writing a 1 to it. 1 = This bit is set when the AHB Device would normally assert the PME# signal independent of the state of the PME Enable bit (bit 8 in this register).
14:9	00h RO	Reserved1: Reserved.
8	0h RW	PME Enable (PMEENABLE): A 1 enables the function to assert PME#. When 0, PME# message on SB is disabled.
7:4	0h RO	Reserved2: Reserved.
3	1h RO	No_Soft_Reset (NO_SOFT_RESET): This bit indicates that devices transitioning from D3hot to D0 because of PowerState commands do not perform an internal reset. Configuration Context is preserved.
2	0h RO	Reserved3: Reserved.
1:0	0h RW	Power State (POWERSTATE): This field is used both to determine the current power state of the AHB IP and to set a new power state. The values are: 00 = D0 state 11 = D3HOT state - Others = Reserved Notes: If software attempts to write a value of 01b or 10b in to this field, the write operation must complete normally; however, the data is discarded and no state change occurs. When in the D3HOT states, interrupts are blocked. D3Hot will not be used for Downstream decode on fabric ports.

24.2.13 Manufacturer ID (MANID)—Offset F8h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:30, F:0] + F8h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0

MANID

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	Manufacturer ID (MANID): This register is brought out as straps to the top level.

24.3 SIO DMA Memory Mapped I/O Registers for SPI, HSUART, PWM

Table 253. Summary of SIO DMA 1 Memory Mapped I/O Registers—BAR

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
0–3h	4	"Source Address Register for Channel 0 - Low (SAR0_LO)—Offset 0h" on page 3451	00000000h
4–7h	4	"Source Address Register for Channel 0 - High (SAR0_HI)—Offset 4h" on page 3452	00000000h
8–Bh	4	"Destination Address Register for Channel 0 - Low (DAR0_LO)—Offset 8h" on page 3452	00000000h
C–Fh	4	"Destination Address Register for Channel 0 - High (DAR0_HI)—Offset Ch" on page 3453	00000000h

24.3.1 Source Address Register for Channel 0 - Low (SAR0_LO)—Offset 0h

The starting source address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the source address of the current AHB transfer.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 0h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:30, F:0] + 10h

Default: 00000000h

31 28 24 20 16 12 8 4 0

0 0 0 0 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0

SAR

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	Current Source Address of DMA Transfer (SAR): Updated after each source transfer. The SINC field in the CTLx register determines whether the address increments, decrements, or is left unchanged on every source transfer throughout the block transfer.

24.3.2 Source Address Register for Channel 0 - High (SAR0_HI)—Offset 4h

Refer to the description for register Source Address Register for Channel 0 - Low.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 4h**BAR Type:** PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:30, F:0] + 10h

Default: 00000000h

[illegible]

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	Undefined: RESERVED

24.3.3 Destination Address Register for Channel 0 - Low (DAR0_LO)—Offset 8h

The starting destination address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the destination address of the current AHB transfer.

Access Method

24.3.6 Linked List Pointer Register for Channel 0 - High (LLP0_HI)—Offset 14h

Access Method

BAR Reference: [B:0, D:30, F:0] + 10h

[illegible]

24.3.7 Control Register for Channel 0 - Low (CTL0_LO)—Offset 18h

Access Method

BAR Reference: [B:0, D:30, F:0] + 10h

October 2018
Document Number: 538136, Rev. 4.3

31				28				24				20				16				12				8				4				0																															
0 0 0 0				0 0 0 0				0 0 1 1				0 0 0 0				0 1 0 0				1 0 0 0				0 0 0 0				0 0 0 0				0 0 0 1																															
Undefined_				LLP_SRC_EN				LLP_DST_EN				SMS				DMS				TT_FC				Undefined				DST_SCATTER_EN				SRC_GATHER_EN				SRC_MSIZ				DEST_MSIZ				SINC				DINC				SRC_TR_WIDTH				DST_TR_WIDTH				INT_EN			

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RW	Undefined_ : RESERVED
28	0h RW	LLP_SRC_EN : Block chaining is enabled on the source side only if the LLP_SRC_EN field is high and LLPx.LOC is non-zero
27	0h RW	LLP_DST_EN : Block chaining is enabled on the destination side only if the LLP_DST_EN field is high and LLPx.LOC is non-zero.
26:25	0h RW	Source Master Select (SMS) : Identifies the Master Interface layer from which the source device (peripheral or memory) is accessed.
24:23	0h RW	Destination Master Select (DMS) : Identifies the Master Interface layer where the destination device (peripheral or memory) resides.
22:20	3h RW	Transfer Type and Flow Control (TT_FC) : The following transfer types are supported. - Memory to Memory - Memory to Peripheral - Peripheral to Memory - Peripheral to Peripheral Flow Control can be assigned to the DW_ahb_dmac, the source peripheral, or the destination peripheral.
19	0h RW	Undefined : RESERVED
18	0h RW	Destination Scatter Enable Bit (DST_SCATTER_EN) : 0 = disabled 1 = enabled
17	0h RW	Source Gather Enable Bit (SRC_GATHER_EN) : 0 = disabled 1 = enabled
16:14	1h RW	Source Burst Transaction Length (SRC_MSIZ) : Number of data items, each of width CTLx.SRC_TR_WIDTH, to be read from the source every time a source burst transaction request is made from either the corresponding hardware or software handshaking interface.
13:11	1h RW	Destination Burst Transaction Length (DEST_MSIZ) : Number of data items, each of width CTLx.DST_TR_WIDTH, to be written to the destination every time a destination burst transaction request is made from either the corresponding hardware or software handshaking interface.
10:9	0h RW	Source Address Increment (SINC) : 00 = Increment 01 = Decrement 1x = No change

Bit Range	Default & Access	Field Name (ID): Description
8:7	0h RW	Destination Address Increment (DINC): Indicates whether to increment or decrement the destination address on every destination transfer. 00 = Increment 01 = Decrement 1x = No change
6:4	0h RW	Source Transfer Width (SRC_TR_WIDTH): This value must be less than or equal to DMAH_Mx_HDATA_WIDTH, where x is the AHB layer 1 to 4 where the source resides.
3:1	0h RW	Destination Transfer Width (DST_TR_WIDTH): This value must be less than or equal to DMAH_Mk_HDATA_WIDTH, where k is the AHB layer 1 to 4 where the destination resides.
0	1h RW	Interrupt Enable Bit (INT_EN): If set, then all interrupt-generating sources are enabled.

24.3.8 Control Register for Channel 0 - High (CTL0_HI)—Offset 1Ch

Refer to the register description for Control Register for Channel 0 - Low.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 1Ch

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:30, F:0] + 10h

Default: 00000002h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
Undefined					DONE	BLOCK_TS		

Bit Range	Default & Access	Field Name (ID): Description
31:13	0h RW	Undefined_ : RESERVED
12	0h RW	Done Bit (DONE) : If status write-back is enabled, the upper word of the control register, CTLx[63:32], is written to the control register location of the Linked List Item (LLI) in system memory at the end of the block transfer with the done bit set. Software can poll the LLI CTLx.DONE bit to see when a block transfer is complete. The LLI CTLx.DONE bit should be cleared when the linked lists are set up in memory, prior to enabling the channel. LLI accesses are always 32-bit accesses (Hsize = 2) aligned to 32-bit boundaries and cannot be changed or programmed to anything other than 32-bit.
11:0	2h RW	Block Transfer Size (BLOCK_TS) : When the DW_ahb_dmac is the flow controller, the user writes this field before the channel is enabled in order to indicate the block size.

Access Method

Offset: [BAR] + 28h

BAR Reference: [B:0, D:30, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	DSTAT: Dest status information retrieved by hw from the addrx pointed to by DSTATAR0 register.

24.3.12 Dest Status Register for Channel 0 - High (DSTAT0_HI)—Offset 2Ch

Refer to the register description for Dest Status Register for Channel 0 - Low.

Access Method

Offset: [BAR] + 2Ch

BAR Reference: [B:0, D:30, F:0] + 10h

Default: 00000000h

24.3.17 Configuration Register for Channel 0 - Low (CFG0_LO)—Offset 40h

This register contains fields that configure the DMA transfer. The channel configuration register remains fixed for all blocks of a multi-block transfer. **Note:** You need to program this register prior to enabling the channel.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 40h**BAR Type:** PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:30, F:0] + 10h

Default: 00000E00h

31			28				24				20				16				12				8				4				0			
0 0 0 0			0 0 0 0				0 0 0 0 0				0 0 0 0 0				0 0 0 0 0				1 1 1 0				0 0 0 0 0				0 0 0 0 0							
RELOAD_DST	RELOAD_SRC		MAX_ABRST											SRC_HS_POL	DST_HS_POL	LOCK_B	LOCK_CH	LOCK_B_L	LOCK_CH_L	HS_SEL_SRC	HS_SEL_DST	FIFO_EMPTY	CH_SUSP	CH_PRIOR	Undefined									

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	Automatic Destination Reload (RELOAD_DST): The DARx register can be automatically reloaded from its initial value at the end of every block for multi-block transfers.
30	0h RW	Automatic Source Reload (RELOAD_SRC): The SARx register can be automatically reloaded from its initial value at the end of every block for multi-block transfers.
29:20	0h RW	Maximum AMBA Burst Length (MAX_ABRST): Maximum AMBA burst length that is used for DMA transfers on this channel. A value of 0 indicates that software is not limiting the maximum AMBA burst length for DMA transfers on this channel.
19	0h RW	Source Handshaking Interface Polarity (SRC_HS_POL): 0 = Active high 1 = Active low
18	0h RW	Destination Handshaking Interface Polarity (DST_HS_POL): 0 = Active high 1 = Active low
17	0h RW	Bus Lock Bit (LOCK_B): When active, the AHB bus master signal hlock is asserted for the duration specified in CFGx.LOCK_B_L.
16	0h RW	Channel Lock Bit (LOCK_CH): When the channel is granted control of the master bus interface and if the CFGx.LOCK_CH bit is asserted, then no other channels are granted control of the master bus interface for the duration specified in CFGx.LOCK_CH_L. Indicates to the master bus interface arbiter that this channel wants exclusive access to the master bus interface for the duration specified in CFGx.LOCK_CH_L.
15:14	0h RW	Bus Lock Level (LOCK_B_L): Indicates the duration over which CFGx.LOCK_B bit applies. 00 = Over complete DMA transfer 01 = Over complete DMA block transfer 1x = Over complete DMA transaction
13:12	0h RW	Channel Lock Level (LOCK_CH_L): Indicates the duration over which CFGx.LOCK_CH bit applies. 00 = DMA transfer 01 = DMA block transfer 1x = DMA transaction

Access Method

Offset: [BAR] + 44h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:30, F:0] + 10h

Default: 00000004h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
Undefined				DEST_PER		SRC_PER		SS_UPD_EN
								DS_UPD_EN
						PROTCTL		FIFO_MODE
								ECMODE

Bit Range	Default & Access	Field Name (ID): Description
31:15	0h RW	Undefined: Reserved.
14:11	0h RW	DEST_PER: Assigns a hardware handshaking interface (0 - DMAH_NUM_HS_INT-1) to the destination of channel x if the CFGx.HS_SEL_DST field is 0; otherwise, this field is ignored.
10:7	0h RW	SRC_PER: Assigns a hardware handshaking interface (0 - DMAH_NUM_HS_INT-1) to the source of channel x if the CFGx.HS_SEL_SRC field is 0; otherwise, this field is ignored.
6	0h RW	Source Status Update Enable (SS_UPD_EN): Source status information is fetched only from the location pointed to by the SSTATARx register, stored in the SSTATx register and written out to the SSTATx location of the LLI (refer to Figure 52 on page 243) if SS_UPD_EN is high.

Bit Range	Default & Access	Field Name (ID): Description
5	0h RW	Destination Status Update Enable (DS_UPD_EN): Destination status information is fetched only from the location pointed to by the DSTATARx register, stored in the DSTATx register and written out to the DSTATx location of the LLI if DS_UPD_EN is high.
4:2	1h RW	PROTCTL: Protection Control bits used to drive the AHB HPROT[3:1] bus.
1	0h RW	FIFO Mode Select (FIFO_MODE): Determines how much space or data needs to be available in the FIFO before a burst transaction request is serviced. 0 = Space/data available for single AHB transfer of the specified transfer width. 1 = Data available is greater than or equal to half the FIFO depth for destination transfers and space available is greater than half the fifo depth for source transfers.
0	0h RW	Flow Control Mode (FCMODE): Determines when source transaction requests are serviced when the Destination Peripheral is the flow controller. 0 = Source transaction requests are serviced when they occur. Data pre-fetching is enabled. 1 = Source transaction requests are not serviced until a destination transaction request occurs.

24.3.19 Source Gather Register for Channel 0 - Low (SGR0_LO)—Offset 48h

The CTLx.SINC field controls whether the address increments or decrements. When the CTLx.SINC field indicates a fixed-address control, then the address remains constant throughout the transfer and the SGRx register is ignored.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 48h**BAR Type:** PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:30, F:0] + 10h

Intel Atom® Processor E3800 Product Family
Datasheet
3486

Bit Range	Default & Access	Field Name (ID): Description
29:20	0h RW	Maximum AMBA Burst Length (MAX_ABRST): Maximum AMBA burst length that is used for DMA transfers on this channel. A value of 0 indicates that software is not limiting the maximum AMBA burst length for DMA transfers on this channel.
19	0h RW	Source Handshaking Interface Polarity (SRC_HS_POL): 0 = Active high 1 = Active low
18	0h RW	Destination Handshaking Interface Polarity (DST_HS_POL): 0 = Active high 1 = Active low
17	0h RW	Bus Lock Bit (LOCK_B): When active, the AHB bus master signal hlock is asserted for the duration specified in CFGx.LOCK_B_L.
16	0h RW	Channel Lock Bit (LOCK_CH): When the channel is granted control of the master bus interface and if the CFGx.LOCK_CH bit is asserted, then no other channels are granted control of the master bus interface for the duration specified in CFGx.LOCK_CH_L. Indicates to the master bus interface arbiter that this channel wants exclusive access to the master bus interface for the duration specified in CFGx.LOCK_CH_L.
15:14	0h RW	Bus Lock Level (LOCK_B_L): Indicates the duration over which CFGx.LOCK_B bit applies. 00 = Over complete DMA transfer 01 = Over complete DMA block transfer 1x = Over complete DMA transaction
13:12	0h RW	Channel Lock Level (LOCK_CH_L): Indicates the duration over which CFGx.LOCK_CH bit applies. 00 = DMA transfer 01 = DMA block transfer 1x = DMA transaction
11	1h RW	Source Software or Hardware Handshaking Select (HS_SEL_SRC): 0 = HW handshaking 1 = SW handshaking
10	1h RW	Destination Software or Hardware Handshaking Select (HS_SEL_DST): 0 = HW handshaking 1 = SW handshaking
9	1h RO	FIFO_EMPTY: Indicates if there is data left in the channel FIFO.
8	0h RW	Channel Suspend (CH_SUSP): Suspends all DMA transfers from source until this bit is cleared.
7:5	2h RW	Channel Priority (CH_PRIOR): Priority of 7 is the highest priority.
4:0	0h RW	Undefined: RESERVED

24.3.62 Configuration Register for Channel 2 - High (CFG2_HI)—Offset F4h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	Automatic Destination Reload (RELOAD_DST): The DARx register can be automatically reloaded from its initial value at the end of every block for multi-block transfers.
30	0h RW	Automatic Source Reload (RELOAD_SRC): The SARx register can be automatically reloaded from its initial value at the end of every block for multi-block transfers.

Bit Range	Default & Access	Field Name (ID): Description
29:20	0h RW	Maximum AMBA Burst Length (MAX_ABRST): Maximum AMBA burst length that is used for DMA transfers on this channel. A value of 0 indicates that software is not limiting the maximum AMBA burst length for DMA transfers on this channel.
19	0h RW	Source Handshaking Interface Polarity (SRC_HS_POL): 0 = Active high 1 = Active low
18	0h RW	Destination Handshaking Interface Polarity (DST_HS_POL): 0 = Active high 1 = Active low
17	0h RW	Bus Lock Bit (LOCK_B): When active, the AHB bus master signal hlock is asserted for the duration specified in CFGx.LOCK_B_L.
16	0h RW	Channel Lock Bit (LOCK_CH): When the channel is granted control of the master bus interface and if the CFGx.LOCK_CH bit is asserted, then no other channels are granted control of the master bus interface for the duration specified in CFGx.LOCK_CH_L. Indicates to the master bus interface arbiter that this channel wants exclusive access to the master bus interface for the duration specified in CFGx.LOCK_CH_L.
15:14	0h RW	Bus Lock Level (LOCK_B_L): Indicates the duration over which CFGx.LOCK_B bit applies. 00 = Over complete DMA transfer 01 = Over complete DMA block transfer 1x = Over complete DMA transaction
13:12	0h RW	Channel Lock Level (LOCK_CH_L): Indicates the duration over which CFGx.LOCK_CH bit applies. 00 = DMA transfer 01 = DMA block transfer 1x = DMA transaction
11	1h RW	Source Software or Hardware Handshaking Select (HS_SEL_SRC): 0 = HW handshaking 1 = SW handshaking
10	1h RW	Destination Software or Hardware Handshaking Select (HS_SEL_DST): 0 = HW handshaking 1 = SW handshaking
9	1h RO	FIFO_EMPTY: Indicates if there is data left in the channel FIFO.
8	0h RW	Channel Suspend (CH_SUSP): Suspends all DMA transfers from source until this bit is cleared.
7:5	3h RW	Channel Priority (CH_PRIOR): Priority of 7 is the highest priority.
4:0	0h RW	Undefined: RESERVED

24.3.84 Configuration Register for Channel 3 - High (CFG3_HI)—Offset 14Ch

Refer to the register description for Configuration Register for Channel 0 - Low.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 14Ch

BAR Type: PCI Configuration Register (Size: 32 bits)

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	Automatic Destination Reload (RELOAD_DST): The DARx register can be automatically reloaded from its initial value at the end of every block for multi-block transfers.
30	0h RW	Automatic Source Reload (RELOAD_SRC): The SARx register can be automatically reloaded from its initial value at the end of every block for multi-block transfers.
29:20	0h RW	Maximum AMBA Burst Length (MAX_ABRST): Maximum AMBA burst length that is used for DMA transfers on this channel. A value of 0 indicates that software is not limiting the maximum AMBA burst length for DMA transfers on this channel.
19	0h RW	Source Handshaking Interface Polarity (SRC_HS_POL): 0 = Active high 1 = Active low
18	0h RW	Destination Handshaking Interface Polarity (DST_HS_POL): 0 = Active high 1 = Active low
17	0h RW	Bus Lock Bit (LOCK_B): When active, the AHB bus master signal hlock is asserted for the duration specified in CFGx.LOCK_B_L.

Bit Range	Default & Access	Field Name (ID): Description
31:15	0h RW	Undefined: Reserved.
14:11	0h RW	DEST_PER: Assigns a hardware handshaking interface (0 - DMAH_NUM_HS_INT-1) to the destination of channel x if the CFGx.HS_SEL_DST field is 0; otherwise, this field is ignored.
10:7	0h RW	SRC_PER: Assigns a hardware handshaking interface (0 - DMAH_NUM_HS_INT-1) to the source of channel x if the CFGx.HS_SEL_SRC field is 0; otherwise, this field is ignored.
6	0h RW	Source Status Update Enable (SS_UPD_EN): Source status information is fetched only from the location pointed to by the SSTATARx register, stored in the SSTATx register and written out to the SSTATx location of the LLI (refer to Figure 52 on page 243) if SS_UPD_EN is high.
5	0h RW	Destination Status Update Enable (DS_UPD_EN): Destination status information is fetched only from the location pointed to by the DSTATARx register, stored in the DSTATx register and written out to the DSTATx location of the LLI if DS_UPD_EN is high.
4:2	1h RW	PROTCTL: Protection Control bits used to drive the AHB HPROT[3:1] bus.
1	0h RW	FIFO Mode Select (FIFO_MODE): Determines how much space or data needs to be available in the FIFO before a burst transaction request is serviced. 0 = Space/data available for single AHB transfer of the specified transfer width. 1 = Data available is greater than or equal to half the FIFO depth for destination transfers and space available is greater than half the fifo depth for source transfers.
0	0h RW	Flow Control Mode (FCMODE): Determines when source transaction requests are serviced when the Destination Peripheral is the flow controller. 0 = Source transaction requests are serviced when they occur. Data pre-fetching is enabled. 1 = Source transaction requests are not serviced until a destination transaction request occurs.

24.3.127 Configuration Register for Channel 5 - Low (CFG5_LO)—Offset 1F8h

Refer to the register description for Configuration Register for Channel 0 - Low.

Access Method

Offset: [BAR] + 1FCh

BAR Type: PCI Configuration Register (Size: 32 bits)

Default: 00000004h

Bit Range	Default & Access	Field Name (ID): Description
31:15	0h RW	Undefined: Reserved.
14:11	0h RW	DEST_PER: Assigns a hardware handshaking interface (0 - DMAH_NUM_HS_INT-1) to the destination of channel x if the CFGx.HS_SEL_DST field is 0; otherwise, this field is ignored.
10:7	0h RW	SRC_PER: Assigns a hardware handshaking interface (0 - DMAH_NUM_HS_INT-1) to the source of channel x if the CFGx.HS_SEL_SRC field is 0; otherwise, this field is ignored.
6	0h RW	Source Status Update Enable (SS_UPD_EN): Source status information is fetched only from the location pointed to by the SSTATARx register, stored in the SSTATx register and written out to the SSTATx location of the LLI (refer to Figure 52 on page 243) if SS_UPD_EN is high.
5	0h RW	Destination Status Update Enable (DS_UPD_EN): Destination status information is fetched only from the location pointed to by the DSTATARx register, stored in the DSTATx register and written out to the DSTATx location of the LLI if DS_UPD_EN is high.
4:2	1h RW	PROTCTL: Protection Control bits used to drive the AHB HPROT[3:1] bus.

Bit Range	Default & Access	Field Name (ID): Description
1	0h RW	FIFO Mode Select (FIFO_MODE): Determines how much space or data needs to be available in the FIFO before a burst transaction request is serviced. 0 = Space/data available for single AHB transfer of the specified transfer width. 1 = Data available is greater than or equal to half the FIFO depth for destination transfers and space available is greater than half the FIFO depth for source transfers.
0	0h RW	Flow Control Mode (FCMODE): Determines when source transaction requests are serviced when the Destination Peripheral is the flow controller. 0 = Source transaction requests are serviced when they occur. Data pre-fetching is enabled. 1 = Source transaction requests are not serviced until a destination transaction request occurs.

24.3.129 Source Gather Register for Channel 5 - Low (SGR5_LO)—Offset 200h

Refer to the register description for Source Gather Register for Channel 0 - Low.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 200h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:30, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description													
31:0	0h RW	Current Destination Address of DMA Transfer (DAR): Updated after each destination transfer. The DINC field in the CTLx register determines whether the address increments, decrements, or is left unchanged on every destination transfer throughout the block transfer.													

24.3.136 Destination Address Register for Channel 6 - High (DAR6_HI)—Offset 21Ch

Access Method

Offset: [BAR] + 21Ch

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:30, F:0] + 10h

Default: 00000000h

Access Method

Offset: [BAR] + 220h

BAR Type: PCI Configuration Register (Size: 32 bits)

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RW	LOC: Starting Address In Memory of next LLI if block chaining is enabled.
1:0	0h RW	List Master Select (LMS): Identifies the AHB layer/interface where the memory device that stores the next linked list item resides.

24.3.138 Linked List Pointer Register for Channel 6 - High (LLP6_HI)—Offset 224h

Access Method

Offset: [BAR] + 224h

BAR Type: PCI Configuration Register (Size: 32 bits)

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
18	0h RW	Destination Scatter Enable Bit (DST_SCATTER_EN): 0 = disabled 1 = enabled
17	0h RW	Source Gather Enable Bit (SRC_GATHER_EN): 0 = disabled 1 = enabled
16:14	1h RW	Source Burst Transaction Length (SRC_MSIZ): Refer to the description of CTL0_LO.SRC_MSIZ.
13:11	1h RW	Destination Burst Transaction Length (DEST_MSIZ): Refer to the description of CTL0_LO.DEST_MSIZ.
10:9	0h RW	Source Address Increment (SINC): 00 = Increment 01 = Decrement 1x = No change
8:7	0h RW	Destination Address Increment (DINC): Indicates whether to increment or decrement the destination address on every destination transfer. 00 = Increment 01 = Decrement 1x = No change
6:4	0h RW	Source Transfer Width (SRC_TR_WIDTH): This value must be less than or equal to DMAH_Mk_HDATA_WIDTH, where x is the AHB layer 1 to 4 where the source resides.
3:1	0h RW	Destination Transfer Width (DST_TR_WIDTH): This value must be less than or equal to DMAH_Mk_HDATA_WIDTH, where k is the AHB layer 1 to 4 where the destination resides.
0	1h RW	Interrupt Enable Bit (INT_EN): If set, then all interrupt-generating sources are enabled.

24.3.140 Control Register for Channel 6 - High (CTL6_HI)—Offset 22Ch

Refer to the register description for Control Register for Channel 0 - Low.

Access Method

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:30, F:0] + 10h

Default: 00000EC0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	Automatic Destination Reload (RELOAD_DST): The DARx register can be automatically reloaded from its initial value at the end of every block for multi-block transfers.
30	0h RW	Automatic Source Reload (RELOAD_SRC): The SARx register can be automatically reloaded from its initial value at the end of every block for multi-block transfers.
29:20	0h RW	Maximum AMBA Burst Length (MAX_ABRST): Maximum AMBA burst length that is used for DMA transfers on this channel. A value of 0 indicates that software is not limiting the maximum AMBA burst length for DMA transfers on this channel.
19	0h RW	Source Handshaking Interface Polarity (SRC_HS_POL): 0 = Active high 1 = Active low
18	0h RW	Destination Handshaking Interface Polarity (DST_HS_POL): 0 = Active high 1 = Active low
17	0h RW	Bus Lock Bit (LOCK_B): When active, the AHB bus master signal hlock is asserted for the duration specified in CFGx.LOCK_B_L.
16	0h RW	Channel Lock Bit (LOCK_CH): When the channel is granted control of the master bus interface and if the CFGx.LOCK_CH bit is asserted, then no other channels are granted control of the master bus interface for the duration specified in CFGx.LOCK_CH_L. Indicates to the master bus interface arbiter that this channel wants exclusive access to the master bus interface for the duration specified in CFGx.LOCK_CH_L.
15:14	0h RW	Bus Lock Level (LOCK_B_L): Indicates the duration over which CFGx.LOCK_B bit applies. 00 = Over complete DMA transfer 01 = Over complete DMA block transfer 1x = Over complete DMA transaction
13:12	0h RW	Channel Lock Level (LOCK_CH_L): Indicates the duration over which CFGx.LOCK_CH bit applies. 00 = DMA transfer 01 = DMA block transfer 1x = DMA transaction

Bit Range	Default & Access	Field Name (ID): Description
11	1h RW	Source Software or Hardware Handshaking Select (HS_SEL_SRC): 0 = HW handshaking 1 = SW handshaking
10	1h RW	Destination Software or Hardware Handshaking Select (HS_SEL_DST): 0 = HW handshaking 1 = SW handshaking
9	1h RO	FIFO_EMPTY: Indicates whether there is data left in the channel FIFO.
8	0h RW	Channel Suspend (CH_SUSP): Suspends all DMA transfers from source until this bit is cleared.
7:5	6h RW	Channel Priority (CH_PRIOR): Priority of 7 is the highest priority.
4:0	0h RW	Undefined: RESERVED

24.3.150 Configuration Register for Channel 6 - High (CFG6_HI)—Offset 254h

Refer to the register description for Configuration Register for Channel 0 - Low.

24.3.188 Interrupt Status Registers - High (StatusTfr_HI)—Offset 2ECh

All interrupt events from all channels are stored in these Interrupt Status registers after masking: StatusBlock, StatusDstTran, StatusErr, StatusSrcTran, and StatusTfr. Each Interrupt Status register has a bit allocated per channel; for example, StatusTfr[2] is the Channel 2 status transfer complete interrupt. The contents of these registers are used to generate the interrupt signals (int or int_n bus, depending on interrupt polarity) leaving the DW_ahb_dmac.

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	Undefined: Reserved.

24.3.207 Interrupt Clear Registers - Low (ClearTfr_LO)—Offset 338h

Each bit in the Raw Status and Status registers is cleared on the same cycle by writing a 1 to the corresponding location in the Clear registers: ClearBlock, ClearDstTran, ClearErr, ClearSrcTran, and ClearTfr. Each Interrupt Clear register has a bit allocated per channel; for example, ClearTfr[2] is the clear bit for the Channel 2 transfer complete interrupt. Writing a 0 has no effect. These registers are not readable.

Access Method

24.3.209 Interrupt Clear Registers - Low (ClearBlock_LO)—Offset 340h

Refer to the description for register ClearTfr_HI.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 340h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:30, F:0] + 10h

24.3.248 DW_ahb_dmac Component Parameters Register 2 - High (DMA_COMP_PARAMS_2_HI)—Offset 3ECh

This is a constant read-only register that contains encoded information about the component parameter settings. The reset value depends on coreConsultant parameter(s).

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 3ECh

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:30, F:0] + 10h

Default: 00000000h

24.3.249 DW_ahb_dmac Component Parameters Register 1 - Low (DMA_COMP_PARAMS_1_LO)—Offset 3F0h

This is a constant read-only register that contains encoded information about the component parameter settings. The reset value depends on coreConsultant parameter(s).

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 3F0h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:30, F:0] + 10h

Default: AAAAAAAAh

7:4	0h RW	Undefined0: Reserved.
3	0h RO	MABRST: The value of this register is derived from the DMAH_MABRST coreConsultant parameter. For a description of this parameter, refer to page 103. 0 = FALSE 1 = TRUE
2:1	2h RO	INTR_IO: The value of this register is derived from the DMAH_INTR_IO coreConsultant parameter. For a description of this parameter, refer to page 103. 0h = ALL 1h = TYPE 2h = COMBINED 3h = reserved
0	0h RO	BIG_ENDIAN: The value of this register is derived from the DMAH_BIG_ENDIAN coreConsultant parameter. For a description of this parameter, refer to page 104. 0 = FALSE 1 = TRUE

24.3.252 DMA Component ID Register - High (DmaCompsID_HI)—Offset 3FCh

This is the DW_ahb_dmac Component Version register, which is a read-only register that specifies the version of the packaged component in the upper 32 bits and the component type in the lower 32 bits.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 3FCh

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:30, F:0] + 10h

Default: 3231362Ah

31	28	24	20	16	12	8	4	0														
0	0	1	1	0	0	1	0	0	0	1	1	0	0	1	0	0	1	0	1	0	1	0
DMA_COMP_VERSION																						

Bit Range	Default & Access	Field Name (ID): Description
31:0	3231362ah RO	Version of the Component (DMA_COMP_VERSION): Reserved.

Access Method

Offset: [B:0, D:24, F:0] + 8h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
CLASS_CODES							RID	

24.4.4 Cache Line Latency Header and BIST (CLLATHEADERBIST)—Offset Ch

Access Method

Offset: [B:0, D:24, F:0] + Ch

October 2018
Document Number: 538136, Rev. 4.3

31	28	24	20	16	12	8	4	0
0	0	0	0	1	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
Reserved0				MULFNDEV	HEADERTYPE			
					LATTIMER			
								CACHELINE_SIZE

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RO	Reserved0: Reserved.
23	1h RO	Multi Function Device (MULFNDEV): This bit is always 0 for non fabric ports. For Fabric ports it is driven from fabric_mult_function strap. 1 = multifunction device 0 = single function device
22:16	00h RO	Header Type (HEADERTYPE): Implements Type 0 Configuration header.
15:8	00h RO	Latency Timer (LATTIMER): Does not apply to PCI Express. Hardwired to 00h.
7:0	00h RW	Cache Line Size (CACHELINE_SIZE): Doesn't apply to PCI Express. PCI Express spec requires this to be implemented as a R/W register but has no functional impact on the AHB Device connected.

24.4.5 Base Address Register (BAR)—Offset 10h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:24, F:0] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
BASEADDR						SIZEINDICATOR	PREFETCHABLE	TYPE
								MESSAGE_SPACE

Bit Range	Default & Access	Field Name (ID): Description
31:12	00000h RW	Base Address (BASEADDR): Base address of the AHB device memory space. Taken from Strap values as 1.s
11:4	00h RO	Size Indicator Read Only (SIZEINDICATOR): Always returns zero. The size of this register depends on the size of the Memory space. This size is determined by a top level of STRAP values as 0.s. Always will be zero as minimum size is 4K.
3	0h RO	Prefetchable (PREFETCHABLE): Indicates that this BAR is not prefetchable.

24.4.8 Expansion ROM Base Address (EXPANSION_ROM_BASEADDR)—Offset 30h

Offset: [B:0, D:24, F:0] + 30h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
EXPANSION_ROM_BASE								

24.4.9 Capabilities Pointer (CAPABILITYPTR)—Offset 34h

Offset: [B:0, D:24, F:0] + 34h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RW/1C	PME Status (PMESTATUS): 0 = Software clears the bit by writing a 1 to it. 1 = This bit is set when the AHB Device would normally assert the PME# signal independent of the state of the PME Enable bit (bit 8 in this register).
14:9	00h RO	Reserved1: Reserved.
8	0h RW	PME Enable (PMEENABLE): A 1 enables the function to assert PME#. When 0, PME# message on SB is disabled.
7:4	0h RO	Reserved2: Reserved.
3	1h RO	No_Soft_Reset (NO_SOFT_RESET): This bit indicates that devices transitioning from D3hot to D0 because of PowerState commands do not perform an internal reset. Configuration Context is preserved.
2	0h RO	Reserved3: Reserved.
1:0	0h RW	Power State (POWERSTATE): This field is used both to determine the current power state of the AHB IP and to set a new power state. The values are: 00 = D0 state 11 = D3HOT state - Others = Reserved Notes: If software attempts to write a value of 01b or 10b in to this field, the write operation must complete normally; however, the data is discarded and no state change occurs. When in the D3HOT states, interrupts are blocked. D3Hot will not be used for Downstream decode on fabric ports.

24.4.13 Manufacturer ID (MANID)—Offset F8h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:24, F:0] + F8h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0

24.5.1 Source Address Register for Channel 0 - Low (SAR0_LO)—Offset 0h

The starting source address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the source address of the current AHB transfer.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 0h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:0] + 10h

Default: 00000000h

Undefined								

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	Undefined: RESERVED

Access Method

Offset: [BAR] + 8h

BAR Reference: [B:0, D:24, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	Current Destination Address of DMA Transfer (DAR): Updated after each destination transfer. The DINC field in the CTLx register determines whether the address increments, decrements, or is left unchanged on every destination transfer throughout the block transfer.

24.5.4 Destination Address Register for Channel 0 - High (DAR0_HI)—Offset Ch

Refer to the description for register Destination Address Register for Channel 0 - Low.

Access Method

Offset: [BAR] + Ch

BAR Reference: [B:0, D:24, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	Undefined: Reserved.

24.5.6 Linked List Pointer Register for Channel 0 - High (LLP0_HI)—Offset 14h

24.5.7 Control Register for Channel 0 - Low (CTL0_LO)—Offset 18h

This register contains fields that control the DMA transfer. **Note:** You need to program this register prior to enabling the channel.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 18h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:0] + 10h

Default: 00304801h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RW	Undefined_: RESERVED
28	0h RW	LLP_SRC_EN: Block chaining is enabled on the source side only if the LLP_SRC_EN field is high and LLPx.LOC is non-zero
27	0h RW	LLP_DST_EN: Block chaining is enabled on the destination side only if the LLP_DST_EN field is high and LLPx.LOC is non-zero.
26:25	0h RW	Source Master Select (SMS): Identifies the Master Interface layer from which the source device (peripheral or memory) is accessed.
24:23	0h RW	Destination Master Select (DMS): Identifies the Master Interface layer where the destination device (peripheral or memory) resides.
22:20	3h RW	Transfer Type and Flow Control (TT_FC): The following transfer types are supported. - Memory to Memory - Memory to Peripheral - Peripheral to Memory - Peripheral to Peripheral Flow Control can be assigned to the DW_ahb_dmac, the source peripheral, or the destination peripheral.
19	0h RW	Undefined: RESERVED
18	0h RW	Destination Scatter Enable Bit (DST_SCATTER_EN): 0 = disabled 1 = enabled
17	0h RW	Source Gather Enable Bit (SRC_GATHER_EN): 0 = disabled 1 = enabled
16:14	1h RW	Source Burst Transaction Length (SRC_MSIZE): Number of data items, each of width CTLx.SRC_TR_WIDTH, to be read from the source every time a source burst transaction request is made from either the corresponding hardware or software handshaking interface.

Bit Range	Default & Access	Field Name (ID): Description
13:11	1h RW	Destination Burst Transaction Length (DEST_MSIZ): Number of data items, each of width CTLx.DST_TR_WIDTH, to be written to the destination every time a destination burst transaction request is made from either the corresponding hardware or software handshaking interface.
10:9	0h RW	Source Address Increment (SINC): 00 = Increment 01 = Decrement 1x = No change
8:7	0h RW	Destination Address Increment (DINC): Indicates whether to increment or decrement the destination address on every destination transfer. 00 = Increment 01 = Decrement 1x = No change
6:4	0h RW	Source Transfer Width (SRC_TR_WIDTH): This value must be less than or equal to DMAH_Mx_HDATA_WIDTH, where x is the AHB layer 1 to 4 where the source resides.
3:1	0h RW	Destination Transfer Width (DST_TR_WIDTH): This value must be less than or equal to DMAH_Mk_HDATA_WIDTH, where k is the AHB layer 1 to 4 where the destination resides.
0	1h RW	Interrupt Enable Bit (INT_EN): If set, then all interrupt-generating sources are enabled.

24.5.8 Control Register for Channel 0 - High (CTL0_HI)—Offset 1Ch

Refer to the register description for Control Register for Channel 0 - Low.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 1Ch

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	SSTATAR: Pointer from where the hw can fetch the source status information registered in SSTAT0.

24.5.14 Source Status Address Register for Channel 0 - High (SSTATAR0_HI)—Offset 34h

Access Method

Offset: [BAR] + 34h

BAR Reference: [B:0, D:24, F:0] + 10h

[illegible]

24.5.17 Configuration Register for Channel 0 - Low (CFG0_LO)—Offset 40h

This register contains fields that configure the DMA transfer. The channel configuration register remains fixed for all blocks of a multi-block transfer. **Note:** You need to program this register prior to enabling the channel.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 40h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:0] + 10h

Default: 00000E00h

31				28				24				20				16				12				8				4				0																											
0 0 0 0				0 0 0 0				0 0 0 0				0 0 0 0				0 0 0 0				1 1 1 0				0 0 0 0				0 0 0 0

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	Automatic Destination Reload (RELOAD_DST): The DARx register can be automatically reloaded from its initial value at the end of every block for multi-block transfers.
30	0h RW	Automatic Source Reload (RELOAD_SRC): The SARx register can be automatically reloaded from its initial value at the end of every block for multi-block transfers.
29:20	0h RW	Maximum AMBA Burst Length (MAX_ABRST): Maximum AMBA burst length that is used for DMA transfers on this channel. A value of 0 indicates that software is not limiting the maximum AMBA burst length for DMA transfers on this channel.
19	0h RW	Source Handshaking Interface Polarity (SRC_HS_POL): 0 = Active high 1 = Active low
18	0h RW	Destination Handshaking Interface Polarity (DST_HS_POL): 0 = Active high 1 = Active low
17	0h RW	Bus Lock Bit (LOCK_B): When active, the AHB bus master signal hlock is asserted for the duration specified in CFGx.LOCK_B_L.
16	0h RW	Channel Lock Bit (LOCK_CH): When the channel is granted control of the master bus interface and if the CFGx.LOCK_CH bit is asserted, then no other channels are granted control of the master bus interface for the duration specified in CFGx.LOCK_CH_L. Indicates to the master bus interface arbiter that this channel wants exclusive access to the master bus interface for the duration specified in CFGx.LOCK_CH_L.

24.5.22 Dest Scatter Register for Channel 0 - High (DSR0_HI)—Offset 54h

Refer to the register description for Destination Scatter Register for Channel 0 - Low.

Access Method

Type: Memory Mapped I/O Register

SAR

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	Current Source Address of DMA Transfer (SAR): Updated after each source transfer. The SINC field in the CTLx register determines whether the address increments, decrements, or is left unchanged on every source transfer throughout the block transfer.

Bit Range	Default & Access	Field Name (ID): Description
26:25	0h RW	Source Master Select (SMS): Identifies the Master Interface layer from which the source device (peripheral or memory) is accessed.
24:23	0h RW	Destination Master Select (DMS): Identifies the Master Interface layer where the destination device (peripheral or memory) resides.
22:20	3h RW	Transfer Type and Flow Control (TT_FC): Refer to description for CTL0_LO.TT_FC.
19	0h RW	Undefined: RESERVED
18	0h RW	Destination Scatter Enable Bit (DST_SCATTER_EN): 0 = disabled 1 = enabled
17	0h RW	Source Gather Enable Bit (SRC_GATHER_EN): 0 = disabled 1 = enabled
16:14	1h RW	Source Burst Transaction Length (SRC_MSIZ): Refer to the description of CTL0_LO.SRC_MSIZ.
13:11	1h RW	Destination Burst Transaction Length (DEST_MSIZ): Refer to the description for CTL0_LO.DEST_MSIZ.
10:9	0h RW	Source Address Increment (SINC): 00 = Increment 01 = Decrement 1x = No change
8:7	0h RW	Destination Address Increment (DINC): Indicates whether to increment or decrement the destination address on every destination transfer. 00 = Increment 01 = Decrement 1x = No change
6:4	0h RW	Source Transfer Width (SRC_TR_WIDTH): This value must be less than or equal to DMAH_Mx_HDATA_WIDTH, where x is the AHB layer 1 to 4 where the source resides.
3:1	0h RW	Destination Transfer Width (DST_TR_WIDTH): This value must be less than or equal to DMAH_Mk_HDATA_WIDTH, where k is the AHB layer 1 to 4 where the destination resides.
0	1h RW	Interrupt Enable Bit (INT_EN): If set, then all interrupt-generating sources are enabled.

24.5.30 Control Register for Channel 1 - High (CTL1_HI)—Offset 74h

Refer to the register description for Control Register for Channel 0 - Low.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 74h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:0] + 10h

Default: 00000002h

Bit Range	Default & Access	Field Name (ID): Description
14:11	0h RW	DEST_PER: Assigns a hardware handshaking interface (0 - DMAH_NUM_HS_INT-1) to the destination of channel x if the CFGx.HS_SEL_DST field is 0; otherwise, this field is ignored.
10:7	0h RW	SRC_PER: Assigns a hardware handshaking interface (0 - DMAH_NUM_HS_INT-1) to the source of channel x if the CFGx.HS_SEL_SRC field is 0; otherwise, this field is ignored.
6	0h RW	Source Status Update Enable (SS_UPD_EN): Source status information is fetched only from the location pointed to by the SSTATARx register, stored in the SSTATx register and written out to the SSTATx location of the LLI (refer to Figure 52 on page 243) if SS_UPD_EN is high.
5	0h RW	Destination Status Update Enable (DS_UPD_EN): Destination status information is fetched only from the location pointed to by the DSTATARx register, stored in the DSTATx register and written out to the DSTATx location of the LLI if DS_UPD_EN is high.
4:2	1h RW	PROTCTL: Protection Control bits used to drive the AHB HPROT[3:1] bus.
1	0h RW	FIFO Mode Select (FIFO_MODE): Determines how much space or data needs to be available in the FIFO before a burst transaction request is serviced. 0 = Space/data available for single AHB transfer of the specified transfer width. 1 = Data available is greater than or equal to half the FIFO depth for destination transfers and space available is greater than half the fifo depth for source transfers.
0	0h RW	Flow Control Mode (FCMODE): Determines when source transaction requests are serviced when the Destination Peripheral is the flow controller. 0 = Source transaction requests are serviced when they occur. Data pre-fetching is enabled. 1 = Source transaction requests are not serviced until a destination transaction request occurs.

24.5.41 Source Gather Register for Channel 1 - Low (SGR1_LO)—Offset A0h

Refer to the register description for Source Gather Register for Channel 0 - Low.

Access Method

Type: Memory Mapped I/O Register

SSTATAR								

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	DSTATAR (SSTATAR): Pointer from where the hw can fetch the source status information registered in SSTAT0.

24.5.82 Dest Status Address Register for Channel 3 - High (DSTATAR3_HI)—Offset 144h

Refer to the description for register Dest Status Address Register for Channel 0 - Low.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 144h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:0] + 10h

Default: 00000000h

Access Method

Offset: [BAR] + 148h**BAR Type:** PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:0] + 10h

Default: 00000E60h

[illegible]

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	Automatic Destination Reload (RELOAD_DST): The DARx register can be automatically reloaded from its initial value at the end of every block for multi-block transfers.
30	0h RW	Automatic Source Reload (RELOAD_SRC): The SARx register can be automatically reloaded from its initial value at the end of every block for multi-block transfers.
29:20	0h RW	Maximum AMBA Burst Length (MAX_ABRST): Maximum AMBA burst length that is used for DMA transfers on this channel. A value of 0 indicates that software is not limiting the maximum AMBA burst length for DMA transfers on this channel.
19	0h RW	Source Handshaking Interface Polarity (SRC_HS_POL): 0 = Active high 1 = Active low
18	0h RW	Destination Handshaking Interface Polarity (DST_HS_POL): 0 = Active high 1 = Active low
17	0h RW	Bus Lock Bit (LOCK_B): When active, the AHB bus master signal hlock is asserted for the duration specified in CFGx.LOCK_B_L.

Bit Range	Default & Access	Field Name (ID): Description
31:15	0h RW	Undefined: Reserved.
14:11	0h RW	DEST_PER: Assigns a hardware handshaking interface (0 - DMAH_NUM_HS_INT-1) to the destination of channel x if the CFGx.HS_SEL_DST field is 0; otherwise, this field is ignored.
10:7	0h RW	SRC_PER: Assigns a hardware handshaking interface (0 - DMAH_NUM_HS_INT-1) to the source of channel x if the CFGx.HS_SEL_SRC field is 0; otherwise, this field is ignored.
6	0h RW	Source Status Update Enable (SS_UPD_EN): Source status information is fetched only from the location pointed to by the SSTATARx register, stored in the SSTATx register and written out to the SSTATx location of the LLI (refer to Figure 52 on page 243) if SS_UPD_EN is high.
5	0h RW	Destination Status Update Enable (DS_UPD_EN): Destination status information is fetched only from the location pointed to by the DSTATARx register, stored in the DSTATx register and written out to the DSTATx location of the LLI if DS_UPD_EN is high.
4:2	1h RW	PROCTL: Protection Control bits used to drive the AHB HPROT[3:1] bus.
1	0h RW	FIFO Mode Select (FIFO_MODE): Determines how much space or data needs to be available in the FIFO before a burst transaction request is serviced. 0 = Space/data available for single AHB transfer of the specified transfer width. 1 = Data available is greater than or equal to half the FIFO depth for destination transfers and space available is greater than half the fifo depth for source transfers.
0	0h RW	Flow Control Mode (FCMODE): Determines when source transaction requests are serviced, when the Destination Peripheral is the flow controller. 0 = Source transaction requests are serviced when they occur. Data pre-fetching is enabled. 1 = Source transaction requests are not serviced until a destination transaction request occurs.

24.5.85 Source Gather Register for Channel 3 - Low (SGR3_LO)—Offset 150h

Refer to the register description for Source Gather Register for Channel 0 - Low.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 150h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:0] + 10h

Default: 00000000h

[illegible]

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RW	Source Gather Count (SGC): Source contiguous transfer count between successive gather boundaries.
19:0	0h RW	Source Gather Interval (SGI): Refer to the description for SGR0_LO.SGI.

Access Method

BAR Reference: [B:0, D:24, F:0] + 10h

[illegible]

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	Undefined: Reserved.

24.5.87 Destination Scatter Register for Channel 3 - Low (DSR3_LO)—Offset 158h

Access Method

24.5.126 Dest Status Address Register for Channel 5 - High (DSTATAR5_HI)—Offset 1F4h

Refer to the description for register Dest Status Address Register for Channel 0 - Low.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 1F4h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:0] + 10h

Default: 00000000h

Access Method

Offset: [BAR] + 1F8h

BAR Type: PCI Configuration Register (Size: 32 bits)

Default: 00000EA0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	Automatic Destination Reload (RELOAD_DST): The DARx register can be automatically reloaded from its initial value at the end of every block for multi-block transfers.
30	0h RW	Automatic Source Reload (RELOAD_SRC): The SARx register can be automatically reloaded from its initial value at the end of every block for multi-block transfers.
29:20	0h RW	Maximum AMBA Burst Length (MAX_ABRST): Maximum AMBA burst length that is used for DMA transfers on this channel. A value of 0 indicates that software is not limiting the maximum AMBA burst length for DMA transfers on this channel.
19	0h RW	Source Handshaking Interface Polarity (SRC_HS_POL): 0 = Active high 1 = Active low
18	0h RW	Destination Handshaking Interface Polarity (DST_HS_POL): 0 = Active high 1 = Active low
17	0h RW	Bus Lock Bit (LOCK_B): When active, the AHB bus master signal hlock is asserted for the duration specified in CFGx.LOCK_B_L.

Bit Range	Default & Access	Field Name (ID): Description
16	0h RW	Channel Lock Bit (LOCK_CH): When the channel is granted control of the master bus interface, and if the CFGx.LOCK_CH bit is asserted, then no other channels are granted control of the master bus interface for the duration specified in CFGx.LOCK_CH_L. Indicates to the master bus interface arbiter that this channel wants exclusive access to the master bus interface for the duration specified in CFGx.LOCK_CH_L.
15:14	0h RW	Bus Lock Level (LOCK_B_L): Indicates the duration over which CFGx.LOCK_B bit applies. 00 = Over complete DMA transfer 01 = Over complete DMA block transfer 1x = Over complete DMA transaction
13:12	0h RW	Channel Lock Level (LOCK_CH_L): Indicates the duration over which CFGx.LOCK_CH bit applies. 00 = DMA transfer 01 = DMA block transfer 1x = DMA transaction
11	1h RW	Source Software or Hardware Handshaking Select (HS_SEL_SRC): 0 = HW handshaking 1 = SW handshaking
10	1h RW	Destination Software or Hardware Handshaking Select (HS_SEL_DST): 0 = HW handshaking 1 = SW handshaking
9	1h RO	FIFO_EMPTY: Indicates if there is data left in the channel FIFO.
8	0h RW	Channel Suspend (CH_SUSP): Suspends all DMA transfers from source until this bit is cleared.
7:5	5h RW	Channel Priority (CH_PRIOR): Priority of 7 is the highest priority.
4:0	0h RW	Undefined: RESERVED

24.5.135 Destination Address Register for Channel 6 - Low (DAR6_LO)—Offset 218h

Refer to the description for register Destination Address Register for Channel 0 - Low.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 218h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:0] + 10h

Default: 00000000h

Diagram illustrating the 32-bit DAR register structure. The register is divided into eight 4-bit segments, each labeled with a hexadecimal value: 31, 28, 24, 20, 16, 12, 8, and 4. The bits are numbered 0 to 31 from right to left. The label 'DAR' is positioned below the 16-bit segment.

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	Current Destination Address of DMA Transfer (DAR): Updated after each destination transfer. The DINC field in the CTLx register determines whether the address increments, decrements, or is left unchanged on every destination transfer throughout the block transfer.

24.5.136 Destination Address Register for Channel 6 - High (DAR6_HI)—Offset 21Ch

Refer to the description for register Destination Address Register for Channel 0 - Low.

Access Method

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:0] + 10h

Default: 00000EC0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	Automatic Destination Reload (RELOAD_DST): The DARx register can be automatically reloaded from its initial value at the end of every block for multi-block transfers.
30	0h RW	Automatic Source Reload (RELOAD_SRC): The SARx register can be automatically reloaded from its initial value at the end of every block for multi-block transfers.
29:20	0h RW	Maximum AMBA Burst Length (MAX_ABRST): Maximum AMBA burst length that is used for DMA transfers on this channel. A value of 0 indicates that software is not limiting the maximum AMBA burst length for DMA transfers on this channel.
19	0h RW	Source Handshaking Interface Polarity (SRC_HS_POL): 0 = Active high 1 = Active low
18	0h RW	Destination Handshaking Interface Polarity (DST_HS_POL): 0 = Active high 1 = Active low
17	0h RW	Bus Lock Bit (LOCK_B): When active, the AHB bus master signal hlock is asserted for the duration specified in CFGx.LOCK_B_L.
16	0h RW	Channel Lock Bit (LOCK_CH): When the channel is granted control of the master bus interface and if the CFGx.LOCK_CH bit is asserted, then no other channels are granted control of the master bus interface for the duration specified in CFGx.LOCK_CH_L. Indicates to the master bus interface arbiter that this channel wants exclusive access to the master bus interface for the duration specified in CFGx.LOCK_CH_L.
15:14	0h RW	Bus Lock Level (LOCK_B_L): Indicates the duration over which CFGx.LOCK_B bit applies. 00 = Over complete DMA transfer 01 = Over complete DMA block transfer 1x = Over complete DMA transaction
13:12	0h RW	Channel Lock Level (LOCK_CH_L): Indicates the duration over which CFGx.LOCK_CH bit applies. 00 = DMA transfer 01 = DMA block transfer 1x = DMA transaction

Bit Range	Default & Access	Field Name (ID): Description
5	0h RW	Destination Status Update Enable (DS_UPD_EN): Destination status information is fetched only from the location pointed to by the DSTATARx register, stored in the DSTATx register and written out to the DSTATx location of the LLI if DS_UPD_EN is high.
4:2	1h RW	PROTCTL: Protection Control bits used to drive the AHB HPROT[3:1] bus.
1	0h RW	FIFO Mode Select (FIFO_MODE): Determines how much space or data needs to be available in the FIFO before a burst transaction request is serviced. 0 = Space/data available for single AHB transfer of the specified transfer width. 1 = Data available is greater than or equal to half the FIFO depth for destination transfers and space available is greater than half the fifo depth for source transfers.
0	0h RW	Flow Control Mode (FCMODE): Determines when source transaction requests are serviced when the Destination Peripheral is the flow controller. 0 = Source transaction requests are serviced when they occur. Data pre-fetching is enabled. 1 = Source transaction requests are not serviced until a destination transaction request occurs.

24.5.177 Interrupt Raw Status Registers - Low (RawTfr_LO)—Offset 2C0h

Interrupt events are stored in these Raw Interrupt Status registers before masking: RawBlock, RawDstTran, RawErr, RawSrcTran, and RawTfr. Each Raw Interrupt Status register has a bit allocated per channel; for example, RawTfr[2] is the Channel 2 raw transfer complete interrupt. Each bit in these registers is cleared by writing a 1 to the corresponding location in the ClearTfr, ClearBlock, ClearSrcTran, ClearDstTran, ClearErr registers.

24.5.188 Interrupt Status Registers - High (StatusTfr_HI)—Offset 2ECh

All interrupt events from all channels are stored in these Interrupt Status registers after masking: StatusBlock, StatusDstTran, StatusErr, StatusSrcTran, and StatusTfr. Each Interrupt Status register has a bit allocated per channel; for example, StatusTfr[2] is the Channel 2 status transfer complete interrupt. The contents of these registers are used to generate the interrupt signals (int or int_n bus, depending on interrupt polarity) leaving the DW_ahb_dmac.

Access Method

24.5.217 Combined Interrupt Status Register - Low (StatusInt_LO)— Offset 360h

The contents of each of the five Status registers StatusTfr, StatusBlock, StatusSrcTran, StatusDstTran, StatusErr is ORed to produce a single bit for each interrupt type in the Combined Status register (StatusInt). This register is read-only.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 360h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:0] + 10h

Default: 00000000h

24.5.236 DW_ahb_dmac ID Register - High (DmaIdReg_HI)—Offset 3ACh

Refer to the description of DW_ahb_dmac ID Register - Low.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 3ACh

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:0] + 10h

Default: 00000000h

Diagram illustrating the bit positions (31 down to 0) and the value 0x00000000. The register is divided into sections of 4 bits each, labeled 31, 28, 24, 20, 16, 12, 8, 4, and 0. The value 0x00000000 is shown in the top row. A vertical line labeled 'Undefined' is positioned at bit 16, indicating that bits 16 through 31 are undefined.

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	Undefined: Reserved.

24.5.237 DW_ahb_dmac Test Register - Low (DmaTestReg_LO)—Offset 3B0h

This register is used to put the AHB slave interface into test mode, during which the readback value of the writable registers match the value written, assuming the DW_ahb_dmac configuration has not optimized the same registers. In normal operation, the readback value of some registers is a function of the DW_ahb_dmac state, and does not match the value written.

The PWM module will apply the new settings at the end of the current cycle and reset this bit. 0 = No updates pending 1 = Update pending
29:24	0b RO	RSVD0: Reserved
23:8	0100h RW	PWM Base Unit (PWM_BASE_UNIT): Base unit register. Unsigned 8 integer bits, 8 fraction bits. Used to determine PWM output frequency.
7:0	00h RW	PWM On Time Divisor (PWM_ON_TIME_DIVISOR): PWM duty cycle = PWM_on-time_divisor/256.

Bit Range	Default & Access	Field Name (ID): Description
3	0h RW	gpo1: not applicable
2	0h RW	reset_e: not applicable
1	0h RW	sleep_enable: not applicable
0	0h RW	power_enable: not applicable

Bit Range	Default & Access	Field Name (ID): Description
7:3	00h RO	Reserved5: Reserved.
2	0h RW	Bus Master Enable (BME): If this bit is 0, Bridge does not generate any new upstream transaction on IOSF as a master.
1	0h RW	Memory Space Enable (MSE): This bit controls Bridge's response to downstream Memory accesses. When set, accesses to memory space of the device is enabled.
0	0h RO	Reserved6: Reserved.

24.7.3 Revision ID and Class Code (REVCLASSCODE)—Offset 8h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:30, F:2] + 8h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
CLASS_CODES							RID	

Bit Range	Default & Access	Field Name (ID): Description
31:8	000000h RO	Class Code (CLASS_CODES): The Class Code register is read-only and used to identify the generic function of the device and, in some cases, a specific register level programming interface. The register is broken into three byte size fields. The upper byte (at offset 0Bh) is a base class code which broadly classifies the type of function the device performs. The middle byte (at offset 0Ah) is a sub-class code which identifies more specifically the function of the device. The lower byte (at offset 09h) identifies a specific register-level programming interface (if any) so that device independent software can interact with the device. This register is tied to a strap at the top level.
7:0	00h RO	Revision ID (RID): Revision ID identifies the revision of particular AHB device. This is tied to a strap at the top level.

24.7.4 Cache Line Latency Header and BIST (CLLATHEADERBIST)—Offset Ch

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:30, F:2] + Ch

Default: 00800000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
Reserved0	MULFNDEV	HEADERTYPE	LATTIMER	CACHELINE_SIZE				

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RO	Reserved0: Reserved.
23	1h RO	Multi Function Device (MULFNDEV): This bit is always 0 for non fabric ports. For Fabric ports it is driven from fabric_mult_function strap. 1 = multifunction device 0 = single function device
22:16	00h RO	Header Type (HEADERTYPE): Implements Type 0 Configuration header.
15:8	00h RO	Latency Timer (LATTIMER): Does not apply to PCI Express. Hardwired to 00h.
7:0	00h RW	Cache Line Size (CACHELINE_SIZE): Doesn't apply to PCI Express. PCI Express spec requires this to be implemented as a R/W register but has no functional impact on the AHB Device connected.

24.7.5 Base Address Register (BAR)—Offset 10h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:30, F:2] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
BASEADDR	SIZEINDICATOR	PREFETCHABLE	TYPE	MESSAGE_SPACE				

Bit Range	Default & Access	Field Name (ID): Description
31:12	00000h RW	Base Address (BASEADDR): Base address of the AHB device memory space. Taken from Strap values as 1.s
11:4	00h RO	Size Indicator Read Only (SIZEINDICATOR): Always returns zero. The size of this register depends on the size of the Memory space. This size is determined by a top level of STRAP values as 0.s. Always will be zero as minimum size is 4K.
3	0h RO	Prefetchable (PREFETCHABLE): Indicates that this BAR is not prefetchable.

Bit Range	Default & Access	Field Name (ID): Description
2:1	0h RO	Type (TYPE): 00 indicates BAR lies in 32 bit address range.
0	0h RO	Memory Space Indicator (MESSAGE_SPACE): 0. Indicates this BAR is present in the memory space.

24.7.6 Base Address Register 1 (BAR1)—Offset 14h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:30, F:2] + 14h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
BASEADDR1						SIZEINDICATOR1		
PREFETCHABLE1			TYPE1			MESSAGE_SPACE1		

Bit Range	Default & Access	Field Name (ID): Description
31:12	00000h RW	Base Address Register 1 (BASEADDR1): BAR1 of the LP10 device.
11:4	00h RO	SIZEINDICATOR1: Always will be zero as minimum size is 4K.
3	0h RO	Prefetchable (PREFETCHABLE1): Indicates that this BAR is not.
2:1	0h RO	Type (TYPE1): 00 Indicates BAR lies in 32 bit address range.
0	0h RO	Memory Space Indicator (MESSAGE_SPACE1): 0. Indicates this BAR is present in the memory space.

24.7.7 Subsystem Vendor and Subsystem ID (SUBSYSTEMID)—Offset 2Ch

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:30, F:2] + 2Ch

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW/O	Subsystem ID (SUBSYSTEMID): This register should be implemented for any function that could be instantiated more than once in a given system. The SID register in combination with the Subsystem Vendor ID register, make it possible for the operating environment to distinguish one audio subsystem from the other. This register is a Read Write Once type register.
15:0	0000h RW/O	Subsystem Vendor ID (SUBSYSTEMVENDORID): This register should be implemented for any function that could be instantiated more than once in a given system. The SVID register, in combination with the Subsystem ID register, enables the operating environment to distinguish one subsystem from the other. This register is a Read Write Once register.

Expansion ROM Base Address (EXPANSION_ROM_BASEADDR)—Offset 30h

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:30, F:2] + 30h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
EXPANSTON_ROM_BASE								

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	EXPANSION_ROM_BASE: Reserved.

24.7.9 Capabilities Pointer (CAPABILITYPTR)—Offset 34h

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:30, F:2] + 34h

Default: 00030001h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	1
PMESUPPORT					Reserved0			VERSION
					NXTCAP			POWER_CAP

Bit Range	Default & Access	Field Name (ID): Description
31:27	00h RO	PME_Support (PMESUPPORT): This 5-bit field indicates the power states in which the function may assert PME#. A value of 0b for any bit indicates that the function is not capable of asserting the PME# signal while in that power state. - bit(11) X XXX1b - PME# can be asserted from D0. - bit(12) X XX1Xb - PME# can be asserted from D1. Bridge does not support this state. - bit(13) X X1XXb - PME# can be asserted from D2. Bridge does not support this state. - bit(14) X 1XXXb - PME# can be asserted from D3hot. - bit(15) 1 XXXXb - PME# can be asserted from D3cold. Bridge does not support this state. This field is taken from the strap strap_pme_support.
26:19	00h RO	Reserved0: Reserved.
18:16	3h RO	Version (VERSION): Indicates support for Revision 1.2 of the PCI Power Management Specification.
15:8	00h RO	Next Capability (NXTCAP): Points to the next capability structure. This points to NULL.
7:0	01h RO	Power Management Capability (POWER_CAP): Indicates this is power management capability.

24.7.12 PME Control and Status Register (PMECTRLSTATUS)—Offset 84h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:30, F:2] + 84h

Default: 00000008h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	1

PWM_ENABLE	PWM_SW_UPDATE	RSVD0	PWM_BASE_UNIT	PWM_ON_TIME_DIVISOR				

Bit Range	Default & Access	Field Name (ID): Description
31	0b RW	PWM Enable (PWM_ENABLE): 0 = Disable PWM Output 1 = Enable PWM Output
30	0b RW	PWM Software Update (PWM_SW_UPDATE): Indication that there is an update to PWM settings pending. SW sets this bit to 1 when updating the PWM_base_unit or PWM_on_time_divisor fields. The PWM module will apply the new settings at the end of the current cycle and reset this bit. 0 = No updates pending 1 = Update pending
29:24	0b RO	RSVD0: Reserved
23:8	0100h RW	PWM Base Unit (PWM_BASE_UNIT): Base unit register. Unsigned 8 integer bits, 8 fraction bits. Used to determine PWM output frequency.
7:0	00h RW	PWM On Time Divisor (PWM_ON_TIME_DIVISOR): PWM duty cycle = PWM_on-time_divisor/256.

Bit Range	Default & Access	Field Name (ID): Description
3	0h RW	gpo1: not applicable
2	0h RW	reset_e: not applicable
1	0h RW	sleep_enable: not applicable
0	0h RW	power_enable: not applicable

25 SIO - Serial Peripheral Interface (SPI)

The Serial I/O implements one SPI controller that supports master mode.

Note: This SPI controller does not support platform firmware (BIOS). See the SPI controller in the PCU instead.

25.1 Signal Descriptions

Please see [Chapter 2, “Physical Interfaces”](#) for additional details.

The signal description table has the following headings:

- **Signal Name:** The name of the signal/pin
- **Direction:** The buffer direction can be either input, output, or I/O (bidirectional)
- **Platform Power:** The reference power plane.
- **Description:** A brief explanation of the signal’s function

Figure 115.SPI Interface Signals (Sheet 1 of 2)

Signal Name	Direction Plat. Power	Description
SIO_SPI_CLK	I/O V1P8S	SPI Serial Clock

**Figure 115.SPI Interface Signals (Sheet 2 of 2)**

Signal Name	Direction Plat. Power	Description
SIO_SPI_CS#	I/O V1P8S	SPI Chip Select SPI Chip Select is active low.
SIO_SPI_MOSI	O V1P8S	SPI Master Output Slave Input
SIO_SPI_MISO	I V1P8S	SPI Slave Output Master Input

25.2 Features

The following is a list of SPI features:

- Single interrupt line
 - Could be assigned to interrupt PCI INT [A] or ACPISIO INT[1]
- Configurable frame format, clock polarity and clock phase
- supporting one SPI peripheral only
- Supports master mode only
- Receive and transit buffers are both 256x32bits
 - The receive buffer has only 1 water mark
 - The transmit buffer has 2 water marks
- Supports up to 15 Mbps

25.2.1 Clock Phase and Polarity

SPI clock phase and clock polarity overview.

- The SSCR1.SPO polarity setting bit determines whether the serial transfer occurs on the rising edge of the clock or the falling edge of the clock.
 - When SSCR1.SPO = 0, the inactive or idle state of SIO_SPI_CLK is low.
 - When SSCR1.SPO = 1, the inactive or idle state of SIO_SPI_CLK is high.
- The SSCR1.SPH phase setting bit selects the relationship of the serial clock with the slave select signal.
 - When SSCR1.SPH = 0, SIO_SPI_CLK is inactive until one cycle after the start of a frame and active until 1/2 cycle after the end of a frame.
 - When SSCR1.SPH = 1, SIO_SPI_CLK is inactive until 1/2 cycle after the start of a frame and active until one cycle after the end of a frame.

Below figure shows an 8-bit data transfer with different phase and polarity settings.

Figure 116. Clock Phase and Polarity

- In a single frame transfer, the SPI controller supports all four possible combinations for the serial clock phase and polarity.

25.2.2 Mode Numbers

The combinations of polarity and phases are referred to as modes which are commonly numbered according to the following convention, with SSCR1.SPO as the high order bit and SSCR1.SPH as the low order bit.

Table 259. SPI Modes

Mode	SSCR1.SPO	SSCR1.SPH
0	0	0
1	0	1
2	1	0
3	1	1

25.2.3 Frame Direction

The SSCR1.SFRMDIR bit is a read-write bit that determines whether the SSP is the master or slave with respect to driving the SSPSFRM. When SSCR1.SFRMDIR=0, the SSP generates the SSPSFRM internally, acts as the master and drives it. When SSCR1.SFRMDIR=1, the SSP acts as the slave and receives the SSPSFRM signal from an external device. When the SSP is to be configured as a slave to the frame, the external device driving frame must wait until the SSSR.CSS bit is cleared after enabling the SSP before asserting frame (i.e. not external clock cycles are needed, the external device just needs to wait a certain amount of time before asserting frame). When the GPIO alternate function is selected for the SSP, this bit has precedence over the GPIO direction bit (i.e. if SFRMDIR=1, the GPIO is an input, and if SFRMDIR=0, then the pin is an output). Therefore, the SCLKDIR and SFRMDIR bits should be written to before the GPIO direction bits (to prevent any possible contention of the SSPSCLK or SSPSFRM pins). Also, when the SCLKDIR bit is set, the SSCR0.NCS and SSCR0.ECS bits must be cleared.

25.3 Register Map

Figure 117.SIO - SPI Register Map

§

Type: PCI Configuration Register
(Size: 32 bits)

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
SUBSYSTEMID					SUBSYSTEMVENDORID			

October 2018
Document Number: 538136, Rev. 4.3

Bit Range	Default & Access	Field Name (ID): Description
7:0	00h RO	Capabilities Pointer (CAPPTR_POWER): Indicates what the next capability is. This capability can be programmed to be PM Capability (0x80) if PM Capability is enabled in SB. If PM capability is disabled then this register has 00h.

25.4.10 Interrupt Register (INTERRUPTREG)—Offset 3Ch

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:30, F:5] + 3Ch

Default: 00000100h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	1	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
MAX_LAT				MIN_GNT				INTPIN
				Reserved0				INTLINE

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RO	Max_Lat (MAX_LAT): Value of 0 indicates device has no major requirements for the settings of latency timers.
23:16	00h RO	Min_Gnt (MIN_GNT): Value of 0 indicates device has no major requirements for the settings of latency timers.
15:12	0h RO	Reserved0: Reserved.
11:8	1h RO	Interrupt Pin (INTPIN): Each AHB IP on Bridge is a Single function device. Hence Bridge only generates INTA on IOSF SB. The Fabric on AHB Bridge appears as a Multifunction device. Interrupt Pin Value in this register is reflected from the IPIN value in the private configuration space.
7:0	00h RW	Interrupt Line (INTLINE): Bridge does not use this field directly. It is used to tell software which interrupt line the interrupt pin is connected to.

25.4.11 PowerManagement Capability ID (POWERCAPID)—Offset 80h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:30, F:5] + 80h

Default: 00030001h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	1
0	0	0	0	0	0	0	0	0

PMESUPPORT				Reserved0				POWER_CAP
				VERSION				
				NXTCAP				

25.4.13 Manufacturer ID (MANID)—Offset F8h

Bit Range	Default & Access	Field Name (ID): Description
3	1h RO	No_Soft_Reset (NO_SOFT_RESET): This bit indicates that devices transitioning from D3hot to D0 because of PowerState commands do not perform an internal reset. Configuration Context is preserved.
2	0h RO	Reserved3: Reserved.
1:0	0h RW	Power State (POWERSTATE): This field is used both to determine the current power state of the AHB IP and to set a new power state. The values are: 00 = D0 state 11 = D3HOT state - Others = Reserved Notes: If software attempts to write a value of 01b or 10b in to this field, the write operation must complete normally; however, the data is discarded and no state change occurs. When in the D3HOT states, interrupts are blocked. D3Hot will not be used for Downstream decode on fabric ports.

25.4.13 Manufacturer ID (MANID)—Offset F8h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:30, F:5] + F8h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0
MANID								

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	Manufacturer ID (MANID): This register is brought out as straps to the top level.

Bit Range	Default & Access	Field Name (ID): Description
31	0b RW	Mode (MOD): 0 = Normal SSP Mode 1 = Network Mode
30	0b RW	Audio Clock Select (ACS): 0 = Clock selection is determined by the NCS and ECS bits 1 = Audio Clock (and Audio Clock Divider) are used to create the SSP's serial clock (SSPCLK)
29	0b RO	Reserved (RSVD): Reserved.
28:27	00b RO	RSVD: Reserved
26:24	000b RW	Frame Rate Divider Control (FRDC): Value 0-7 indicates the number of time slots per frame when in network mode (the actual number of time slots is FRDC+1, so 1 to 8 time slots).
23	0b RW	Transmit FIFO Under Run Interrupt Mask (TIM): 0 = TUR events will generate an SSP interrupt 1 = TUR events will not generate an SSP interrupt
22	0b RW	Receive FIFO Over Run Interrupt Mask (RIM): 0 = ROR events will generate an SSP interrupt 1 = ROR events will not generate an SSP interrupt
21	0b RW	Network Clock Select (NCS): 0 = Clock selection is determined by ECS bit 1 = Network clock is used to create the SSP's serial clock (SSPCLK)
20	0b RW	Extended Data Size Select (EDSS): 0 = A zero is prepended to the DSS value, which sets the DSS range from 4-16 bits 1 = A one is pre-appended to the DSS value which sets the DSS range from 17-32 bits
19:8	000h RW	Serial Clock Rate (SCR): Value (0 to 4095) used to generate transmission rate of SSP. Serial bit rate = SSP clock/(SCR+1), where SCR is decimal integer.
7	0b RW	Synchronous Serial Port Enable (SSE): 0 = SSP operation disabled 1 = SSP operation enabled
6	0b RW	External Clock Select (ECS): 0 = On-chip clock used to produce the SSP's serial clock (SSPCLK) 1 = SSPEXTCLK/GPIO pin is used to create the SSP's SSPCLK
5:4	00b RW	Frame Format (FRF): 00 = Motorola Serial Peripheral Interface (SPI) 01 = Texas Instruments Synchronous Serial Protocol (SSP) 10 = National Semiconductor Microwire 11 = Programmable Serial Protocol (PSP)
3:0	0000b RW	Data Size Select (DSS): With EDSS as MSB, value+1 gives data size. Values 4 to 32 allowed.

25.5.2 SSP Control Register 1 (SSCR1)—Offset 4h

The Enhanced SSP Control 1 registers contain bit fields that control various SSP functions. Bits must be set to the preferred value before enabling the Enhanced SSP. Note that Writes to reserved bits should be zeroes, and Read value of these bits are undetermined.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 4h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:30, F:5] + 10h

Default: 00000000h

17	0b RW	RSVD: Reserved
16	0b RW	Invert Frame Signal (IFS): 0 = Frame polarity is determined by SSP format and PSP polarity bits. 1 = Frame signal will be inverted from the normal SSP frame signal (as defined by the SSP format and PSP polarity bits).
15	0b RW	STRF: Select FIFO for EFWR (test mode bit) (when EFWR=1) 0 = Transmit FIFO is selected for both writes and reads through the SSP Data Register (SSDR) 1 = Receive FIFO is selected for both writes and reads through the SSP Data Register (SSDR)
14	0b RW	Enable FIFO Write/Read (EFWR): Test mode bit. 0 = FIFO write/read special function is disabled (normal SSP operational mode) 1 = FIFO write/read special function is enabled
13:10	0000b RW	Receive FIFO Trigger Threshold (RFT): Sets threshold level at which receive FIFO asserts interrupt. This level should be set to the desired threshold value minus 1.
9:6	0000b RW	Transmit FIFO Trigger Threshold (TFT): Sets threshold level at which transmit FIFO asserts interrupt. This level should be set to the desired threshold value minus 1.
5	0b RW	Microwire Transmit Data Size (MWDS): 0 = 8-bit command words are transmitted 1 = 16-bit command words are transmitted
4	0b RW	Motorola SPI SSPCLK Phase Setting (SPH): 0 = SSPCLK is inactive one cycle at the start of a frame and cycle at the end of a frame 1 = SSPCLK is inactive cycle at the start of a frame and one cycle at the end of a frame
3	0b RW	Motorola SPI SSPCLK Polarity Setting (SPO): 0 = The inactive or idle state of SSPCLK is low 1 = The inactive or idle state of SSPCLK is high
2	0b RW	Loop-Back Mode (LBM): Test mode bit. 0 = Normal serial port operation enabled 1 = Output of transmit serial shifter connected to input of receive serial shifter, internally
1	0b RW	Transmit FIFO Interrupt Enable (TIE): 0 = Transmit FIFO level interrupt is disabled 1 = Transmit FIFO level interrupt is enabled

25.5.3 SSP Status Register (SSSR)—Offset 8h

Bit Range	Default & Access	Field Name (ID): Description
17:16	00b RO	RSVD2: Reserved
15:12	1111b RO	Receive FIFO Level (RFL): Number of entries minus one in Receive FIFO. Note: When the value 0xF is read, the FIFO is either empty or full and the programmer should refer to the RNE bit.
11:8	0000b RO	Transmit FIFO Level (TFL): Number of entries in Transmit FIFO. Note: When the value 0x0 is read, the FIFO is either empty or full and the programmer should refer to the TNF bit.
7	0b RW1C	Receive FIFO Overrun (ROR): 0 = Receive FIFO has not experienced an overrun 1 = Attempted data write to full receive FIFO, request interrupt
6	0b RO	Receive FIFO Service Request (RFS): 0 = Receive FIFO level is at or below RFT threshold (RFT), or SSP disabled 1 = Receive FIFO level exceeds RFT threshold (RFT), request interrupt
5	0b RO	Transmit FIFO Service Request (TFS): 0 = Transmit FIFO level exceeds the TFT threshold (TFT+1), or SSP disabled 1 = Transmit FIFO level is at or below TFT threshold (TFT+1), request interrupt
4	0b RO	SSP Busy (BSY): 0 = SSP is idle or disabled 1 = SSP currently transmitting or receiving a frame
3	0b RO	Receive FIFO Not Empty (RNE): 0 = Receive FIFO is empty 1 = Receive FIFO is not empty
2	1b RO	Transmit FIFO Not Full (TNF): 0 = Transmit FIFO is full 1 = Transmit FIFO is not full
1:0	00b RO	RSVD3: Reserved

25.5.4 SSP Interrupt Test Register (SSITR)—Offset Ch

The read-write SSP Interrupt Test registers should be used only for testing purposes. Writing a 1 to the test transmit FIFO request SSITR.TTFS, bit 5, will generate a non-maskable Interrupt strobe signal to the Interrupt controller, and a DMA request for the Transmit FIFO. Writing a 1 to the test receive FIFO request SSITR.TRFS, bit 6, will generate a non-maskable Interrupt strobe signal to the Interrupt controller, and a DMA request for the Receive FIFO. Writing a 1 to the test receive FIFO overrun bit SSITR.TROR, bit 7, will generate a non-maskable Interrupt strobe signal to the Interrupt controller only, no DMA request will be made. Setting any of these bits will also cause the corresponding status bit(s) to be set in the Enhanced SSP Status register (SSSR). The Interrupt and/or service request, caused by the setting of one of these test bits, will remain active until the test bit is cleared by writing a 0 it. Note that Writes to reserved bits must be zeroes, and Read value of these bits are undetermined.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + Ch

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:30, F:5] + 10h

0	0h RW	spi_cs_mode: Selects HW mode or SW mode for chip select for spi.

26 SIO - I²C Interface

The SoC supports 7 instances of I²C controller. Both 7-bit and 10-bit addressing modes are supported. These controllers operate in master mode only.

26.1 Signal Descriptions

I²C is a two-wire bus for inter-IC communication. Data and clock signals carry information between the connected devices. The following is the I²C Interface. The SoC supports 7 I²C interfaces for general purpose to control external devices. The I²C signals are muxed over GPIOs.

Please see [Chapter 2, "Physical Interfaces"](#) for additional details.

The signal description table has the following headings:

- **Signal Name:** The name of the signal/pin
- **Direction:** The buffer direction can be either input, output, or I/O (bidirectional)
- **Platform Power:** The reference power plane.
- **Description:** A brief explanation of the signal's function

Table 262. I²C[6:0] Signals

Signal Name	Direction Plat. Power	Description
SIO_I2C[6:0]_DATA	I/O V1P8S	I²C Serial Data <i>These signals are muxed and may be used by other functions.</i>
SIO_I2C[6:0]_CLK	I/O V1P8S	I²C Serial Clock <i>These signals are muxed and may be used by other functions.</i>

26.2 Features

26.2.1 I²C Protocol

The I²C bus is a two-wire serial interface, consisting of a serial data line and a serial clock. These wires carry information between the devices connected to the bus. Each device is recognized by a unique address and can operate as either a “transmitter” or “receiver,” depending on the function of the device. Devices are considered slaves when performing data transfers, as the SoC will always be a Master. A master is a device which initiates a data transfer on the bus and generates the clock signals to permit that transfer. At that time, any device addressed is considered a slave.

- The SoC is always the I²C master; and it supports multi-master mode.
- The SoC can support clock stretching by slave devices.
- The SIO_I2Cx_DATA line is a bidirectional signal and changes only while the SIO_I2Cx_CLK line is low, except for STOP, START, and RESTART conditions.
- The output drivers are open-drain or open-collector to perform wire-AND functions on the bus.
- The maximum number of devices on the bus is limited by the maximum capacitance specification of 400 pF
- Refer to [Chapter 9, “Electrical Specifications”](#) for details.
- Data is transmitted in byte packages.

26.2.2 I²C Modes of Operation

The I²C module can operate in the following modes:

- Standard mode (with a bit rate up to 100 Kb/s)
- Fast mode (with a bit rate up to 400 Kb/s)
- Fast-mode Plus (Fm+, with a bit rate up to 1 Mb/s)
- High-speed mode (Hs-mode, with a bit rate up to 3.4 Mb/s)

Note: Higher speeds require tuning of the analog buffers. Please work with your BIOS vendor to incorporate.

The I²C can communicate with devices only using these modes as long as they are attached to the bus. Additionally, high speed mode, fast mode plus and fast mode devices are downward compatible.

- High-speed mode devices can communicate with fast mode and standard mode devices in a mixed speed bus system.
- Fast mode devices can communicate with standard mode devices in a 0–100 Kb/s I²C bus system.

However, according to the I²C specification, standard mode devices are not upward compatible and should not be incorporated in a fast-mode I²C bus system since they cannot follow the higher transfer rate and unpredictable states would occur.

26.2.3 Functional Description

- The I²C master is responsible for generating the clock and controlling the transfer of data.
- The slave is responsible for either transmitting or receiving data to/from the master.
- The acknowledgment of data is sent by the device that is receiving data, which can be either a master or a slave.
- Each slave has a unique address that is determined by the system designer:
 - When a master wants to communicate with a slave, the master transmits a START/RESTART condition that is then followed by the slave's address and a control bit (R/W), to determine if the master wants to transmit data or receive data from the slave.
 - The slave then sends an acknowledge (ACK) pulse after the address.
- If the master (master-transmitter) is writing to the slave (slave-receiver)
 - The receiver gets one byte of data.
 - This transaction continues until the master terminates the transmission with a STOP condition.
- If the master is reading from a slave (master-receiver)
 - The slave transmits (slave-transmitter) a byte of data to the master, and the master then acknowledges the transaction with the ACK pulse.
 - This transaction continues until the master terminates the transmission by not acknowledging (NACK) the transaction after the last byte is received, and then the master issues a STOP condition. This behavior is illustrated in below figure.

Figure 118. Data Transfer on the I²C Bus

26.2.3.1 START and STOP Conditions

When the bus is idle, both the clock and data signals are pulled high through external pull-up resistors on the bus.

When the master wants to start a transmission on the bus, the master issues a START condition.

- This is defined to be a high-to-low transition of the data signal while the clock is high.
- When the master wants to terminate the transmission, the master issues a STOP condition. This is defined to be a low-to-high transition of the data line while the clock is high. [Figure 119](#) shows the timing of the START and STOP conditions.
- When data is being transmitted on the bus, the data line must be stable when the clock is high.

Figure 119. START and STOP Conditions

The signal transitions for the START/STOP conditions, as depicted above, reflect those observed at the output of the master driving the I²C bus. Care should be taken when observing the data/clock signals at the input of the slave(s), because unequal line delays may result in an incorrect data/clock timing relationship.

26.2.3.2 Addressing Slave Protocol

There are two address formats—seven-bit address format and 10-bit address format.

Seven-bit Address Format

- During the seven-bit address format, the first seven bits (bits 7:1) of the first byte set the slave address and the LSB bit (bit 0) is the R/W bit as shown in [Figure 120](#).
- When bit 0 (R/W) is set to 0, the master writes to the slave. When bit 0 (R/W) is set to 1, the master reads from the slave.

Figure 120. Seven-Bit Address Format

Ten-bit Address Format

- During 10-bit addressing, 2 bytes are transferred to set the 10-bit address. The transfer of the first byte contains the following bit definition.
 - The first five bits (bits 7:3) notify the slaves that this is a 10-bit transfer. The next two bits (bits 2:1) set the slaves address bits 9:8, and the LSB bit (bit 0) is the RW bit.
 - The second byte transferred sets bits 7:0 of the slave address.
 - Figure 121 shows the 10-bit address format, and Table 263 defines the special purpose and reserved first byte addresses.

Figure 121. Ten-Bit Address Format

Table 263. I²C Definition of Bits in First Byte (Sheet 1 of 2)

Slave Address	RW Bit	Description
0000 000	0	General Call Address —The I ² C controller places the data in the receive buffer and issues a General Call interrupt.
0000 000	1	START byte —For more details, refer to I ² C bus specification section 3.15.
0000 001	X	CBUS address —I ² C controller ignores these accesses.
0000 010	X	Reserved
0000 011	X	Reserved

Table 263. I²C Definition of Bits in First Byte (Sheet 2 of 2)

Slave Address	RW Bit	Description
0000 1XX	X	High-speed master code
1111 1XX	X	Reserved
1111 0XX	X	Ten (10)-bit slave addressing

26.2.3.3 Transmit and Receive Protocol

The master can initiate data transmission and reception to/from the bus, acting as either a master-transmitter or master-receiver. A slave responds to requests from the master by either transmitting data or receiving data to/from the bus, acting as either a slave-transmitter or slave-receiver, respectively.

Master-Transmitter and Slave-Receiver

All data is transmitted in byte format, with no limit on the number of bytes transferred per data transfer. After the master sends the address and RW bit or the master transmits a byte of data to the slave, the slave-receiver must respond with the acknowledge signal (ACK). When a slave-receiver does not respond with an ACK pulse, the master aborts the transfer by issuing a STOP condition. The slave must leave the data line high so that the master can abort the transfer.

If the master-transmitter is transmitting data as shown in Figure 122, then the slave-receiver responds to the master-transmitter with an acknowledge pulse after every byte of data is received.

Figure 122. Master Transmitter Protocol

Master-Receiver and Slave-Transmitter

If the master is receiving data as shown in Figure 123, the master responds to the Slave-Transmitter with an acknowledge pulse after a byte of data has been received, except for the last byte. This is the way the Master-Receiver notifies the Slave-Transmitter that this is the last byte. The Slave-Transmitter relinquishes the data line after detecting the No Acknowledge (NACK) so that the master can issue a STOP condition.

When a master does not want to relinquish the bus with a STOP condition, the master can issue a RESTART condition. This is identical to a START condition except it occurs after the ACK pulse. The master can then communicate with the same slave.

Figure 123. Master Receiver Protocol

26.2.3.4 START BYTE Transfer Protocol

The START BYTE Transfer protocol is set up for systems that do not have an on-board dedicated I²C hardware module. When the I²C controller is a master, it supports the generation of START BYTE transfers at the beginning of every transfer in case a slave device requires it. This protocol consists of 7 '0's being transmitted followed by a 1, as illustrated in Figure 124. This allows the processor that is polling the bus to under-sample the address phase until 0s are detected. Once the microcontroller detects a 0, it switches from the under sampling rate to the correct rate of the master.

Figure 124. START Byte Transfer

The START BYTE procedure is as follows:

1. Master generates a START condition.
2. Master transmits the START byte (0000 0001).
3. Master transmits the ACK clock pulse. (Present only to conform with the byte handling format used on the bus.)
4. No slave sets the ACK signal to 0.
5. Master generates a RESTART (R) condition.

A hardware receiver does not respond to the START BYTE because it is a reserved address and resets after the RESTART condition is generated.

26.3 Use

26.3.1 Master Mode Operation

To use the I²C controller as a master, perform the following steps:

1. Disable the I²C controller by writing 0 (zero) to IC_ENABLE.ENABLE.
2. Write to the IC_CON register to set the maximum speed mode supported for slave operation IC_CON.SPEED and to specify whether the I²C controller starts its transfers in 7/10 bit addressing mode when the device is a slave (IC_CON.IC_10BITADDR_SLAVE).
3. Write to the IC_TAR register the address of the I²C device to be addressed. It also indicates whether a General Call or a START BYTE command is going to be performed by I²C. The desired speed of the I²C controller master-initiated transfers, either 7-bit or 10-bit addressing, is controlled by the IC_TAR.IC_10BITADDR_MASTER bit field.
4. Write to the IC_HS_MADDR register the desired master code for the I²C controller. The master code is programmer-defined.
5. Enable the I²C controller by writing a 1 in IC_ENABLE.
6. Now write the transfer direction and data to be sent to the IC_DATA_CMD register. If the IC_DATA_CMD register is written before the I²C controller is enabled, the data and commands are lost as the buffers are kept cleared when the I²C controller is not enabled.

The I²C controller supports updating of the IC_TAR.IC_TAR and IC_TAR.IC_10BITADDR_MASTER. The IC_TAR register can be written to provided the following conditions are met:

- The I²C controller is not enabled (IC_ENABLE.ENABLE=0)

The I²C controller supports switching back and forth between reading and writing based on what is written in IC_CMD register. To transmit data, write the data to be written to the lower byte of the I²C Rx/Tx Data Buffer and Command Register (IC_DATA_CMD). The IC_DATA_CMD.CMD should be written to 0 for I²C write operations. Subsequently, a read command may be issued by writing "don't cares" to IC_DATA_CMD.DAT register bits, and a 1 should be written to the IC_DATA_CMD.CMD bit.

26.3.2 Disabling the I²C Controller

The register IC_ENABLE allows software to unambiguously determine when the hardware has completely shutdown in response to the IC_ENABLE.ENABLE register being cleared from 1 to 0.

Procedure

1. Define a timer interval (t_{i2c_poll}) equal to 10 times the signaling period for the highest I²C transfer speed used in the system and supported by the I²C controller. For example, if the highest I²C transfer mode is 400Kb/s, then this t_{i2c_poll} is 25 μ s.
2. Define a maximum time-out parameter, MAX_T_POLL_COUNT, such that if any repeated polling operation exceeds this maximum value, an error is reported.
3. Execute a blocking thread/process/function that prevents any further I²C master transactions to be started by software, but allows any pending transfers to be completed.
4. The variable POLL_COUNT is initialized to zero (0).
5. Clear IC_ENABLE.ENABLE to zero (0).
6. Read the IC_ENABLE_STATUS.IC_EN bit. Increment POLL_COUNT by one. If $POLL_COUNT \geq MAX_T_POLL_COUNT$, exit with the relevant error code.
7. If IC_ENABLE_STATUS.IC_EN is 1, then sleep for t_{i2c_poll} and proceed to the previous step. Otherwise, exit with a relevant success code.

0	0	0	0	0	0	0	0	0
Reserved0				MULFNDEV	HEADERTYPE			
					LATTIMER			
					CACHELINE_SIZE			

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RO	Reserved0: Reserved.
23	1h RO	Multi Function Device (MULFNDEV): This bit is always 0 for non fabric ports. For Fabric ports it is driven from fabric_mult_function strap. 1 = multifunction device 0 = single function device
22:16	00h RO	Header Type (HEADERTYPE): Implements Type 0 Configuration header.
15:8	00h RO	Latency Timer (LATTIMER): Does not apply to PCI Express. Hardwired to 00h.
7:0	00h RW	Cache Line Size (CACHELINE_SIZE): Doesn't apply to PCI Express. PCI Express spec requires this to be implemented as a R/W register but has no functional impact on the AHB Device connected.

26.6.5 Base Address Register (BAR)—Offset 10h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:24, F:1] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
BASEADDR						SIZEINDICATOR	PREFETCHABLE	TYPE
								MESSAGE_SPACE

Bit Range	Default & Access	Field Name (ID): Description
31:12	00000h RW	Base Address (BASEADDR): Base address of the AHB device memory space. Taken from Strap values as 1.s
11:4	00h RO	Size Indicator Read Only (SIZEINDICATOR): Always returns zero. The size of this register depends on the size of the Memory space. This size is determined by a top level of STRAP values as 0.s. Always will be zero as minimum size is 4K.
3	0h RO	Prefetchable (PREFETCHABLE): Indicates that this BAR is not prefetchable.

Access Method

Offset: [B:0, D:24, F:1] + 14h

31	28	24	20	16	12	8	4	0

26.6.9 Capabilities Pointer (CAPABILITYPTR)—Offset 34h

Offset: [B:0, D:24, F:1] + 34h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
Reserved0							CAPPTR_POWER	

Bit Range	Default & Access	Field Name (ID): Description
31:8	000000h RO	Reserved0: Reserved.
7:0	00h RO	Capabilities Pointer (CAPPTR_POWER): Indicates what the next capability is. This capability can be programmed to be PM Capability (0x80) if PM Capability is enabled in SB. If PM capability is disabled then this register has 00h.

26.6.10 Interrupt Register (INTERRUPTREG)—Offset 3Ch

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:24, F:1] + 3Ch

Default: 00000100h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	1	0	0
MAX_LAT				MIN_GNT				INTLINE

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RO	Max_Lat (MAX_LAT): Value of 0 indicates device has no major requirements for the settings of latency timers.
23:16	00h RO	Min_Gnt (MIN_GNT): Value of 0 indicates device has no major requirements for the settings of latency timers.
15:12	0h RO	Reserved0: Reserved.
11:8	1h RO	Interrupt Pin (INTPIN): Each AHB IP on Bridge is a Single function device. Hence Bridge only generates INTA on IOSF SB. The Fabric on AHB Bridge appears as a Multifunction device. Interrupt Pin Value in this register is reflected from the IPIN value in the private configuration space.
7:0	00h RW	Interrupt Line (INTLINE): Bridge does not use this field directly. It is used to tell software which interrupt line the interrupt pin is connected to.

26.6.11 PowerManagement Capability ID (POWERCAPID)—Offset 80h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:24, F:1] + 80h

Default: 00030001h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	1
PMESUPPORT				Reserved0	VERSION	NXTCAP	POWER_CAP	

Bit Range	Default & Access	Field Name (ID): Description
31:27	00h RO	PME_Support (PMESUPPORT): This 5-bit field indicates the power states in which the function may assert PME#. A value of 0b for any bit indicates that the function is not capable of asserting the PME# signal while in that power state. - bit(11) X XXX1b - PME# can be asserted from D0. - bit(12) X XX1Xb - PME# can be asserted from D1. Bridge does not support this state. - bit(13) X X1XXb - PME# can be asserted from D2. Bridge does not support this state. - bit(14) X 1XXXb - PME# can be asserted from D3hot. - bit(15) 1 XXXXb - PME# can be asserted from D3cold. Bridge does not support this state. This field is taken from the strap strap_pme_support.
26:19	00h RO	Reserved0: Reserved.
18:16	3h RO	Version (VERSION): Indicates support for Revision 1.2 of the PCI Power Management Specification.
15:8	00h RO	Next Capability (NXTCAP): Points to the next capability structure. This points to NULL.
7:0	01h RO	Power Management Capability (POWER_CAP): Indicates this is power management capability.

26.6.12 PME Control and Status Register (PMECTRLSTATUS)—Offset 84h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:24, F:1] + 84h

Default: 00000008h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
Reserved0				PMESTATUS	Reserved1	PMEENABLE	Reserved2	NO_SOFT_RESET
								Reserved3
								POWERSTATE

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RO	Reserved0: Reserved.

Bit Range	Default & Access	Field Name (ID): Description
15	0h RW/1C	PME Status (PMESTATUS): 0 = Software clears the bit by writing a 1 to it. 1 = This bit is set when the AHB Device would normally assert the PME# signal independent of the state of the PME Enable bit (bit 8 in this register).
14:9	00h RO	Reserved1: Reserved.
8	0h RW	PME Enable (PMEENABLE): A 1 enables the function to assert PME#. When 0, PME# message on SB is disabled.
7:4	0h RO	Reserved2: Reserved.
3	1h RO	No_Soft_Reset (NO_SOFT_RESET): This bit indicates that devices transitioning from D3hot to D0 because of PowerState commands do not perform an internal reset. Configuration Context is preserved.
2	0h RO	Reserved3: Reserved.
1:0	0h RW	Power State (POWERSTATE): This field is used both to determine the current power state of the AHB IP and to set a new power state. The values are: 00 = D0 state 11 = D3HOT state - Others = Reserved Notes: If software attempts to write a value of 01b or 10b in to this field, the write operation must complete normally; however, the data is discarded and no state change occurs. When in the D3HOT states, interrupts are blocked. D3Hot will not be used for Downstream decode on fabric ports.

26.6.13 Manufacturer ID (MANID)—Offset F8h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:24, F:1] + F8h

Default: 00000000h

824–827h	4	"reg_I2C_TX_COMPLETE_INTR_CLR (I2C_TX_COMPLETE_INTR_CLR)—Offset 824h" on page 3903	00000000h

Bit Range	Default & Access	Field Name (ID): Description
11	0h RW	SPECIAL: This bit indicates whether software performs a General Call or START BYTE command. 0 = ignore bit 10 GC_OR_START and use IC_TAR normally 1 = perform special I2C command as specified in GC_OR_START bit
10	0h RW	GC_OR_START: If bit 11 (SPECIAL) is set to 1, then this bit indicates whether a General Call(0) or START(1) byte command is to be performed by the DW_apb_i2c.
9:0	55h RW	IC_TAR: This is the target address for any master transaction. When transmitting a General Call, these bits are ignored. To generate a START BYTE, the CPU needs to write only once into these bits.

26.7.3 I2C Slave Address Register (IC_SAR)—Offset 8h

The IC SAR Address Register holds the slave address when the I2C is operating as a slave.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 8h**BAR Type:** PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:1] + 10h

Default: 00000055h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	1
0	0	0	0	0	0	0	0	1
0	0	0	0	0	0	0	0	1
Reserved_10_31							IC_SAR	

Bit Range	Default & Access	Field Name (ID): Description
31:10	0b RW	Reserved_10_31: Reserved.
9:0	55h RW	IC_SAR: The IC_SAR holds the slave address when the I2C is operating as a slave. For 7-bit addressing, only IC_SAR[6:0] is used. This register can be written only when the I2C interface is disabled, which corresponds to the IC_ENABLE register being set to 0. Writes at other times have no effect.

26.7.4 I2C High Speed Master Mode Code Address Register (IC_HS_MADDR)—Offset Ch

Note: It is not necessary to perform any write to this register if DW_apb_i2c is enabled as an I2C slave only.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + Ch

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:1] + 10h

Default: 00000001h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	1
Reserved_3_31								IC_HS_MAR

Bit Range	Default & Access	Field Name (ID): Description
31:3	0b RW	Reserved_3_31: Reserved.
2:0	1h RW	IC_HS_MAR: This bit field holds the value of the I2C HS mode master code. HS-mode master codes are reserved 8-bit codes (00001xxx) that are not used for slave addressing or other purposes. Each master has its unique master code; up to eight highspeed mode masters can be present on the same I2C bus system. Valid values are from 0 to 7. This register can be written only when the I2C interface is disabled, which corresponds to the IC_ENABLE register being set to 0. Writes at other times have no effect.

26.7.5 I2C Rx/Tx Data Buffer and Command Register (IC_DATA_CMD)—Offset 10h

This is the register written to by the CPU when filling the TX FIFO, and read from by the CPU when retrieving bytes from RX FIFO.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 10h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:1] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
Reserved_11_31						RESTART	STOP	CMD
								DAT

Bit Range	Default & Access	Field Name (ID): Description
31:11	0b RW	Reserved_11_31: Reserved.

Bit Range	Default & Access	Field Name (ID): Description
10	0h RW	RESTART: This bit controls whether a RESTART is issued before the byte is sent or received. This bit is available only if IC_EMPTYFIFO_HOLD_MASTER_EN is configured to 1. 1 If IC_RESTART_EN is 1, a RESTART is issued before the data is sent/received (according to the value of CMD), regardless of whether or not the transfer direction is changing from the previous command; if IC_RESTART_EN is 0, a STOP followed by a START is issued instead. 0 If IC_RESTART_EN is 1, a RESTART is issued only if the transfer direction is changing from the previous command; if IC_RESTART_EN is 0, a STOP followed by a START is issued instead.
9	0h RW	STOP: This bit determines whether STOP is generated after a data byte is sent or received.
8	0h RW	CMD: This bit controls whether a read or a write is performed. This bit does not control the direction when the DW_apb_i2c acts as a slave. It only controls the direction when it acts as a master. 1 = Read 0 = Write
7:0	0h RW	DAT: This register contains the data to be transmitted or received on the I2C bus. If you are writing to this register and want to perform a read, bits 7:0 (DAT) are ignored by the DW_apb_i2c. When you read this register, however, these bits return the value of data received on the DW_apb_i2c interface.

26.7.6 Standard Speed I2C Clock SCL High Count Register (IC_SS_SCL_HCNT)—Offset 14h

This register must be set before any I2C bus transaction can take place to ensure proper I/O timing. This register sets the SCL clock high-period count for standard speed.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 14h

BAR Type: PCI Configuration Register (Size: 32 bits)

Bit Range	Default & Access	Field Name (ID): Description
8	0h RO	R_ACTIVITY: This bit captures DW_apb_i2c activity and stays set until it is cleared. There are four ways to clear it: Disabling the DW_apb_i2c, Reading the IC_CLR_ACTIVITY register, Reading the IC_CLR_INTR register, System reset
7	0h RO	R_RX_DONE: When the DW_apb_i2c is acting as a slave-transmitter, this bit is set to 1 if the master does not acknowledge a transmitted byte. This occurs on the last byte of the transmission, indicating that the transmission is done.
6	0h RO	R_TX_ABRT: This bit indicates whether DW_apb_i2c, as an I2C transmitter, is unable to complete the intended actions on the contents of the transmit FIFO.
5	0h RO	R_RD_REQ: This bit is set to 1 when DW_apb_i2c is acting as a slave and another I2C master is attempting to read data from DW_apb_i2c.
4	0h RO	R_TX_EMPTY: This bit is set to 1 when the transmit buffer is at or below the threshold value set in the IC_TX_TL register.
3	0h RO	R_TX_OVER: Set during transmit if the transmit buffer is filled to IC_TX_BUFFER_DEPTH, and the processor attempts to issue another I2C command by writing to the IC_DATA_CMD register.
2	0h RO	R_RX_FULL: Set when the receive buffer reaches or goes above the RX_TL threshold in the IC_RX_TL register.
1	0h RO	R_RX_OVER: Set during transmit if the transmit buffer is filled to IC_TX_BUFFER_DEPTH and the processor attempts to issue another I2C command by writing to the IC_DATA_CMD register.
0	0h RO	R_RX_UNDER: Set if the processor attempts to read the receive buffer when it is empty by reading from the IC_DATA_CMD register.

26.7.13 I2C Interrupt Mask Register (IC_INTR_MASK)—Offset 30h

These bits mask their corresponding interrupt status bits. This register is active low.

- 0 masks the interrupt
- 1 unmasks the interrupt

Access Method

Bit Range	Default & Access	Field Name (ID): Description
31:1	0b RW	Reserved_1_31: Reserved.
0	0h RO	CLR_RX_UNDER: Read this register to clear the RX_UNDER interrupt (bit 0) of the IC_RAW_INTR_STAT register.

26.7.19 Clear RX_OVER Interrupt Register (IC_CLR_RX_OVER)—Offset 48h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 48h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:1] + 10h

Access Method

Offset: [BAR] + 54h

BAR Reference: [B:0, D:24, F:1] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
Reserved_1_31								CLR_TX_ABORT

Bit Range	Default & Access	Field Name (ID): Description
31:1	0b RW	Reserved_1_31: Reserved.
0	0h RO	CLR_TX_ABORT: Read this register to clear the TX_ABORT interrupt (bit 6) of the IC_RAW_INTR_STAT register, and the IC_TX_ABORT_SOURCE register. This also releases the TX FIFO from the flushed/reset state, allowing more writes to the TX FIFO.

Access Method

Offset: [BAR] + 58h

BAR Reference: [B:0, D:24, F:1] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0b RW	Reserved_1_31: Reserved.
0	0h RO	CLR_RX_DONE: Read this register to clear the RX_DONE interrupt (bit 7) of the IC_RAW_INTR_STAT register.

Access Method

Offset: [BAR] + 5Ch

BAR Reference: [B:0, D:24, F:1] + 10h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0b RW	Reserved_1_31: Reserved.
0	0h RO	CLR_ACTIVITY: Reading this register clears the ACTIVITY interrupt if the I2C is not active anymore. If the I2C module is still active on the bus, the ACTIVITY interrupt bit continues to be set. It is automatically cleared by hardware if the module is disabled and if there is no further activity on the bus. The value read from this register to get status of the ACTIVITY interrupt (bit 8) of the IC_RAW_INTR_STAT register.

Access Method

Offset: [BAR] + 60h

BAR Reference: [B:0, D:24, F:1] + 10h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0b RW	Reserved_1_31: Reserved.
0	0h RO	CLR_STOP_DET: Read this register to clear the STOP_DET interrupt (bit 9) of the IC_RAW_INTR_STAT register.

26.7.26 Clear START_DET Interrupt Register (IC_CLR_START_DET)—Offset 64h

Access Method

Offset: [BAR] + 64h

BAR Reference: [B:0, D:24, F:1] + 10h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0b RW	Reserved_1_31: Reserved.
0	0h RO	CLR_START_DET: Read this register to clear the START_DET interrupt (bit 10) of the IC_RAW_INTR_STAT register.

26.7.27 Clear GEN_CALL Interrupt Register (IC_CLR_GEN_CALL)—Offset 68h

Access Method

Intel Atom® Processor E3800 Product Family
Datasheet
3885

26.7.29 I2C Status Register (IC_STATUS)—Offset 70h

26.7.30 I2C Transmit FIFO Level Register (IC_TXFLR)—Offset 74h

This register contains the number of valid data entries in the transmit FIFO buffer. It is cleared whenever:

- The I2C is disabled
- There is a transmit abort -- that is, TX_ABRT bit is set in the IC_RAW_INTR_STAT register
- The slave bulk transmit mode is aborted

The register increments whenever data is placed into the transmit FIFO and decrements when data is taken from the transmit FIFO.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 74h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:1] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
Reserved_9_31							TXFLR	

Bit Range	Default & Access	Field Name (ID): Description
31:9	0b RW	Reserved_9_31: Reserved
8:0	0h RO	Transmit FIFO Level (TXFLR): Contains the number of valid data entries in the transmit FIFO.

26.7.31 I2C Receive FIFO Level Register (IC_RXFLR)—Offset 78h

This register contains the number of valid data entries in the receive FIFO buffer. The register is cleared by the following methods:

- The I2C is disabled
- Whenever there is a transmit abort caused by any of the events tracked in IC_TX_ABRT_SOURCE

The register increments whenever data is placed into the receive FIFO and decrements when data is taken from the receive FIFO.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 78h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:1] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:9	0b RW	Reserved_9_31: Reserved
8:0	0h RO	Receive FIFO Level (RXFLR): Contains the number of valid data entries in the receive FIFO.

This register controls the amount of hold time on the SDA signal after a negative edge of SCL in both master and slave mode, in units of `ic_clk` period. The value programmed must be greater than the minimum hold time in each mode for the value to be implemented: one cycle in master mode, seven cycles in slave mode. Writes to this register succeed only when `IC_ENABLE=0`. The programmed SDA hold time cannot exceed at any time the duration of the low part of `scl`. Therefore the programmed value cannot be larger than `N_SCL_LOW-2`, where `N_SCL_LOW` is the duration of the low part of the `scl` period measured in `ic_clk` cycles.

Type: Memory Mapped I/O Register
(Size: 32 bits)

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:1] + 10h

Default: 00000001h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0b RW	Reserved_16_31: Reserved
15:0	1h RW	IC_SDA_HOLD: Sets the required SDA hold time in units of ic_clk period.

26.7.33 I2C Transmit Abort Source Register (IC_TX_ABRT_SOURCE)—Offset 80h

This register has 16 bits that indicate the source of the TX_ABRT bit. Except for Bit 9, this register is cleared whenever the IC_CLR_TX_ABRT register or the IC_CLR_INTR register is read. To clear Bit 9, the source of the ABRT_SBYTE_NORSTRT must be fixed first; RESTART must be enabled (IC_CON[5]=1), the SPECIAL bit must be cleared (IC_TAR[11]), or the GC_OR_START bit must be cleared (IC_TAR[10]). Once the source of the ABRT_SBYTE_NORSTRT is fixed, then this bit can be cleared in the same manner as other bits in this register. If the source of the ABRT_SBYTE_NORSTRT is not fixed before attempting to clear this bit, Bit 9 clears for one cycle and is then re-asserted.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 80h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:1] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	TX_FLUSH_CNT: This field preserves the TXFLR value prior to the last TX_ABRT event. It is enabled when fix_ctrl_1680 = 1. It is cleared whenever I2C is disabled.
23:17	0b RW	Reserved_17_23: Reserved
16	0h RO	ABRT_USER_ABRT: This is a master-mode only bit. Master has detected the user initiated transfer abort (IC_ENABLE[1]). It is enabled only when fix_ctrl_1680 = 1
15	0h RO	ABRT_SLVRD_INTX: 1 = When the processor side responds to a slave mode request for data to be transmitted to a remote master and user writes a 1 in CMD (bit 8) of IC_DATA_CMD register.
14	0h RO	ABRT_SLV_ARBLOST: 1 = Slave lost the bus while transmitting data to a remote master. IC_TX_ABRT_SOURCE[12] is set at the same time.
13	0h RO	ABRT_SLVFLUSH_TXFIFO: 1 = Slave has received a read command and some data exists in the TX FIFO so the slave issues a TX_ABRT interrupt to flush old data in TX FIFO.
12	0h RO	ARB_LOST: 1 = Master has lost arbitration, or if IC_TX_ABRT_SOURCE[14] is also set, then the slave transmitter has lost arbitration.
11	0h RO	ABRT_MASTER_DIS: 1 = User tries to initiate a Master operation with the Master mode disabled.

Bit Range	Default & Access	Field Name (ID): Description
10	0h RO	ABRT_10B_RD_NORSTRT: 1 = The restart is disabled (IC_RESTART_EN bit (IC_CON[5]) = 0) and the master sends a read command in 10-bit addressing mode.
9	0h RO	ABRT_SBYTE_NORSTRT: 1 = The restart is disabled (IC_RESTART_EN bit (IC_CON[5]) = 0) and the user is trying to send a START Byte.
8	0h RO	ABRT_HS_NORSTRT: 1 = The restart is disabled (IC_RESTART_EN bit (IC_CON[5]) = 0) and the user is trying to use the master to transfer data in High Speed mode.
7	0h RO	ABRT_SBYTE_ACKDET: 1 = Master has sent a START Byte and the START Byte was acknowledged (wrong behavior).
6	0h RO	ABRT_HS_ACKDET: 1 = Master is in High Speed mode and the High Speed Master code was acknowledged (wrong behavior).
5	0h RO	ABRT_GCALL_READ: 1 = DW_apb_i2c in master mode sent a General Call but the user programmed the byte following the General Call to be a read from the bus (IC_DATA_CMD[9] is set to 1).
4	0h RO	ABRT_GCALL_NOACK: 1 = DW_apb_i2c in master mode sent a General Call and no slave on the bus acknowledged the General Call.
3	0h RO	ABRT_TXDATA_NOACK: 1 = This is a master-mode only bit. Master has received an acknowledgement for the address, but when it sent data byte(s) following the address, it did not receive an acknowledge from the remote slave(s).
2	0h RO	ABRT_10ADDR2_NOACK: 1 = Master is in 10-bit address mode and the second address byte of the 10-bit address was not acknowledged by any slave.
1	0h RO	ABRT_10ADDR1_NOACK: 1 = Master is in 10-bit address mode and the first 10-bit address byte was not acknowledged by any slave.
0	0h RO	ABRT_7B_ADDR_NOACK: 1 = Master is in 7-bit addressing mode and the address sent was not acknowledged by any slave.

26.7.34 Generate Slave Data NACK Register (IC_SLV_DATA_NACK_ONLY)—Offset 84h

The register is used to generate a NACK for the data part of a transfer when DW_apb_i2c is acting as a slave-receiver. A write can occur on this register if either of the following conditions are met.

- DW_apb_i2c is disabled (IC_ENABLE[0] = 0)
- Slave part is inactive (IC_STATUS[6] = 0)

NOTE = The IC_STATUS[6] is a register read-back location for the internal slv_activity signal; the user should poll this before writing the ic_slv_data_nack_only bit.

Access Method

Bit Range	Default & Access	Field Name (ID): Description
31:1	0b RW	Reserved_1_31: Reserved.
0	1h RW	ACK General Call (ACK_GEN_CALL): When set to 1, DW_apb_i2c responds with a ACK (by asserting ic_data_oe) when it receives a General Call. When set to 0, the DW_apb_i2c does not generate General Call interrupts.

26.7.40 I2C Enable Status Register (IC_ENABLE_STATUS)—Offset 9Ch

The register is used to report the DW_apb_i2c hardware status when the IC_ENABLE register is set from 1 to 0, that is, when DW_apb_i2c is disabled.

- If IC_ENABLE has been set to 1, bits 2:1 are forced to 0, and bit 0 is forced to 1.
- If IC_ENABLE has been set to 0, bits 2:1 will only be valid as soon as bit 0 is read as 0.

NOTE = When IC_ENABLE has been written with 0, a delay occurs for bit 0 to be read as 0 because disabling the DW_apb_i2c depends on I2C bus activities.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 9Ch

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:1] + 10h

Default: 00000000h

Access Method

Offset: [BAR] + A4h

BAR Reference: [B:0, D:24, F:1] + 10h

Default: 00000002h

[illegible]

Bit Range	Default & Access	Field Name (ID): Description
31:8	0b RW	Reserved_8_31: Reserved.
7:0	2h RW	IC_HS_SPKLEN: This register must be set before any I2C bus transaction can take place to ensure stable operation. This register sets the duration, measured in ic_clk cycles, of the longest spike in the SCL or SDA lines that are filtered out by the spike suppression logic; for more information, refer to Spike Suppression on page 52. This register can be written only when the I2C interface is disabled, which corresponds to the IC_ENABLE register being set to 0. Writes at other times have no effect. The minimum valid value is 1; hardware prevents values less than this being written, and if attempted results in 2 being set.

26.7.44 I2C Component Version Register (IC_COMP_VERSION)—Offset F8h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + F8h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:1] + 10h

Default: 3131352Ah

Bit Range	Default & Access	Field Name (ID): Description
31:1	0b RO	RSVD0: Reserved
0	0h RW	i2c_tx_complete_intr_clr: indicate TX transaction has finished write 1 to clear the interrupt

Bit Range	Default & Access	Field Name (ID): Description
7:3	00h RO	Reserved5: Reserved.
2	0h RW	Bus Master Enable (BME): If this bit is 0, Bridge does not generate any new upstream transaction on IOSF as a master.
1	0h RW	Memory Space Enable (MSE): This bit controls Bridge's response to downstream Memory accesses. When set, accesses to memory space of the device is enabled.
0	0h RO	Reserved6: Reserved.

26.8.3 Revision ID and Class Code (REVCLASSCODE)—Offset 8h

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:24, F:2] + 8h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
CLASS_CODES							RID	

Bit Range	Default & Access	Field Name (ID): Description
31:8	000000h RO	Class Code (CLASS_CODES): The Class Code register is read-only and used to identify the generic function of the device and, in some cases, a specific register level programming interface. The register is broken into three byte size fields. The upper byte (at offset 0Bh) is a base class code which broadly classifies the type of function the device performs. The middle byte (at offset 0Ah) is a sub-class code which identifies more specifically the function of the device. The lower byte (at offset 09h) identifies a specific register-level programming interface (if any) so that device independent software can interact with the device. This register is tied to a strap at the top level.
7:0	00h RO	Revision ID (RID): Revision ID identifies the revision of particular AHB device. This is tied to a strap at the top level.

26.8.4 Cache Line Latency Header and BIST (CLLATHEADERBIST)—Offset Ch

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:24, F:2] + Ch

Default: 00800000h

31	28	24	20	16	12	8	4	0
0	0	0	0	1	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
Reserved0				MULFNDEV	HEADERTYPE			
					LATTIMER			
					CACHELINE_SIZE			

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RO	Reserved0: Reserved.
23	1h RO	Multi Function Device (MULFNDEV): This bit is always 0 for non fabric ports. For Fabric ports it is driven from fabric_mult_function strap. 1 = multifunction device 0 = single function device
22:16	00h RO	Header Type (HEADERTYPE): Implements Type 0 Configuration header.
15:8	00h RO	Latency Timer (LATTIMER): Does not apply to PCI Express. Hardwired to 00h.
7:0	00h RW	Cache Line Size (CACHELINE_SIZE): Doesn't apply to PCI Express. PCI Express spec requires this to be implemented as a R/W register but has no functional impact on the AHB Device connected.

26.8.6 Base Address Register 1 (BAR1)—Offset 14h

Bit Range	Default & Access	Field Name (ID): Description
31:12	00000h RW	Base Address Register 1 (BASEADDR1): BAR1 of the LP10 device.

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:24, F:2] + 2Ch

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
SUBSYSTEMID					SUBSYSTEMVENDORID			

Intel Atom® Processor E3800 Product Family
Datasheet
3909

Offset: [B:0, D:24, F:2] + 30h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	EXPANSION_ROM_BASE: Reserved.

Offset: [B:0, D:24, F:2] + 34h

Bit Range	Default & Access	Field Name (ID): Description
31:8	000000h RO	Reserved0: Reserved.
7:0	00h RO	Capabilities Pointer (CAPPTR_POWER): Indicates what the next capability is. This capability can be programmed to be PM Capability (0x80) if PM Capability is enabled in SB. If PM capability is disabled then this register has 00h.

26.8.10 Interrupt Register (INTERRUPTREG)—Offset 3Ch

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:24, F:2] + 3Ch

Default: 00000100h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	1	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
MAX_LAT				MIN_GNT				INTLINE
				Reserved0				INTPIN

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RO	Max_Lat (MAX_LAT): Value of 0 indicates device has no major requirements for the settings of latency timers.
23:16	00h RO	Min_Gnt (MIN_GNT): Value of 0 indicates device has no major requirements for the settings of latency timers.
15:12	0h RO	Reserved0: Reserved.
11:8	1h RO	Interrupt Pin (INTPIN): Each AHB IP on Bridge is a Single function device. Hence Bridge only generates INTA on IOSF SB. The Fabric on AHB Bridge appears as a Multifunction device. Interrupt Pin Value in this register is reflected from the IPIN value in the private configuration space.
7:0	00h RW	Interrupt Line (INTLINE): Bridge does not use this field directly. It is used to tell software which interrupt line the interrupt pin is connected to.

26.8.11 PowerManagement Capability ID (POWERCAPID)—Offset 80h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:24, F:2] + 80h

Default: 00030001h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	1
PMESUPPORT				Reserved0				POWER_CAP
				VERSION				NXTCAP

Access Method

Offset: [B:0, D:24, F:2] + 84h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
Reserved0				PMESTATUS	Reserved1		PMEENABLE	Reserved2
							NO_SOFT_RESET	Reserved3
								POWERSTATE

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RO	Reserved0: Reserved.
15	0h RW/1C	PME Status (PMESTATUS): 0 = Software clears the bit by writing a 1 to it. 1 = This bit is set when the AHB Device would normally assert the PME# signal independent of the state of the PME Enable bit (bit 8 in this register).
14:9	00h RO	Reserved1: Reserved.
8	0h RW	PME Enable (PMEENABLE): A 1 enables the function to assert PME#. When 0, PME# message on SB is disabled.
7:4	0h RO	Reserved2: Reserved.

Bit Range	Default & Access	Field Name (ID): Description
3	1h RO	No_Soft_Reset (NO_SOFT_RESET): This bit indicates that devices transitioning from D3hot to D0 because of PowerState commands do not perform an internal reset. Configuration Context is preserved.
2	0h RO	Reserved3: Reserved.
1:0	0h RW	Power State (POWERSTATE): This field is used both to determine the current power state of the AHB IP and to set a new power state. The values are: 00 = D0 state 11 = D3HOT state - Others = Reserved Notes: If software attempts to write a value of 01b or 10b in to this field, the write operation must complete normally; however, the data is discarded and no state change occurs. When in the D3HOT states, interrupts are blocked. D3Hot will not be used for Downstream decode on fabric ports.

26.8.13 Manufacturer ID (MANID)—Offset F8h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:24, F:2] + F8h

Default: 00000000h

Diagram illustrating the structure of the 32-bit MANID field. The field is divided into eight 4-bit segments, each labeled with a hexadecimal value (31, 28, 24, 20, 16, 12, 8, 4, 0). Each segment contains four bits, all of which are 0. The label 'MANID' is positioned vertically below the 16-bit segment.

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	Manufacturer ID (MANID): This register is brought out as straps to the top level.

26.9.1 I2C Control Register (IC_CON)—Offset 0h

This register can be written only when the DW_apb_i2c is disabled, which corresponds to the IC_ENABLE register being set to 0. Writes at other times have no effect.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 0h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:2] + 10h

Default: 0000007Fh

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
Reserved_7_31							IC_SLAVE_DISABLE	IC_RESTART_EN
							IC_10BITADDR_MASTER_rd_only	IC_10BITADDR_SLAVE
							SPEED	MASTER_MODE

Bit Range	Default & Access	Field Name (ID): Description
31:7	0b RW	Reserved_7_31: Reserved.
6	1h RW	IC_SLAVE_DISABLE: This bit controls whether I2C has its slave disabled. By default, the slave is always enabled (in reset state as well). If you need to disable it after reset, set this bit to 1. If this bit is set (slave is disabled), DW_apb_i2c functions only as a master and does not perform any action that requires a slave.
5	1h RW	IC_RESTART_EN: Determines whether RESTART conditions may be sent when acting as a master. When the RESTART is disabled, the DW_apb_i2c master is incapable of performing the following functions: - Sending a START BYTE - Performing any high-speed mode operation - Performing direction changes in combined format mode - Performing a read operation with a 10-bit address
4	1h RO	IC_10BITADDR_MASTER (IC_10BITADDR_MASTER_rd_only): Controls whether the DW_apb_i2c starts its transfers in 7- or 10-bit addressing mode when acting as a master. If I2C_DYNAMIC_TAR_UPDATE = 1, then this bit is read-only copy of bit 12 of IC_TAR register.
3	1h RW	IC_10BITADDR_SLAVE: When acting as a slave, this bit controls whether the DW_apb_i2c responds to 7- or 10-bit addresses.
2:1	3h RW	SPEED: These bits control at which speed the DW_apb_i2c operates; its setting is relevant only if one is operating the DW_apb_i2c in master mode. Hardware protects against illegal values being programmed by software. This register should be programmed only with a value in the range of 1 to IC_MAX_SPEED_MODE; otherwise, hardware updates this register with the value of IC_MAX_SPEED_MODE.
0	1h RW	MASTER MODE (MASTER_MODE): This bit controls whether the DW_apb_i2c master is enabled. Software should ensure that if this bit is set to X, then bit 6 should also be set to X.

26.9.2 I2C Target Address Register (IC_TAR)—Offset 4h

Access Method

Offset: [BAR] + 8h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:2] + 10h

Default: 00000055h

R_RX_OVER	0	0	0	0	0	0	0									
R_RX_UNDER	0	0	0	0	0	0	0									

Bit Range	Default & Access	Field Name (ID): Description
31:12	0b RW	Reserved_12_31: Reserved.
11	0h RO	R_GEN_CALL: Set only when a General Call address is received and acknowledged. It stays set until it is cleared either by disabling DW_apb_i2c or when the CPU reads bit 0 of the IC_CLR_GEN_CALL register.
10	0h RO	R_START_DET: Indicates whether a START or RESTART condition has occurred on the I2C interface, regardless of whether DW_apb_i2c is operating in slave or master mode.
9	0h RO	R_STOP_DET: Indicates whether a STOP condition has occurred on the I2C interface, regardless of whether DW_apb_i2c is operating in slave or master mode.
8	0h RO	R_ACTIVITY: This bit captures DW_apb_i2c activity and stays set until it is cleared. There are four ways to clear it: Disabling the DW_apb_i2c, Reading the IC_CLR_ACTIVITY register, Reading the IC_CLR_INTR register, System reset
7	0h RO	R_RX_DONE: When the DW_apb_i2c is acting as a slave-transmitter, this bit is set to 1 if the master does not acknowledge a transmitted byte. This occurs on the last byte of the transmission, indicating that the transmission is done.
6	0h RO	R_TX_ABRT: This bit indicates whether DW_apb_i2c, as an I2C transmitter, is unable to complete the intended actions on the contents of the transmit FIFO.
5	0h RO	R_RD_REQ: This bit is set to 1 when DW_apb_i2c is acting as a slave and another I2C master is attempting to read data from DW_apb_i2c.

These bits mask their corresponding interrupt status bits. This register is active low.

- ## Access Method

Offset: [BAR] + 30h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:2] + 10h

[illegible]

Intel Atom[®] Processor E3800 Product Family
Datasheet

26.9.28 I2C Enable Register (IC_ENABLE)—Offset 6Ch

Bit Range	Default & Access	Field Name (ID): Description
31:1	0b RW	Reserved_1_31: Reserved.
0	0h RO	CLR_GEN_CALL: Read this register to clear the GEN_CALL interrupt (bit 11) of IC_RAW_INTR_STAT register.

26.9.28 I2C Enable Register (IC_ENABLE)—Offset 6Ch

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 6Ch

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:2] + 10h

Default: 00000000h

[illegible]

Bit Range	Default & Access	Field Name (ID): Description
31:2	0b RW	Reserved_2_31: Reserved
1	0h WO	ABORT: Software can abort the I2C transfer by setting this bit. This bit can be set only when ENABLE = 1 and fix_ctrl_1680 = 1. The HW will clear the ABORT bit once the STOP condition has been sent.
0	0h RW	ENABLE: Controls whether the DW_apb_i2c is enabled. 0 = Disables DW_apb_i2c (TX and RX FIFOs are held in an erased state) 1 = Enables DW_apb_i2c

26.9.29 I2C Status Register (IC_STATUS)—Offset 70h

This is a read-only register used to indicate the current transfer status and FIFO status. The status register may be read at any time. None of the bits in this register request an interrupt. The following occurs when the I2C is disabled by writing 0 in bit 0 of the IC_ENABLE register:

- Bits 1 and 2 are set to 1
- Bits 3 and 4 are set to 0

When the master or slave state machines goes to idle and `ic_en=0`:

- Bits 5 and 6 are set to 0

Access Method

0	0	0	0	0	0	0	0	0
Reserved_9_31						TXFLR		

Bit Range	Default & Access	Field Name (ID): Description
31:9	0b RW	Reserved_9_31: Reserved
8:0	0h RO	Transmit FIFO Level (TXFLR): Contains the number of valid data entries in the transmit FIFO.

26.9.31 I2C Receive FIFO Level Register (IC_RXFLR)—Offset 78h

This register contains the number of valid data entries in the receive FIFO buffer. The register is cleared by the following methods:

- The I2C is disabled
- Whenever there is a transmit abort caused by any of the events tracked in IC_TX_ABRT_SOURCE

The register increments whenever data is placed into the receive FIFO and decrements when data is taken from the receive FIFO.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 78h

BAR Type: PCI Configuration Register (Size: 32 bits)

Bit Range	Default & Access	Field Name (ID): Description
31:9	0b RW	Reserved_9_31: Reserved
8:0	0h RO	Receive FIFO Level (RXFLR): Contains the number of valid data entries in the receive FIFO.

26.9.32 I2C SDA Hold Time Length Register (IC_SDA_HOLD)—Offset 7Ch

This register controls the amount of hold time on the SDA signal after a negative edge of SCL in both master and slave mode, in units of ic_clk period. The value programmed must be greater than the minimum hold time in each mode for the value to be implemented one cycle in master mode, seven cycles in slave mode. Writes to this register succeed only when IC_ENABLE=0. The programmed SDA hold time cannot exceed at any time the duration of the low part of scl. Therefore the programmed value cannot be larger than N_SCL_LOW-2, where N_SCL_LOW is the duration of the low part of the scl period measured in ic_clk cycles.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 7Ch

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:2] + 10h

Reserved_16_31				IC_SDA_HOLD				

Bit Range	Default & Access	Field Name (ID): Description
31:16	0b RW	Reserved_16_31: Reserved
15:0	1h RW	IC_SDA_HOLD: Sets the required SDA hold time in units of ic_clk period.

26.9.33 I2C Transmit Abort Source Register (IC_TX_ABRT_SOURCE)—Offset 80h

This register has 16 bits that indicate the source of the TX_ABRT bit. Except for Bit 9, this register is cleared whenever the IC_CLR_TX_ABRT register or the IC_CLR_INTR register is read. To clear Bit 9, the source of the ABRT_SBYTE_NORSTRT must be fixed first; RESTART must be enabled (IC_CON[5]=1), the SPECIAL bit must be cleared (IC_TAR[11]), or the GC_OR_START bit must be cleared (IC_TAR[10]). Once the source of the ABRT_SBYTE_NORSTRT is fixed, then this bit can be cleared in the same

manner as other bits in this register. If the source of the ABRT_SBYTE_NORSTRT is not fixed before attempting to clear this bit, Bit 9 clears for one cycle and is then re-asserted.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 80h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:2] + 10h

31:24	0h RO	TX_FLUSH_CNT: This field preserves the TXFLR value prior to the last TX_ABRT event. It is enabled when fix_ctrl_1680 = 1. It is cleared whenever I2C is disabled.
23:17	0b RW	Reserved_17_23: Reserved
16	0h RO	ABRT_USER_ABRT: This is a master-mode only bit. Master has detected the user initiated transfer abort (IC_ENABLE[1]). It is enabled only when fix_ctrl_1680 = 1
15	0h RO	ABRT_SLVRD_INTX: 1 = When the processor side responds to a slave mode request for data to be transmitted to a remote master and user writes a 1 in CMD (bit 8) of IC_DATA_CMD register.
14	0h RO	ABRT_SLV_ARBLOST: 1 = Slave lost the bus while transmitting data to a remote master. IC_TX_ABRT_SOURCE[12] is set at the same time.
13	0h RO	ABRT_SLVFLUSH_TXFIFO: 1 = Slave has received a read command and some data exists in the TX FIFO so the slave issues a TX_ABRT interrupt to flush old data in TX FIFO.
12	0h RO	ARB_LOST: 1 = Master has lost arbitration, or if IC_TX_ABRT_SOURCE[14] is also set, then the slave transmitter has lost arbitration.
11	0h RO	ABRT_MASTER_DIS: 1 = User tries to initiate a Master operation with the Master mode disabled.
10	0h RO	ABRT_10B_RD_NORSTRT: 1 = The restart is disabled (IC_RESTART_EN bit (IC_CON[5]) = 0) and the master sends a read command in 10-bit addressing mode.
9	0h RO	ABRT_SBYTE_NORSTRT: 1 = The restart is disabled (IC_RESTART_EN bit (IC_CON[5]) = 0) and the user is trying to send a START Byte.
8	0h RO	ABRT_HS_NORSTRT: 1 = The restart is disabled (IC_RESTART_EN bit (IC_CON[5]) = 0) and the user is trying to use the master to transfer data in High Speed mode.
7	0h RO	ABRT_SBYTE_ACKDET: 1 = Master has sent a START Byte and the START Byte was acknowledged (wrong behavior).

26.9.35 DMA Control Register (IC DMA CR)—Offset 88h

This register is only valid when DW_apb_i2c is configured with a set of DMA Controller interface signals (IC_HAS_DMA = 1). When DW_apb_i2c is not configured for DMA operation, this register does not exist and writing to the registers address has no effect and reading from this register address will return zero. The register is used to enable the DMA Controller interface operation. There is a separate bit for transmit and receive. This can be programmed regardless of the state of IC_ENABLE.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 88h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:2] + 10h

Default: 00000000h

26.9.39 I2C ACK General Call Register (IC_ACK_GENERAL_CALL)—Offset 98h

The register controls whether DW_apb_i2c responds with an ACK or NACK when it receives an I2C General Call address.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 98h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:2] + 10h

Default: 00000001h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	1
Reserved_1_31								ACK_GEN_CALL

Bit Range	Default & Access	Field Name (ID): Description
31:1	0b RW	Reserved_1_31: Reserved.
0	1h RW	ACK General Call (ACK_GEN_CALL): When set to 1, DW_apb_i2c responds with a ACK (by asserting ic_data_oe) when it receives a General Call. When set to 0, the DW_apb_i2c does not generate General Call interrupts.

26.9.40 I2C Enable Status Register (IC_ENABLE_STATUS)—Offset 9Ch

The register is used to report the DW_apb_i2c hardware status when the IC_ENABLE register is set from 1 to 0, that is, when DW_apb_i2c is disabled.

- If IC_ENABLE has been set to 1, bits 2:1 are forced to 0, and bit 0 is forced to 1.
- If IC_ENABLE has been set to 0, bits 2:1 will only be valid as soon as bit 0 is read as 0.

NOTE = When IC_ENABLE has been written with 0, a delay occurs for bit 0 to be read as 0 because disabling the DW_apb_i2c depends on I2C bus activities.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 9Ch

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:2] + 10h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:3	0b RW	Reserved_3_31: Reserved.
2	0h RO	SLV_RX_DATA_LOST: This bit indicates if a Slave-Receiver operation has been aborted with at least one data byte received from an I2C transfer due to the setting of IC_ENABLE from 1 to 0.
1	0h RO	SLV_DISABLED_WHILE_BUSY: This bit indicates if a potential or active Slave operation has been aborted due to the setting of the IC_ENABLE register from 1 to 0.
0	0h RO	ic_en Status (IC_EN): This bit always reflects the value driven on the output port ic_en. When read as 1, DW_apb_i2c is deemed to be in an enabled state. When read as 0, DW_apb_i2c is deemed completely inactive.

26.9.41 IC_FS_SPKLEN—Offset A0h

This register is used to store the duration, measured in `ic_clk` cycles, of the longest spike that is filtered out by the spike suppression logic when the component is operating in SS or FS modes. The relevant I2C requirement is `tSP` (Table 4) as detailed in the I2C Bus Specification. This register must be programmed with a minimum value of 1.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + A0h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:2] + 10h

CLASS_CODES							RID	

Bit Range	Default & Access	Field Name (ID): Description
31:8	000000h RO	Class Code (CLASS_CODES): The Class Code register is read-only and used to identify the generic function of the device and, in some cases, a specific register level programming interface. The register is broken into three byte size fields. The upper byte (at offset 0Bh) is a base class code which broadly classifies the type of function the device performs. The middle byte (at offset 0Ah) is a sub-class code which identifies more specifically the function of the device. The lower byte (at offset 09h) identifies a specific register-level programming interface (if any) so that device independent software can interact with the device. This register is tied to a strap at the top level.
7:0	00h RO	Revision ID (RID): Revision ID identifies the revision of particular AHB device. This is tied to a strap at the top level.

26.10.4 Cache Line Latency Header and BIST (CLLATHEADERBIST)—Offset Ch

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:24, F:3] + Ch

Default: 00800000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
Reserved0	MULFNDEV	HEADERTYPE	LATTIMER	CACHELINE_SIZE				

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RO	Reserved0: Reserved.
23	1h RO	Multi Function Device (MULFNDEV): This bit is always 0 for non fabric ports. For Fabric ports it is driven from fabric_mult_function strap. 1 = multifunction device 0 = single function device
22:16	00h RO	Header Type (HEADERTYPE): Implements Type 0 Configuration header.
15:8	00h RO	Latency Timer (LATTIMER): Does not apply to PCI Express. Hardwired to 00h.
7:0	00h RW	Cache Line Size (CACHELINE_SIZE): Doesn't apply to PCI Express. PCI Express spec requires this to be implemented as a R/W register but has no functional impact on the AHB Device connected.

26.10.5 Base Address Register (BAR)—Offset 10h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:24, F:3] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
BASEADDR	SIZEINDICATOR	PREFETCHABLE	TYPE	MESSAGE_SPACE				

Bit Range	Default & Access	Field Name (ID): Description
31:12	00000h RW	Base Address (BASEADDR): Base address of the AHB device memory space. Taken from Strap values as 1.s
11:4	00h RO	Size Indicator Read Only (SIZEINDICATOR): Always returns zero. The size of this register depends on the size of the Memory space. This size is determined by a top level of STRAP values as 0.s. Always will be zero as minimum size is 4K.
3	0h RO	Prefetchable (PREFETCHABLE): Indicates that this BAR is not prefetchable.

Bit Range	Default & Access	Field Name (ID): Description
2:1	0h RO	Type (TYPE): 00 indicates BAR lies in 32 bit address range.
0	0h RO	Memory Space Indicator (MESSAGE_SPACE): 0. Indicates this BAR is present in the memory space.

26.10.6 Base Address Register 1 (BAR1)—Offset 14h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:24, F:3] + 14h

Default: 00000000h

31	28	24	20	16	12	8	4	0			
0	0	0	0	0	0	0	0	0			
BASEADDR1						SIZEINDICATOR1			PREFETCHABLE1	TYPE1	MESSAGE_SPACE1

Bit Range	Default & Access	Field Name (ID): Description
31:12	00000h RW	Base Address Register 1 (BASEADDR1): BAR1 of the LP10 device.
11:4	00h RO	SIZEINDICATOR1: Always will be zero as minimum size is 4K.
3	0h RO	Prefetchable (PREFETCHABLE1): Indicates that this BAR is not.
2:1	0h RO	Type (TYPE1): 00 Indicates BAR lies in 32 bit address range.
0	0h RO	Memory Space Indicator (MESSAGE_SPACE1): 0. Indicates this BAR is present in the memory space.

26.10.7 Subsystem Vendor and Subsystem ID (SUBSYSTEMID)—Offset 2Ch

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:24, F:3] + 2Ch

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
SUBSYSTEMID								SUBSYSTEMVENDORID

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW/O	Subsystem ID (SUBSYSTEMID): This register should be implemented for any function that could be instantiated more than once in a given system. The SID register, in combination with the Subsystem Vendor ID register, make it possible for the operating environment to distinguish one audio subsystem from the other. This register is a Read Write Once type register.
15:0	0000h RW/O	Subsystem Vendor ID (SUBSYSTEMVENDORID): This register should be implemented for any function that could be instantiated more than once in a given system. The SVID register, in combination with the Subsystem ID register, enables the operating environment to distinguish one subsystem from the other. This register is a Read Write Once register.

Type: PCI Configuration Register
(Size: 32 bits)

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	EXPANSION_ROM_BASE: Reserved.

26.10.9 Capabilities Pointer (CAPABILITYPTR)—Offset 34h

Type: PCI Configuration Register
(Size: 32 bits)

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	000000h RO	Reserved0: Reserved.
7:0	00h RO	Capabilities Pointer (CAPPTR_POWER): Indicates what the next capability is. This capability can be programmed to be PM Capability (0x80) if PM Capability is enabled in SB. If PM capability is disabled then this register has 00h.

26.10.10 Interrupt Register (INTERRUPTREG)—Offset 3Ch

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:24, F:3] + 3Ch

Default: 00000100h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	1	0
MAX_LAT				MIN_GNT				INTLINE

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RO	Max_Lat (MAX_LAT): Value of 0 indicates device has no major requirements for the settings of latency timers.
23:16	00h RO	Min_Gnt (MIN_GNT): Value of 0 indicates device has no major requirements for the settings of latency timers.
15:12	0h RO	Reserved0: Reserved.
11:8	1h RO	Interrupt Pin (INTPIN): Each AHB IP on Bridge is a Single function device. Hence Bridge only generates INTA on IOSF SB. The Fabric on AHB Bridge appears as a Multifunction device. Interrupt Pin Value in this register is reflected from the IPIN value in the private configuration space.
7:0	00h RW	Interrupt Line (INTLINE): Bridge does not use this field directly. It is used to tell software which interrupt line the interrupt pin is connected to.

26.10.11 PowerManagement Capability ID (POWERCAPID)—Offset 80h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:24, F:3] + 80h

Default: 00030001h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	1
PMESUPPORT				Reserved0	VERSION	NXTCAP	POWER_CAP	

26.10.13 Manufacturer ID (MANID)—Offset F8h

Bit Range	Default & Access	Field Name (ID): Description
3	1h RO	No_Soft_Reset (NO_SOFT_RESET): This bit indicates that devices transitioning from D3hot to D0 because of PowerState commands do not perform an internal reset. Configuration Context is preserved.
2	0h RO	Reserved3: Reserved.
1:0	0h RW	Power State (POWERSTATE): This field is used both to determine the current power state of the AHB IP and to set a new power state. The values are: 00 = D0 state 11 = D3HOT state - Others = Reserved Notes: If software attempts to write a value of 01b or 10b in to this field, the write operation must complete normally; however, the data is discarded and no state change occurs. When in the D3HOT states, interrupts are blocked. D3Hot will not be used for Downstream decode on fabric ports.

26.10.13 Manufacturer ID (MANID)—Offset F8h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:24, F:3] + F8h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0
MANID								

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	Manufacturer ID (MANID): This register is brought out as straps to the top level.

26.11 SIO I²C 2 Memory Mapped I/O Registers

Table 269. Summary of I²C 2 Memory Mapped I/O Registers—BAR

26.11.2 I2C Target Address Register (IC_TAR)—Offset 4h

Writes to IC_TAR succeed when one of the following conditions are true:

- DW_apb_i2c is NOT enabled (IC_ENABLE is set to 0)
- OR
- DW_apb_i2c is enabled (IC_ENABLE=1)
- AND
- DW_apb_i2c is NOT engaged in any Master (tx, rx) operation (IC_STATUS[5]=0)
- AND
- DW_apb_i2c is enabled to operate in Master mode (IC_CON[0]=1)
- AND
- There are NO entries in the TX FIFO (IC_STATUS[2]=1)

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 4h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:3] + 10h

Default: 00001055h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	1
Reserved_13_31					IC_10BITADDR_MASTER	SPECIAL		
						GC_OR_START		
					IC_TAR			

Bit Range	Default & Access	Field Name (ID): Description
31:13	0b RW	Reserved_13_31: Reserved.
12	1h RW	IC_10BITADDR_MASTER: This bit controls whether the DW_apb_i2c starts its transfers in 7-or 10-bit addressing mode when acting as a master.
11	0h RW	SPECIAL: This bit indicates whether software performs a General Call or START BYTE command. • 0 = ignore bit 10 GC_OR_START and use IC_TAR normally • 1 = perform special I2C command as specified in GC_OR_START bit
10	0h RW	GC_OR_START: If bit 11 (SPECIAL) is set to 1, then this bit indicates whether a General Call(0) or START(1) byte command is to be performed by the DW_apb_i2c.
9:0	55h RW	IC_TAR: This is the target address for any master transaction. When transmitting a General Call, these bits are ignored. To generate a START BYTE, the CPU needs to write only once into these bits.

This register must be set before any I2C bus transaction can take place to ensure proper I/O timing. This register sets the SCL clock high-period count for standard speed.

Bit Range	Default & Access	Field Name (ID): Description
31:16	0b RW	Reserved_16_31: Reserved.
15:0	190h RW	Standard Speed I2C Clock SCL High Count Register (IC_SS_SCL_HCNT): This register can be written only when the I2C interface is disabled, which corresponds to the IC_ENABLE register being set to 0. Writes at other times have no effect.

This register must be set before any I2C bus transaction can take place to ensure proper I/O timing. This register sets the SCL clock low period count for standard speed.

Type: Memory Mapped I/O Register
(Size: 32 bits)

BAR Type: PCI Configuration Register (Size: 32 bits)

Default: 000001D6h

This register must be set before any I2C bus transaction can take place to ensure proper I/O timing. This register sets the SCL clock high-period count for fast speed. It is used in high-speed mode to send the Master Code and START BYTE or General CALL.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 1Ch

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:3] + 10h

Default: 0000003Ch

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
Reserved_16_31					IC_FS_SCL_HCNT			

Bit Range	Default & Access	Field Name (ID): Description
31:16	0b RW	Reserved_16_31: Reserved.
15:0	003ch RW	Fast Speed I2C Clock SCL High Count Register (IC_FS_SCL_HCNT): This register can be written only when the I2C interface is disabled, which corresponds to the IC_ENABLE register being set to 0. Writes at other times have no effect.

This register must be set before any I2C bus transaction can take place, to ensure proper I/O timing. This register sets the SCL clock low-period count for fast speed. It is used in high-speed mode to send the Master Code and START BYTE or General CALL. The SCL High time depends on the loading of the bus. For 100pF loading, the SCL High time is 60ns; for 400pF loading, the SCL High time is 120ns. This register goes away and becomes read-only if `IC_MAX_SPEED_MODE` != high. This register can be written only when the I2C interface is disabled, which corresponds to the `IC_ENABLE` register being set to 0. Writes at other times have no effect. The minimum valid value is 8; hardware prevents values less than this being written, and, if attempted, results in 8 being set. For designs with `APB_DATA_WIDTH` == 8 the order of programming is important to ensure the correct operation of the `DW_apb_i2c`. The lower byte must be programmed first. Then the upper byte can be programmed.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 28h**BAR Type:** PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:3] + 10h

Offset: [BAR] + 3Ch

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:3] + 10h

Default: 00000010h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	1	0
0	0	0	0	0	0	0	0	0
Reserved_8_31							TX_TL	

Bit Range	Default & Access	Field Name (ID): Description
31:8	0b RW	Reserved_8_31: Reserved.
7:0	10h RW	Transmit FIFO Threshold Level (TX_TL): Controls the level of entries (or below) that trigger the TX_EMPTY interrupt (bit 4 in IC_RAW_INTR_STAT register). The valid range is 0-255, with the additional restriction that it may not be set to value larger than the depth of the buffer. If an attempt is made to do that, the actual value set will be the maximum depth of the buffer.

26.11.17 Clear Combined and Individual Interrupt Register (IC_CLR_INTR)—Offset 40h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 40h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:3] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
Reserved_1_31								CLR_INTR

Bit Range	Default & Access	Field Name (ID): Description
31:1	0b RW	Reserved_1_31: Reserved.
0	0h RO	CLR_INTR: Read this register to clear the combined interrupt, all individual interrupts, and the IC_TX_ABRT_SOURCE register. This bit does not clear hardware clearable interrupts but software clearable interrupts.

26.11.18 Clear RX_UNDER Interrupt Register (IC_CLR_RX_UNDER)—Offset 44h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 44h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:3] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
Reserved_1_31								CLR_RX_UNDER

Bit Range	Default & Access	Field Name (ID): Description
31:1	0b RW	Reserved_1_31: Reserved.
0	0h RO	CLR_RX_UNDER: Read this register to clear the RX_UNDER interrupt (bit 0) of the IC_RAW_INTR_STAT register.

26.11.19 Clear RX_OVER Interrupt Register (IC_CLR_RX_OVER)—Offset 48h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 48h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:3] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
Reserved_1_31								CLR_RX_OVER

Bit Range	Default & Access	Field Name (ID): Description
31:1	0b RW	Reserved_1_31: Reserved.
0	0h RO	CLR_RX_OVER: Read this register to clear the RX_OVER interrupt (bit 1) of the IC_RAW_INTR_STAT register.

26.11.20 Clear TX_OVER Interrupt Register (IC_CLR_TX_OVER)—Offset 4Ch

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 4Ch

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:3] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
Reserved_1_31								CLR_TX_OVER

Bit Range	Default & Access	Field Name (ID): Description
31:1	0b RW	Reserved_1_31: Reserved.
0	0h RO	CLR_TX_OVER: Read this register to clear the TX_OVER interrupt (bit 3) of the IC_RAW_INTR_STAT register.

26.11.21 Clear RD_REQ Interrupt Register (IC_CLR_RD_REQ)—Offset 50h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 50h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:3] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
Reserved_1_31								CLR_RD_REQ

Bit Range	Default & Access	Field Name (ID): Description
31:1	0b RW	Reserved_1_31: Reserved.
0	0h RO	CLR_RD_REQ: Read this register to clear the RD_REQ interrupt (bit 5) of the IC_RAW_INTR_STAT register.

26.11.22 Clear TX_ABRT Interrupt Register (IC_CLR_TX_ABRT)—Offset 54h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 54h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:3] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
Reserved_1_31								CLR_TX_ABRT

Bit Range	Default & Access	Field Name (ID): Description
31:1	0b RW	Reserved_1_31: Reserved.
0	0h RO	CLR_TX_ABRT: Read this register to clear the TX_ABRT interrupt (bit 6) of the IC_RAW_INTR_STAT register, and the IC_TX_ABRT_SOURCE register. This also releases the TX FIFO from the flushed/reset state, allowing more writes to the TX FIFO.

26.11.23 Clear RX_DONE Interrupt Register (IC_CLR_RX_DONE)—Offset 58h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 58h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:3] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
Reserved_1_31								CLR_RX_DONE

Bit Range	Default & Access	Field Name (ID): Description
31:1	0b RW	Reserved_1_31: Reserved.
0	0h RO	CLR_RX_DONE: Read this register to clear the RX_DONE interrupt (bit 7) of the IC_RAW_INTR_STAT register.

26.11.24 Clear ACTIVITY Interrupt Register (IC_CLR_ACTIVITY)—Offset 5Ch

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 5Ch

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:3] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
Reserved_1_31								CLR_ACTIVITY

Bit Range	Default & Access	Field Name (ID): Description
31:1	0b RW	Reserved_1_31: Reserved.
0	0h RO	CLR_ACTIVITY: Reading this register clears the ACTIVITY interrupt if the I2C is not active anymore. If the I2C module is still active on the bus, the ACTIVITY interrupt bit continues to be set. It is automatically cleared by hardware if the module is disabled and if there is no further activity on the bus. The value read from this register to get status of the ACTIVITY interrupt (bit 8) of the IC_RAW_INTR_STAT register.

26.11.25 Clear STOP_DET Interrupt Register (IC_CLR_STOP_DET)—Offset 60h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 60h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:3] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
Reserved_1_31								CLR_STOP_DET

Bit Range	Default & Access	Field Name (ID): Description
31:1	0b RW	Reserved_1_31: Reserved.

26.11.27 Clear GEN_CALL Interrupt Register (IC_CLR_GEN_CALL)—Offset 68h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0b RW	Reserved_1_31: Reserved.
0	0h RO	CLR_GEN_CALL: Read this register to clear the GEN_CALL interrupt (bit 11) of IC_RAW_INTR_STAT register.

26.11.28 I2C Enable Register (IC_ENABLE)—Offset 6Ch

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 6Ch

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:3] + 10h

Default: 00000000h

[illegible]

Bit Range	Default & Access	Field Name (ID): Description
31:2	0b RW	Reserved_2_31: Reserved
1	0h WO	ABORT: Software can abort the I2C transfer by setting this bit. This bit can be set only when ENABLE = 1 and fix_ctrl_1680 = 1. The HW will clear the ABORT bit once the STOP condition has been sent.
0	0h RW	ENABLE: Controls whether the DW_apb_i2c is enabled. 0 = Disables DW_apb_i2c (TX and RX FIFOs are held in an erased state) 1 = Enables DW_apb_i2c

26.11.29 I2C Status Register (IC_STATUS)—Offset 70h

This is a read-only register used to indicate the current transfer status and FIFO status. The status register may be read at any time. None of the bits in this register request an interrupt. The following occurs when the I2C is disabled by writing 0 in bit 0 of the IC_ENABLE register:

- Bits 1 and 2 are set to 1
- Bits 3 and 4 are set to 0

When the master or slave state machines goes to idle and `ic_en=0`:

- Bits 5 and 6 are set to 0

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 70h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:3] + 10h

Default: 00000006h

	31				28				24				20				16				12				8				4				0			
	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	0

	SLV_ACTIVITY																																			
	MST_ACTIVITY																																			
	RFF																																			
	RFNE																																			
	TFE																																			
	TFNF																																			
	ACTIVITY																																			

Bit Range	Default & Access	Field Name (ID): Description
31:7	0b RW	Reserved_7_31: Reserved.
6	0h RO	Slave FSM Activity Status (SLV_ACTIVITY): When the Slave Finite State Machine (FSM) is not in the IDLE state, this bit is set.
5	0h RO	Master FSM Activity Status (MST_ACTIVITY): When the Master Finite State Machine (FSM) is not in the IDLE state, this bit is set.
4	0h RO	Receive FIFO Completely Full (RFF): When the receive FIFO is completely full, this bit is set. When the receive FIFO contains one or more empty location, this bit is cleared.
3	0h RO	Receive FIFO Not Empty (RFNE): This bit is set when the receive FIFO contains one or more entries; it is cleared when the receive FIFO is empty.
2	1h RO	Transmit FIFO Completely Empty (TFE): When the transmit FIFO is completely empty, this bit is set. When it contains one or more valid entries, this bit is cleared. This bit field does not request an interrupt.
1	1h RO	Transmit FIFO Not Full (TFNF): Set when the transmit FIFO contains one or more empty locations, and is cleared when the FIFO is full.
0	0h RO	ACTIVITY: I2C Activity Status

26.11.30 I2C Transmit FIFO Level Register (IC_TXFLR)—Offset 74h

This register contains the number of valid data entries in the transmit FIFO buffer. It is cleared whenever:

- The I2C is disabled
- There is a transmit abort -- that is, TX_ABORT bit is set in the IC_RAW_INTR_STAT register
- The slave bulk transmit mode is aborted

The register increments whenever data is placed into the transmit FIFO and decrements when data is taken from the transmit FIFO.

Access Method

Bit Range	Default & Access	Field Name (ID): Description
31:9	0b RW	Reserved_9_31: Reserved
8:0	0h RO	Receive FIFO Level (RXFLR): Contains the number of valid data entries in the receive FIFO.

26.11.32 I2C SDA Hold Time Length Register (IC_SDA_HOLD)—Offset 7Ch

This register controls the amount of hold time on the SDA signal after a negative edge of SCL in both master and slave mode, in units of ic_clk period. The value programmed must be greater than the minimum hold time in each mode for the value to be implemented one cycle in master mode, seven cycles in slave mode. Writes to this register succeed only when IC_ENABLE=0. The programmed SDA hold time cannot exceed at any time the duration of the low part of scl. Therefore the programmed value cannot be larger than N_SCL_LOW-2, where N_SCL_LOW is the duration of the low part of the scl period measured in ic_clk cycles.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 7Ch

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:3] + 10h

Default: 00000001h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	1
Reserved_16_31								IC_SDA_HOLD

Bit Range	Default & Access	Field Name (ID): Description
31:16	0b RW	Reserved_16_31: Reserved
15:0	1h RW	IC_SDA_HOLD: Sets the required SDA hold time in units of ic_clk period.

26.11.33 I2C Transmit Abort Source Register (IC_TX_ABRT_SOURCE)—Offset 80h

This register has 16 bits that indicate the source of the TX_ABRT bit. Except for Bit 9, this register is cleared whenever the IC_CLR_TX_ABRT register or the IC_CLR_INTR register is read. To clear Bit 9, the source of the ABRT_SBYTE_NORSTRT must be fixed first; RESTART must be enabled (IC_CON[5]=1), the SPECIAL bit must be cleared (IC_TAR[11]), or the GC_OR_START bit must be cleared (IC_TAR[10]). Once the source of the ABRT_SBYTE_NORSTRT is fixed, then this bit can be cleared in the same

- DW_apb_i2c is disabled (IC_ENABLE[0] = 0)
- Slave part is inactive (IC_STATUS[6] = 0)

Access Method

Offset: [BAR] + 84h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:3] + 10h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
								NACK

Bit Range	Default & Access	Field Name (ID): Description
0	0h RW	Generate NACK (NACK): This NACK generation only occurs when DW_apb_i2c is a slavereceiver. If this register is set to a value of 1, it can only generate a NACK after a data byte is received; hence, the data transfer is aborted and the data received is not pushed to the receive buffer. When the register is set to a value of 0, it generates NACK/ACK, depending on normal criteria. 1 = generate NACK after data byte received 0 = generate NACK/ACK normally

26.11.35 DMA Control Register (IC_DMA_CR)—Offset 88h

This register is only valid when DW_apb_i2c is configured with a set of DMA Controller interface signals (IC_HAS_DMA = 1). When DW_apb_i2c is not configured for DMA operation, this register does not exist and writing to the registers address has no effect and reading from this register address will return zero. The register is used to enable the DMA Controller interface operation. There is a separate bit for transmit and receive. This can be programmed regardless of the state of IC_ENABLE.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 88h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:3] + 10h

Default: 00000000h

[illegible]

Bit Range	Default & Access	Field Name (ID): Description
31:2	0b RW	Reserved_2_31: Reserved.
1	0h RW	Transmit DMA Enable (TDMAE): This bit enables/disables the transmit FIFO DMA channel. 0 = Transmit DMA disabled 1 = Transmit DMA enabled
0	0h RW	Receive DMA Enable (RDMAE): This bit enables/disables the receive FIFO DMA channel. 0 = Receive DMA disabled 1 = Receive DMA enabled

26.11.36 DMA Transmit Data Level Register (IC_DMA_TDLR)—Offset 8Ch

This register is only valid when the DW_apb_i2c is configured with a set of DMA interface signals (IC_HAS_DMA = 1). When DW_apb_i2c is not configured for DMA operation, this register does not exist, writing to its address has no effect, and reading from its address returns zero.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 8Ch

BAR Type: PCI Configuration Register (Size: 32 bits)

Reserved_8_31							DMARDL	

Bit Range	Default & Access	Field Name (ID): Description
31:8	0b RW	Reserved_8_31: Reserved.

This register controls the amount of time delay (in terms of number of ic_clk clock periods) introduced in the rising edge of SCL -- relative to SDA changing -- by holding SCL low when DW_apb_i2c services a read request while operating as a slave-transmitter. The relevant I2C requirement is tSU:DAT (note 4) as detailed in the I2C Bus Specification. This register must be programmed with a value equal to or greater than 2. **NOTE:** The length of setup time is calculated using $[(IC_SDA_SETUP - 1) * (ic_clk_period)]$, so if the user requires 10 ic_clk periods of setup time, they should program a value of 11. The IC_SDA_SETUP register is only used by the DW_apb_i2c when operating as a slave transmitter.

Type: Memory Mapped I/O Register
(Size: 32 bits)

BAR Type: PCI Configuration Register (Size: 32 bits)

Default: 00000064h

	31	28	24	20	16	12	8	4	0		
	0	0	0	0	0	0	0	0	0	0	
	0	0	0	0	0	0	0	0	0	0	
	Reserved_8_31							SDA_SETUP			

Bit Range	Default & Access	Field Name (ID): Description
31:8	0b RW	Reserved_8_31: Reserved.
7:0	64h RW	SDA Setup (SDA_SETUP): It is recommended that if the required delay is 1000ns, then for an ic_clk frequency of 10 MHz, IC_SDA_SETUP should be programmed to a value of 11.

26.11.39 I2C ACK General Call Register (IC_ACK_GENERAL_CALL)—Offset 98h

The register controls whether DW_apb_i2c responds with an ACK or NACK when it receives an I2C General Call address.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 98h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:3] + 10h

Default: 00000001h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	1
Reserved_1_31								ACK_GEN_CALL

Bit Range	Default & Access	Field Name (ID): Description
31:1	0b RW	Reserved_1_31: Reserved.
0	1h RW	ACK General Call (ACK_GEN_CALL): When set to 1, DW_apb_i2c responds with a ACK (by asserting ic_data_oe) when it receives a General Call. When set to 0, the DW_apb_i2c does not generate General Call interrupts.

26.11.40 I2C Enable Status Register (IC_ENABLE_STATUS)—Offset 9Ch

The register is used to report the DW_apb_i2c hardware status when the IC_ENABLE register is set from 1 to 0, that is, when DW_apb_i2c is disabled.

- If IC_ENABLE has been set to 1, bits 2:1 are forced to 0, and bit 0 is forced to 1.
- If IC_ENABLE has been set to 0, bits 2:1 will only be valid as soon as bit 0 is read as 0.

NOTE = When IC_ENABLE has been written with 0, a delay occurs for bit 0 to be read as 0 because disabling the DW_apb_i2c depends on I2C bus activities.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 9Ch

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:3] + 10h

26.11.47 Software Reset (RESETS)—Offset 804h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 804h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:3] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
reserved								reset_apb reset_func

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RW	Reserved (reserved): Reserved.
1	0h RW	reset_apb: reset the apb domain
0	0h RW	reset_func: reset the func clock domain

26.11.48 General Purpose Register (GENERAL)—Offset 808h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 808h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:3] + 10h

Default: 55000000h

[illegible]

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	sda_mux_sel: Reserved.
30	1h RW	sda_signal_state: Reserved.
29	0h RW	scl_mux_sel: Reserved.

26.11.50 I2C_TX_COMPLETE_INTR_STAT—Offset 820h

TX transaction has finished interrupt

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 820h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:3] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
Reserved								i2c_tx_complete_interrupt_mask
								i2c_tx_completion_interrupt

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	Reserved: Reserved
1	0h RW	i2c_tx_complete_interrupt_mask: Mask TX transaction has finished interrupt
0	0h RO	i2c_tx_completion_interrupt: indicate TX transaction has finished

26.11.51 reg_I2C_TX_COMPLETE_INTR_CLR (I2C_TX_COMPLETE_INTR_CLR)—Offset 824h

indicate TX transaction has finished write 1 to clear the interrupt

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 824h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:3] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
RSVD0								i2c_tx_complete_intr_clr

Bit Range	Default & Access	Field Name (ID): Description
31:1	0b RO	RSVD0: Reserved
0	0h RW	i2c_tx_complete_intr_clr: indicate TX transaction has finished write 1 to clear the interrupt

0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
Reserved0				MULFNDEV	HEADERTYPE			
					LATTIMER			
								CACHELINE_SIZE

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RO	Reserved0: Reserved.
23	1h RO	Multi Function Device (MULFNDEV): This bit is always 0 for non fabric ports. For Fabric ports it is driven from fabric_mult_function strap. 1 = multifunction device 0 = single function device
22:16	00h RO	Header Type (HEADERTYPE): Implements Type 0 Configuration header.
15:8	00h RO	Latency Timer (LATTIMER): Does not apply to PCI Express. Hardwired to 00h.
7:0	00h RW	Cache Line Size (CACHELINE_SIZE): Doesn't apply to PCI Express. PCI Express spec requires this to be implemented as a R/W register but has no functional impact on the AHB Device connected.

26.12.5 Base Address Register (BAR)—Offset 10h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:24, F:4] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
BASEADDR						SIZEINDICATOR	PREFETCHABLE	TYPE
								MESSAGE_SPACE

Bit Range	Default & Access	Field Name (ID): Description
31:12	00000h RW	Base Address (BASEADDR): Base address of the AHB device memory space. Taken from Strap values as 1.s
11:4	00h RO	Size Indicator Read Only (SIZEINDICATOR): Always returns zero. The size of this register depends on the size of the Memory space. This size is determined by a top level of STRAP values as 0.s. Always will be zero as minimum size is 4K.
3	0h RO	Prefetchable (PREFETCHABLE): Indicates that this BAR is not prefetchable.

26.12.9 Capabilities Pointer (CAPABILITYPTR)—Offset 34h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:24, F:4] + 34h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
Reserved0							CAPPTR_POWER	

Bit Range	Default & Access	Field Name (ID): Description
31:8	000000h RO	Reserved0: Reserved.
7:0	00h RO	Capabilities Pointer (CAPPTR_POWER): Indicates what the next capability is. This capability can be programmed to be PM Capability (0x80) if PM Capability is enabled in SB. If PM capability is disabled then this register has 00h.

26.12.10 Interrupt Register (INTERRUPTREG)—Offset 3Ch

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:24, F:4] + 3Ch

Default: 00000100h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	1	0
0	0	0	0	0	0	0	0	0
MAX_LAT				MIN_GNT				INTLINE

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RO	Max_Lat (MAX_LAT): Value of 0 indicates device has no major requirements for the settings of latency timers.
23:16	00h RO	Min_Gnt (MIN_GNT): Value of 0 indicates device has no major requirements for the settings of latency timers.
15:12	0h RO	Reserved0: Reserved.
11:8	1h RO	Interrupt Pin (INTPIN): Each AHB IP on Bridge is a Single function device. Hence Bridge only generates INTA on IOSF SB. The Fabric on AHB Bridge appears as a Multifunction device. Interrupt Pin Value in this register is reflected from the IPIN value in the private configuration space.
7:0	00h RW	Interrupt Line (INTLINE): Bridge does not use this field directly. It is used to tell software which interrupt line the interrupt pin is connected to.

26.12.11 PowerManagement Capability ID (POWERCAPID)—Offset 80h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:24, F:4] + 80h

Default: 00030001h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	1
PMESUPPORT		Reserved0		VERSION		NXTCAP		POWER_CAP

Bit Range	Default & Access	Field Name (ID): Description
31:27	00h RO	PME_Support (PMESUPPORT): This 5-bit field indicates the power states in which the function may assert PME#. A value of 0b for any bit indicates that the function is not capable of asserting the PME# signal while in that power state. - bit(11) X XXX1b - PME# can be asserted from D0. - bit(12) X XX1Xb - PME# can be asserted from D1. Bridge does not support this state. - bit(13) X X1XXb - PME# can be asserted from D2. Bridge does not support this state. - bit(14) X 1XXXb - PME# can be asserted from D3hot. - bit(15) 1 XXXXb - PME# can be asserted from D3cold. Bridge does not support this state. This field is taken from the strap strap_pme_support.
26:19	00h RO	Reserved0: Reserved.
18:16	3h RO	Version (VERSION): Indicates support for Revision 1.2 of the PCI Power Management Specification.
15:8	00h RO	Next Capability (NXTCAP): Points to the next capability structure. This points to NULL.
7:0	01h RO	Power Management Capability (POWER_CAP): Indicates this is power management capability.

26.13 SIO I²C 3 Memory Mapped I/O Registers

26.13.2 I2C Target Address Register (IC_TAR)—Offset 4h

Access Method

Offset: [BAR] + 8h**BAR Type:** PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:4] + 10h

Default: 00000055h

Bit Range	Default & Access	Field Name (ID): Description
31:10	0b RW	Reserved_10_31: Reserved.
9:0	55h RW	IC_SAR: The IC_SAR holds the slave address when the I2C is operating as a slave. For 7-bit addressing, only IC_SAR[6:0] is used. This register can be written only when the I2C interface is disabled, which corresponds to the IC_ENABLE register being set to 0. Writes at other times have no effect.

26.13.4 I2C High Speed Master Mode Code Address Register (IC_HS_MADDR)—Offset Ch

Note: It is not necessary to perform any write to this register if DW_apb_i2c is enabled as an I2C slave only.

Access Method

Offset: [BAR] + Ch

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:4] + 10h

Default: 00000001h

31	28	24	20	16	12	8	4	0	
0	0	0	0	0	0	0	0	0	1
Reserved_3_31									IC_HS_MAR

26.13.8 Fast Speed I2C Clock SCL High Count Register (IC_FS_SCL_HCNT)—Offset 1Ch

Access Method

Offset: [BAR] + 1Ch

BAR Reference: [B:0, D:24, F:4] + 10h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
Reserved_16_31				IC_FS_SCL_HCNT				

Intel Atom® Processor E3800 Product Family
Datasheet
4019

26.13.11 High Speed I2C Clock SCL Low Count Register (IC_HS_SCL_LCNT)—Offset 28h

Access Method

Offset: [BAR] + 28h**BAR Type:** PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:4] + 10h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
Reserved_16_31				IC_HS_SCL_LCNT				

26.13.12 I2C Interrupt Status Register (IC_INTR_STAT)—Offset 2Ch

Bit Range	Default & Access	Field Name (ID): Description
7	1h RW	M_RX_DONE: See description of M_TX_EMPTY bit field.
6	1h RW	M_TX_ABRT: See description of M_TX_EMPTY bit field.
5	1h RW	M_RD_REQ: See description of M_TX_EMPTY bit field.
4	1h RW	M_TX_EMPTY: These bits mask their corresponding interrupt status bits in the IC_INTR_STAT register. Reset value: 12h8ff
3	1h RW	M_TX_OVER: See description of M_TX_EMPTY bit field.
2	1h RW	M_RX_FULL: See description of M_TX_EMPTY bit field.
1	1h RW	M_RX_OVER: See description of M_TX_EMPTY bit field.
0	1h RW	M_RX_UNDER: See description of M_TX_EMPTY bit field.

26.13.14 I2C Raw Interrupt Status Register (IC_RAW_INTR_STAT)—Offset 34h

Unlike the IC_INTR_STAT register, these bits are not masked -- so they always show the true status of the DW_apb_i2c.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 34h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:4] + 10h

Default: 00000000h

0	0h RO	CLR_RX_OVER: Read this register to clear the RX_OVER interrupt (bit 1) of the IC_RAW_INTR_STAT register.

26.13.20 Clear TX_OVER Interrupt Register (IC_CLR_TX_OVER)—Offset 4Ch

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 4Ch

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:4] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
Reserved_1_31								CLR_TX_OVER

Bit Range	Default & Access	Field Name (ID): Description
31:1	0b RW	Reserved_1_31: Reserved.
0	0h RO	CLR_TX_OVER: Read this register to clear the TX_OVER interrupt (bit 3) of the IC_RAW_INTR_STAT register.

26.13.21 Clear RD_REQ Interrupt Register (IC_CLR_RD_REQ)—Offset 50h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 50h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:4] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
Reserved_1_31								CLR_RD_REQ

Bit Range	Default & Access	Field Name (ID): Description
31:1	0b RW	Reserved_1_31: Reserved.
0	0h RO	CLR_RD_REQ: Read this register to clear the RD_REQ interrupt (bit 5) of the IC_RAW_INTR_STAT register.

26.13.22 Clear TX_ABRT Interrupt Register (IC_CLR_TX_ABRT)—Offset 54h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 54h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:4] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
Reserved_1_31								CLR_TX_ABRT

Bit Range	Default & Access	Field Name (ID): Description
31:1	0b RW	Reserved_1_31: Reserved.
0	0h RO	CLR_TX_ABRT: Read this register to clear the TX_ABRT interrupt (bit 6) of the IC_RAW_INTR_STAT register, and the IC_TX_ABRT_SOURCE register. This also releases the TX FIFO from the flushed/reset state, allowing more writes to the TX FIFO.

26.13.23 Clear RX_DONE Interrupt Register (IC_CLR_RX_DONE)—Offset 58h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 58h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:4] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
Reserved_1_31								CLR_RX_DONE

Bit Range	Default & Access	Field Name (ID): Description

Bit Range	Default & Access	Field Name (ID): Description
31:9	0b RW	Reserved_9_31: Reserved
8:0	0h RO	Transmit FIFO Level (TXFLR): Contains the number of valid data entries in the transmit FIFO.

26.13.31 I2C Receive FIFO Level Register (IC_RXFLR)—Offset 78h

This register contains the number of valid data entries in the receive FIFO buffer. The register is cleared by the following methods:

- The I2C is disabled
- Whenever there is a transmit abort caused by any of the events tracked in IC_TX_ABRT_SOURCE

The register increments whenever data is placed into the receive FIFO and decrements when data is taken from the receive FIFO.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 78h

31:9	0b RW	Reserved_9_31: Reserved
8:0	0h RO	Receive FIFO Level (RXFLR): Contains the number of valid data entries in the receive FIFO.

26.13.32 I2C SDA Hold Time Length Register (IC_SDA_HOLD)—Offset 7Ch

This register controls the amount of hold time on the SDA signal after a negative edge of SCL in both master and slave mode, in units of ic_clk period. The value programmed must be greater than the minimum hold time in each mode for the value to be implemented one cycle in master mode, seven cycles in slave mode. Writes to this register succeed only when IC_ENABLE=0. The programmed SDA hold time cannot exceed at any time the duration of the low part of scl. Therefore the programmed value cannot be larger than N_SCL_LOW-2, where N_SCL_LOW is the duration of the low part of the scl period measured in ic_clk cycles.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 7Ch

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:4] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0b RW	Reserved_16_31: Reserved
15:0	1h RW	IC_SDA_HOLD: Sets the required SDA hold time in units of ic_clk period.

26.13.33 I2C Transmit Abort Source Register (IC_TX_ABRT_SOURCE)—Offset 80h

This register has 16 bits that indicate the source of the TX_ABRT bit. Except for Bit 9, this register is cleared whenever the IC_CLR_TX_ABRT register or the IC_CLR_INTR register is read. To clear Bit 9, the source of the ABRT_SBYTE_NORSTRT must be fixed first; RESTART must be enabled (IC_CON[5]=1), the SPECIAL bit must be cleared (IC_TAR[11]), or the GC_OR_START bit must be cleared (IC_TAR[10]). Once the source of the ABRT_SBYTE_NORSTRT is fixed, then this bit can be cleared in the same

manner as other bits in this register. If the source of the ABRT_SBYTE_NORSTRT is not fixed before attempting to clear this bit, Bit 9 clears for one cycle and is then re-asserted.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 80h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:4] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	TX_FLUSH_CNT: This field preserves the TXFLR value prior to the last TX_ABRT event. It is enabled when fix_ctrl_1680 = 1. It is cleared whenever I2C is disabled.
23:17	0b RW	Reserved_17_23: Reserved
16	0h RO	ABRT_USER_ABRT: This is a master-mode only bit. Master has detected the user initiated transfer abort (IC_ENABLE[1]). It is enabled only when fix_ctrl_1680 = 1
15	0h RO	ABRT_SLVRD_INTX: 1 = When the processor side responds to a slave mode request for data to be transmitted to a remote master and user writes a 1 in CMD (bit 8) of IC_DATA_CMD register.
14	0h RO	ABRT_SLV_ARBLOST: 1 = Slave lost the bus while transmitting data to a remote master. IC_TX_ABRT_SOURCE[12] is set at the same time.
13	0h RO	ABRT_SLVFLUSH_TXFIFO: 1 = Slave has received a read command and some data exists in the TX FIFO so the slave issues a TX_ABRT interrupt to flush old data in TX FIFO.
12	0h RO	ARB_LOST: 1 = Master has lost arbitration, or if IC_TX_ABRT_SOURCE[14] is also set, then the slave transmitter has lost arbitration.
11	0h RO	ABRT_MASTER_DIS: 1 = User tries to initiate a Master operation with the Master mode disabled.
10	0h RO	ABRT_10B_RD_NORSTRT: 1 = The restart is disabled (IC_RESTART_EN bit (IC_CON[5]) = 0) and the master sends a read command in 10-bit addressing mode.
9	0h RO	ABRT_SBYTE_NORSTRT: 1 = The restart is disabled (IC_RESTART_EN bit (IC_CON[5]) = 0) and the user is trying to send a START Byte.
8	0h RO	ABRT_HS_NORSTRT: 1 = The restart is disabled (IC_RESTART_EN bit (IC_CON[5]) = 0) and the user is trying to use the master to transfer data in High Speed mode.
7	0h RO	ABRT_SBYTE_ACKDET: 1 = Master has sent a START Byte and the START Byte was acknowledged (wrong behavior).

Bit Range	Default & Access	Field Name (ID): Description
0	0h RW	Generate NACK (NACK): This NACK generation only occurs when DW_apb_i2c is a slavereceiver. If this register is set to a value of 1, it can only generate a NACK after a data byte is received; hence, the data transfer is aborted and the data received is not pushed to the receive buffer. When the register is set to a value of 0, it generates NACK/ACK, depending on normal criteria. 1 = generate NACK after data byte received 0 = generate NACK/ACK normally

26.13.35 DMA Control Register (IC_DMA_CR)—Offset 88h

Access Method

Offset: [BAR] + 88h

BAR Type: PCI Configuration Register (Size: 32 bits)

Default: 00000000h

[illegible]

Bit Range	Default & Access	Field Name (ID): Description
31:2	0b RW	Reserved_2_31: Reserved.
1	0h RW	Transmit DMA Enable (TDMAE): This bit enables/disables the transmit FIFO DMA channel. 0 = Transmit DMA disabled 1 = Transmit DMA enabled
0	0h RW	Receive DMA Enable (RDMAE): This bit enables/disables the receive FIFO DMA channel. 0 = Receive DMA disabled 1 = Receive DMA enabled

26.13.36 DMA Transmit Data Level Register (IC_DMA_TDLR)—Offset 8Ch

This register is only valid when the DW_apb_i2c is configured with a set of DMA interface signals (IC_HAS_DMA = 1). When DW_apb_i2c is not configured for DMA operation, this register does not exist, writing to its address has no effect, and reading from its address returns zero.

This register controls the amount of time delay (in terms of number of ic_clk clock periods) introduced in the rising edge of SCL -- relative to SDA changing -- by holding SCL low when DW_apb_i2c services a read request while operating as a slave-transmitter. The relevant I2C requirement is tSU:DAT (note 4) as detailed in the I2C Bus Specification. This register must be programmed with a value equal to or greater than 2. **NOTE:** The length of setup time is calculated using $[(IC_SDA_SETUP - 1) * (ic_clk_period)]$, so if the user requires 10 ic_clk periods of setup time, they should program a value of 11. The IC_SDA_SETUP register is only used by the DW_apb_i2c when operating as a slave transmitter.

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 94h

BAR Type: PCI Configuration Register (Size: 32 bits)

Bit Range	Default & Access	Field Name (ID): Description
31:1	0b RW	Reserved_1_31: Reserved.
0	1h RW	ACK General Call (ACK_GEN_CALL): When set to 1, DW_apb_i2c responds with a ACK (by asserting ic_data_oe) when it receives a General Call. When set to 0, the DW_apb_i2c does not generate General Call interrupts.

26.13.40 I2C Enable Status Register (IC_ENABLE_STATUS)—Offset 9Ch

The register is used to report the DW_apb_i2c hardware status when the IC_ENABLE register is set from 1 to 0, that is, when DW_apb_i2c is disabled.

- If IC_ENABLE has been set to 1, bits 2:1 are forced to 0, and bit 0 is forced to 1.
- If IC_ENABLE has been set to 0, bits 2:1 will only be valid as soon as bit 0 is read as 0.

NOTE = When IC_ENABLE has been written with 0, a delay occurs for bit 0 to be read as 0 because disabling the DW_apb_i2c depends on I2C bus activities.

Access Method

1	0h RW	i2c_tx_complete_interrupt_mask: Mask TX transaction has finished interrupt
0	0h RO	i2c_tx_completion_interrupt: indicate TX transaction has finished

26.13.51 reg_I2C_TX_COMPLETE_INTR_CLR (I2C_TX_COMPLETE_INTR_CLR)—Offset 824h

indicate TX transaction has finished write 1 to clear the interrupt

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 824h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:4] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
RSVD0								i2c_tx_complete_intr_clr

Bit Range	Default & Access	Field Name (ID): Description
31:1	0b RO	RSVD0: Reserved
0	0h RW	i2c_tx_complete_intr_clr: indicate TX transaction has finished write 1 to clear the interrupt

26.14.3 Revision ID and Class Code (REVCLASSCODE)—Offset 8h

Bit Range	Default & Access	Field Name (ID): Description
7:3	00h RO	Reserved5: Reserved.
2	0h RW	Bus Master Enable (BME): If this bit is 0, Bridge does not generate any new upstream transaction on IOSF as a master.
1	0h RW	Memory Space Enable (MSE): This bit controls Bridge's response to downstream Memory accesses. When set, accesses to memory space of the device is enabled.
0	0h RO	Reserved6: Reserved.

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:24, F:5] + 8h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
CLASS_CODES							RID	

Bit Range	Default & Access	Field Name (ID): Description
31:8	000000h RO	Class Code (CLASS_CODES): The Class Code register is read-only and used to identify the generic function of the device and, in some cases, a specific register level programming interface. The register is broken into three byte size fields. The upper byte (at offset 0Bh) is a base class code which broadly classifies the type of function the device performs. The middle byte (at offset 0Ah) is a sub-class code which identifies more specifically the function of the device. The lower byte (at offset 09h) identifies a specific register-level programming interface (if any) so that device independent software can interact with the device. This register is tied to a strap at the top level.
7:0	00h RO	Revision ID (RID): Revision ID identifies the revision of particular AHB device. This is tied to a strap at the top level.

26.14.4 Cache Line Latency Header and BIST (CLLATHEADERBIST)—Offset Ch

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:24, F:5] + Ch

Default: 00800000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
Reserved0	MULFNDEV	HEADERTYPE	LATTIMER	CACHELINE_SIZE				

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RO	Reserved0: Reserved.
23	1h RO	Multi Function Device (MULFNDEV): This bit is always 0 for non fabric ports. For Fabric ports it is driven from fabric_mult_function strap. 1 = multifunction device 0 = single function device
22:16	00h RO	Header Type (HEADERTYPE): Implements Type 0 Configuration header.
15:8	00h RO	Latency Timer (LATTIMER): Does not apply to PCI Express. Hardwired to 00h.
7:0	00h RW	Cache Line Size (CACHELINE_SIZE): Doesn't apply to PCI Express. PCI Express spec requires this to be implemented as a R/W register but has no functional impact on the AHB Device connected.

Access Method

0	0	0	0	0	0	0	0	0
SUBSYSTEMID					SUBSYSTEMVENDORID			

26.14.8 Expansion ROM Base Address (EXPANSION_ROM_BASEADDR)—Offset 30h

Access Method

Offset: [B:0, D:24, F:5] + 30h

October 2018
Document Number: 538136, Rev.4.3

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
EXPANSION_ROM_BASE								

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	EXPANSION_ROM_BASE: Reserved.

26.14.9 Capabilities Pointer (CAPABILITYPTR)—Offset 34h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:24, F:5] + 34h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
Reserved0							CAPPTR_POWER	

Bit Range	Default & Access	Field Name (ID): Description
31:8	000000h RO	Reserved0: Reserved.
7:0	00h RO	Capabilities Pointer (CAPPTR_POWER): Indicates what the next capability is. This capability can be programmed to be PM Capability (0x80) if PM Capability is enabled in SB. If PM capability is disabled then this register has 00h.

26.14.10 Interrupt Register (INTERRUPTREG)—Offset 3Ch

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:24, F:5] + 3Ch

Default: 00000100h

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RO	Max_Lat (MAX_LAT): Value of 0 indicates device has no major requirements for the settings of latency timers.
23:16	00h RO	Min_Gnt (MIN_GNT): Value of 0 indicates device has no major requirements for the settings of latency timers.
15:12	0h RO	Reserved0: Reserved.
11:8	1h RO	Interrupt Pin (INTPIN): Each AHB IP on Bridge is a Single function device. Hence Bridge only generates INTA on IOSF SB. The Fabric on AHB Bridge appears as a Multifunction device. Interrupt Pin Value in this register is reflected from the IPIN value in the private configuration space.
7:0	00h RW	Interrupt Line (INTLINE): Bridge does not use this field directly. It is used to tell software which interrupt line the interrupt pin is connected to.

26.14.11 PowerManagement Capability ID (POWERCAPID)—Offset 80h

Type: PCI Configuration Register
(Size: 32 bits)

Default: 00030001h

Bit Range	Default & Access	Field Name (ID): Description
31:27	00h RO	PME_Support (PMESUPPORT): This 5-bit field indicates the power states in which the function may assert PME#. A value of 0b for any bit indicates that the function is not capable of asserting the PME# signal while in that power state. • bit(11) X XXX1b - PME# can be asserted from D0. • bit(12) X XX1Xb - PME# can be asserted from D1. Bridge does not support this state. • bit(13) X X1XXb - PME# can be asserted from D2. Bridge does not support this state. • bit(14) X 1XXXb - PME# can be asserted from D3hot. • bit(15) 1 XXXXb - PME# can be asserted from D3cold. Bridge does not support this state. This field is taken from the strap strap_pme_support.
26:19	00h RO	Reserved0: Reserved.

Bit Range	Default & Access	Field Name (ID): Description
18:16	3h RO	Version (VERSION): Indicates support for Revision 1.2 of the PCI Power Management Specification.
15:8	00h RO	Next Capability (NXTCAP): Points to the next capability structure. This points to NULL.
7:0	01h RO	Power Management Capability (POWER_CAP): Indicates this is power management capability.

26.14.12 PME Control and Status Register (PMECTRLSTATUS)—Offset 84h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:24, F:5] + 84h

Default: 00000008h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
Reserved0				PMESTATUS	Reserved1		PMEENABLE	Reserved2
								NO_SOFT_RESET
								Reserved3
								POWERSTATE

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RO	Reserved0: Reserved.
15	0h RW/1C	PME Status (PMESTATUS): 0 = Software clears the bit by writing a 1 to it. 1 = This bit is set when the AHB Device would normally assert the PME# signal independent of the state of the PME Enable bit (bit 8 in this register).
14:9	00h RO	Reserved1: Reserved.
8	0h RW	PME Enable (PMEENABLE): A 1 enables the function to assert PME#. When 0, PME# message on SB is disabled.
7:4	0h RO	Reserved2: Reserved.
3	1h RO	No_Soft_Reset (NO_SOFT_RESET): This bit indicates that devices transitioning from D3hot to D0 because of PowerState commands do not perform an internal reset. Configuration Context is preserved.
2	0h RO	Reserved3: Reserved.

Bit Range	Default & Access	Field Name (ID): Description
1:0	0h RW	Power State (POWERSTATE): This field is used both to determine the current power state of the AHB IP and to set a new power state. The values are: 00 = D0 state 11 = D3HOT state - Others = Reserved Notes: If software attempts to write a value of 01b or 10b in to this field, the write operation must complete normally; however, the data is discarded and no state change occurs. When in the D3HOT states, interrupts are blocked. D3Hot will not be used for Downstream decode on fabric ports.

26.14.13 Manufacturer ID (MANID)—Offset F8h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:24, F:5] + F8h

Default: 00000000h

26.15.2 I2C Target Address Register (IC_TAR)—Offset 4h

Writes to IC_TAR succeed when one of the following conditions are true:

- DW_apb_i2c is NOT enabled (IC_ENABLE is set to 0)
-
- OR
-
- DW_apb_i2c is enabled (IC_ENABLE=1)
- AND
- DW_apb_i2c is NOT engaged in any Master (tx, rx) operation (IC_STATUS[5]=0)
- AND
- DW_apb_i2c is enabled to operate in Master mode (IC_CON[0]=1)
- AND
- There are NO entries in the TX FIFO (IC_STATUS[2]=1)

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 4h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:5] + 10h

Default: 00001055h

0	0	0	0	0	0	0	0	1
Reserved_13_31					IC_10BITADDR_MASTER	SPECIAL		
						GC_OR_START		
						IC_TAR		

Bit Range	Default & Access	Field Name (ID): Description
31:13	0b RW	Reserved_13_31: Reserved.
12	1h RW	IC_10BITADDR_MASTER: This bit controls whether the DW_apb_i2c starts its transfers in 7-or 10-bit addressing mode when acting as a master.
11	0h RW	SPECIAL: This bit indicates whether software performs a General Call or START BYTE command. • 0 = ignore bit 10 GC_OR_START and use IC_TAR normally • 1 = perform special I2C command as specified in GC_OR_START bit
10	0h RW	GC_OR_START: If bit 11 (SPECIAL) is set to 1, then this bit indicates whether a General Call(0) or START(1) byte command is to be performed by the DW_apb_i2c.
9:0	55h RW	IC_TAR: This is the target address for any master transaction. When transmitting a General Call, these bits are ignored. To generate a START BYTE, the CPU needs to write only once into these bits.

Bit Range	Default & Access	Field Name (ID): Description
31:16	0b RW	Reserved_16_31: Reserved.
15:0	01d6h RW	Standard Speed I2C Clock SCL Low Count Register (IC_SS_SCL_LCNT): This register can be written only when the I2C interface is disabled, which corresponds to the IC_ENABLE register being set to 0. Writes at other times have no effect.

26.15.8 Fast Speed I2C Clock SCL High Count Register (IC_FS_SCL_HCNT)—Offset 1Ch

This register must be set before any I2C bus transaction can take place to ensure proper I/O timing. This register sets the SCL clock high-period count for fast speed. It is used in high-speed mode to send the Master Code and START BYTE or General CALL.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 1Ch

BAR Type: PCI Configuration Register (Size: 32 bits)

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
Reserved_16_31				IC_FS_SCL_HCNT				

Bit Range	Default & Access	Field Name (ID): Description
31:16	0b RW	Reserved_16_31: Reserved.
15:0	003ch RW	Fast Speed I2C Clock SCL High Count Register (IC_FS_SCL_HCNT): This register can be written only when the I2C interface is disabled, which corresponds to the IC_ENABLE register being set to 0. Writes at other times have no effect.

This register must be set before any I2C bus transaction can take place, to ensure proper I/O timing. This register sets the SCL clock low-period count for fast speed. It is used in high-speed mode to send the Master Code and START BYTE or General CALL. The SCL High time depends on the loading of the bus. For 100pF loading, the SCL High time is 60ns; for 400pF loading, the SCL High time is 120ns. This register goes away and becomes read-only if IC_MAX_SPEED_MODE!= high. This register can be written only when the I2C interface is disabled, which corresponds to the IC_ENABLE register being set to 0. Writes at other times have no effect. The minimum valid value is 8; hardware prevents values less than this being written, and, if attempted, results in 8 being set. For designs with APB_DATA_WIDTH == 8 the order of programming is important to ensure the correct operation of the DW_apb_i2c. The lower byte must be programmed first. Then the upper byte can be programmed.

31:12	0b RW	Reserved_12_31: Reserved.
11	0h RO	R_GEN_CALL: Set only when a General Call address is received and acknowledged. It stays set until it is cleared either by disabling DW_apb_i2c or when the CPU reads bit 0 of the IC_CLR_GEN_CALL register.
10	0h RO	R_START_DET: Indicates whether a START or RESTART condition has occurred on the I2C interface, regardless of whether DW_apb_i2c is operating in slave or master mode.
9	0h RO	R_STOP_DET: Indicates whether a STOP condition has occurred on the I2C interface, regardless of whether DW_apb_i2c is operating in slave or master mode.
8	0h RO	R_ACTIVITY: This bit captures DW_apb_i2c activity and stays set until it is cleared. There are four ways to clear it: Disabling the DW_apb_i2c, Reading the IC_CLR_ACTIVITY register, Reading the IC_CLR_INTR register, System reset
7	0h RO	R_RX_DONE: When the DW_apb_i2c is acting as a slave-transmitter, this bit is set to 1 if the master does not acknowledge a transmitted byte. This occurs on the last byte of the transmission, indicating that the transmission is done.
6	0h RO	R_TX_ABRT: This bit indicates whether DW_apb_i2c, as an I2C transmitter, is unable to complete the intended actions on the contents of the transmit FIFO.
5	0h RO	R_RD_REQ: This bit is set to 1 when DW_apb_i2c is acting as a slave and another I2C master is attempting to read data from DW_apb_i2c.

Bit Range	Default & Access	Field Name (ID): Description
4	0h RO	R_TX_EMPTY: This bit is set to 1 when the transmit buffer is at or below the threshold value set in the IC_TX_TL register.
3	0h RO	R_TX_OVER: Set during transmit if the transmit buffer is filled to IC_TX_BUFFER_DEPTH, and the processor attempts to issue another I2C command by writing to the IC_DATA_CMD register.
2	0h RO	R_RX_FULL: Set when the receive buffer reaches or goes above the RX_TL threshold in the IC_RX_TL register.
1	0h RO	R_RX_OVER: Set during transmit if the transmit buffer is filled to IC_TX_BUFFER_DEPTH and the processor attempts to issue another I2C command by writing to the IC_DATA_CMD register.
0	0h RO	R_RX_UNDER: Set if the processor attempts to read the receive buffer when it is empty by reading from the IC_DATA_CMD register.

26.15.13 I2C Interrupt Mask Register (IC_INTR_MASK)—Offset 30h

These bits mask their corresponding interrupt status bits. This register is active low.

- 0 masks the interrupt
- 1 unmask the interrupt

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 30h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:5] + 10h

Default: 000008FFh

26.15.15 I2C Receive FIFO Threshold Register (IC_RX_TL)—Offset 38h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 38h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:5] + 10h

Default: 00000010h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	1
0	0	0	0	0	0	0	0	0
Reserved_8_31							RX_TL	

Bit Range	Default & Access	Field Name (ID): Description
31:8	0b RW	Reserved_8_31: Reserved.
7:0	10h RW	Receive FIFO Threshold Level (RX_TL): The valid range is 0-255, with the additional restriction that hardware does not allow this value to be set to a value larger than the depth of the buffer. If an attempt is made to do that, the actual value set will be the maximum depth of the buffer.

26.15.16 I2C Transmit FIFO Threshold Register (IC_TX_TL)—Offset 3Ch

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 3Ch

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:5] + 10h

Default: 00000010h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	1	0
0	0	0	0	0	0	0	0	0
Reserved_8_31							TX_TL	

Bit Range	Default & Access	Field Name (ID): Description
31:8	0b RW	Reserved_8_31: Reserved.
7:0	10h RW	Transmit FIFO Threshold Level (TX_TL): Controls the level of entries (or below) that trigger the TX_EMPTY interrupt (bit 4 in IC_RAW_INTR_STAT register). The valid range is 0-255, with the additional restriction that it may not be set to value larger than the depth of the buffer. If an attempt is made to do that, the actual value set will be the maximum depth of the buffer.

26.15.17 Clear Combined and Individual Interrupt Register (IC_CLR_INTR)—Offset 40h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 40h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:5] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
Reserved_1_31								CLR_INTR

Bit Range	Default & Access	Field Name (ID): Description
31:1	0b RW	Reserved_1_31: Reserved.
0	0h RO	CLR_INTR: Read this register to clear the combined interrupt, all individual interrupts, and the IC_TX_ABRT_SOURCE register. This bit does not clear hardware clearable interrupts but software clearable interrupts.

26.15.18 Clear RX_UNDER Interrupt Register (IC_CLR_RX_UNDER)—Offset 44h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 44h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:5] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
Reserved_1_31								CLR_RX_UNDER

Bit Range	Default & Access	Field Name (ID): Description
31:1	0b RW	Reserved_1_31: Reserved.
0	0h RO	CLR_RX_UNDER: Read this register to clear the RX_UNDER interrupt (bit 0) of the IC_RAW_INTR_STAT register.

26.15.19 Clear RX_OVER Interrupt Register (IC_CLR_RX_OVER)—Offset 48h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 48h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:5] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
Reserved_1_31								CLR_RX_OVER

Bit Range	Default & Access	Field Name (ID): Description
31:1	0b RW	Reserved_1_31: Reserved.
0	0h RO	CLR_RX_OVER: Read this register to clear the RX_OVER interrupt (bit 1) of the IC_RAW_INTR_STAT register.

26.15.20 Clear TX_OVER Interrupt Register (IC_CLR_TX_OVER)—Offset 4Ch

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 4Ch

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:5] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
Reserved_1_31								CLR_TX_OVER

Bit Range	Default & Access	Field Name (ID): Description
31:1	0b RW	Reserved_1_31: Reserved.
0	0h RO	CLR_TX_OVER: Read this register to clear the TX_OVER interrupt (bit 3) of the IC_RAW_INTR_STAT register.

26.15.21 Clear RD_REQ Interrupt Register (IC_CLR_RD_REQ)—Offset 50h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 50h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:5] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
Reserved_1_31								CLR_RD_REQ

Bit Range	Default & Access	Field Name (ID): Description
31:1	0b RW	Reserved_1_31: Reserved.
0	0h RO	CLR_RD_REQ: Read this register to clear the RD_REQ interrupt (bit 5) of the IC_RAW_INTR_STAT register.

26.15.22 Clear TX_ABRT Interrupt Register (IC_CLR_TX_ABRT)—Offset 54h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 54h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:5] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
Reserved_1_31								CLR_TX_ABRT

Bit Range	Default & Access	Field Name (ID): Description
31:1	0b RW	Reserved_1_31: Reserved.
0	0h RO	CLR_TX_ABRT: Read this register to clear the TX_ABRT interrupt (bit 6) of the IC_RAW_INTR_STAT register, and the IC_TX_ABRT_SOURCE register. This also releases the TX FIFO from the flushed/reset state, allowing more writes to the TX FIFO.

26.15.23 Clear RX_DONE Interrupt Register (IC_CLR_RX_DONE)—Offset 58h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 58h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:5] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
Reserved_1_31								CLR_RX_DONE

Bit Range	Default & Access	Field Name (ID): Description
31:1	0b RW	Reserved_1_31: Reserved.
0	0h RO	CLR_RX_DONE: Read this register to clear the RX_DONE interrupt (bit 7) of the IC_RAW_INTR_STAT register.

26.15.24 Clear ACTIVITY Interrupt Register (IC_CLR_ACTIVITY)—Offset 5Ch

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 5Ch

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:5] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
Reserved_1_31								CLR_ACTIVITY

Bit Range	Default & Access	Field Name (ID): Description
31:1	0b RW	Reserved_1_31: Reserved.
0	0h RO	CLR_ACTIVITY: Reading this register clears the ACTIVITY interrupt if the I2C is not active anymore. If the I2C module is still active on the bus, the ACTIVITY interrupt bit continues to be set. It is automatically cleared by hardware if the module is disabled and if there is no further activity on the bus. The value read from this register to get status of the ACTIVITY interrupt (bit 8) of the IC_RAW_INTR_STAT register.

26.15.25 Clear STOP_DET Interrupt Register (IC_CLR_STOP_DET)—Offset 60h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 60h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:5] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
Reserved_1_31								CLR_STOP_DET

Bit Range	Default & Access	Field Name (ID): Description
31:1	0b RW	Reserved_1_31: Reserved.

Type: Memory Mapped I/O Register
(Size: 32 bits)

BAR Reference: [B:0, D:24, F:5] + 10h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
Reserved_1_31								
CIR_START_DEF								

Bit Range	Default & Access	Field Name (ID): Description
31:1	0b RW	Reserved_1_31: Reserved.
0	0h RO	CLR_START_DET: Read this register to clear the START_DET interrupt (bit 10) of the IC_RAW_INTR_STAT register.

26.15.27 Clear GEN_CALL Interrupt Register (IC_CLR_GEN_CALL)—Offset 68h

Type: Memory Mapped I/O Register
(Size: 32 bits)

BAR Reference: [B:0, D:24, F:5] + 10h

31	28	24	20	16	12	8	4	0	
0	0	0	0	0	0	0	0	0	0
Reserved_1_31									CLR_GEN_CALI

Bit Range	Default & Access	Field Name (ID): Description
31:1	0b RW	Reserved_1_31: Reserved.
0	0h RO	CLR_GEN_CALL: Read this register to clear the GEN_CALL interrupt (bit 11) of IC_RAW_INTR_STAT register.

26.15.28 I2C Enable Register (IC_ENABLE)—Offset 6Ch

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 6Ch

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:5] + 10h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0b RW	Reserved_2_31: Reserved
1	0h WO	ABORT: Software can abort the I2C transfer by setting this bit. This bit can be set only when ENABLE = 1 and fix_ctrl_1680 = 1. The HW will clear the ABORT bit once the STOP condition has been sent.
0	0h RW	ENABLE: Controls whether the DW_apb_i2c is enabled. 0 = Disables DW_apb_i2c (TX and RX FIFOs are held in an erased state) 1 = Enables DW_apb_i2c

26.15.29 I2C Status Register (IC_STATUS)—Offset 70h

This is a read-only register used to indicate the current transfer status and FIFO status. The status register may be read at any time. None of the bits in this register request an interrupt. The following occurs when the I2C is disabled by writing 0 in bit 0 of the IC_ENABLE register:

- Bits 1 and 2 are set to 1
- Bits 3 and 4 are set to 0

When the master or slave state machines goes to idle and `ic_en=0`:

- Bits 5 and 6 are set to 0

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 70h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:5] + 10h

Default: 00000006h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
Reserved_7_31							SLV_ACTIVITY	
							MST_ACTIVITY	
							RFF	
							RFNE	
							TFE	
							TFNF	
							ACTIVITY	

Bit Range	Default & Access	Field Name (ID): Description
31:7	0b RW	Reserved_7_31: Reserved.
6	0h RO	Slave FSM Activity Status (SLV_ACTIVITY): When the Slave Finite State Machine (FSM) is not in the IDLE state, this bit is set.
5	0h RO	Master FSM Activity Status (MST_ACTIVITY): When the Master Finite State Machine (FSM) is not in the IDLE state, this bit is set.
4	0h RO	Receive FIFO Completely Full (RFF): When the receive FIFO is completely full, this bit is set. When the receive FIFO contains one or more empty location, this bit is cleared.
3	0h RO	Receive FIFO Not Empty (RFNE): This bit is set when the receive FIFO contains one or more entries; it is cleared when the receive FIFO is empty.
2	1h RO	Transmit FIFO Completely Empty (TFE): When the transmit FIFO is completely empty, this bit is set. When it contains one or more valid entries, this bit is cleared. This bit field does not request an interrupt.
1	1h RO	Transmit FIFO Not Full (TFNF): Set when the transmit FIFO contains one or more empty locations, and is cleared when the FIFO is full.
0	0h RO	ACTIVITY: I2C Activity Status

26.15.30 I2C Transmit FIFO Level Register (IC_TXFLR)—Offset 74h

This register contains the number of valid data entries in the transmit FIFO buffer. It is cleared whenever:

- The I2C is disabled
- There is a transmit abort -- that is, TX_ABRT bit is set in the IC_RAW_INTR_STAT register
- The slave bulk transmit mode is aborted

The register increments whenever data is placed into the transmit FIFO and decrements when data is taken from the transmit FIFO.

Access Method

Bit Range	Default & Access	Field Name (ID): Description
31:9	0b RW	Reserved_9_31: Reserved
8:0	0h RO	Receive FIFO Level (RXFLR): Contains the number of valid data entries in the receive FIFO.

26.15.32 I2C SDA Hold Time Length Register (IC_SDA_HOLD)—Offset 7Ch

This register controls the amount of hold time on the SDA signal after a negative edge of SCL in both master and slave mode, in units of ic_clk period. The value programmed must be greater than the minimum hold time in each mode for the value to be implemented one cycle in master mode, seven cycles in slave mode. Writes to this register succeed only when IC_ENABLE=0. The programmed SDA hold time cannot exceed at any time the duration of the low part of scl. Therefore the programmed value cannot be larger than N_SCL_LOW-2, where N_SCL_LOW is the duration of the low part of the scl period measured in ic_clk cycles.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 7Ch

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:5] + 10h

Default: 00000001h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	1
Reserved_16_31								IC_SDA_HOLD

Bit Range	Default & Access	Field Name (ID): Description
31:16	0b RW	Reserved_16_31: Reserved
15:0	1h RW	IC_SDA_HOLD: Sets the required SDA hold time in units of ic_clk period.

26.15.33 I2C Transmit Abort Source Register (IC_TX_ABRT_SOURCE)—Offset 80h

This register has 16 bits that indicate the source of the TX_ABRT bit. Except for Bit 9, this register is cleared whenever the IC_CLR_TX_ABRT register or the IC_CLR_INTR register is read. To clear Bit 9, the source of the ABRT_SBYTE_NORSTRT must be fixed first; RESTART must be enabled (IC_CON[5]=1), the SPECIAL bit must be cleared (IC_TAR[11]), or the GC_OR_START bit must be cleared (IC_TAR[10]). Once the source of the ABRT_SBYTE_NORSTRT is fixed, then this bit can be cleared in the same

26.15.34 Generate Slave Data NACK Register (IC_SLV_DATA_NACK_ONLY)—Offset 84h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 8Ch

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:5] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
Reserved_8_31							DMATDL	

Bit Range	Default & Access	Field Name (ID): Description
31:8	0b RW	Reserved_8_31: Reserved.
7:0	0h RW	Transmit Data Level (DMATDL): This bit field controls the level at which a DMA request is made by the transmit logic. It is equal to the watermark level; that is, the dma_tx_req signal is generated when the number of valid data entries in the transmit FIFO is equal to or below this field value, and TDMAE = 1.

26.15.37 I2C Receive Data Level Register (IC_DMA_RDLR)—Offset 90h

This register is only valid when DW_apb_i2c is configured with a set of DMA interface signals(IC_HAS_DMA = 1). When DW_apb_i2c is not configured for DMA operation, this register does not exist, writing to its address has no effect, and reading from its address returns zero.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 90h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:5] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
Reserved_8_31							DMARDL	

Bit Range	Default & Access	Field Name (ID): Description
31:8	0b RW	Reserved_8_31: Reserved.

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RW	Receive Data Level (DMARDL): This bit field controls the level at which a DMA request is made by the receive logic. The watermark level = DMARDL+1; that is, dma_rx_req is generated when the number of valid data entries in the receive FIFO is equal to or more than this field value + 1, and RDMAE =1. For instance, when DMARDL is 0, then dma_rx_req is asserted when 1 or more data entries are present in the receive FIFO.

26.15.38 I2C SDA Setup Register (IC_SDA_SETUP)—Offset 94h

This register controls the amount of time delay (in terms of number of ic_clk clock periods) introduced in the rising edge of SCL -- relative to SDA changing -- by holding SCL low when DW_apb_i2c services a read request while operating as a slave-transmitter. The relevant I2C requirement is tSU:DAT (note 4) as detailed in the I2C Bus Specification. This register must be programmed with a value equal to or greater than 2. **NOTE:** The length of setup time is calculated using $[(IC_SDA_SETUP - 1) * (ic_clk_period)]$, so if the user requires 10 ic_clk periods of setup time, they should program a value of 11. The IC_SDA_SETUP register is only used by the DW_apb_i2c when operating as a slave transmitter.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 94h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:5] + 10h

Default: 00000064h

	31	28	24	20	16	12	8	4	0	
	0	0	0	0	0	0	0	0	1	1
	0	0	0	0	0	0	0	0	0	0
	Reserved_8_31							SDA_SETUP		

Bit Range	Default & Access	Field Name (ID): Description
31:8	0b RW	Reserved_8_31: Reserved.
7:0	64h RW	SDA Setup (SDA_SETUP): It is recommended that if the required delay is 1000ns, then for an ic_clk frequency of 10 MHz, IC_SDA_SETUP should be programmed to a value of 11.

26.15.39 I2C ACK General Call Register (IC_ACK_GENERAL_CALL)—Offset 98h

The register controls whether DW_apb_i2c responds with an ACK or NACK when it receives an I2C General Call address.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 98h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:5] + 10h

Default: 00000001h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	1
Reserved_1_31								ACK_GEN_CALL

Bit Range	Default & Access	Field Name (ID): Description
31:1	0b RW	Reserved_1_31: Reserved.
0	1h RW	ACK General Call (ACK_GEN_CALL): When set to 1, DW_apb_i2c responds with a ACK (by asserting ic_data_oe) when it receives a General Call. When set to 0, the DW_apb_i2c does not generate General Call interrupts.

26.15.40 I2C Enable Status Register (IC_ENABLE_STATUS)—Offset 9Ch

The register is used to report the DW_apb_i2c hardware status when the IC_ENABLE register is set from 1 to 0, that is, when DW_apb_i2c is disabled.

- If IC_ENABLE has been set to 1, bits 2:1 are forced to 0, and bit 0 is forced to 1.
- If IC_ENABLE has been set to 0, bits 2:1 will only be valid as soon as bit 0 is read as 0.

NOTE = When IC_ENABLE has been written with 0, a delay occurs for bit 0 to be read as 0 because disabling the DW_apb_i2c depends on I2C bus activities.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 9Ch

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:5] + 10h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:3	0b RW	Reserved_3_31: Reserved.
2	0h RO	SLV_RX_DATA_LOST: This bit indicates if a Slave-Receiver operation has been aborted with at least one data byte received from an I2C transfer due to the setting of IC_ENABLE from 1 to 0.
1	0h RO	SLV_DISABLED_WHILE_BUSY: This bit indicates if a potential or active Slave operation has been aborted due to the setting of the IC_ENABLE register from 1 to 0.
0	0h RO	ic_en Status (IC_EN): This bit always reflects the value driven on the output port ic_en. When read as 1, DW_apb_i2c is deemed to be in an enabled state. When read as 0, DW_apb_i2c is deemed completely inactive.

This register is used to store the duration, measured in `ic_clk` cycles, of the longest spike that is filtered out by the spike suppression logic when the component is operating in SS or FS modes. The relevant I2C requirement is `tSP` (Table 4) as detailed in the I2C Bus Specification. This register must be programmed with a minimum value of 1.

Type: Memory Mapped I/O Register
(Size: 32 bits)

BAR Reference: [B:0, D:24, F:5] + 10h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	1
Reserved_8_31							IC_FS_SPKLEN	

Access Method

Offset: [BAR] + A4h

BAR Reference: [B:0, D:24, F:5] + 10h

[illegible]

Bit Range	Default & Access	Field Name (ID): Description
31:8	0b RW	Reserved_8_31: Reserved.
7:0	2h RW	IC_HS_SPKLEN: This register must be set before any I2C bus transaction can take place to ensure stable operation. This register sets the duration, measured in ic_clk cycles, of the longest spike in the SCL or SDA lines that are filtered out by the spike suppression logic; for more information, refer to Spike Suppression on page 52. This register can be written only when the I2C interface is disabled, which corresponds to the IC_ENABLE register being set to 0. Writes at other times have no effect. The minimum valid value is 1; hardware prevents values less than this being written, and if attempted results in 2 being set.

26.15.43 Component Parameter Register 1 (IC_COMP_PARAM_1)—Offset F4h

26.15.44 I2C Component Version Register (IC_COMP_VERSION)—Offset F8h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + F8h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:5] + 10h

CLASS_CODES							RID	

Bit Range	Default & Access	Field Name (ID): Description
31:8	000000h RO	Class Code (CLASS_CODES): The Class Code register is read-only and used to identify the generic function of the device and, in some cases, a specific register level programming interface. The register is broken into three byte size fields. The upper byte (at offset 0Bh) is a base class code which broadly classifies the type of function the device performs. The middle byte (at offset 0Ah) is a sub-class code which identifies more specifically the function of the device. The lower byte (at offset 09h) identifies a specific register-level programming interface (if any) so that device independent software can interact with the device. This register is tied to a strap at the top level.
7:0	00h RO	Revision ID (RID): Revision ID identifies the revision of particular AHB device. This is tied to a strap at the top level.

26.16.4 Cache Line Latency Header and BIST (CLLATHEADERBIST)—Offset Ch

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:24, F:6] + Ch

Default: 00800000h

31	28	24	20	16	12	8	4	0
0	0	0	0	1	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
Reserved0				MULFNDEV	HEADERTYPE			
					LATTIMER			
					CACHELINE_SIZE			

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RO	Reserved0: Reserved.
23	1h RO	Multi Function Device (MULFNDEV): This bit is always 0 for non fabric ports. For Fabric ports it is driven from fabric_mult_function strap. 1 = multifunction device 0 = single function device
22:16	00h RO	Header Type (HEADERTYPE): Implements Type 0 Configuration header.
15:8	00h RO	Latency Timer (LATTIMER): Does not apply to PCI Express. Hardwired to 00h.
7:0	00h RW	Cache Line Size (CACHELINE_SIZE): Doesn't apply to PCI Express. PCI Express spec requires this to be implemented as a R/W register but has no functional impact on the AHB Device connected.

26.16.5 Base Address Register (BAR)—Offset 10h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:24, F:6] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
BASEADDR						SIZEINDICATOR		PREFETCHABLE
								TYPE
								MESSAGE_SPACE

Bit Range	Default & Access	Field Name (ID): Description
31:12	00000h RW	Base Address (BASEADDR): Base address of the AHB device memory space. Taken from Strap values as 1.s
11:4	00h RO	Size Indicator Read Only (SIZEINDICATOR): Always returns zero. The size of this register depends on the size of the Memory space. This size is determined by a top level of STRAP values as 0.s. Always will be zero as minimum size is 4K.
3	0h RO	Prefetchable (PREFETCHABLE): Indicates that this BAR is not prefetchable.
2:1	0h RO	Type (TYPE): 00 indicates BAR lies in 32 bit address range.
0	0h RO	Memory Space Indicator (MESSAGE_SPACE): 0. Indicates this BAR is present in the memory space.

26.16.6 Base Address Register 1 (BAR1)—Offset 14h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:24, F:6] + 14h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
BASEADDR1						SIZEINDICATOR1		PREFETCHABLE1
								TYPE1
								MESSAGE_SPACE1

Bit Range	Default & Access	Field Name (ID): Description
31:12	00000h RW	Base Address Register 1 (BASEADDR1): BAR1 of the LPIO device.

Bit Range	Default & Access	Field Name (ID): Description
11:4	00h RO	SIZEINDICATOR1: Always will be zero as minimum size is 4K.
3	0h RO	Prefetchable (PREFETCHABLE1): Indicates that this BAR is not.
2:1	0h RO	Type (TYPE1): 00 Indicates BAR lies in 32 bit address range.
0	0h RO	Memory Space Indicator (MESSAGE_SPACE1): 0. Indicates this BAR is present in the memory space.

26.16.7 Subsystem Vendor and Subsystem ID (SUBSYSTEMID)—Offset 2Ch

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:24, F:6] + 2Ch

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
SUBSYSTEMID					SUBSYSTEMVENDORID			

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW/O	Subsystem ID (SUBSYSTEMID): This register should be implemented for any function that could be instantiated more than once in a given system. The SID register, in combination with the Subsystem Vendor ID register, make it possible for the operating environment to distinguish one audio subsystem from the other. This register is a Read Write Once type register.
15:0	0000h RW/O	Subsystem Vendor ID (SUBSYSTEMVENDORID): This register should be implemented for any function that could be instantiated more than once in a given system. The SVID register, in combination with the Subsystem ID register, enables the operating environment to distinguish one subsystem from the other. This register is a Read Write Once register.

26.16.10 Interrupt Register (INTERRUPTREG)—Offset 3Ch

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:24, F:6] + 3Ch

Default: 00000100h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	1	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
MAX_LAT				MIN_GNT				INTLINE
				Reserved0				INTPIN

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RO	Max_Lat (MAX_LAT): Value of 0 indicates device has no major requirements for the settings of latency timers.
23:16	00h RO	Min_Gnt (MIN_GNT): Value of 0 indicates device has no major requirements for the settings of latency timers.
15:12	0h RO	Reserved0: Reserved.
11:8	1h RO	Interrupt Pin (INTPIN): Each AHB IP on Bridge is a Single function device. Hence Bridge only generates INTA on IOSF SB. The Fabric on AHB Bridge appears as a Multifunction device. Interrupt Pin Value in this register is reflected from the IPIN value in the private configuration space.
7:0	00h RW	Interrupt Line (INTLINE): Bridge does not use this field directly. It is used to tell software which interrupt line the interrupt pin is connected to.

26.16.11 PowerManagement Capability ID (POWERCAPID)—Offset 80h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:24, F:6] + 80h

Default: 00030001h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	1
PMESUPPORT				Reserved0				POWER_CAP
				VERSION				
				NXTCAP				

Access Method

Offset: [B:0, D:24, F:6] + 84h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
Reserved0				PMESTATUS	Reserved1		PMEENABLE	Reserved2
							NO_SOFT_RESET	Reserved3
								POWERSTATE

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RO	Reserved0: Reserved.
15	0h RW/1C	PME Status (PMESTATUS): 0 = Software clears the bit by writing a 1 to it. 1 = This bit is set when the AHB Device would normally assert the PME# signal independent of the state of the PME Enable bit (bit 8 in this register).
14:9	00h RO	Reserved1: Reserved.
8	0h RW	PME Enable (PMEENABLE): A 1 enables the function to assert PME#. When 0, PME# message on SB is disabled.
7:4	0h RO	Reserved2: Reserved.

Bit Range	Default & Access	Field Name (ID): Description
3	1h RO	No_Soft_Reset (NO_SOFT_RESET): This bit indicates that devices transitioning from D3hot to D0 because of PowerState commands do not perform an internal reset. Configuration Context is preserved.
2	0h RO	Reserved3: Reserved.
1:0	0h RW	Power State (POWERSTATE): This field is used both to determine the current power state of the AHB IP and to set a new power state. The values are: 00 = D0 state 11 = D3HOT state - Others = Reserved Notes: If software attempts to write a value of 01b or 10b in to this field, the write operation must complete normally; however, the data is discarded and no state change occurs. When in the D3HOT states, interrupts are blocked. D3Hot will not be used for Downstream decode on fabric ports.

26.16.13 Manufacturer ID (MANID)—Offset F8h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:24, F:6] + F8h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
MANID								

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	Manufacturer ID (MANID): This register is brought out as straps to the top level.

26.17 SIO I²C 5 Memory Mapped I/O Registers

26.17.1 I2C Control Register (IC_CON)—Offset 0h

This register can be written only when the DW_apb_i2c is disabled, which corresponds to the IC_ENABLE register being set to 0. Writes at other times have no effect.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 0h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:6] + 10h

Default: 0000007Fh

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
Reserved_7_31							IC_SLAVE_DISABLE	IC_RESTART_EN
							IC_10BITADDR_MASTER_rd_only	IC_10BITADDR_SLAVE
							SPEED	MASTER_MODE

Bit Range	Default & Access	Field Name (ID): Description
31:7	0b RW	Reserved_7_31: Reserved.
6	1h RW	IC_SLAVE_DISABLE: This bit controls whether I2C has its slave disabled. By default, the slave is always enabled (in reset state as well). If you need to disable it after reset, set this bit to 1. If this bit is set (slave is disabled), DW_apb_i2c functions only as a master and does not perform any action that requires a slave.
5	1h RW	IC_RESTART_EN: Determines whether RESTART conditions may be sent when acting as a master. When the RESTART is disabled, the DW_apb_i2c master is incapable of performing the following functions: - Sending a START BYTE - Performing any high-speed mode operation - Performing direction changes in combined format mode - Performing a read operation with a 10-bit address
4	1h RO	IC_10BITADDR_MASTER (IC_10BITADDR_MASTER_rd_only): Controls whether the DW_apb_i2c starts its transfers in 7- or 10-bit addressing mode when acting as a master. If I2C_DYNAMIC_TAR_UPDATE = 1, then this bit is read-only copy of bit 12 of IC_TAR register.
3	1h RW	IC_10BITADDR_SLAVE: When acting as a slave, this bit controls whether the DW_apb_i2c responds to 7- or 10-bit addresses.
2:1	3h RW	SPEED: These bits control at which speed the DW_apb_i2c operates; its setting is relevant only if one is operating the DW_apb_i2c in master mode. Hardware protects against illegal values being programmed by software. This register should be programmed only with a value in the range of 1 to IC_MAX_SPEED_MODE; otherwise, hardware updates this register with the value of IC_MAX_SPEED_MODE.
0	1h RW	MASTER MODE (MASTER_MODE): This bit controls whether the DW_apb_i2c master is enabled. Software should ensure that if this bit is set to X, then bit 6 should also be set to X.

26.17.2 I2C Target Address Register (IC_TAR)—Offset 4h

26.17.3 I2C Slave Address Register (IC_SAR)—Offset 8h

The IC SAR Address Register holds the slave address when the I2C is operating as a slave.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 8h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:6] + 10h

Default: 00000055h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	1
0	0	0	0	0	0	0	1	0
0	0	0	0	0	0	0	1	1
Reserved_10_31							IC_SAR	

Bit Range	Default & Access	Field Name (ID): Description
31:10	0b RW	Reserved_10_31: Reserved.
9:0	55h RW	IC_SAR: The IC_SAR holds the slave address when the I2C is operating as a slave. For 7-bit addressing, only IC_SAR[6:0] is used. This register can be written only when the I2C interface is disabled, which corresponds to the IC_ENABLE register being set to 0. Writes at other times have no effect.

26.17.4 I2C High Speed Master Mode Code Address Register (IC_HS_MADDR)—Offset Ch

Note: It is not necessary to perform any write to this register if DW_apb_i2c is enabled as an I2C slave only.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + Ch

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:6] + 10h

Reserved_16_31				IC_FS_SCL_LCNT				

Bit Range	Default & Access	Field Name (ID): Description
31:16	0b RW	Reserved_16_31: Reserved.
15:0	0082h RW	Fast Speed I2C Clock SCL Low Count Register (IC_FS_SCL_LCNT): This register can be written only when the I2C interface is disabled, which corresponds to the IC_ENABLE register being set to 0. Writes at other times have no effect.

26.17.10 High Speed I2C Clock SCL High Count Register (IC_HS_SCL_HCNT)—Offset 24h

Access Method

Offset: [BAR] + 24h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:6] + 10h

Default: 0000000Ch

26.17.11 High Speed I2C Clock SCL Low Count Register (IC_HS_SCL_LCNT)—Offset 28h

Access Method

Offset: [BAR] + 28h**BAR Type:** PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:6] + 10h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
Reserved_16_31				IC_HS_SCL_LCNT				

26.17.12 I2C Interrupt Status Register (IC_INTR_STAT)—Offset 2Ch

Bit Range	Default & Access	Field Name (ID): Description
4	0h RO	R_TX_EMPTY: This bit is set to 1 when the transmit buffer is at or below the threshold value set in the IC_TX_TL register.
3	0h RO	R_TX_OVER: Set during transmit if the transmit buffer is filled to IC_TX_BUFFER_DEPTH, and the processor attempts to issue another I2C command by writing to the IC_DATA_CMD register.
2	0h RO	R_RX_FULL: Set when the receive buffer reaches or goes above the RX_TL threshold in the IC_RX_TL register.
1	0h RO	R_RX_OVER: Set during transmit if the transmit buffer is filled to IC_TX_BUFFER_DEPTH and the processor attempts to issue another I2C command by writing to the IC_DATA_CMD register.
0	0h RO	R_RX_UNDER: Set if the processor attempts to read the receive buffer when it is empty by reading from the IC_DATA_CMD register.

26.17.13 I2C Interrupt Mask Register (IC_INTR_MASK)—Offset 30h

These bits mask their corresponding interrupt status bits. This register is active low.

- 0 masks the interrupt
- 1 unmask the interrupt

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 30h**BAR Type:** PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:6] + 10h

Default: 000008FFh

26.17.15 I2C Receive FIFO Threshold Register (IC_RX_TL)—Offset 38h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 38h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:6] + 10h

Default: 00000010h

31	28	24	20	16	12	8	4	0				
0	0	0	0	0	0	0	0	1	0	0	0	0
Reserved_8_31								RX_TL				

Bit Range	Default & Access	Field Name (ID): Description
31:8	0b RW	Reserved_8_31: Reserved.
7:0	10h RW	Receive FIFO Threshold Level (RX_TL): The valid range is 0-255, with the additional restriction that hardware does not allow this value to be set to a value larger than the depth of the buffer. If an attempt is made to do that, the actual value set will be the maximum depth of the buffer.

26.17.16 I2C Transmit FIFO Threshold Register (IC_TX_TL)—Offset 3Ch

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 3Ch

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:6] + 10h

Default: 00000010h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	1	0
Reserved_8_31							TX_TL	0

Bit Range	Default & Access	Field Name (ID): Description
31:8	0b RW	Reserved_8_31: Reserved.
7:0	10h RW	Transmit FIFO Threshold Level (TX_TL): Controls the level of entries (or below) that trigger the TX_EMPTY interrupt (bit 4 in IC_RAW_INTR_STAT register). The valid range is 0-255, with the additional restriction that it may not be set to value larger than the depth of the buffer. If an attempt is made to do that, the actual value set will be the maximum depth of the buffer.

26.17.17 Clear Combined and Individual Interrupt Register (IC_CLR_INTR)—Offset 40h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 40h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:6] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
Reserved_1_31								CLR_INTR

Bit Range	Default & Access	Field Name (ID): Description
31:1	0b RW	Reserved_1_31: Reserved.
0	0h RO	CLR_INTR: Read this register to clear the combined interrupt, all individual interrupts, and the IC_TX_ABRT_SOURCE register. This bit does not clear hardware clearable interrupts but software clearable interrupts.

26.17.18 Clear RX_UNDER Interrupt Register (IC_CLR_RX_UNDER)—Offset 44h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 44h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:6] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
Reserved_1_31								CLR_RX_UNDER

Bit Range	Default & Access	Field Name (ID): Description
31:1	0b RW	Reserved_1_31: Reserved.
0	0h RO	CLR_RX_UNDER: Read this register to clear the RX_UNDER interrupt (bit 0) of the IC_RAW_INTR_STAT register.

26.17.19 Clear RX_OVER Interrupt Register (IC_CLR_RX_OVER)—Offset 48h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 48h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:6] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
Reserved_1_31								CLR_RX_OVER

Bit Range	Default & Access	Field Name (ID): Description
31:1	0b RW	Reserved_1_31: Reserved.
0	0h RO	CLR_RX_OVER: Read this register to clear the RX_OVER interrupt (bit 1) of the IC_RAW_INTR_STAT register.

26.17.20 Clear TX_OVER Interrupt Register (IC_CLR_TX_OVER)—Offset 4Ch

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 4Ch

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:6] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
Reserved_1_31								CLR_TX_OVER

Bit Range	Default & Access	Field Name (ID): Description
31:1	0b RW	Reserved_1_31: Reserved.
0	0h RO	CLR_TX_OVER: Read this register to clear the TX_OVER interrupt (bit 3) of the IC_RAW_INTR_STAT register.

26.17.21 Clear RD_REQ Interrupt Register (IC_CLR_RD_REQ)—Offset 50h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 50h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:6] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
Reserved_1_31								CLR_RD_REQ

Bit Range	Default & Access	Field Name (ID): Description
31:1	0b RW	Reserved_1_31: Reserved.
0	0h RO	CLR_RD_REQ: Read this register to clear the RD_REQ interrupt (bit 5) of the IC_RAW_INTR_STAT register.

26.17.23 Clear RX_DONE Interrupt Register (IC_CLR_RX_DONE)—Offset 58h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0b RW	Reserved_1_31: Reserved.
0	0h RO	CLR_RX_DONE: Read this register to clear the RX_DONE interrupt (bit 7) of the IC_RAW_INTR_STAT register.

26.17.24 Clear ACTIVITY Interrupt Register (IC_CLR_ACTIVITY)—Offset 5Ch

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 5Ch

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:6] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
Reserved_1_31								CLR_ACTIVITY

Bit Range	Default & Access	Field Name (ID): Description
31:1	0b RW	Reserved_1_31: Reserved.
0	0h RO	CLR_ACTIVITY: Reading this register clears the ACTIVITY interrupt if the I2C is not active anymore. If the I2C module is still active on the bus, the ACTIVITY interrupt bit continues to be set. It is automatically cleared by hardware if the module is disabled and if there is no further activity on the bus. The value read from this register to get status of the ACTIVITY interrupt (bit 8) of the IC_RAW_INTR_STAT register.

26.17.25 Clear STOP_DET Interrupt Register (IC_CLR_STOP_DET)—Offset 60h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 60h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:6] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
Reserved_1_31								CLR_STOP_DET

Bit Range	Default & Access	Field Name (ID): Description
31:1	0b RW	Reserved_1_31: Reserved.

Bit Range	Default & Access	Field Name (ID): Description
0	0h RO	CLR_STOP_DET: Read this register to clear the STOP_DET interrupt (bit 9) of the IC_RAW_INTR_STAT register.

26.17.26 Clear START_DET Interrupt Register (IC_CLR_START_DET)—Offset 64h

8:0	0h RO	Transmit FIFO Level (TXFLR): Contains the number of valid data entries in the transmit FIFO.

26.17.31 I2C Receive FIFO Level Register (IC_RXFLR)—Offset 78h

This register contains the number of valid data entries in the receive FIFO buffer. The register is cleared by the following methods:

- The I2C is disabled
- Whenever there is a transmit abort caused by any of the events tracked in IC_TX_ABRT_SOURCE

The register increments whenever data is placed into the receive FIFO and decrements when data is taken from the receive FIFO.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 78h

BAR Type: PCI Configuration Register (Size: 32 bits)

8:0	0h RO	Receive FIFO Level (RXFLR): Contains the number of valid data entries in the receive FIFO.

26.17.32 I2C SDA Hold Time Length Register (IC_SDA_HOLD)—Offset 7Ch

This register controls the amount of hold time on the SDA signal after a negative edge of SCL in both master and slave mode, in units of ic_clk period. The value programmed must be greater than the minimum hold time in each mode for the value to be implemented one cycle in master mode, seven cycles in slave mode. Writes to this register succeed only when IC_ENABLE=0. The programmed SDA hold time cannot exceed at any time the duration of the low part of scl. Therefore the programmed value cannot be larger than N_SCL_LOW-2, where N_SCL_LOW is the duration of the low part of the scl period measured in ic_clk cycles.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 7Ch

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:6] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0b RW	Reserved_16_31: Reserved
15:0	1h RW	IC_SDA_HOLD: Sets the required SDA hold time in units of ic_clk period.

26.17.33 I2C Transmit Abort Source Register (IC_TX_ABRT_SOURCE)—Offset 80h

This register has 16 bits that indicate the source of the TX_ABRT bit. Except for Bit 9, this register is cleared whenever the IC_CLR_TX_ABRT register or the IC_CLR_INTR register is read. To clear Bit 9, the source of the ABRT_SBYTE_NORSTRT must be fixed first; RESTART must be enabled (IC_CON[5]=1), the SPECIAL bit must be cleared (IC_TAR[11]), or the GC_OR_START bit must be cleared (IC_TAR[10]). Once the source of the ABRT_SBYTE_NORSTRT is fixed, then this bit can be cleared in the same

manner as other bits in this register. If the source of the ABRT_SBYTE_NORSTRT is not fixed before attempting to clear this bit, Bit 9 clears for one cycle and is then re-asserted.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	TX_FLUSH_CNT: This field preserves the TXFLR value prior to the last TX_ABRT event. It is enabled when fix_ctrl_1680 = 1. It is cleared whenever I2C is disabled.
23:17	0b RW	Reserved_17_23: Reserved
16	0h RO	ABRT_USER_ABRT: This is a master-mode only bit. Master has detected the user initiated transfer abort (IC_ENABLE[1]). It is enabled only when fix_ctrl_1680 = 1
15	0h RO	ABRT_SLVRD_INTX: 1 = When the processor side responds to a slave mode request for data to be transmitted to a remote master and user writes a 1 in CMD (bit 8) of IC_DATA_CMD register.
14	0h RO	ABRT_SLV_ARBLOST: 1 = Slave lost the bus while transmitting data to a remote master. IC_TX_ABRT_SOURCE[12] is set at the same time.
13	0h RO	ABRT_SLVFLUSH_TXFIFO: 1 = Slave has received a read command and some data exists in the TX FIFO so the slave issues a TX_ABRT interrupt to flush old data in TX FIFO.
12	0h RO	ARB_LOST: 1 = Master has lost arbitration, or if IC_TX_ABRT_SOURCE[14] is also set, then the slave transmitter has lost arbitration.
11	0h RO	ABRT_MASTER_DIS: 1 = User tries to initiate a Master operation with the Master mode disabled.
10	0h RO	ABRT_10B_RD_NORSTRT: 1 = The restart is disabled (IC_RESTART_EN bit (IC_CON[5]) = 0) and the master sends a read command in 10-bit addressing mode.
9	0h RO	ABRT_SBYTE_NORSTRT: 1 = The restart is disabled (IC_RESTART_EN bit (IC_CON[5]) = 0) and the user is trying to send a START Byte.
8	0h RO	ABRT_HS_NORSTRT: 1 = The restart is disabled (IC_RESTART_EN bit (IC_CON[5]) = 0) and the user is trying to use the master to transfer data in High Speed mode.
7	0h RO	ABRT_SBYTE_ACKDET: 1 = Master has sent a START Byte and the START Byte was acknowledged (wrong behavior).

26.17.35 DMA Control Register (IC DMA CR)—Offset 88h

Bit Range	Default & Access	Field Name (ID): Description
0	0h RW	Generate NACK (NACK): This NACK generation only occurs when DW_apb_i2c is a slavereceiver. If this register is set to a value of 1, it can only generate a NACK after a data byte is received; hence, the data transfer is aborted and the data received is not pushed to the receive buffer. When the register is set to a value of 0, it generates NACK/ACK, depending on normal criteria. 1 = generate NACK after data byte received 0 = generate NACK/ACK normally

26.17.35 DMA Control Register (IC DMA CR)—Offset 88h

This register is only valid when DW_apb_i2c is configured with a set of DMA Controller interface signals (IC_HAS_DMA = 1). When DW_apb_i2c is not configured for DMA operation, this register does not exist and writing to the registers address has no effect and reading from this register address will return zero. The register is used to enable the DMA Controller interface operation. There is a separate bit for transmit and receive. This can be programmed regardless of the state of IC_ENABLE.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 88h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:6] + 10h

Default: 00000000h

[illegible]

Bit Range	Default & Access	Field Name (ID): Description
31:2	0b RW	Reserved_2_31: Reserved.
1	0h RW	Transmit DMA Enable (TDMAE): This bit enables/disables the transmit FIFO DMA channel. 0 = Transmit DMA disabled 1 = Transmit DMA enabled
0	0h RW	Receive DMA Enable (RDMAE): This bit enables/disables the receive FIFO DMA channel. 0 = Receive DMA disabled 1 = Receive DMA enabled

26.17.36 DMA Transmit Data Level Register (IC_DMA_TDLR)—Offset 8Ch

This register is only valid when the DW_apb_i2c is configured with a set of DMA interface signals (IC_HAS_DMA = 1). When DW_apb_i2c is not configured for DMA operation, this register does not exist, writing to its address has no effect, and reading from its address returns zero.

This register controls the amount of time delay (in terms of number of ic_clk clock periods) introduced in the rising edge of SCL -- relative to SDA changing -- by holding SCL low when DW_apb_i2c services a read request while operating as a slave-transmitter. The relevant I2C requirement is tSU:DAT (note 4) as detailed in the I2C Bus Specification. This register must be programmed with a value equal to or greater than 2. **NOTE:** The length of setup time is calculated using $[(IC_SDA_SETUP - 1) * (ic_clk_period)]$, so if the user requires 10 ic_clk periods of setup time, they should program a value of 11. The IC_SDA_SETUP register is only used by the DW_apb_i2c when operating as a slave transmitter.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 94h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0b RW	Reserved_8_31: Reserved.
7:0	64h RW	SDA Setup (SDA_SETUP): It is recommended that if the required delay is 1000ns, then for an ic_clk frequency of 10 MHz, IC_SDA_SETUP should be programmed to a value of 11.

26.17.39 I2C ACK General Call Register (IC_ACK_GENERAL_CALL)—Offset 98h

The register controls whether DW_apb_i2c responds with an ACK or NACK when it receives an I2C General Call address.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 98h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:6] + 10h

Default: 00000001h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	1
Reserved_1_31								ACK_GEN_CALL

Bit Range	Default & Access	Field Name (ID): Description
31:1	0b RW	Reserved_1_31: Reserved.
0	1h RW	ACK General Call (ACK_GEN_CALL): When set to 1, DW_apb_i2c responds with a ACK (by asserting ic_data_oe) when it receives a General Call. When set to 0, the DW_apb_i2c does not generate General Call interrupts.

26.17.40 I2C Enable Status Register (IC_ENABLE_STATUS)—Offset 9Ch

The register is used to report the DW_apb_i2c hardware status when the IC_ENABLE register is set from 1 to 0, that is, when DW_apb_i2c is disabled.

- If IC_ENABLE has been set to 1, bits 2:1 are forced to 0, and bit 0 is forced to 1.
- If IC_ENABLE has been set to 0, bits 2:1 will only be valid as soon as bit 0 is read as 0.

NOTE = When IC_ENABLE has been written with 0, a delay occurs for bit 0 to be read as 0 because disabling the DW_apb_i2c depends on I2C bus activities.

Access Method

0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
Reserved0	MULFNDEV	HEADERTYPE	LATTIMER	CACHELINE_SIZE				

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RO	Reserved0: Reserved.
23	1h RO	Multi Function Device (MULFNDEV): This bit is always 0 for non fabric ports. For Fabric ports it is driven from fabric_mult_function strap. 1 = multifunction device 0 = single function device
22:16	00h RO	Header Type (HEADERTYPE): Implements Type 0 Configuration header.
15:8	00h RO	Latency Timer (LATTIMER): Does not apply to PCI Express. Hardwired to 00h.
7:0	00h RW	Cache Line Size (CACHELINE_SIZE): Doesn't apply to PCI Express. PCI Express spec requires this to be implemented as a R/W register but has no functional impact on the AHB Device connected.

26.18.5 Base Address Register (BAR)—Offset 10h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:24, F:7] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
BASEADDR	SIZEINDICATOR	PREFETCHABLE	TYPE	MESSAGE_SPACE				

Bit Range	Default & Access	Field Name (ID): Description
31:12	00000h RW	Base Address (BASEADDR): Base address of the AHB device memory space. Taken from Strap values as 1.s
11:4	00h RO	Size Indicator Read Only (SIZEINDICATOR): Always returns zero. The size of this register depends on the size of the Memory space. This size is determined by a top level of STRAP values as 0.s. Always will be zero as minimum size is 4K.
3	0h RO	Prefetchable (PREFETCHABLE): Indicates that this BAR is not prefetchable.

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
SUBSYSTEMID				SUBSYSTEMVENDORID				

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW/O	Subsystem ID (SUBSYSTEMID): This register should be implemented for any function that could be instantiated more than once in a given system. The SID register, in combination with the Subsystem Vendor ID register, make it possible for the operating environment to distinguish one audio subsystem from the other. This register is a Read Write Once type register.
15:0	0000h RW/O	Subsystem Vendor ID (SUBSYSTEMVENDORID): This register should be implemented for any function that could be instantiated more than once in a given system. The SVID register, in combination with the Subsystem ID register, enables the operating environment to distinguish one subsystem from the other. This register is a Read Write Once register.

26.18.8 Expansion ROM Base Address (EXPANSION_ROM_BASEADDR)—Offset 30h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:24, F:7] + 30h

Default: 00000000h

31	28	24	20	16	12	8	4	0

26.19.2 I2C Target Address Register (IC_TAR)—Offset 4h

Writes to IC_TAR succeed when one of the following conditions are true:

- DW_apb_i2c is NOT enabled (IC_ENABLE is set to 0)
-
- OR
-
- DW_apb_i2c is enabled (IC_ENABLE=1)
- AND
- DW_apb_i2c is NOT engaged in any Master (tx, rx) operation (IC_STATUS[5]=0)
- AND
- DW_apb_i2c is enabled to operate in Master mode (IC_CON[0]=1)
- AND
- There are NO entries in the TX FIFO (IC_STATUS[2]=1)

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 4h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:7] + 10h

Default: 00001055h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	1
Reserved_13_31					IC_10BITADDR_MASTER	SPECIAL		
						GC_OR_START		
					IC_TAR			

Bit Range	Default & Access	Field Name (ID): Description
31:13	0b RW	Reserved_13_31: Reserved.
12	1h RW	IC_10BITADDR_MASTER: This bit controls whether the DW_apb_i2c starts its transfers in 7-or 10-bit addressing mode when acting as a master.
11	0h RW	SPECIAL: This bit indicates whether software performs a General Call or START BYTE command. • 0 = ignore bit 10 GC_OR_START and use IC_TAR normally • 1 = perform special I2C command as specified in GC_OR_START bit
10	0h RW	GC_OR_START: If bit 11 (SPECIAL) is set to 1, then this bit indicates whether a General Call(0) or START(1) byte command is to be performed by the DW_apb_i2c.
9:0	55h RW	IC_TAR: This is the target address for any master transaction. When transmitting a General Call, these bits are ignored. To generate a START BYTE, the CPU needs to write only once into these bits.

This register must be set before any I2C bus transaction can take place to ensure proper I/O timing. This register sets the SCL clock high-period count for standard speed.

000000000000000000000000111100																															
Reserved_16_31																IC_FS_SCL_HCNT															
Bit Range		Default & Access		Field Name (ID): Description																											
31:16		0b RW		Reserved_16_31: Reserved.																											
15:0		003ch RW		Fast Speed I2C Clock SCL High Count Register (IC_FS_SCL_HCNT): This register can be written only when the I2C interface is disabled, which corresponds to the IC_ENABLE register being set to 0. Writes at other times have no effect.																											

This register must be set before any I2C bus transaction can take place, to ensure proper I/O timing. This register sets the SCL clock low-period count for fast speed. It is used in high-speed mode to send the Master Code and START BYTE or General CALL. The SCL High time depends on the loading of the bus. For 100pF loading, the SCL High time is 60ns; for 400pF loading, the SCL High time is 120ns. This register goes away and becomes read-only if IC_MAX_SPEED_MODE!= high. This register can be written only when the I2C interface is disabled, which corresponds to the IC_ENABLE register being set to 0. Writes at other times have no effect. The minimum valid value is 8; hardware prevents values less than this being written, and, if attempted, results in 8 being set. For designs with APB_DATA_WIDTH == 8 the order of programming is important to ensure the correct operation of the DW_apb_i2c. The lower byte must be programmed first. Then the upper byte can be programmed.

Bit Range	Default & Access	Field Name (ID): Description
31:12	0b RW	Reserved_12_31: Reserved.
11	0h RO	R_GEN_CALL: Set only when a General Call address is received and acknowledged. It stays set until it is cleared either by disabling DW_apb_i2c or when the CPU reads bit 0 of the IC_CLR_GEN_CALL register.
10	0h RO	R_START_DET: Indicates whether a START or RESTART condition has occurred on the I2C interface, regardless of whether DW_apb_i2c is operating in slave or master mode.
9	0h RO	R_STOP_DET: Indicates whether a STOP condition has occurred on the I2C interface, regardless of whether DW_apb_i2c is operating in slave or master mode.
8	0h RO	R_ACTIVITY: This bit captures DW_apb_i2c activity and stays set until it is cleared. There are four ways to clear it: Disabling the DW_apb_i2c, Reading the IC_CLR_ACTIVITY register, Reading the IC_CLR_INTR register, System reset
7	0h RO	R_RX_DONE: When the DW_apb_i2c is acting as a slave-transmitter, this bit is set to 1 if the master does not acknowledge a transmitted byte. This occurs on the last byte of the transmission, indicating that the transmission is done.
6	0h RO	R_TX_ABRT: This bit indicates whether DW_apb_i2c, as an I2C transmitter, is unable to complete the intended actions on the contents of the transmit FIFO.
5	0h RO	R_RD_REQ: This bit is set to 1 when DW_apb_i2c is acting as a slave and another I2C master is attempting to read data from DW_apb_i2c.

Bit Range	Default & Access	Field Name (ID): Description
4	0h RO	R_TX_EMPTY: This bit is set to 1 when the transmit buffer is at or below the threshold value set in the IC_TX_TL register.
3	0h RO	R_TX_OVER: Set during transmit if the transmit buffer is filled to IC_TX_BUFFER_DEPTH, and the processor attempts to issue another I2C command by writing to the IC_DATA_CMD register.
2	0h RO	R_RX_FULL: Set when the receive buffer reaches or goes above the RX_TL threshold in the IC_RX_TL register.
1	0h RO	R_RX_OVER: Set during transmit if the transmit buffer is filled to IC_TX_BUFFER_DEPTH and the processor attempts to issue another I2C command by writing to the IC_DATA_CMD register.
0	0h RO	R_RX_UNDER: Set if the processor attempts to read the receive buffer when it is empty by reading from the IC_DATA_CMD register.

26.19.13 I2C Interrupt Mask Register (IC_INTR_MASK)—Offset 30h

These bits mask their corresponding interrupt status bits. This register is active low.

- 0 masks the interrupt
- 1 unmasks the interrupt

Bit Range	Default & Access	Field Name (ID): Description
31:1	0b RW	Reserved_1_31: Reserved.
0	0h RO	CLR_INTR: Read this register to clear the combined interrupt, all individual interrupts, and the IC_TX_ABRT_SOURCE register. This bit does not clear hardware clearable interrupts but software clearable interrupts.

26.19.18 Clear RX_UNDER Interrupt Register (IC_CLR_RX_UNDER)—Offset 44h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 44h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:7] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
Reserved_1_31								CLR_RX_UNDER

Bit Range	Default & Access	Field Name (ID): Description
31:1	0b RW	Reserved_1_31: Reserved.
0	0h RO	CLR_RX_UNDER: Read this register to clear the RX_UNDER interrupt (bit 0) of the IC_RAW_INTR_STAT register.

26.19.19 Clear RX_OVER Interrupt Register (IC_CLR_RX_OVER)—Offset 48h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 48h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:7] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
Reserved_1_31								CLR_RX_OVER

Bit Range	Default & Access	Field Name (ID): Description
31:1	0b RW	Reserved_1_31: Reserved.
0	0h RO	CLR_RX_OVER: Read this register to clear the RX_OVER interrupt (bit 1) of the IC_RAW_INTR_STAT register.

26.19.20 Clear TX_OVER Interrupt Register (IC_CLR_TX_OVER)—Offset 4Ch

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 4Ch

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:7] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
Reserved_1_31								CLR_TX_OVER

Bit Range	Default & Access	Field Name (ID): Description
31:1	0b RW	Reserved_1_31: Reserved.
0	0h RO	CLR_TX_OVER: Read this register to clear the TX_OVER interrupt (bit 3) of the IC_RAW_INTR_STAT register.

26.19.21 Clear RD_REQ Interrupt Register (IC_CLR_RD_REQ)—Offset 50h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 50h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:7] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
Reserved_1_31								CLR_RD_REQ

Bit Range	Default & Access	Field Name (ID): Description
31:1	0b RW	Reserved_1_31: Reserved.
0	0h RO	CLR_RD_REQ: Read this register to clear the RD_REQ interrupt (bit 5) of the IC_RAW_INTR_STAT register.

26.19.22 Clear TX_ABRT Interrupt Register (IC_CLR_TX_ABRT)—Offset 54h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 54h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:7] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
Reserved_1_31								CLR_TX_ABRT

Bit Range	Default & Access	Field Name (ID): Description
31:1	0b RW	Reserved_1_31: Reserved.
0	0h RO	CLR_TX_ABRT: Read this register to clear the TX_ABRT interrupt (bit 6) of the IC_RAW_INTR_STAT register, and the IC_TX_ABRT_SOURCE register. This also releases the TX FIFO from the flushed/reset state, allowing more writes to the TX FIFO.

26.19.23 Clear RX_DONE Interrupt Register (IC_CLR_RX_DONE)—Offset 58h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 58h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:7] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
Reserved_1_31								CLR_RX_DONE

Bit Range	Default & Access	Field Name (ID): Description
31:1	0b RW	Reserved_1_31: Reserved.
0	0h RO	CLR_RX_DONE: Read this register to clear the RX_DONE interrupt (bit 7) of the IC_RAW_INTR_STAT register.

26.19.24 Clear ACTIVITY Interrupt Register (IC_CLR_ACTIVITY)—Offset 5Ch

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 5Ch

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:7] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
Reserved_1_31								CLR_ACTIVITY

Bit Range	Default & Access	Field Name (ID): Description
31:1	0b RW	Reserved_1_31: Reserved.
0	0h RO	CLR_ACTIVITY: Reading this register clears the ACTIVITY interrupt if the I2C is not active anymore. If the I2C module is still active on the bus, the ACTIVITY interrupt bit continues to be set. It is automatically cleared by hardware if the module is disabled and if there is no further activity on the bus. The value read from this register to get status of the ACTIVITY interrupt (bit 8) of the IC_RAW_INTR_STAT register.

26.19.25 Clear STOP_DET Interrupt Register (IC_CLR_STOP_DET)—Offset 60h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 60h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:7] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
Reserved_1_31								CLR_STOP_DET

Bit Range	Default & Access	Field Name (ID): Description
31:1	0b RW	Reserved_1_31: Reserved.

26.19.27 Clear GEN_CALL Interrupt Register (IC_CLR_GEN_CALL)—Offset 68h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0b RW	Reserved_1_31: Reserved.
0	0h RO	CLR_GEN_CALL: Read this register to clear the GEN_CALL interrupt (bit 11) of IC_RAW_INTR_STAT register.

26.19.28 I2C Enable Register (IC_ENABLE)—Offset 6Ch

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 6Ch

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:7] + 10h

Default: 00000000h

[illegible]

Bit Range	Default & Access	Field Name (ID): Description
31:2	0b RW	Reserved_2_31: Reserved
1	0h WO	ABORT: Software can abort the I2C transfer by setting this bit. This bit can be set only when ENABLE = 1 and fix_ctrl_1680 = 1. The HW will clear the ABORT bit once the STOP condition has been sent.
0	0h RW	ENABLE: Controls whether the DW_apb_i2c is enabled. 0 = Disables DW_apb_i2c (TX and RX FIFOs are held in an erased state) 1 = Enables DW_apb_i2c

26.19.29 I2C Status Register (IC_STATUS)—Offset 70h

This is a read-only register used to indicate the current transfer status and FIFO status. The status register may be read at any time. None of the bits in this register request an interrupt. The following occurs when the I2C is disabled by writing 0 in bit 0 of the IC_ENABLE register:

- Bits 1 and 2 are set to 1
- Bits 3 and 4 are set to 0

When the master or slave state machines goes to idle and `ic_en=0`:

- Bits 5 and 6 are set to 0

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 70h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:7] + 10h

Default: 00000006h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
Reserved_7_31							SLV_ACTIVITY	
							MST_ACTIVITY	
							RFF	
							RFNE	
							TFE	
							TFNF	
							ACTIVITY	

Bit Range	Default & Access	Field Name (ID): Description
31:7	0b RW	Reserved_7_31: Reserved.
6	0h RO	Slave FSM Activity Status (SLV_ACTIVITY): When the Slave Finite State Machine (FSM) is not in the IDLE state, this bit is set.
5	0h RO	Master FSM Activity Status (MST_ACTIVITY): When the Master Finite State Machine (FSM) is not in the IDLE state, this bit is set.
4	0h RO	Receive FIFO Completely Full (RFF): When the receive FIFO is completely full, this bit is set. When the receive FIFO contains one or more empty location, this bit is cleared.
3	0h RO	Receive FIFO Not Empty (RFNE): This bit is set when the receive FIFO contains one or more entries; it is cleared when the receive FIFO is empty.
2	1h RO	Transmit FIFO Completely Empty (TFE): When the transmit FIFO is completely empty, this bit is set. When it contains one or more valid entries, this bit is cleared. This bit field does not request an interrupt.
1	1h RO	Transmit FIFO Not Full (TFNF): Set when the transmit FIFO contains one or more empty locations, and is cleared when the FIFO is full.
0	0h RO	ACTIVITY: I2C Activity Status

26.19.30 I2C Transmit FIFO Level Register (IC_TXFLR)—Offset 74h

This register contains the number of valid data entries in the transmit FIFO buffer. It is cleared whenever:

- The I2C is disabled
- There is a transmit abort -- that is, TX_ABRT bit is set in the IC_RAW_INTR_STAT register
- The slave bulk transmit mode is aborted

The register increments whenever data is placed into the transmit FIFO and decrements when data is taken from the transmit FIFO.

Access Method

Bit Range	Default & Access	Field Name (ID): Description
31:9	0b RW	Reserved_9_31: Reserved
8:0	0h RO	Receive FIFO Level (RXFLR): Contains the number of valid data entries in the receive FIFO.

26.19.32 I2C SDA Hold Time Length Register (IC_SDA_HOLD)—Offset 7Ch

This register controls the amount of hold time on the SDA signal after a negative edge of SCL in both master and slave mode, in units of ic_clk period. The value programmed must be greater than the minimum hold time in each mode for the value to be implemented one cycle in master mode, seven cycles in slave mode. Writes to this register succeed only when IC_ENABLE=0. The programmed SDA hold time cannot exceed at any time the duration of the low part of scl. Therefore the programmed value cannot be larger than N_SCL_LOW-2, where N_SCL_LOW is the duration of the low part of the scl period measured in ic_clk cycles.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 7Ch

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:7] + 10h

Default: 00000001h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	1
Reserved_16_31								IC_SDA_HOLD

Bit Range	Default & Access	Field Name (ID): Description
31:16	0b RW	Reserved_16_31: Reserved
15:0	1h RW	IC_SDA_HOLD: Sets the required SDA hold time in units of ic_clk period.

26.19.33 I2C Transmit Abort Source Register (IC_TX_ABRT_SOURCE)—Offset 80h

This register has 16 bits that indicate the source of the TX_ABRT bit. Except for Bit 9, this register is cleared whenever the IC_CLR_TX_ABRT register or the IC_CLR_INTR register is read. To clear Bit 9, the source of the ABRT_SBYTE_NORSTRT must be fixed first; RESTART must be enabled (IC_CON[5]=1), the SPECIAL bit must be cleared (IC_TAR[11]), or the GC_OR_START bit must be cleared (IC_TAR[10]). Once the source of the ABRT_SBYTE_NORSTRT is fixed, then this bit can be cleared in the same

26.19.34 Generate Slave Data NACK Register (IC_SLV_DATA_NACK_ONLY)—Offset 84h

Bit Range	Default & Access	Field Name (ID): Description
0	0h RW	Generate NACK (NACK): This NACK generation only occurs when DW_apb_i2c is a slavereceiver. If this register is set to a value of 1, it can only generate a NACK after a data byte is received; hence, the data transfer is aborted and the data received is not pushed to the receive buffer. When the register is set to a value of 0, it generates NACK/ACK, depending on normal criteria. 1 = generate NACK after data byte received 0 = generate NACK/ACK normally

26.19.35 DMA Control Register (IC_DMA_CR)—Offset 88h

This register is only valid when DW_apb_i2c is configured with a set of DMA Controller interface signals (IC_HAS_DMA = 1). When DW_apb_i2c is not configured for DMA operation, this register does not exist and writing to the registers address has no effect and reading from this register address will return zero. The register is used to enable the DMA Controller interface operation. There is a separate bit for transmit and receive. This can be programmed regardless of the state of IC_ENABLE.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 88h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:7] + 10h

Default: 00000000h

[illegible]

Bit Range	Default & Access	Field Name (ID): Description
31:2	0b RW	Reserved_2_31: Reserved.
1	0h RW	Transmit DMA Enable (TDMAE): This bit enables/disables the transmit FIFO DMA channel. 0 = Transmit DMA disabled 1 = Transmit DMA enabled
0	0h RW	Receive DMA Enable (RDMAE): This bit enables/disables the receive FIFO DMA channel. 0 = Receive DMA disabled 1 = Receive DMA enabled

26.19.36 DMA Transmit Data Level Register (IC_DMA_TDLR)—Offset 8Ch

This register is only valid when the DW_apb_i2c is configured with a set of DMA interface signals (IC_HAS_DMA = 1). When DW_apb_i2c is not configured for DMA operation, this register does not exist, writing to its address has no effect, and reading from its address returns zero.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 8Ch

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:7] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
Reserved_8_31							DMATDL	

Bit Range	Default & Access	Field Name (ID): Description
31:8	0b RW	Reserved_8_31: Reserved.
7:0	0h RW	Transmit Data Level (DMATDL): This bit field controls the level at which a DMA request is made by the transmit logic. It is equal to the watermark level; that is, the dma_tx_req signal is generated when the number of valid data entries in the transmit FIFO is equal to or below this field value, and TDMAE = 1.

26.19.37 I2C Receive Data Level Register (IC_DMA_RDLR)—Offset 90h

This register is only valid when DW_apb_i2c is configured with a set of DMA interface signals (IC_HAS_DMA = 1). When DW_apb_i2c is not configured for DMA operation, this register does not exist, writing to its address has no effect, and reading from its address returns zero.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 90h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:7] + 10h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
Reserved_8_31							DMARDL	

Bit Range	Default & Access	Field Name (ID): Description
31:8	0b RW	Reserved_8_31: Reserved.

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RW	Receive Data Level (DMARDL): This bit field controls the level at which a DMA request is made by the receive logic. The watermark level = DMARDL+1; that is, dma_rx_req is generated when the number of valid data entries in the receive FIFO is equal to or more than this field value + 1, and RDMAE =1. For instance, when DMARDL is 0, then dma_rx_req is asserted when 1 or more data entries are present in the receive FIFO.

26.19.38 I2C SDA Setup Register (IC_SDA_SETUP)—Offset 94h

This register controls the amount of time delay (in terms of number of ic_clk clock periods) introduced in the rising edge of SCL -- relative to SDA changing -- by holding SCL low when DW_apb_i2c services a read request while operating as a slave-transmitter. The relevant I2C requirement is tSU:DAT (note 4) as detailed in the I2C Bus Specification. This register must be programmed with a value equal to or greater than 2. **NOTE:** The length of setup time is calculated using $[(IC_SDA_SETUP - 1) * (ic_clk_period)]$, so if the user requires 10 ic_clk periods of setup time, they should program a value of 11. The IC_SDA_SETUP register is only used by the DW_apb_i2c when operating as a slave transmitter.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 94h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:7] + 10h

Default: 00000064h

[illegible]

Bit Range	Default & Access	Field Name (ID): Description
31:8	0b RW	Reserved_8_31: Reserved.
7:0	64h RW	SDA Setup (SDA_SETUP): It is recommended that if the required delay is 1000ns, then for an ic_clk frequency of 10 MHz, IC_SDA_SETUP should be programmed to a value of 11.

26.19.39 I2C ACK General Call Register (IC_ACK_GENERAL_CALL)—Offset 98h

The register controls whether DW_apb_i2c responds with an ACK or NACK when it receives an I2C General Call address.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 98h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:7] + 10h

Default: 00000001h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	1
Reserved_1_31								ACK_GEN_CALL

Bit Range	Default & Access	Field Name (ID): Description
31:1	0b RW	Reserved_1_31: Reserved.
0	1h RW	ACK General Call (ACK_GEN_CALL): When set to 1, DW_apb_i2c responds with a ACK (by asserting ic_data_oe) when it receives a General Call. When set to 0, the DW_apb_i2c does not generate General Call interrupts.

26.19.40 I2C Enable Status Register (IC_ENABLE_STATUS)—Offset 9Ch

The register is used to report the DW_apb_i2c hardware status when the IC_ENABLE register is set from 1 to 0, that is, when DW_apb_i2c is disabled.

- If IC_ENABLE has been set to 1, bits 2:1 are forced to 0, and bit 0 is forced to 1.
- If IC_ENABLE has been set to 0, bits 2:1 will only be valid as soon as bit 0 is read as 0.

NOTE = When IC_ENABLE has been written with 0, a delay occurs for bit 0 to be read as 0 because disabling the DW_apb_i2c depends on I2C bus activities.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 9Ch

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:24, F:7] + 10h

Default: 00000000h

Access Method

Offset: [BAR] + A4h

BAR Reference: [B:0, D:24, F:7] + 10h

Default: 00000002h

[illegible]

Bit Range	Default & Access	Field Name (ID): Description
31:8	0b RW	Reserved_8_31: Reserved.
7:0	2h RW	IC_HS_SPKLEN: This register must be set before any I2C bus transaction can take place to ensure stable operation. This register sets the duration, measured in ic_clk cycles, of the longest spike in the SCL or SDA lines that are filtered out by the spike suppression logic; for more information, refer to Spike Suppression on page 52. This register can be written only when the I2C interface is disabled, which corresponds to the IC_ENABLE register being set to 0. Writes at other times have no effect. The minimum valid value is 1; hardware prevents values less than this being written, and if attempted results in 2 being set.

26.19.43 Component Parameter Register 1 (IC_COMP_PARAM_1)—Offset F4h

26.19.44 I2C Component Version Register (IC_COMP_VERSION)—Offset F8h

27 SIO – High Speed UART

The SoC implements two instances of high speed UART controller that support baud rates between 300 and 3686400. Hardware flow control is also supported.

27.1 Signal Descriptions

Please see [Chapter 2, “Physical Interfaces”](#) for additional details.

The signal description table has the following headings:

- **Signal Name:** The name of the signal/pin
- **Direction:** The buffer direction can be either input, output, or I/O (bidirectional)
- **Platform Power:** The reference power plane.
- **Description:** A brief explanation of the signal’s function

Table 278. UART 1 Interface Signals

Signal Name	Direction Plat. Power	Description
SIO_UART1_RXD	I V1P8S	High-speed UART receive data input: <i>This signal is muxed and may be used by other functions.</i>
SIO_UART1_TXD	O V1P8S	High-speed UART transmit data: <i>This signal is muxed and may be used by other functions.</i>
SIO_UART1_RTS#	O V1P8S	High-speed UART request to send: <i>This signal is muxed and may be used by other functions.</i>
SIO_UART1_CTS#	I V1P8S	High-speed UART clear to send: <i>This signal is muxed and may be used by other functions.</i>

Table 279. UART 2 Interface Signals

Signal Name	Direction Plat. Power	Description
SIO_UART2_RXD	I V1P8S	High-speed UART receive data input: <i>This signal is muxed and may be used by other functions.</i>
SIO_UART2_TXD	O V1P8S	High-speed UART transmit data: <i>This signal is muxed and may be used by other functions.</i>
SIO_UART2_RTS#	O V1P8S	High-speed UART request to send: <i>This signal is muxed and may be used by other functions.</i>
SIO_UART2_CTS#	I V1P8S	High-speed UART clear to send: <i>This signal is muxed and may be used by other functions.</i>

27.2 Features

27.2.1 UART Function

The UART transmits and receives data in bit frames as shown in Figure 126.

- Each data frame is between 7 and 12 bits long, depending on the size of data programmed and if parity and stop bits are enabled.
- The frame begins with a start bit that is represented by a high-to-low transition.
- Next, 5 to 8 bits of data are transmitted, beginning with the least significant bit. An optional parity bit follows, which is set if even parity is enabled and an odd number of ones exist within the data byte; or, if odd parity is enabled and the data byte contains an even number of ones.
- The data frame ends with one, one-and-one-half, or two stop bits (as programmed by users), which is represented by one or two successive bit periods of a logic one.

Figure 126. UART Data Transfer Flow

Each UART has a Transmit FIFO and a Receive FIFO and each holds 64 characters of data. There are two separate methods for moving data into/out of the FIFOs—Interrupts and Polling.

27.2.2 Clock and Reset

The BAUD rate generates from serial clock (**Sclock**) frequency which is based on a fixed base/system clock (**Fbase**) of 100 MHz processed through an M/N divider. M/N divider settings are found in the HSUART's PRV_CLOCK_PARAMS register. **Sclock** frequency = (Fbase*M)/N. Some useful Sclock frequencies and related M/N values are shown below:

Table 280. Sclock Frequencies from M/N Settings

M Value	N Value	Sclock
288 (0x120)	15625 (0x3D09)	1.84320 MHz
1024 (0x400)	3125 (0xC35)	32.7680 MHz
9216 (0x2400)	15625 (0x3D09)	58.9824 MHz

27.2.3 Baud Rate Generator

The baud rates for the UARTs are generated with from the serial clock frequency (Sclock) by programming the DLH and DLL registers as a divisor. The hexadecimal value of the **divisor** is (IER_DLH[7:0]<8) | RBR_THR_DLL[7:0].

Fbase is the system clock frequency in Hz (100,000,000 in decimal when the system clock frequency is 100 MHz.).

The output baud rate is as follows:

$$\text{— } \text{baud rate} = (\text{Sclock}) / (16 * \text{divisor})$$

Table 281. Baud Rates Achievable with Different DLAB Settings

DLH,DLL Divisor	DLH,DLL Divisor Hexadecimal	Baud Rate
Sclock = 1.84320 MHz		
1	0001	115200
2	0002	57600
3	0003	38400
6	0006	19200
12	000C	9600
24	0018	4800
48	0030	2400
192	00C0	600
384	0180	300
Sclock = 58.9824 MHz		
4	0004	921600
8	0008	460800
16	0010	230400
24	0018	153600
Sclock = 32.768 MHz		
8	0008	256000
16	0010	128000

27.3 Use

Each UART has a transmit FIFO and a receive FIFO, each FIFO holding 64 characters of data. Three separate methods move data into and out of the FIFOs: interrupts, DMA, and polled.

27.3.1 DMA Mode Operation

27.3.1.1 Receiver DMA

The data transfer from the HSUART to host memory is controlled by the DMA write channel. To configure the channel in write mode, channel direction in the channel control register needs to be programmed to "1". The software need to program the descriptor start address register, descriptor transfer size register, and descriptor control register before starting the channel using the channel active bit in the channel control register.

27.3.1.2 Transmit DMA

The data transfer from host memory to HSUART is controlled by DMA read channel. To configure the channel in read mode, channel direction in the channel control register needs to be programmed to "0". The software need to program the descriptor start address register, descriptor transfer size register, and descriptor control register before starting the channel using the channel active bit in the channel control register.

27.3.1.3 Removing Trailing Bytes in DMA Mode

When the number of entries in the Receive FIFO is less than its trigger level, and no additional data is received, the remaining bytes are called Trailing bytes. These are DMAed out by the DMA as it has visibility into the FIFO Occupancy register.

27.3.2 FIFO Polled-Mode Operation

With the FIFOs enabled (IIR_FCR.IID0_FIFOE bit set to 1), clearing IER_DLH[7] and IER_DLH[4:0] puts the serial port in the FIFO Polled Operation mode. Because the receiver and the transmitter are controlled separately, either one or both can be in Polled Operation mode. In this mode, software checks Receiver and Transmitter status using the Line Status Register (LSR). The processor polls the following bits for Receive and Transmit Data Service.

27.3.2.1 Receive Data Service

The processor checks data ready (LSR.DR) bit which is set when 1 or more bytes remains in the Receive FIFO or Receive Buffer Register (RBR_THR_DLL).

27.3.2.2 Transmit Data Service

The processor checks transmit data request LSR.THRE bit, which is set when the transmitter needs data.

The processor can also check transmitter empty LSR.TEMT, which is set when the Transmit FIFO or Holding register is empty.

27.3.2.3 Autoflow Control

Autoflow Control uses Clear-to-Send (nCTS) and Request-to-Send (nRTS) signals to automatically control the flow of data between the UART and external modem. When autoflow is enabled, the remote device is not allowed to send data unless the UART asserts nRTS low. If the UART de-asserts nRTS while the remote device is sending data, the remote device is allowed to send one additional byte after nRTS is deasserted. An overflow could occur if the remote device violates this rule. Likewise, the UART is not allowed to transmit data unless the remote device asserts nCTS low. This feature increases system efficiency and eliminates the possibility of a Receive FIFO Overflow error due to long interrupt latency.

Autoflow mode can be used in two ways: Full autoflow, automating both nCTS and nRTS, and half autoflow, automating only nCTS. Full Autoflow is enabled by writing a 1 to bits 1 and 5 of the Modem Control Register (MCR). Auto-nCTS-Only mode is enabled by writing a 1 to bit 5 and a 0 to bit 1 of the MCR register.

27.3.2.4 RTS (UART Output)

When in full autoflow mode, nRTS is asserted when the UART FIFO is ready to receive data from the remote transmitter. This occurs when the amount of data in the Receive FIFO is below the programmable threshold value. When the amount of data in the Receive FIFO reaches the programmable threshold, nRTS is de-asserted. It will be asserted once again when enough bytes are removed from the FIFO to lower the data level below the threshold.

27.3.2.5 CTS (UART Input)

When in Full or Half-Autoflow mode, nCTS is asserted by the remote receiver when the receiver is ready to receive data from the UART. The UART checks nCTS before sending the next byte of data and will not transmit the byte until nCTS is low. If nCTS goes high while the transfer of a byte is in progress, the transmitter will complete this byte.

27.4 Register Map

Refer to [Chapter 3, “Register Access Methods”](#) and [Chapter 4, “Mapping Address Spaces”](#) for additional information.

Figure 127.SIO - HSUART Register Map

31	28	24	20	16	12	8	4	0
0	0	0	0	1	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
Reserved0				MULFNDEV	HEADERTYPE			
					LATTIMER			
								CACHELINE_SIZE

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RO	Reserved0: Reserved.
23	1h RO	Multi Function Device (MULFNDEV): This bit is always 0 for non fabric ports. For Fabric ports it is driven from fabric_mult_function strap. 1 = multifunction device 0 = single function device
22:16	00h RO	Header Type (HEADERTYPE): Implements Type 0 Configuration header.
15:8	00h RO	Latency Timer (LATTIMER): Does not apply to PCI Express. Hardwired to 00h.
7:0	00h RW	Cache Line Size (CACHELINE_SIZE): Doesn't apply to PCI Express. PCI Express spec requires this to be implemented as a R/W register but has no functional impact on the AHB Device connected.

27.5.5 Base Address Register (BAR)—Offset 10h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:30, F:3] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
BASEADDR						SIZEINDICATOR	PREFETCHABLE	TYPE
								MESSAGE_SPACE

Bit Range	Default & Access	Field Name (ID): Description
31:12	00000h RW	Base Address (BASEADDR): Base address of the AHB device memory space. Taken from Strap values as 1.s
11:4	00h RO	Size Indicator Read Only (SIZEINDICATOR): Always returns zero. The size of this register depends on the size of the Memory space. This size is determined by a top level of STRAP values as 0.s. Always will be zero as minimum size is 4K.
3	0h RO	Prefetchable (PREFETCHABLE): Indicates that this BAR is not prefetchable.

Access Method

Offset: [B:0, D:30, F:3] + 14h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
BASEADDR1						SIZEINDICATOR1		
						PREFETCHABLE1		
						TYPE1		
						MESSAGE_SPACE1		

27.5.7 Subsystem Vendor and Subsystem ID (SUBSYSTEMID)—Offset 2Ch

Access Method

Offset: [B:0, D:30, F:3] + 2Ch

Default: 00000000h

Type: PCI Configuration Register
(Size: 32 bits)

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
EXPANSION_ROM_BASE								

27.5.9 Capabilities Pointer (CAPABILITYPTR)—Offset 34h

Type: PCI Configuration Register
(Size: 32 bits)

October 2018
Document Number: 538136, Rev. 4.3

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
Reserved0							CAPPTR_POWER	

Bit Range	Default & Access	Field Name (ID): Description
31:8	000000h RO	Reserved0: Reserved.
7:0	00h RO	Capabilities Pointer (CAPPTR_POWER): Indicates what the next capability is. This capability can be programmed to be PM Capability (0x80) if PM Capability is enabled in SB. If PM capability is disabled then this register has 00h.

27.5.10 Interrupt Register (INTERRUPTREG)—Offset 3Ch

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:30, F:3] + 3Ch

Default: 00000100h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	1	0
0	0	0	0	0	0	0	0	0
MAX_LAT				MIN_GNT				INTLINE

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RO	Max_Lat (MAX_LAT): Value of 0 indicates device has no major requirements for the settings of latency timers.
23:16	00h RO	Min_Gnt (MIN_GNT): Value of 0 indicates device has no major requirements for the settings of latency timers.
15:12	0h RO	Reserved0: Reserved.
11:8	1h RO	Interrupt Pin (INTPIN): Each AHB IP on Bridge is a Single function device. Hence Bridge only generates INTA on IOSF SB. The Fabric on AHB Bridge appears as a Multifunction device. Interrupt Pin Value in this register is reflected from the IPIN value in the private configuration space.
7:0	00h RW	Interrupt Line (INTLINE): Bridge does not use this field directly. It is used to tell software which interrupt line the interrupt pin is connected to.

27.5.11 PowerManagement Capability ID (POWERCAPID)—Offset 80h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:30, F:3] + 80h

Default: 00030001h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	1
PMESUPPORT				Reserved0	VERSION	NXTCAP	POWER_CAP	

Bit Range	Default & Access	Field Name (ID): Description
31:27	00h RO	PME_Support (PMESUPPORT): This 5-bit field indicates the power states in which the function may assert PME#. A value of 0b for any bit indicates that the function is not capable of asserting the PME# signal while in that power state. - bit(11) X XXX1b - PME# can be asserted from D0. - bit(12) X XX1Xb - PME# can be asserted from D1. Bridge does not support this state. - bit(13) X X1XXb - PME# can be asserted from D2. Bridge does not support this state. - bit(14) X 1XXXb - PME# can be asserted from D3hot. - bit(15) 1 XXXXb - PME# can be asserted from D3cold. Bridge does not support this state. This field is taken from the strap strap_pme_support.
26:19	00h RO	Reserved0: Reserved.
18:16	3h RO	Version (VERSION): Indicates support for Revision 1.2 of the PCI Power Management Specification.
15:8	00h RO	Next Capability (NXTCAP): Points to the next capability structure. This points to NULL.
7:0	01h RO	Power Management Capability (POWER_CAP): Indicates this is power management capability.

27.5.12 PME Control and Status Register (PMECTRLSTATUS)—Offset 84h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:30, F:3] + 84h

Default: 00000008h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
Reserved0				PMESTATUS	Reserved1	PMEENABLE	Reserved2	NO_SOFT_RESET
								Reserved3
								POWERSTATE

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RO	Reserved0: Reserved.

Bit Range	Default & Access	Field Name (ID): Description
15	0h RW/1C	PME Status (PMESTATUS): 0 = Software clears the bit by writing a 1 to it. 1 = This bit is set when the AHB Device would normally assert the PME# signal independent of the state of the PME Enable bit (bit 8 in this register).
14:9	00h RO	Reserved1: Reserved.
8	0h RW	PME Enable (PMEENABLE): A 1 enables the function to assert PME#. When 0, PME# message on SB is disabled.
7:4	0h RO	Reserved2: Reserved.
3	1h RO	No_Soft_Reset (NO_SOFT_RESET): This bit indicates that devices transitioning from D3hot to D0 because of PowerState commands do not perform an internal reset. Configuration Context is preserved.
2	0h RO	Reserved3: Reserved.
1:0	0h RW	Power State (POWERSTATE): This field is used both to determine the current power state of the AHB IP and to set a new power state. The values are: 00 = D0 state 11 = D3HOT state - Others = Reserved Notes: If software attempts to write a value of 01b or 10b in to this field, the write operation must complete normally; however, the data is discarded and no state change occurs. When in the D3HOT states, interrupts are blocked. D3Hot will not be used for Downstream decode on fabric ports.

27.5.13 Manufacturer ID (MANID)—Offset F8h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:30, F:3] + F8h

Default: 00000000h

27.6.1 Receive Buffer Register/Transmit Holding Register/Divisor Latch (Low). (RBR THR DLL)—Offset 0h

Register is used for different purposes depending on the mode. See description details

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 0h**BAR Type:** PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:30, F:3] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
RSVD0							rbr_thr_dll	

Bit Range	Default & Access	Field Name (ID): Description
31:8	0b RO	RSVD0: Reserved
7:0	0h RW	rbr_thr_dll: RBR[7:0] (Receive Buffer Register) (Read Only): Data byte received on the serial input port (sin) in UART mode. The data in this register is valid only if the Data Ready (DR) bit in the Line Status Register (LCR) is set. If FIFOs are disabled (FCR[0] set to zero), the data in the RBR must be read before the next data arrives, otherwise it is overwritten, resulting in an over-run error. If FIFOs are enabled (FCR[0] set to one), this register accesses the head of the receive FIFO. If the receive FIFO is full and this register is not read before the next data character arrives, then the data already in the FIFO is preserved, but any incoming data are lost and an over-run error occurs. THR[7:0] (Transmit Holding Register) (Write Only): Data to be transmitted on the serial output port (sout) in UART mode. Data should only be written to the THR when the THR Empty (THRE) bit (LSR[5]) is set. If in non-FIFO mode or FIFOs are disabled (FCR[0] = 0) and THRE is set, writing a single character to the THR clears the THRE. Any additional writes to the THR before the THRE is set again causes the THR data to be overwritten. If in FIFO mode and FIFOs are enabled (FCR[0] = 1) and THRE is set, x number of characters of data may be written to the THR before the FIFO is full. The number x (default=16) is determined by the value of FIFO Depth that you set during configuration. Any attempt to write data when the FIFO is full results in the write data being lost. DLL[7:0] (Divisor Latch Low) (Read-Write): Lower 8 bits of a 16-bit, read/write, Divisor Latch register that contains the baud rate divisor for the UART. this register may be accessed only when the DLAB bit (LCR[7]) is set. The output baud rate is equal to the serial frequency divided by sixteen times the value of the baud rate divisor, as follows: $\text{baud rate} = (\text{serial clock freq}) / (16 * \text{divisor})$. Note that with the Divisor Latch Registers (DLL and DLH) set to zero, the baud clock is disabled and no serial communications occur. Also, once the DLL is set, at least 8 clock cycles of the slowest HSUART clock should be allowed to pass before transmitting or receiving data.

27.6.2 Divisor Latch (High)/ Interrupt Enable Register. (IER_DLH)—Offset 4h

Register bits [7:0] is used for different purposes depending on the mode. DLH (Divisor Latch High) Upper 8-bits of a 16-bit, read/write, Divisor Latch register that contains the baud rate divisor for the UART. This register may be accessed only when the DLAB bit (LCR[7]) is set. The output baud rate is equal to the serial clock frequency divided by sixteen times the value of the baud rate divisor, as follows: $\text{baud rate} = (\text{serial clock freq}) / (16 * \text{divisor})$. Note that with the Divisor Latch Registers (DLL and DLH) set to zero, the baud clock is disabled and no serial communications occur. Also, once the DLH is set, at least 8 clock cycles of the slowest HSUART clock should be allowed to pass before transmitting or receiving data.

Access Method

 (Size: 32 bits)

Offset: [BAR] + 8h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:30, F:3] + 10h

Default: 00000001h

31	28	24	20	16	12	8	4	0				
0	0	0	0	0	0	0	0	1				
RSVD0							RCVR	TET	DMAM	XFIFOR	RFIFOR	FIFOE

Bit Range	Default & Access	Field Name (ID): Description
31:8	0b RO	RSVD0: Reserved
7:6	0h RW	FIFOE_RCVR (RCVR): FIFOE (FIFOs Enabled) This is used to indicate whether the FIFOs are enabled or disabled. 00 = disabled 11 = enabled RCVR Trigger. This is used to select the trigger level in the receiver FIFO at which the Received Data Available Interrupt is generated. In auto flow control mode it is used to determine when the rts_n signal is de-asserted. It also determines when the dma_rx_req_n signal is asserted in certain modes of operation. The following trigger levels are supported: 00 = 1 character in the FIFO 01 = FIFO full 10 = FIFO full 11 = FIFO 2 less than full
5:4	0h RW	Res_TET (TET): TX Empty Trigger. This is used to select the empty threshold level at which the THRE Interrupts are generated when the mode is active. It also determines when the dma_tx_req_n signal is asserted when in certain modes of operation. The following trigger levels are supported: 00 = FIFO empty 01 = 2 characters in the FIFO 10 = FIFO full 11 = FIFO full
3	0h RW	IID3_DMAM (DMAM): DMA Mode. Reserved
2	0h RW	IID2_XFIFOR (XFIFOR): XMIT FIFO Reset. This resets the control portion of the transmit FIFO and treats the FIFO as empty. Note that this bit is 'self-clearing'. It is not necessary to clear this bit.
1	0h RW	IID1_RFIFOR (RFIFOR): RCVR FIFO Reset. This resets the control portion of the receive FIFO and treats the FIFO as empty. Note that this bit is 'self-clearing'. It is not necessary to clear this bit.
0	1h RW	IID0_FIFO Enable (FIFOE): This enables/disables the transmit (XMIT) and receive (RCVR) FIFOs. Whenever the value of this bit is changed both the XMIT and RCVR controller portion of FIFOs is reset

27.6.4 Line Control Register (LCR)—Offset Ch

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + Ch

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:30, F:3] + 10h

Default: 00000000h

31				28				24				20				16				12				8				4				0			
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0			
RSVD0																								DLAB	Break	RSVD1	EPS	PEN	STOP	DLS					

Bit Range	Default & Access	Field Name (ID): Description
31:6	0b RO	RSVD0: Reserved
5	0h RW	Auto Flow Control Enable (AFCE): When FIFOs are enabled and the Auto Flow Control Enable (AFCE) bit is set, 0 = Auto Flow Control Mode disabled 1 = Auto Flow Control Mode enabled Reset Value: 0x0
4	0h RW	LoopBack Bit (LoopBack): This is used to put the UART into a diagnostic mode for test purposes. If operating in UART mode (MCR[6] set to zero), data on the sout line is held high, while serial data output is looped back to the sin line, internally. In this mode all the interrupts are fully functional. Also, in loopback mode, the modem control inputs (dsr_n, cts_n, ri_n, dcd_n) are disconnected and the modem control outputs (dtr_n, rts_n, out1_n, out2_n) are looped back to the inputs, internally. Reset Value: 0x0
3	0h RW	Output2 (OUT2): This is used to directly control the user-designated Output2 (out2_n) output. The value written to this location is inverted and driven out on out2_n, that is: 0 = out2_n de-asserted (logic 1) 1 = out2_n asserted (logic 0) Note that in Loopback mode (MCR[4] set to one), the out2_n output is held inactive high while the value of this location is internally looped back to an input. Reset Value: 0x0
2	0h RW	Output1 (OUT1): This is used to directly control the user-designated Output1 (out1_n) output. The value written to this location is inverted and driven out on out1_n, that is: 0 = out1_n de-asserted (logic 1) 1 = out1_n asserted (logic 0) Note that in Loopback mode (MCR[4] set to one), the out1_n output is held inactive high while the value of this location is internally looped back to an input. Reset Value: 0x0
1	0h RW	Request to Send (RTS): This is used to directly control the Request to Send (rts_n) output. The Request To Send (rts_n) output is used to inform the modem or data set that the UART is ready to exchange data. When Auto RTS Flow Control is not enabled (MCR[5] set to zero), the rts_n signal is set low by programming MCR[1] (RTS) to a high. In Auto Flow Control, (MCR[5] set to one) and FIFOs enable (FCR[0] set to one), the rts_n output is controlled in the same way, but is also gated with the receiver FIFO threshold trigger (rts_n is inactive high when above the threshold). The rts_n signal is de-asserted when MCR[1] is set low. Note that in Loopback mode (MCR[4] set to one), the rts_n output is held inactive high while the value of this location is internally looped back to an input. Reset Value: 0x0
0	0h RW	Data Terminal Ready (DTR): This is used to directly control the Data Terminal Ready (dtr_n) output. The value written to this location is inverted and driven out on dtr_n, that is: 0 = dtr_n de-asserted (logic 1) 1 = dtr_n asserted (logic 0) The Data Terminal Ready output is used to inform the modem or data set that the UART is ready to establish communications. Note that in Loopback mode (MCR[4] set to one), the dtr_n output is held inactive high while the value of this location is internally looped back to an input. Reset Value: 0x0

27.6.6 Line Status Register (LSR)—Offset 14h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 14h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:30, F:3] + 10h

Default: 00000060h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
RSVD0							RFE	TEMT
							THRE	BI
							FE	PE
							OE	DR

Bit Range	Default & Access	Field Name (ID): Description
31:8	0b RO	RSVD0: Reserved
7	0h RW	Receiver FIFO Error Bit (RFE): This bit is only relevant when FIFOs are enabled (FCR[0] set to one). This is used to indicate if there is at least one parity error, framing error, or break indication in the FIFO. 0 = no error in RX FIFO 1 = error in RX FIFO This bit is cleared when the LSR is read, the character with the error is at the top of the receiver FIFO, and there are no subsequent errors in the FIFO. Reset Value: 0x0
6	1h RW	Transmitter Empty Bit (TEMT): If FIFOs enabled (FCR[0] set to one), this bit is set whenever the Transmitter Shift Register and the FIFO are both empty. If in non-FIFO mode or FIFOs are disabled, this bit is set whenever the Transmitter Holding Register and the Transmitter Shift Register are both empty. Reset Value: 0x1
5	1h RW	Transmit Holding Register Empty Bit (THRE): If THRE mode is disabled (IER[7] set to zero), this bit indicates that the THR or TX FIFO is empty. This bit is set whenever data is transferred from the THR or TX FIFO to the transmitter shift register and no new data has been written to the THR or TX FIFO. This also causes a THRE Interrupt to occur, if the THRE Interrupt is enabled. If THRE mode is enabled and and FIFOs enabled (IER[7] set to one and FCR[0] set to one respectively), the functionality is switched to indicate the transmitter FIFO is full, and no longer controls THRE interrupts, which are then controlled by the FCR[5:4] threshold setting. Reset Value: 0x1
4	0h RW	Break Interrupt Bit (BI): This is used to indicate the detection of a break sequence on the serial input data. If in UART mode it is set whenever the serial input, sin, is held in a logic '0' state for longer than the sum of start time + data bits + parity + stop bits. In the FIFO mode, the character associated with the break condition is carried through the FIFO and is revealed when the character is at the top of the FIFO. Reading the LSR clears the BI bit. In the non-FIFO mode, the BI indication occurs immediately and persists until the LSR is read.
3	0h RW	Framing Error Bit (FE): This is used to indicate the occurrence of a framing error in the receiver. A framing error occurs when the receiver does not detect a valid STOP bit in the received data. In the FIFO mode, since the framing error is associated with a character received, it is revealed when the character with the framing error is at the top of the FIFO. When a framing error occurs, the UART tries to resynchronize. It does this by assuming that the error was due to the start bit of the next character and then continues receiving the other bit i.e. data, and/or parity and stop. It should be noted that the Framing Error (FE) bit (LSR[3]) is set if a break interrupt has occurred, as indicated by Break Interrupt (BI) bit (LSR[4]). 0 = no framing error 1 = framing error Reading the LSR clears the FE bit. Reset Value: 0x0
2	0h RW	Parity Error Bit (PE): This is used to indicate the occurrence of a parity error in the receiver if the Parity Enable (PEN) bit (LCR[3]) is set. In the FIFO mode, since the parity error is associated with a character received, it is revealed when the character with the parity error arrives at the top of the FIFO. It should be noted that the Parity Error (PE) bit (LSR[2]) is set if a break interrupt has occurred, as indicated by Break Interrupt (BI) bit (LSR[4]). 0 = no parity error 1 = parity error Reading the LSR clears the PE bit. Reset Value: 0x0

Bit Range	Default & Access	Field Name (ID): Description
1	0h RW	Overrun Error Bit (OE): This is used to indicate the occurrence of an overrun error. This occurs if a new data character was received before the previous data was read. In the non-FIFO mode, the OE bit is set when a new character arrives in the receiver before the previous character was read from the RBR. When this happens, the data in the RBR is overwritten. In the FIFO mode, an overrun error occurs when the FIFO is full and a new character arrives at the receiver. The data in the FIFO is retained and the data in the receive shift register is lost. 0 = no overrun error 1 = overrun error Reading the LSR clears the OE bit. Reset Value: 0x0
0	0h RW	Data Ready Bit (DR): This is used to indicate that the receiver contains at least one character in the RBR or the receiver FIFO. 0 = no data ready 1 = data ready This bit is cleared when the RBR is read in non-FIFO mode, or when the receiver FIFO is empty, in FIFO mode. Reset Value: 0x0

27.6.7 Modem Status Register (MSR)—Offset 18h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 18h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:30, F:3] + 10h

Default: 00000000h

31				28				24				20				16				12				8				4				0			
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0			
RSVD0																				DCD	RI	DSR	CTS	DDCD	TERI	DDSR	DCTS								

Bit Range	Default & Access	Field Name (ID): Description
31:8	0b RO	RSVD0: Reserved
7	0h RW	Data Carrier Detect (DCD): This is used to indicate the current state of the modem control line dcd_n. This bit is the complement of dcd_n. When the Data Carrier Detect input (dcd_n) is asserted, it is an indication that the carrier has been detected by the modem or data set. 0 = dcd_n input is de-asserted (logic 1) 1 = dcd_n input is asserted (logic 0) In Loopback Mode (MCR[4] set to one), DCD is the same as MCR[3] (Out2). Reset Value: 0x0
6	0h RW	Ring Indicator (RI): This is used to indicate the current state of the modem control line ri_n. This bit is the complement of ri_n. When the Ring Indicator input (ri_n) is asserted it is an indication that a telephone ringing signal has been received by the modem or data set. 0 = ri_n input is de-asserted (logic 1) 1 = ri_n input is asserted (logic 0) In Loopback Mode (MCR[4] set to one), RI is the same as MCR[2] (Out1). Reset Value: 0x0

Bit Range	Default & Access	Field Name (ID): Description
5	0h RW	Data Set Ready (DSR): This is used to indicate the current state of the modem control line dsr_n. This bit is the complement of dsr_n. When the Data Set Ready input (dsr_n) is asserted it is an indication that the modem or data set is ready to establish communications with the DW_apb_uart. 0 = dsr_n input is de-asserted (logic 1) 1 = dsr_n input is asserted (logic 0) In Loopback Mode (MCR[4] set to one), DSR is the same as MCR[0] (DTR). Reset Value: 0x0
4	0h RW	Clear to Send (CTS): This is used to indicate the current state of the modem control line cts_n. This bit is the complement of cts_n. When the Clear to Send input (cts_n) is asserted, it is an indication that the modem or data set is ready to exchange data with the DW_apb_uart. 0 = cts_n input is de-asserted (logic 1) 1 = cts_n input is asserted (logic 0) In Loopback Mode (MCR[4] = 1), CTS is the same as MCR[1] (RTS). Reset Value: 0x0
3	0h RW	Delta Data Carrier Detect (DDCD): This is used to indicate that the modem control line dcd_n has changed since the last time the MSR was read. 0 = no change on dcd_n since last read of MSR 1 = change on dcd_n since last read of MSR Reading the MSR clears the DDCD bit. In Loopback Mode (MCR[4] = 1), DDCD reflects changes on MCR[3] (Out2). Note, if the DDCD bit is not set and the dcd_n signal is asserted (low) and a reset occurs (software or otherwise), then the DDCD bit is set when the reset is removed if the dcd_n signal remains asserted. Reset Value: 0x0
2	0h RW	Trailing Edge of Ring Indicator (TERI): This is used to indicate that a change on the input ri_n (from an active-low to an inactive-high state) has occurred since the last time the MSR was read. 0 = no change on ri_n since last read of MSR 1 = change on ri_n since last read of MSR Reading the MSR clears the TERI bit. In Loopback Mode (MCR[4] = 1), TERI reflects when MCR[2] (Out1) has changed state from a high to a low. Reset Value: 0x0
1	0h RW	Delta Data Set Ready (DDSR): This is used to indicate that the modem control line dsr_n has changed since the last time the MSR was read. 0 = no change on dsr_n since last read of MSR 1 = change on dsr_n since last read of MSR Reading the MSR clears the DDSR bit. In Loopback Mode (MCR[4] = 1), DDSR reflects changes on MCR[0] (DTR). Note, if the DDSR bit is not set and the dsr_n signal is asserted (low) and a reset occurs (software or otherwise), then the DDSR bit is set when the reset is removed if the dsr_n signal remains asserted. Reset Value: 0x0
0	0h RW	Delta Clear to Send (DCTS): This is used to indicate that the modem control line cts_n has changed since the last time the MSR was read. 0 = no change on cts_n since last read of MSR 1 = change on cts_n since last read of MSR Reading the MSR clears the DCTS bit. In Loopback Mode (MCR[4] = 1), DCTS reflects changes on MCR[1] (RTS). Note that if the DCTS bit is not set, the cts_n signal is asserted (low) and a reset occurs (software or otherwise), then the DCTS bit is set when the reset is removed if the cts_n signal remains asserted. Reset Value: 0x0

Bit Range	Default & Access	Field Name (ID): Description
31:8	0b RO	RSVD0: Reserved
7:0	0h RW	srbr_sthr0: This is a shadow register for the RBR and has been allocated sixteen 32-bit locations to accommodate burst accesses from the master. This register contains the data byte received on the serial input port (sin) in UART mode or the serial infrared input (sir_in) in infrared mode. The data in this register is valid only if the Data Ready (DR) bit in the Line status Register (LSR) is set. If FIFOs are disabled (FCR[0] set to zero), the data in the RBR must be read before the next data arrives, otherwise it is overwritten, resulting in an overrun error. If FIFOs are enabled (FCR[0] set to one), this register accesses the head of the receive FIFO. If the receive FIFO is full and this register is not read before the next data character arrives, then the data already in the FIFO are preserved, but any incoming data are lost. An overrun error also occurs. Reset Value: 0x0

27.6.10 Shadow Receive Buffer Register and Shadow Transmit Holding Register 1 (SRBR_STHR1)—Offset 34h

Refer to bit field description for SRBR_STHR0.srbr_sthr0.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 34h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:30, F:3] + 10h

Default: 00000000h

4:0	0h RW	Receive FIFO Level (rfl): This indicates the number of data entries in the receive FIFO. Reset Value: 0x0

27.6.31 Software Reset Register (SRR)—Offset 88h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 88h**BAR Type:** PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:30, F:3] + 10h

Default: 00000000h

[illegible]

Bit Range	Default & Access	Field Name (ID): Description
31:3	0b RO	RSVDD0: Reserved
2	0h RW	XMIT FIFO Reset (XFR): This is a shadow register for the XMIT FIFO Reset bit (FCR[2]). This can be used to remove the burden on software having to store previously written FCR values (which are pretty static) just to reset the transmit FIFO. This resets the control portion of the transmit FIFO and treats the FIFO as empty. This also de-asserts the DMA TX request and single signals when additional DMA handshaking signals are selected (DMA_EXTRA == YES). Note that this bit is 'self-clearing'. It is not necessary to clear this bit. Reset Value: 0x0
1	0h RW	RCVR FIFO Reset (RFR): This is a shadow register for the RCVR FIFO Reset bit (FCR[1]). This can be used to remove the burden on software having to store previously written FCR values (which are pretty static) just to reset the receive FIFO. This resets the control portion of the receive FIFO and treats the FIFO as empty. This also de-asserts the DMA RX request and single signals when additional DMA handshaking signals are selected (DMA_EXTRA == YES). Note that this bit is 'self-clearing'. It is not necessary to clear this bit. Reset Value: 0x0
0	0h RW	UART Reset (UR): This asynchronously resets the DW_apb_uart and synchronously removes the reset assertion. For a two clock implementation both pclk and sclk domains are reset. Reset Value: 0x0

27.6.32 Shadow Request to Send (SRTS)—Offset 8Ch

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 8Ch

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:30, F:3] + 10h

Default: 00000000h

27.6.33 Shadow Break Control Register (SBCR)—Offset 90h

This is a shadow register for the Break bit (LCR[6]), this can be used to remove the burden of having to performing a read modify write on the LCR. This is used to cause a break condition to be transmitted to the receiving device. If set to one the serial output is forced to the spacing (logic 0) state. When not in Loopback Mode, as determined by MCR[4], the sout line is forced low until the Break bit is cleared.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 90h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:30, F:3] + 10h

27.6.36 Shadow RCVR Trigger (SRT)—Offset 9Ch

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 9Ch

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:30, F:3] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
RSVD0								st

Bit Range	Default & Access	Field Name (ID): Description
31:2	0b RO	RSVD0: Reserved
1:0	0h RW	Shadow RCVR Trigger (srt): This is a shadow register for the RCVR trigger bits (FCR[7:6]). This can be used to remove the burden of having to store the previously written value to the FCR in memory and having to mask this value so that only the RCVR trigger bit gets updated. This is used to select the trigger level in the receiver FIFO at which the Received Data Available Interrupt is generated. It also determines when the dma_rx_req_n signal is asserted when DMA Mode (FCR[3]) = 1. The following trigger levels are supported: 00 = 1 character in the FIFO 01 = FIFO full 10 = FIFO full 11 = FIFO 2 less than full Reset Value: 0x0

27.6.37 Shadow TX Empty Trigger (STET)—Offset A0h

This is a shadow register for the TX empty trigger bits (FCR[5:4]). This can be used to remove the burden of having to store the previously written value to the FCR in memory and having to mask this value so that only the TX empty trigger bit gets updated. This is used to select the empty threshold level at which the THRE Interrupts are generated when the mode is active. The following trigger levels are supported:

- 00 = FIFO empty
- 01 = 2 characters in the FIFO
- 10 = FIFO full
- 11 = FIFO full

Reset Value: 0x0

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + A0h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:30, F:3] + 10h

Default: 00000000h

27.6.40 Component Parameter Register (CPR)—Offset F4h

31	28	24	20	16	12	8	4	0	
0	0	0	0	0	0	0	0	0	0
RSVD0									dma

Bit Range	Default & Access	Field Name (ID): Description
31:1	0b RO	RSVD0: Reserved
0	0h RW	dmaa: This register is use to perform a DMA software acknowledge if a transfer needs to be terminated due to an error condition. For example, if the DMA disables the channel, then the DW_apb_uart should clear its request. This causes the TX request, TX single, RX request and RX single signals to de-assert. Note that this bit is 'self-clearing'. It is not necessary to clear this bit. Reset Value: 0x0 Dependencies: Writes have no effect when DMA_EXTRA == No.

27.7 PCU PMC Memory Mapped I/O Registers

**Table 284. Summary of PCU iLB PMC Memory Mapped I/O Registers—
PMC_BASE_ADDRESS**

Offset	Size	Register ID—Description	Default Value
0h	4	"PRSTS - Power and Reset Status (PRSTS)—Offset 0h" on page 4247	00000000h
8h	4	"PM_CFG - Power Management Configuration (PMC_CFG)—Offset 8h" on page 4248	00000000h
Ch	4	"VLV_PM_STS - VLV Power Management Status (VLV_PM_STS)—Offset Ch" on page 4249	00000000h
10h	4	"MTPMC - Message to PMC (MTPMC)—Offset 10h" on page 4251	00000000h
20h	4	"General PM Configuration 1 (GEN_PMCON1)—Offset 20h" on page 4251	00004004h
24h	4	"General PM Configuration 2 (GEN_PMCON2)—Offset 24h" on page 4254	00000000h
28h	4	"MFPMC - Message from PMC (MFPMC)—Offset 28h" on page 4255	00000000h
2Ch	4	"SEC_STS - SEC Status (SEC_STS)—Offset 2Ch" on page 4256	00000000h
30h	4	"Configured Revision ID (CRID)—Offset 30h" on page 4256	00000000h
34h	4	"Function Disable (FUNC_DIS)—Offset 34h" on page 4257	00000000h
38h	4	"Function Disable 2 (FUNC_DIS_2)—Offset 38h" on page 4258	00000000h
3Ch	4	"S0ix wake enable (S0IX_WAKE_EN)—Offset 3Ch" on page 4258	00FFFFFFh
40h	4	"S0ix wake Status (S0IX_WAKE_STS)—Offset 40h" on page 4260	00000000h
44h	4	"S0ix control (S0IX_CTL)—Offset 44h" on page 4261	00000050h
48h	4	"ETR - Extended Test Mode Register (ETR)—Offset 48h" on page 4262	00230000h
50h	4	"VLT - Voltage Detect Register (VLT)—Offset 50h" on page 4263	00000000h
58h	4	"GPIO_ROUT - GPIO_ROUT register (GPIO_ROUT)—Offset 58h" on page 4263	00000000h
60h	4	"PLT_CLK_CTL_0 - Platform Clock Control 0 (PLT_CLK_CTL_0)—Offset 60h" on page 4264	00000003h
64h	4	"PLT_CLK_CTL_1 - Platform Clock Control 1 (PLT_CLK_CTL_1)—Offset 64h" on page 4265	00000003h
68h	4	"PLT_CLK_CTL_2 - Platform Clock Control 2 (PLT_CLK_CTL_2)—Offset 68h" on page 4265	00000003h
6Ch	4	"PLT_CLK_CTL_3 - Platform Clock Control 3 (PLT_CLK_CTL_3)—Offset 6Ch" on page 4266	00000003h
70h	4	"PLT_CLK_CTL_4 - Platform Clock Control 4 (PLT_CLK_CTL_4)—Offset 70h" on page 4266	00000003h
74h	4	"PLT_CLK_CTL_5 - Platform Clock Control 5 (PLT_CLK_CTL_5)—Offset 74h" on page 4267	00000003h
80h	4	"S0IR_TMR - S0I Ready Residency Timer (S0IR_TMR)—Offset 80h" on page 4268	00000000h
84h	4	"S0I1_TMR - S0I1 Residency Timer (S0I1_TMR)—Offset 84h" on page 4268	00000000h
88h	4	"S0I2_TMR - S0I2 Residency Timer (S0I2_TMR)—Offset 88h" on page 4269	00000000h
8Ch	4	"S0I3_TMR - S0I3 Residency Timer (S0I3_TMR)—Offset 8Ch" on page 4269	00000000h
90h	4	"S0_TMR - S0 Residency Timer (S0_TMR)—Offset 90h" on page 4270	00000000h
98h	4	"PSS - Power island Power Status (PSS)—Offset 98h" on page 4270	00000000h
A0h	4	"D3_STS_0 - D3 Status register 0 (D3_STS_0)—Offset A0h" on page 4271	00000000h
A4h	4	"D3_STS_1 - D3 Status register 1 (D3_STS_1)—Offset A4h" on page 4271	00000000h

Bit Range	Default & Access	Description
31:24	0b RO	Power Management Controller Product ID (PMC_PRODID) (pmc_prodid): This field communicates the Product Family of the power management functionality
23:16	0b RO	Power Management Controller Revision ID (PMC_REVID) (pmc_revid): This field communicates the implementation revision of the power management functionality.
15	0b RW	PMC Watchdog Timer Status (PMC_WDT_STS) (pmc_wdt_sts): This bit will be set to '1' when the PMC Watch Dog Timer triggers a reset. It will be cleared by a write of '1' by software.
14:12	0b RO	reserved: Reserved.
11	0b RO	Code Copied Over Status (CODE_COPIED_STS) (code_copied_sts): The SOC sets this bit when PMC code is successfully authenticated and loaded from the flash
10	0b RO	reserved (reserved1): Reserved.
9	0b RO	Code Load Timeout Status (CODE_LOAD_TO) (code_load_to): The SOC sets this bit if the loading function fails to complete within a reasonable time limit. This bit remains valid after a PMC Code load is attempted until the next global reset
8	0b RO	PMC Operational Status (PMC_OP_STS) (pmc_op_sts): The SOC sets this bit when the PMC becomes operational after completing the Code Load. BIOS must wait for this bit to be set before performing resets or sleep events. This bit remains valid after a PMC Code load until the next global reset
7	0b RW	SEC Watch Dog Timer Status (SEC_GBLRST_STS) (sec_gblrst_sts): This bit will be set to '1' when the SEC FW triggers a reset. It will be cleared by a write of '1' by software.
6	0b RW	SEC Watch Dog Timer Status (SEC_WDT_STS) (sec_wdt_sts): This bit will be set to '1' when the SEC Watch Dog Timer triggers a reset. It will be cleared by a write of '1' by software.
5	0b RW	Wake On LAN Override Wake Status (WOL_OVR_WK_STS) (wol_ovr_wk_sts): This bit gets set when integrated LAN Signals a Power Management Event AND the system is in S5. BIOS can read this status bit to determine this wake source. Software clears this bit by writing a 1 to it.
4	0b RW	PMC_HOST_WAKE_STS (PMC_HOST_WAKE_STS) (pmc_host_wake_sts): The SOC Power Management Controller sets this bit if it wakes the host for reasons other than typical host-visible wake events. This status bit provides information to BIOS that the PMC caused the wake.
3:0	0b RO	reserved2: Reserved.

27.7.2 PM_CFG - Power Management Configuration (PMC_CFG)—Offset 8h

This register contains misc. fields used to configure the SOC's power management behavior.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

PMC_CFG: [PMC_BASE_ADDRESS] + 8h

PMC_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)

PMC_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 44h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
reserved							sps	no_reboot
							sx_ent_to_en	reserved2
								timing_t581

Bit Range	Default & Access	Description
31:6	0b RO	reserved: Reserved.
5	0b RW	Shutdown Policy Select (SPS) (sps): When cleared (default) the SOC will drive INIT# in response to the shutdown Message. When set to 1, SOC will treat the shutdown message similar to receiving a CF9h I/O write, and will drive PMU_PLTRST active. . BIOS guide note: This register is reset any time PMU_PLTRST asserts.
4	0b RW	No Reboot (NO_REBOOT) (no_reboot): This bit is set when the No Reboot strap is sampled high on COREPWROK. This bit may be set or cleared by software if the strap is sampled low but may not override the strap when it indicates No Reboot. When set, the TCO timer will count down and generate the SMI# on the first timeout, but will not reboot on the second timeout.
3	0b RW	S1/3/4/5 Entry Timeout Enable (SX_ENT_TO_EN) (sx_ent_to_en): This policy bit determines whether the SOC will apply a timeout to the S1/S3/S4/S5 entry flow. If this timeout is enabled and the entry flow appears to be hung, the SOC will trigger a straight-to-S5 global reset. Encodings: 0: Timeout disabled (default) 1: Timeout enabled reset_type=RSMRST_B
2	0b RO	reserved (reserved2): Reserved.
1:0	0b RW	Timing t581 (TIMING_T581) (timing_t581): This field configures the t581 timing involved in the power down flow (CPU Power Good indication inactive to PLL Enable inactive). Encodings (all min timings): 00: 10 us (default) 01: 100 us 10: 1 ms 11: 10 ms reset_type=Resume Well Reset#

27.7.3 VLV_PM_STS - VLV Power Management Status (VLV_PM_STS)—Offset Ch

This register contains misc. fields used to record events pertaining to SOC power management. Unless otherwise indicated, all RWC bits are cleared with a write of 1 by software.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

VLV_PM_STS: [PMC_BASE_ADDRESS] + Ch

PMC_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)

PMC_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 44h

Default: 00000000h

Bit Range	Default & Access	Description
23	0b RW	DRAM Initialization Scratchpad Bit (DISB) (disb): This bit does not effect hardware functionality in any way. It is provided as a scratchpad bit that is maintained through main power well resets and CF9h-initiated resets. BIOS is expected to set this bit prior to starting the DRAM initialization sequence and to clear this bit after completing the DRAM initialization sequence. BIOS can detect that a DRAM initialization sequence was interrupted by a reset by reading this bit during the boot sequence. If the bit is 1, then the DRAM initialization was interrupted. This bit is reset by the assertion of the RSMRST_B pin.
22	0b RO	RSVDO: Reserved
21	0b RO	Memory Placed in Self-Refresh (MEM_SR) (mem_sr): This bit will be set to 1 if DRAM should have remained powered and held in Self-Refresh through the last power state transition (i.e. the last time the system left S0). The scenarios where this should be the case are: - successful S3 entry and exit - successful Host partition reset without power cycle This bit will be cleared whenever the SOC begins a transition out of S0. Note: This bit should not be consulted upon wake from S1, as that state does not involve the same type of handshake or placing memory into Self-Refresh. It is assumed that software is already aware that memory context is not impacted by S1 and therefore does not need to check this bit. reset_type=global reset
20	0b RW	System Reset Status (SRS) (srs): SOC sets this bit when the PMU_RESETBUTTON_B# button is pressed. BIOS is expected to read this bit and clear it if it is set. This bit is also reset by RSMRST_B and CF9h resets. reset_type=Resume Well Reset#
19	0b RW	CPU Thermal Trip Status (CTS) (cts): This bit is set when the SOC thermal trip active while the system is in a valid state to honor the pin. This bit is also reset by RSMRST_B and CF9h resets. It is not reset by the shutdown and reboot associated with the thermal trip event. reset_type=Resume Well Reset#
18	0b RW	Minimum PMU_SLP_S4_B Assertion Width Violation Status (MS4V) (ms4v): Hardware sets this bit when the PMU_SLP_S4_B assertion width is less than the time programmed in the PMU_SLP_S4_B Minimum Assertion Width field. The SOC begins the timer when PMU_SLP_S4_B pin is asserted during S4/S5 entry, or when the RSMRST_B input is deasserted during SUS well power-up. The status bit is cleared by software writing a 1 to the bit. Note that this bit is functional regardless of the value in the PMU_SLP_S4_B Assertion Stretch Enable and the Disable-SLP_X-Stretching-After-SUS-Power-Failure bits. This bit is reset by the assertion of the RSMRST_B pin, but can be set in some cases before the default value is readable. reset_type=RSMRST_B
17	0b RO	reserved3: Reserved.
16	0b RW	COREPWROK Failure (PWR_FLR) (pwr_flr): Intel SOC sets this bit any time COREPWROK goes low if the system was in an S0 or S1 state. The bit will be cleared only by software writing a 1 back to the bit or by SUS well power loss. reset_type=global reset
15	0b RW	PME B0 S5 Disable (PME_B0_S5_DIS) (pme_b0_s5_dis): When set to '1', this bit blocks wake events from PME_B0_STS in S5, regardless of the state of PME_B0_EN. When cleared (default), wake events from PME_B0_STS are allowed in S5 if PME_B0_EN = '1'. Wakes from power states other than S5 are not affected by this policy bit. The net effect of setting PME_B0_S5_DIS = '1' is described by the truth table below: Y = Wake N = Don't wake B0 = PME_B0_EN OV = WOL Enable Override B0/OV S1/S3/S4 S5 00 N N 01 N Y (LAN only) 11 Y (all PME B0 sources) Y (LAN only) 10 Y (all PME B0 sources) N This bit is cleared by the SRTCST_B pin. reset_type=SRTCST_B
14	1b RW	SUS Well Power Failure (SUS_PWR_FLR) (sus_pwr_flr): This bit is set to '1' whenever SUS well power is lost, as indicated by RSMRST_B assertion. Software writes a 1 to this bit to clear it. This bit is in the SUS well, and defaults to '1' based on RSMRST_B assertion (not cleared by any type of reset). Implementation Note: RSMRST_B is an asynchronous set term to this bit. reset_type=RSMRST_B

Bit Range	Default & Access	Description
13	0b RW	WOL Enable Override (WOL_EN_OVRD) (wol_en_ovrd): When this bit is set to 1, the integrated LAN is enabled to wake the system from S5 regardless of the value in the PME_B0_EN bit in the GPE0a_EN register. This allows the system BIOS to enable Wake-On-LAN regardless of the policies selected through the operating system. This bit is maintained in the RTC power well, therefore permitting WOL following a surprise power failure even in cases in which the system may have been running in S0 without the PME Enables set. (Note that the LAN NVRAM configuration must support WOL after SUS power loss.) When this bit is cleared to 0, the wake-on-LAN policies are determined by OS-visible bits. This bit has no effect on wakes from S1, S3, or S4. This bit is cleared by the SRTCST_B pin reset_type=SRTCST_B
12	0b RW	Disable SLP_X Stretching After SUS Well Power Up (DIS_SLP_X_STRCH_SUS_UP) (dis_slp_x_strch_sus_up): When this bit is set to 1, all SLP_* pin stretching is disabled when powering up after a SUS well power loss. When this bit is left at 0, SLP_* stretching will be performed after SUS power failure as enabled in various other fields. Note that if this bit is a 0, SLP_* stretch timers start on SUS well power up (the SOC has no ability to count stretch time while the SUS well is powered down). Setting this bit can therefore prevent long delays after SUS power loss which may be common in mobile platforms and in manufacturing flow testing, while still allowing for the full power cycling during S3, S4 and S5 states. If the platform guarantees minimum SUS power down residence in other ways, an additional SOC-induced delay is not needed or wanted. This field is not writable when the SLP_Sx# Stretching Policy Lock-Down bit is set. This bit is cleared by the SRTCST_B pin.
11:10	0b RW	PMU_SLP_S3_B Minimum Assertion Width (SLP_S3_MIN_ASST_WDTH) (slp_s3_min_asst_wdth): This 2-bit value indicates the minimum assertion width of the PMU_SLP_S3_B signal to guarantee that the Main power supplies have been fully power-cycled. This value may be modified per platform depending on power supply capacitance, board capacitance, power failure detection circuits, etc. Settings are: 00: 60 usec 01: 1 ms 10: 50 ms 11: 2 sec This field is not writable when the SLP_Sx# Stretching Policy Lock-Down bit is set. This bit is cleared by the RSMRST_B pin. reset_type=RSMRST_B
9	0b RW	General Reset Status (GEN_RST_STS) (gen_rst_sts): This bit is set by hardware whenever PMU_PLTRST asserts for any reason other than going into a software-entered sleep state (via PM1_CNT.SLP_EN write). This bit is an optional tool to help BIOS determine when a reset might have collided with a wake from a valid sleep state. A possible usage model would be to consult and then write a '1' to clear this bit during the boot flow before determining what action to take based on reading PM1_STS.WAK_STS = '1'. If GEN_RST_STS = '1', the cold reset boot path could be followed rather than the resume path, regardless of the setting of WAK_STS. This bit does not affect SOC operation in any way, and can therefore be left set if BIOS chooses not to use it. This bit is set by global reset. reset_type=global reset
8	0b RW	RTC_reserved (rtc_reserved): reset_type=SRTCST_B
7:6	0b RW	SWSMI Rate Select (SWSMI_RATESEL) (swsmi_ratesel): This 2-bit value indicates when the SWSMI timer will time out. Valid values are: 00 1.5ms +/- 0.6ms 01 16ms +/- 4ms 10 32ms +/- 4ms 11 64ms +/- 4ms These bits are not cleared by any type of reset except SRTCST_B.
5:4	0b RW	PMU_SLP_S4_B Minimum Assertion Width (S4MAW) (s4maw): This 2-bit value indicates the minimum assertion width of the PMU_SLP_S4_B signal to guarantee that the DRAMs have been safely power-cycled. This value may be modified per platform depending on DRAM types, power supply capacitance, etc. Valid values are: - 11: 1 second - 10: 2 seconds - 01: 3 seconds - 00: 4 seconds This value is used in two ways: 1. If the PMU_SLP_S4_B assertion width is ever shorter than this time, a status bit is set for BIOS to read when S0 is entered 2. If enabled by bit 3 in this register, the hardware will prevent the PMU_SLP_S4_B signal from deasserting within this minimum time period after asserting. Note that the logic that measures this time is in the suspend power well. Therefore, when leaving a G3 state, the minimum time is measured from the deassertion of the internal suspend well reset (unless the Disable SLP_X Stretching After SUS Power Failure bit is set). This field is not writable when the SLP_Sx# Stretching Policy Lock-Down bit is set. SRTCST_B forces this field to the conservative default state (00b). reset_type=SRTCST_B

Access Method

GEN PMCON2: [PMC BASE ADDRESS] + 24h

PMC BASE ADDRESS Reference: [B:0, D:31, F:0] + 44h

Default: 00000000h

Bit Range	Default & Access	Description
31:19	0b RO	reserved (reserved4): Reserved.

Bit Range	Default & Access	Description
18	0b RW	SLP_Sx# Stretching Policy Lock-Down (SLPSX_STR_POL_LOCK) (slpsx_str_pol_lock): When set to 1, this bit locks down the following fields: - GEN_PMC_1.DIS_SLP_X_STRCH_SUSPF - GEN_PMC_1.SLP_S3_MIN_ASST_WDTH - GEN_PMC_1.S4MAW - GEN_PMC_1.S4ASE Those bits become read-only. This bit becomes locked when a value of 1b is written to it. Writes of 0 to this bit are always ignored. Once locked by writing 1, the only way to clear this bit is to perform a platform reset.
17:11	0b RO	reserved (reserved3): Reserved.
10	0b RW	BIOS PCI Express Enable (BIOS_PCI_EXP_EN) (bios_pci_exp_en): This bit acts as a global enable for the SCI associated with the PCI express ports. If this bit is not set, then the various PCI Express ports cannot cause the PCI_EXP_STS bit to go active.
9	0b RO	Power Button Level (PWRBTN_LVL) (pwrbtn_lvl): This read-only bit indicates the current state of the PMU_PWRBTN_B signal. 1= High, 0 = Low. The value reflected in this bit is the debounced PMU_PWRBTN_B pin value that is seen at the output of a 16ms debouncer.
8:5	0b RO	reserved (reserved1): Reserved.
4	0b RW	SMI Lock (SMI_LOCK) (smi_lock): When this bit is set, writes to the GBL_SMI_EN bit will have no effect. Once the SMI_LOCK bit is set, writes of 0 to SMI_LOCK bit will have no effect (i.e. once set, this bit can only be cleared by PMU_PLTRST).
3:2	0b RO	reserved: Reserved.
1:0	0b RW	Period SMI Select (PER_SMI_SEL) (per_smi_sel): Software sets these bits to control the rate at which the periodic SMI# is generated: 00 = 64 seconds (default), 01 = 32 seconds, 10 = 16 seconds, 11 = 8 seconds Tolerance for the timer is +/- 1 second.

27.7.7 MFPMC - Message from PMC (MFPMC)—Offset 28h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

MFPMC: [PMC_BASE_ADDRESS] + 28h

PMC_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)

PMC_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 44h

Default: 00000000h

31	28	24	20	16	12	8	4	0

0	0	0	0	0	0	0	0	0

mfpmc_bits

Bit Range	Default & Access	Description
31:0	0b RW	Message from PMC (MFPMC) (mfpmc_bits): The data in this register is typically updated in response to a host write to the MTPMC register.

27.7.8 SEC_STS - SEC Status (SEC_STS)—Offset 2Ch

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

SEC_STS: [PMC_BASE_ADDRESS] + 2Ch

PMC_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)

PMC_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 44h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
reserved								sec_exclusion_cause

Bit Range	Default & Access	Description
31:4	0b RO	reserved: Reserved.
3:0	0b RW	SEC_EXCLUSION_CAUSE (sec_exclusion_cause): The cause associated with SeC setting requesting exclusion from power flows in SEC_EXCLUSION_REQ field. 0000b: SeC FW Fault Tolerant Initialization failed. 0001b: SeC FLASH Descriptor Override invoked. 0010b: SeC disabled using SW means (such as OEM setting). 0011b: Post-boot SeC applications not supported. 0100b: ROM BIST failure. 0101b: Fuse unit completed with unsupported request for group 1. 0110b: Invalid fuses bit at line 3 of group 1 fuses wasn't written with value 0. 0111b: DRAM Initializaiton by BIOS failed. Other values reserved.

27.7.9 Configured Revision ID (CRID)—Offset 30h

Note: Configure by Bios Code. Please contact Intel representative if you have questions on CRID support

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

CRID: [PMC_BASE_ADDRESS] + 30h

PMC_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)

PMC_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 44h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
reserved								rid_sel

Bit Range	Default & Access	Description
31:2	0b RO	reserved: Reserved.
1:0	0b RW	RID Select(RID_SEL) (rid_sel): Software writes this field to select the Revision ID reflected in PCI config space. The decoding is: 00 - Revision ID 01 - CRID 0 10 - CRID 1 11 - CRID 2 Once written, this field can only be cleared by a platform reset. reset_type=PMU_PLTRST

27.7.10 Function Disable (FUNC_DIS)—Offset 34h

BIOS uses this register to disable specific function. Upon writing this register PMC will set the corresponding Function Disable bit in the PSF

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

FUNC_DIS: [PMC_BASE_ADDRESS] + 34h

PMC_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)

PMC_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 44h

func_dis_bits

Bit Range	Default & Access	Description
31:0	0b RW	FUNC_DIS_BITS (func_dis_bits): When a bit is set, the corresponding function should be disabled. 31 LPSS2_F7_Disable LPSS2 Function7 (I2C#7) Disable. 1'b1: Disable 1'b0: Enable 30 LPSS2_F6_Disable LPSS2 Function6 (I2C#6) Disable. 1'b1: Disable 1'b0: Enable 29 LPSS2_F5_Disable LPSS2 Function5 (I2C#5) Disable. 1'b1: Disable 1'b0: Enable 28 LPSS2_F4_Disable LPSS2 Function4 (I2C#4) Disable. 1'b1: Disable 1'b0: Enable 27 LPSS2_F3_Disable LPSS2 Function3 (I2C#3) Disable. 1'b1: Disable 1'b0: Enable 26 LPSS2_F2_Disable LPSS2 Function2 (I2C#2) Disable. 1'b1: Disable 1'b0: Enable 25 LPSS2_F1_Disable LPSS2 Function1 (I2C#1) Disable. 1'b1: Disable 1'b0: Enable 24 LPSS2_F0_Disable LPSS2 Function0 (DMA) Disable. 1'b1: Disable 1'b0: Enable 23 PCIe_P3_Disable PCIe Port3 Disable. 1'b1: Disable 1'b0: Enable 22 PCIe_P2_Disable PCIe Port2 Disable. 1'b1: Disable 1'b0: Enable 21 PCIe_P1_Disable PCIe Port1 Disable. 1'b1: Disable 1'b0: Enable 20 PCIe_P0_Disable PCIe Port0 Disable. 1'b1: Disable 1'b0: Enable 19 Reserved2 reserved 18 USB_Disable USB2 (EHCI) Disable. 1'b1: Disable 1'b0: Enable 17 SATA_Disable SATA Disable. 1'b1: Disable 1'b0: Enable 16 LAN_Disable LAN Disable. 1'b1: Disable 1'b0: Enable 15 USH_Disable USH Disable. 1'b1: Disable 1'b0: Enable 14 OTG_Disable OTG Disable. 1'b1: Disable 1'b0: Enable 13 LPE_Disable LPE Disable. 1'b1: Disable 1'b0: Enable 12 HDA_Disable HDA Disable. 1'b1: Disable 1'b0: Enable 11 SCC_MIPI_Disable MIPI-HSI Disable. 1'b1: Disable 1'b0: Enable 10 SCC_SDCARD_Disable SDCARD Disable. 1'b1: Disable 1'b0: Enable 9 SCC_SDIO_Disable SDIO Disable. 1'b1: Disable 1'b0: Enable 8 SCC_eMMC_Disable eMMC Disable. 1'b1: Disable 1'b0: Enable 7 LPSS1_F7_Disable Reserved for LPSS1 function 7 6 LPSS1_F6_Disable Reserved for LPSS1 function 6 5 LPSS1_F5_Disable PSS1 Function5 (SPI) Disable. 1'b1: Disable 1'b0: Enable 4 LPSS1_F4_Disable LPSS1 Function4 (HSUART#2) Disable. 1'b1: Disable 1'b0: Enable 3 LPSS1_F3_Disable LPSS1 Function3 (HSUART#1) Disable. 1'b1: Disable 1'b0: Enable 2 LPSS1_F2_Disable LPSS1 Function2 (PWM#2) Disable. 1'b1: Disable 1'b0: Enable 1 LPSS1_F1_Disable LPSS1 Function1 (PWM#1) Disable. 1'b1: Disable 1'b0: Enable 0 LPSS1_F0_Disable LPSS1 Function0 (DMA) Disable. 1'b1: Disable 1'b0: Enable

27.7.11 Function Disable 2 (FUNC_DIS_2)—Offset 38h

BIOS uses this register to disable specific function. Upon writing this register PMC will set the corresponding Function Disable bit in the PSF

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

FUNC_DIS_2: [PMC_BASE_ADDRESS] + 38h

PMC_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)

PMC_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 44h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
RSVD0								ush_ss_phy_dis
								otg_ss_phy_dis
								smb_dis

Bit Range	Default & Access	Description
31:3	0b RO	RSVD0: Reserved
2	0b RW	USH_SS_PHY_DIS (ush_ss_phy_dis): When this bit is set, USH Super Speed PHY should be disabled.
1	0b RW	OTG_SS_PHY_DIS (otg_ss_phy_dis): When this bit is set, OTG Super Speed PHY should be disabled.
0	0b RW	SMB_DIS (smb_dis): When this bit is set, SMB function should be disabled.

27.7.12 S0ix wake enable (S0IX_WAKE_EN)—Offset 3Ch

This register contains wake enable bit per S0ix wake event. Note: Common wake events with sleep sates have their wake enables in the ACPI space.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

S0IX_WAKE_EN: [PMC_BASE_ADDRESS] + 3Ch

PMC_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)

PMC_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 44h

Default: 00FFFFFFh

27.7.14 S0ix control (S0IX_CTL)—Offset 44h

This register contains S0ix miscellaneous controls

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

S0IX_CTL: [PMC_BASE_ADDRESS] + 44h

PMC_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)

PMC_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 44h

Default: 00000050h

Bit Range	Default & Access	Description
19	0b RO	reserved (reserved1): Reserved.
18	0b RW	CF9h Without Resume Well Reset Enable (CWORWRE) (cworwre): When this bit is set, a CF9h write of 6h or Eh will not cause internal Resume Well Reset (WrsmrstB) to be asserted and thus resume well logic will maintain its state. When this bit is cleared, CF9h write of 6h or Eh will also reset resume well logic. This bit is to be used when a second reset through CF9 write is desired upon power up or after resume from low power states. This bit has to be set prior to the write to CF9 register and has to be cleared upon completing the reset. Failing to do so prevents resume well registers from being reset in the future CF9 writes. reset_type=RSMRST_B
17:16	11b RW	MAX_S0IX (MAX_S0IX (max_s0ix): Indicated the maximum S0i state SOC can go
15:0	0b RO	reserved (reserved2): Reserved.

27.7.16 VLT - Voltage Detect Register (VLT)—Offset 50h

This register reflects the Voltage detect fuses.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

VLT: [PMC BASE ADDRESS] + 50h

PMC_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)

PMC_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 44h

Default: 00000000h

reserved							vlt_fuses	

Bit Range	Default & Access	Description
31:8	0b RO	reserved: Reserved.
7:0	0b RO	VLT Fuses (VLT_FUSES) (vlt_fuses): These bits reflects the Voltage detect fuses

27.7.17 GPIO_ROUT - GPIO_ROUT register (GPIO_ROUT)—Offset 58h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

GPIO_ROUT: [PMC BASE ADDRESS] + 58h

PMC_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)

PMC BASE ADDRESS Reference: [B:0, D:31, F:0] + 44h

Default: 00000000h

Bit Range	Default & Access	Description
31:3	0b RO	reserved (reserved5): Reserved.
2	0b RW	CLK_FREQ (Clock frequency) (clk_freq): This field controls clock frequency: 0 - 25 MHz (XTAL), 1: 19.2 (PLL)
1:0	11b RW	CLK_CTL (Clock control) (clk_ctl): This field controls clock gating: 00 - gated on D3 01 - force on, 1* - force off

Bit Range	Default & Access	Description
31:3	0b RO	reserved (reserved5): Reserved.
2	0b RW	CLK_FREQ (Clock frequency) (clk_freq): This field controls clock frequency: 0 - 25 MHz (XTAL), 1: 19.2 (PLL)
1:0	11b RW	CLK_CTL (Clock control) (clk_ctl): This field controls clock gating: 00 - gated on D3 01 - force on, 1* - force off

27.7.24 S0IR_TMR - S0I Ready Residency Timer (S0IR_TMR)—Offset 80h

This timer accumulates time spent in S0I Ready state

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

S0IR_TMR: [PMC_BASE_ADDRESS] + 80h

PMC_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)

PMC_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 44h

Type: Memory Mapped I/O Register
(Size: 32 bits)

MTPMC 1: [PMC BASE ADDRESS] + B0h

PMC_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)

PMC BASE ADDRESS Reference: [B:0, D:31, F:0] + 44h

Default: 00000000h

31				28				24				20				16				12				8				4				0			
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0					
reserved												mtpmc				lock_exi				push_exi_en				ota_exi_en											

Bit Range	Default & Access	Description
31:8	0b RO	reserved: Reserved.
7:3	0b RW	Message to PMC (MTPMC) (mtpmc): A write to this field causes an interrupt to the PMC. The PMC can read the contents of this register. The host must wait until the PMC has taken action on the previous write to MTPMC, as indicated by the PMC Message Full Status (PMC_MSG_1_FULL_STS) bit being cleared, before initiating another write to the MTPMC register. time spent in S0 state, in units of 32 uS
2	0b RW	LOCK EXI (lock_exi): This field locks the ush_exi_en and otg_exi_en fields. The lock is soft lock, meaning register value will be changed but FW will keep the value on internal register GP1[2] until warm reset
1	0b RW	USH_EXI_Enable (ush_exi_en): A write to this field causes an interrupt to the PMC. The PMC FW will read the contents of this register and will set pcu_ush_exi_enable_xttnfwh signal. This will prevent USH PIMA power down upon S0IX entry. The host must wait until the PMC has taken action, as indicated by the PMC Message Full Status (PMC_MSG_1_FULL_STS) bit being cleared, before initiating another write to the MTPMC register. time spent in S0 state, in units of 32 uS. This field will be copied to FW internal register and it will hold the value until global reset.
0	0b RW	OTG_EXI_Enable (otg_exi_en): A write to this field causes an interrupt to the PMC. The PMC FW will read the contents of this register and will set pcu_otg_exi_enable_xttnfwh signal. This will prevent OTG PIMA power down upon S0IX entry. The host must wait until the PMC has taken action, as indicated by the PMC Message Full Status (PMC_MSG_1_FULL_STS) bit being cleared, before initiating another write to the MTPMC register. time spent in S0 state, in units of 32 uS. This field will be copied to FW internal register and it will hold the value until global reset

27.7.35 MTPMC_2 - Message to PMC 2 (MTPMC_2)—Offset B4h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

MTPMC_2: [PMC_BASE_ADDRESS] + B4h

PMC_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)

PMC_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 44h

27.7.45 Virtual UART register (VUART4)—Offset DCh

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

VUART4: [PMC BASE ADDRESS] + DCh

PMC_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)

PMC_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 44h

Default: 00000000h

[illegible]

Bit Range	Default & Access	Description
31:0	0b RW	Virtual UART register (vuart): Reserved.

27.8 SIO HSUART 1 PCI Configuration Registers

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:30, F:4] + 4h

Default: 00100000h

[illegible]

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	Reserved0: Reserved.
30	0h RW/1C	SSE: Reserved.
29	0h RW/1C	Received Master Abort (RMA): If the completion status received from IOSF is UR, Bridge sets this bit. S/W writes a 1. to this bit to clear it. This bit will not be set for the Fabric port. This bit is not used for the Fabric Port.
28	0h RW/1C	Received Target Abort (RTA): If the completion status received from IOSF is CA, Bridge sets this bit. S/W writes a 1.1 to this bit to clear it. This bit will not be set for the fabric port. This bit is not used for the Fabric Port.
27	0h RW/1C	STA: Reserved.
26:21	00h RO	Reserved1: Reserved.
20	1h RO	Capabilities List (CAPLIST): Hardwired to 1. Indicates that the controller contains a capabilities pointer list. The first item is pointed to by looking at configuration offset 34h. If PM capability is not required, then this bit should be tied to 0.
19	0h RO	Interrupt Status (INTR_STATUS): This bit reflects state of interrupt in the device. Only when the Interrupt Disable bit in the command register is a 0 and this Interrupt Status bit is a 1, will the device.s/function.s INTx# signal be asserted. Setting the Interrupt Disable bit to a 1 has no effect on the state of this bit. This bit reflects Legacy interrupt status.
18:16	0h RO	Reserved2: Reserved.
15:11	00h RO	Reserved3: Reserved.
10	0h RW	Interrupt Disable (INTR_DISABLE): Setting this bit disables INTx assertion from Bridge. The interrupt disabled is legacy INTx# interrupt, i.e. Bridge does not send Interrupt Assert message through the IOSF SideBand Channel.
9	0h RO	Reserved4: Reserved.
8	0h RW	SERR# Enable (SERR_ENABLE): If both SERR# Enable and the Unsupported Request Reporting Enable(URRE) register are 1., the agent sets the Signaled System Error bit in the PCI Status Register and sends an ERR_NONFATAL message on the IOSF sideband interface.
7:3	00h RO	Reserved5: Reserved.
2	0h RW	Bus Master Enable (BME): If this bit is 0, Bridge does not generate any new upstream transaction on IOSF as a master.

Subsystem Vendor and Subsystem ID (SUBSYSTEMID)—Offset 2Ch

Type: PCI Configuration Register
(Size: 32 bits)

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
SUBSYSTEMID					SUBSYSTEMVENDORID			

Intel Atom[®] Processor E3800 Product Family
Datasheet
4284

Bit Range	Default & Access	Field Name (ID): Description
15:0	0000h RW/O	Subsystem Vendor ID (SUBSYSTEMVENDORID): This register should be implemented for any function that could be instantiated more than once in a given system. The SVID register, in combination with the Subsystem ID register, enables the operating environment to distinguish one subsystem from the other. This register is a Read Write Once register.

27.8.8 Expansion ROM Base Address (EXPANSION_ROM_BASEADDR)—Offset 30h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:30, F:4] + 30h

Default: 00000000h

31	28				24				20				16				12				8				4				0		
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0		
EXPANSTION_ROM_BASE																															

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	EXPANSION_ROM_BASE: Reserved.

27.8.9 Capabilities Pointer (CAPABILITYPTR)—Offset 34h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:30, F:4] + 34h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
Reserved0							CAPPTR_POWER	

Bit Range	Default & Access	Field Name (ID): Description
31:8	000000h RO	Reserved0: Reserved.

Bit Range	Default & Access	Field Name (ID): Description
7:0	00h RO	Capabilities Pointer (CAPPTR_POWER): Indicates what the next capability is. This capability can be programmed to be PM Capability (0x80) if PM Capability is enabled in SB. If PM capability is disabled then this register has 00h.

27.8.10 Interrupt Register (INTERRUPTREG)—Offset 3Ch

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:30, F:4] + 3Ch

Default: 00000100h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	1	0
0	0	0	0	0	0	0	0	0
MAX_LAT	MIN_GNT	Reserved0	INTPIN	INTLINE				

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RO	Max_Lat (MAX_LAT): Value of 0 indicates device has no major requirements for the settings of latency timers.
23:16	00h RO	Min_Gnt (MIN_GNT): Value of 0 indicates device has no major requirements for the settings of latency timers.
15:12	0h RO	Reserved0: Reserved.
11:8	1h RO	Interrupt Pin (INTPIN): Each AHB IP on Bridge is a Single function device. Hence Bridge only generates INTA on IOSF SB. The Fabric on AHB Bridge appears as a Multifunction device. Interrupt Pin Value in this register is reflected from the IPIN value in the private configuration space.
7:0	00h RW	Interrupt Line (INTLINE): Bridge does not use this field directly. It is used to tell software which interrupt line the interrupt pin is connected to.

27.8.11 PowerManagement Capability ID (POWERCAPID)—Offset 80h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:30, F:4] + 80h

Default: 00030001h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	1
0	0	0	0	0	0	0	0	0
PMESUPPORT	Reserved0	VERSION	NXTCAP	POWER_CAP				

Bit Range	Default & Access	Field Name (ID): Description
3	1h RO	No_Soft_Reset (NO_SOFT_RESET): This bit indicates that devices transitioning from D3hot to D0 because of PowerState commands do not perform an internal reset. Configuration Context is preserved.
2	0h RO	Reserved3: Reserved.
1:0	0h RW	Power State (POWERSTATE): This field is used both to determine the current power state of the AHB IP and to set a new power state. The values are: 00 = D0 state 11 = D3HOT state - Others = Reserved Notes: If software attempts to write a value of 01b or 10b in to this field, the write operation must complete normally; however, the data is discarded and no state change occurs. When in the D3HOT states, interrupts are blocked. D3Hot will not be used for Downstream decode on fabric ports.

27.8.13 Manufacturer ID (MANID)—Offset F8h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:30, F:4] + F8h

Default: 00000000h

RSVDR

rbr_thr_dll

Bit Range	Default & Access	Field Name (ID): Description
31:8	0b RO	RSVD0: Reserved
7:0	0h RW	rbr_thr_dll: RBR[7:0] (Receive Buffer Register) (Read Only): Data byte received on the serial input port (sin) in UART mode. The data in this register is valid only if the Data Ready (DR) bit in the Line Status Register (LCR) is set. If FIFOs are disabled (FCR[0] set to zero), the data in the RBR must be read before the next data arrives, otherwise it is overwritten, resulting in an over-run error. If FIFOs are enabled (FCR[0] set to one), this register accesses the head of the receive FIFO. If the receive FIFO is full and this register is not read before the next data character arrives, then the data already in the FIFO is preserved, but any incoming data are lost and an over-run error occurs. THR[7:0] (Transmit Holding Register) (Write Only): Data to be transmitted on the serial output port (sout) in UART mode. Data should only be written to the THR when the THR Empty (THRE) bit (LSR[5]) is set. If in non-FIFO mode or FIFOs are disabled (FCR[0] = 0) and THRE is set, writing a single character to the THR clears the THRE. Any additional writes to the THR before the THRE is set again causes the THR data to be overwritten. If in FIFO mode and FIFOs are enabled (FCR[0] = 1) and THRE is set, x number of characters of data may be written to the THR before the FIFO is full. The number x (default=16) is determined by the value of FIFO Depth that you set during configuration. Any attempt to write data when the FIFO is full results in the write data being lost. DLL[7:0] (Divisor Latch Low) (Read-Write): Lower 8 bits of a 16-bit, read/write, Divisor Latch register that contains the baud rate divisor for the UART. this register may be accessed only when the DLAB bit (LCR[7]) is set. The output baud rate is equal to the serial frequency divided by sixteen times the value of the baud rate divisor, as follows: baud rate = (serial clock freq) / (16 * divisor). Note that with the Divisor Latch Registers (DLL and DLH) set to zero, the baud clock is disabled and no serial communications occur. Also, once the DLL is set, at least 8 clock cycles of the slowest HSUART clock should be allowed to pass before transmitting or receiving data.

27.9.2 Divisor Latch (High)/ Interrupt Enable Register. (IER_DLH)—Offset 4h

Register bits [7:0] is used for different purposes depending on the mode. DLH (Divisor Latch High) Upper 8-bits of a 16-bit, read/write, Divisor Latch register that contains the baud rate divisor for the UART. This register may be accessed only when the DLAB bit (LCR[7]) is set. The output baud rate is equal to the serial clock frequency divided by sixteen times the value of the baud rate divisor, as follows: baud rate = (serial clock freq) / (16 * divisor). Note that with the Divisor Latch Registers (DLL and DLH) set to zero, the baud clock is disabled and no serial communications occur. Also, once the DLH is set, at least 8 clock cycles of the slowest HSUART clock should be allowed to pass before transmitting or receiving data.

Bit Range	Default & Access	Field Name (ID): Description
31:8	0b RO	RSVD0: Reserved
7:6	0h RW	FIFOE_RCVR (RCVR): FIFOE (FIFOs Enabled) This is used to indicate whether the FIFOs are enabled or disabled. 00 = disabled 11 = enabled RCVR Trigger. This is used to select the trigger level in the receiver FIFO at which the Received Data Available Interrupt is generated. In auto flow control mode it is used to determine when the rts_n signal is de-asserted. It also determines when the dma_rx_req_n signal is asserted in certain modes of operation. The following trigger levels are supported: 00 = 1 character in the FIFO 01 = FIFO full 10 = FIFO full 11 = FIFO 2 less than full
5:4	0h RW	Res_TET (TET): TX Empty Trigger. This is used to select the empty threshold level at which the THRE Interrupts are generated when the mode is active. It also determines when the dma_tx_req_n signal is asserted when in certain modes of operation. The following trigger levels are supported: 00 = FIFO empty 01 = 2 characters in the FIFO 10 = FIFO full 11 = FIFO full
3	0h RW	IID3_DMAM (DMAM): DMA Mode. Reserved
2	0h RW	IID2_XFIFOR (XFIFOR): XMIT FIFO Reset. This resets the control portion of the transmit FIFO and treats the FIFO as empty. Note that this bit is 'self-clearing'. It is not necessary to clear this bit.
1	0h RW	IID1_RFIFOR (RFIFOR): RCVR FIFO Reset. This resets the control portion of the receive FIFO and treats the FIFO as empty. Note that this bit is 'self-clearing'. It is not necessary to clear this bit.
0	1h RW	IID0_FIFO Enable (FIFOE): This enables/disables the transmit (XMIT) and receive (RCVR) FIFOs. Whenever the value of this bit is changed both the XMIT and RCVR controller portion of FIFOs is reset

27.9.4 Line Control Register (LCR)—Offset Ch

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + Ch

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:30, F:3] + 10h

Default: 00000000h

31				28				24				20				16				12				8				4				0			
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0			
RSVD0																								DLAB	Break	RSVD1	EPS	PEN	STOP	DLS					

Bit Range	Default & Access	Field Name (ID): Description
31:6	0b RO	RSVD0: Reserved
5	0h RW	Auto Flow Control Enable (AFCE): When FIFOs are enabled and the Auto Flow Control Enable (AFCE) bit is set, 0 = Auto Flow Control Mode disabled 1 = Auto Flow Control Mode enabled Reset Value: 0x0
4	0h RW	LoopBack Bit (LoopBack): This is used to put the UART into a diagnostic mode for test purposes. If operating in UART mode (MCR[6] set to zero), data on the sout line is held high, while serial data output is looped back to the sin line, internally. In this mode all the interrupts are fully functional. Also, in loopback mode, the modem control inputs (dsr_n, cts_n, ri_n, dcd_n) are disconnected and the modem control outputs (dtr_n, rts_n, out1_n, out2_n) are looped back to the inputs, internally. Reset Value: 0x0
3	0h RW	Output2 (OUT2): This is used to directly control the user-designated Output2 (out2_n) output. The value written to this location is inverted and driven out on out2_n, that is: 0 = out2_n de-asserted (logic 1) 1 = out2_n asserted (logic 0) Note that in Loopback mode (MCR[4] set to one), the out2_n output is held inactive high while the value of this location is internally looped back to an input. Reset Value: 0x0
2	0h RW	Output1 (OUT1): This is used to directly control the user-designated Output1 (out1_n) output. The value written to this location is inverted and driven out on out1_n, that is: 0 = out1_n de-asserted (logic 1) 1 = out1_n asserted (logic 0) Note that in Loopback mode (MCR[4] set to one), the out1_n output is held inactive high while the value of this location is internally looped back to an input. Reset Value: 0x0
1	0h RW	Request to Send (RTS): This is used to directly control the Request to Send (rts_n) output. The Request To Send (rts_n) output is used to inform the modem or data set that the UART is ready to exchange data. When Auto RTS Flow Control is not enabled (MCR[5] set to zero), the rts_n signal is set low by programming MCR[1] (RTS) to a high. In Auto Flow Control, (MCR[5] set to one) and FIFOs enable (FCR[0] set to one), the rts_n output is controlled in the same way, but is also gated with the receiver FIFO threshold trigger (rts_n is inactive high when above the threshold). The rts_n signal is de-asserted when MCR[1] is set low. Note that in Loopback mode (MCR[4] set to one), the rts_n output is held inactive high while the value of this location is internally looped back to an input. Reset Value: 0x0
0	0h RW	Data Terminal Ready (DTR): This is used to directly control the Data Terminal Ready (dtr_n) output. The value written to this location is inverted and driven out on dtr_n, that is: 0 = dtr_n de-asserted (logic 1) 1 = dtr_n asserted (logic 0) The Data Terminal Ready output is used to inform the modem or data set that the UART is ready to establish communications. Note that in Loopback mode (MCR[4] set to one), the dtr_n output is held inactive high while the value of this location is internally looped back to an input. Reset Value: 0x0

27.9.6 Line Status Register (LSR)—Offset 14h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 14h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:30, F:3] + 10h

Default: 00000060h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
RSVD0							RFE	TEMT
							THRE	BI
							FE	PE
							OE	DR

Bit Range	Default & Access	Field Name (ID): Description
31:8	0b RO	RSVD0: Reserved
7	0h RW	Receiver FIFO Error Bit (RFE): This bit is only relevant when FIFOs are enabled (FCR[0] set to one). This is used to indicate if there is at least one parity error, framing error, or break indication in the FIFO. 0 = no error in RX FIFO 1 = error in RX FIFO This bit is cleared when the LSR is read, the character with the error is at the top of the receiver FIFO, and there are no subsequent errors in the FIFO. Reset Value: 0x0
6	1h RW	Transmitter Empty Bit (TEMT): If FIFOs enabled (FCR[0] set to one), this bit is set whenever the Transmitter Shift Register and the FIFO are both empty. If in non-FIFO mode or FIFOs are disabled, this bit is set whenever the Transmitter Holding Register and the Transmitter Shift Register are both empty. Reset Value: 0x1
5	1h RW	Transmit Holding Register Empty Bit (THRE): If THRE mode is disabled (IER[7] set to zero), this bit indicates that the THR or TX FIFO is empty. This bit is set whenever data is transferred from the THR or TX FIFO to the transmitter shift register and no new data has been written to the THR or TX FIFO. This also causes a THRE Interrupt to occur, if the THRE Interrupt is enabled. If THRE mode is enabled and and FIFOs enabled (IER[7] set to one and FCR[0] set to one respectively), the functionality is switched to indicate the transmitter FIFO is full, and no longer controls THRE interrupts, which are then controlled by the FCR[5:4] threshold setting. Reset Value: 0x1
4	0h RW	Break Interrupt Bit (BI): This is used to indicate the detection of a break sequence on the serial input data. If in UART mode it is set whenever the serial input, sin, is held in a logic '0' state for longer than the sum of start time + data bits + parity + stop bits. In the FIFO mode, the character associated with the break condition is carried through the FIFO and is revealed when the character is at the top of the FIFO. Reading the LSR clears the BI bit. In the non-FIFO mode, the BI indication occurs immediately and persists until the LSR is read.
3	0h RW	Framing Error Bit (FE): This is used to indicate the occurrence of a framing error in the receiver. A framing error occurs when the receiver does not detect a valid STOP bit in the received data. In the FIFO mode, since the framing error is associated with a character received, it is revealed when the character with the framing error is at the top of the FIFO. When a framing error occurs, the UART tries to resynchronize. It does this by assuming that the error was due to the start bit of the next character and then continues receiving the other bit i.e. data, and/or parity and stop. It should be noted that the Framing Error (FE) bit (LSR[3]) is set if a break interrupt has occurred, as indicated by Break Interrupt (BI) bit (LSR[4]). 0 = no framing error 1 = framing error Reading the LSR clears the FE bit. Reset Value: 0x0
2	0h RW	Parity Error Bit (PE): This is used to indicate the occurrence of a parity error in the receiver if the Parity Enable (PEN) bit (LCR[3]) is set. In the FIFO mode, since the parity error is associated with a character received, it is revealed when the character with the parity error arrives at the top of the FIFO. It should be noted that the Parity Error (PE) bit (LSR[2]) is set if a break interrupt has occurred, as indicated by Break Interrupt (BI) bit (LSR[4]). 0 = no parity error 1 = parity error Reading the LSR clears the PE bit. Reset Value: 0x0

Bit Range	Default & Access	Field Name (ID): Description
1	0h RW	Overrun Error Bit (OE): This is used to indicate the occurrence of an overrun error. This occurs if a new data character was received before the previous data was read. In the non-FIFO mode, the OE bit is set when a new character arrives in the receiver before the previous character was read from the RBR. When this happens, the data in the RBR is overwritten. In the FIFO mode, an overrun error occurs when the FIFO is full and a new character arrives at the receiver. The data in the FIFO is retained and the data in the receive shift register is lost. 0 = no overrun error 1 = overrun error Reading the LSR clears the OE bit. Reset Value: 0x0
0	0h RW	Data Ready Bit (DR): This is used to indicate that the receiver contains at least one character in the RBR or the receiver FIFO. 0 = no data ready 1 = data ready This bit is cleared when the RBR is read in non-FIFO mode, or when the receiver FIFO is empty, in FIFO mode. Reset Value: 0x0

27.9.7 Modem Status Register (MSR)—Offset 18h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 18h**BAR Type:** PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:30, F:3] + 10h

Default: 00000000h

31				28				24				20				16				12				8				4				0			
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0			
RSVD0																				DCD	RI	DSR	CTS	DDCD	TERI	DDSR	DCTS								

Bit Range	Default & Access	Field Name (ID): Description
31:8	0b RO	RSVD0: Reserved
7	0h RW	Data Carrier Detect (DCD): This is used to indicate the current state of the modem control line dcd_n. This bit is the complement of dcd_n. When the Data Carrier Detect input (dcd_n) is asserted, it is an indication that the carrier has been detected by the modem or data set. 0 = dcd_n input is de-asserted (logic 1) 1 = dcd_n input is asserted (logic 0) In Loopback Mode (MCR[4] set to one), DCD is the same as MCR[3] (Out2). Reset Value: 0x0
6	0h RW	Ring Indicator (RI): This is used to indicate the current state of the modem control line ri_n. This bit is the complement of ri_n. When the Ring Indicator input (ri_n) is asserted it is an indication that a telephone ringing signal has been received by the modem or data set. 0 = ri_n input is de-asserted (logic 1) 1 = ri_n input is asserted (logic 0) In Loopback Mode (MCR[4] set to one), RI is the same as MCR[2] (Out1). Reset Value: 0x0

Bit Range	Default & Access	Field Name (ID): Description
5	0h RW	Data Set Ready (DSR): This is used to indicate the current state of the modem control line dsr_n. This bit is the complement of dsr_n. When the Data Set Ready input (dsr_n) is asserted it is an indication that the modem or data set is ready to establish communications with the DW_apb_uart. 0 = dsr_n input is de-asserted (logic 1) 1 = dsr_n input is asserted (logic 0) In Loopback Mode (MCR[4] set to one), DSR is the same as MCR[0] (DTR). Reset Value: 0x0
4	0h RW	Clear to Send (CTS): This is used to indicate the current state of the modem control line cts_n. This bit is the complement of cts_n. When the Clear to Send input (cts_n) is asserted, it is an indication that the modem or data set is ready to exchange data with the DW_apb_uart. 0 = cts_n input is de-asserted (logic 1) 1 = cts_n input is asserted (logic 0) In Loopback Mode (MCR[4] = 1), CTS is the same as MCR[1] (RTS). Reset Value: 0x0
3	0h RW	Delta Data Carrier Detect (DDCD): This is used to indicate that the modem control line dcd_n has changed since the last time the MSR was read. 0 = no change on dcd_n since last read of MSR 1 = change on dcd_n since last read of MSR Reading the MSR clears the DDCD bit. In Loopback Mode (MCR[4] = 1), DDCD reflects changes on MCR[3] (Out2). Note, if the DDCD bit is not set and the dcd_n signal is asserted (low) and a reset occurs (software or otherwise), then the DDCD bit is set when the reset is removed if the dcd_n signal remains asserted. Reset Value: 0x0
2	0h RW	Trailing Edge of Ring Indicator (TERI): This is used to indicate that a change on the input ri_n (from an active-low to an inactive-high state) has occurred since the last time the MSR was read. 0 = no change on ri_n since last read of MSR 1 = change on ri_n since last read of MSR Reading the MSR clears the TERI bit. In Loopback Mode (MCR[4] = 1), TERI reflects when MCR[2] (Out1) has changed state from a high to a low. Reset Value: 0x0
1	0h RW	Delta Data Set Ready (DDSR): This is used to indicate that the modem control line dsr_n has changed since the last time the MSR was read. 0 = no change on dsr_n since last read of MSR 1 = change on dsr_n since last read of MSR Reading the MSR clears the DDSR bit. In Loopback Mode (MCR[4] = 1), DDSR reflects changes on MCR[0] (DTR). Note, if the DDSR bit is not set and the dsr_n signal is asserted (low) and a reset occurs (software or otherwise), then the DDSR bit is set when the reset is removed if the dsr_n signal remains asserted. Reset Value: 0x0
0	0h RW	Delta Clear to Send (DCTS): This is used to indicate that the modem control line cts_n has changed since the last time the MSR was read. 0 = no change on cts_n since last read of MSR 1 = change on cts_n since last read of MSR Reading the MSR clears the DCTS bit. In Loopback Mode (MCR[4] = 1), DCTS reflects changes on MCR[1] (RTS). Note that if the DCTS bit is not set, the cts_n signal is asserted (low) and a reset occurs (software or otherwise), then the DCTS bit is set when the reset is removed if the cts_n signal remains asserted. Reset Value: 0x0

BAR Reference: [B:0, D:30, F:3] + 10h

Default: 00000000h

[illegible]

Bit Range	Default & Access	Field Name (ID): Description
31:3	0b RO	RSVD0: Reserved
2	0h RW	XMIT FIFO Reset (XFR): This is a shadow register for the XMIT FIFO Reset bit (FCR[2]). This can be used to remove the burden on software having to store previously written FCR values (which are pretty static) just to reset the transmit FIFO. This resets the control portion of the transmit FIFO and treats the FIFO as empty. This also de-asserts the DMA TX request and single signals when additional DMA handshaking signals are selected (DMA_EXTRA == YES). Note that this bit is 'self-clearing'. It is not necessary to clear this bit. Reset Value: 0x0
1	0h RW	RCVR FIFO Reset (RFR): This is a shadow register for the RCVR FIFO Reset bit (FCR[1]). This can be used to remove the burden on software having to store previously written FCR values (which are pretty static) just to reset the receive FIFO. This resets the control portion of the receive FIFO and treats the FIFO as empty. This also de-asserts the DMA RX request and single signals when additional DMA handshaking signals are selected (DMA_EXTRA == YES). Note that this bit is 'self-clearing'. It is not necessary to clear this bit. Reset Value: 0x0
0	0h RW	UART Reset (UR): This asynchronously resets the DW_apb_uart and synchronously removes the reset assertion. For a two clock implementation both pclk and sclk domains are reset. Reset Value: 0x0

27.9.32 Shadow Request to Send (SRTS)—Offset 8Ch

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 8Ch

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:30, F:3] + 10h

Default: 00000000h

27.9.33 Shadow Break Control Register (SBCR)—Offset 90h

This is a shadow register for the Break bit (LCR[6]), this can be used to remove the burden of having to performing a read modify write on the LCR. This is used to cause a break condition to be transmitted to the receiving device. If set to one the serial output is forced to the spacing (logic 0) state. When not in Loopback Mode, as determined by MCR[4], the sout line is forced low until the Break bit is cleared.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 90h

BAR Type: PCI Configuration Register (Size: 32 bits)

RSVD0								st

Bit Range	Default & Access	Field Name (ID): Description
31:2	0b RO	RSVD0: Reserved
1:0	0h RW	Shadow RCVR Trigger (srt): This is a shadow register for the RCVR trigger bits (FCR[7:6]). This can be used to remove the burden of having to store the previously written value to the FCR in memory and having to mask this value so that only the RCVR trigger bit gets updated. This is used to select the trigger level in the receiver FIFO at which the Received Data Available Interrupt is generated. It also determines when the dma_rx_req_n signal is asserted when DMA Mode (FCR[3]) = 1. The following trigger levels are supported: 00 = 1 character in the FIFO 01 = FIFO full 10 = FIFO full 11 = FIFO 2 less than full Reset Value: 0x0

27.9.37 Shadow TX Empty Trigger (STET)—Offset A0h

This is a shadow register for the TX empty trigger bits (FCR[5:4]). This can be used to remove the burden of having to store the previously written value to the FCR in memory and having to mask this value so that only the TX empty trigger bit gets updated. This is used to select the empty threshold level at which the THRE Interrupts are generated when the mode is active. The following trigger levels are supported:

- 00 = FIFO empty
- 01 = 2 characters in the FIFO
- 10 = FIFO full
- 11 = FIFO full

Reset Value: 0x0

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + A0h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:30, F:3] + 10h

28 SIO – Pulse Width Modulation (PWM)

The Pulse Width Modulation block allows control the frequency and duty cycle of an output signal. The SoC has 2 instances of the PWM interface.

28.1 Signal Descriptions

Please see [Chapter 2, “Physical Interfaces”](#) for additional details.

The signal description table has the following headings:

- **Signal Name:** The name of the signal/pin
- **Direction:** The buffer direction can be either input, output, or I/O (bidirectional)
- **Platform Power:** The reference power plane.
- **Description:** A brief explanation of the signal’s function

Figure 128.PWM Signals

Signal Name	Direction Plat. Power	Description
SIO_PWM[0]	O V1P8S	Pulse Width Modulation output 0.
SIO_PWM[1]	O V1P8S	Pulse Width Modulation output 1.

28.2 Features

The software controls the PWM block by updating the PWMCTRL register and setting the PWMCTRL.PWM_SW_UPDATE bit whenever a change in frequency or duty cycle of the PWM output signal is required. The PWM block applies the new settings at the start of the next output cycle and resets the PWMCTRL.PWM_SW_UPDATE bit. The SoC uses a 25 MHz base clock rate for the PWM counter. See [Figure 129](#) for PWM block diagram:

Figure 129. PWM Block Diagram

There are two controls of the PWM output:

- **Frequency** is controlled by the PWMCTRL.PWM_BASE_UNIT register. The PWMCTRL.PWM_BASE_UNIT value is added to the 16 bit PWM counter every base clock cycle. The counter roll-over/overflow marks the start of a new cycle and resets the counter to the value in PWMCTRL.PWM_BASE_UNIT.
- **Duty Cycle** is controlled by the PWMCTRL.PWM_ON_TIME_DIVISOR setting (0 to 255). When the 16 bit PWM counter is less than PWM_ON_TIME_DIVISOR * 256, the PWM output is low (0). When the 16 bit PWM counter is equal to or greater than PWM_ON_TIME_DIVISOR * 256, the PWM output is high (1).

The PWM block is clocked by the 25 MHz oscillator clock. The output frequency can be estimated with the equation:

- Target frequency = $25 \text{ MHz} / \text{CEILING}(65536/\text{PWM_BASE_UNIT})$
Note that the larger the value of base_unit, the larger the error that the PWM output frequency will have with respect to the equation above. For example any $\text{Base_unit_value}/256 > 128$ will result in 12.5 MHz max frequency. Any value between 86 and 128 will result in 8.33 MHz output frequency. And accordingly the larger the base_unit value the smaller duty cycle resolution. Maximum duty cycle resolution is 8 bits.

[Table 287](#) illustrates the output frequency and duty-cycle resolution for different settings of the base_unit_value (when using 25 MHz oscillator clock).

**Table 287. Example PWM Output Frequency and Resolution**

Target Frequency	Base Unit Value Register	Base 25 MHz Cycle Count	Duty Cycle Resolution
12.5 MHz	$\geq 128 * 256$	1	no resolution
1.07 MHz	$11 * 256$	23	<8 bit resolution
488 kHz	$5 * 256$	51	<8 bit resolution
97.6 kHz	$1 * 256$	256	8 resolution
48.4 kHz	$0.5 * 256$	512	≥ 8 bit resolution
0	0	0	Flat 0 output

28.3 Use

28.3.1 PWM Programming Sequence

For first time activation, follow sequence:

1. Program the counter value PWMCTRL.PWM_BASE_UNIT and PWMCTRL.PWM_ON_TIME_DIVISOR
2. Set the PWMCTRL.PWM_SW_UPDATE bit
3. Enable PWM output by setting the PWMCTRL.PWM_ENABLE bit

For update on the fly, follow sequence:

1. Program the counter value PWMCTRL.PWM_BASE_UNIT and PWMCTRL.PWM_ON_TIME_DIVISOR
2. Set the update bit PWMCTRL.PWM_SW_UPDATE

28.4 Register Map

Refer to [Chapter 3, “Register Access Methods”](#) and [Chapter 4, “Mapping Address Spaces”](#) for additional information.

Figure 130.SIO - PWM Register Map

28.5.3 Revision ID and Class Code (REVCLASSCODE)—Offset 8h

Bit Range	Default & Access	Field Name (ID): Description
7:3	00h RO	Reserved5: Reserved.
2	0h RW	Bus Master Enable (BME): If this bit is 0, Bridge does not generate any new upstream transaction on IOSF as a master.
1	0h RW	Memory Space Enable (MSE): This bit controls Bridge's response to downstream Memory accesses. When set, accesses to memory space of the device is enabled.
0	0h RO	Reserved6: Reserved.

28.5.3 Revision ID and Class Code (REVCLASSCODE)—Offset 8h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:30, F:1] + 8h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
CLASS_CODES							RID	

Bit Range	Default & Access	Field Name (ID): Description
31:8	000000h RO	Class Code (CLASS_CODES): The Class Code register is read-only and used to identify the generic function of the device and, in some cases, a specific register level programming interface. The register is broken into three byte size fields. The upper byte (at offset 0Bh) is a base class code which broadly classifies the type of function the device performs. The middle byte (at offset 0Ah) is a sub-class code which identifies more specifically the function of the device. The lower byte (at offset 09h) identifies a specific register-level programming interface (if any) so that device independent software can interact with the device. This register is tied to a strap at the top level.
7:0	00h RO	Revision ID (RID): Revision ID identifies the revision of particular AHB device. This is tied to a strap at the top level.

28.5.4 Cache Line Latency Header and BIST (CLLATHEADERBIST)—Offset Ch

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:30, F:1] + Ch

Default: 00800000h

31	28	24	20	16	12	8	4	0
0	0	0	0	1	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
Reserved0				MULFNDEV	HEADERTYPE			
					LATTIMER			
								CACHELINE_SIZE

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RO	Reserved0: Reserved.
23	1h RO	Multi Function Device (MULFNDEV): This bit is always 0 for non fabric ports. For Fabric ports it is driven from fabric_mult_function strap. 1 = multifunction device 0 = single function device
22:16	00h RO	Header Type (HEADERTYPE): Implements Type 0 Configuration header.
15:8	00h RO	Latency Timer (LATTIMER): Does not apply to PCI Express. Hardwired to 00h.
7:0	00h RW	Cache Line Size (CACHELINE_SIZE): Doesn't apply to PCI Express. PCI Express spec requires this to be implemented as a R/W register but has no functional impact on the AHB Device connected.

28.5.5 Base Address Register (BAR)—Offset 10h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:30, F:1] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
BASEADDR						SIZEINDICATOR	PREFETCHABLE	TYPE
								MESSAGE_SPACE

Bit Range	Default & Access	Field Name (ID): Description
31:12	00000h RW	Base Address (BASEADDR): Base address of the AHB device memory space. Taken from Strap values as 1.s
11:4	00h RO	Size Indicator Read Only (SIZEINDICATOR): Always returns zero. The size of this register depends on the size of the Memory space. This size is determined by a top level of STRAP values as 0.s. Always will be zero as minimum size is 4K.
3	0h RO	Prefetchable (PREFETCHABLE): Indicates that this BAR is not prefetchable.

Access Method

Offset: [B:0, D:30, F:1] + 14h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
BASEADDR1						SIZEINDICATOR1		
						PREFETCHABLE1		
						TYPE1		
						MESSAGE_SPACE1		

28.5.7 Subsystem Vendor and Subsystem ID (SUBSYSTEMID)—Offset 2Ch

Access Method

Offset: [B:0, D:30, F:1] + 2Ch

October 2018
Document Number: 538136, Rev. 4.3

Access Method

Offset: [B:0, D:30, F:1] + 30h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
EXPANSION_ROM_BASE								

28.5.9

Access Method

Offset: [B:0, D:30, F:1] + 34h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RW/1C	PME Status (PMESTATUS): 0 = Software clears the bit by writing a 1 to it. 1 = This bit is set when the AHB Device would normally assert the PME# signal independent of the state of the PME Enable bit (bit 8 in this register).
14:9	00h RO	Reserved1: Reserved.
8	0h RW	PME Enable (PMEENABLE): A 1 enables the function to assert PME#. When 0, PME# message on SB is disabled.
7:4	0h RO	Reserved2: Reserved.
3	1h RO	No_Soft_Reset (NO_SOFT_RESET): This bit indicates that devices transitioning from D3hot to D0 because of PowerState commands do not perform an internal reset. Configuration Context is preserved.
2	0h RO	Reserved3: Reserved.
1:0	0h RW	Power State (POWERSTATE): This field is used both to determine the current power state of the AHB IP and to set a new power state. The values are: 00 = D0 state 11 = D3HOT state - Others = Reserved Notes: If software attempts to write a value of 01b or 10b in to this field, the write operation must complete normally; however, the data is discarded and no state change occurs. When in the D3HOT states, interrupts are blocked. D3Hot will not be used for Downstream decode on fabric ports.

28.5.13 Manufacturer ID (MANID)—Offset F8h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:30, F:1] + F8h

Default: 00000000h

31	28	24	20	16	12	8	4	0

0	0	0	0	0	0	0	0	0
MANID								

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	Manufacturer ID (MANID): This register is brought out as straps to the top level.

29 Platform Controller Unit (PCU) Overview

The Platform Controller Unit (PCU) is a collection of HW blocks that are critical for implementing a Windows* compatible platform. These HW blocks include:

- PCU – Power Management Controller (PMC)
- PCU – Serial Peripheral Interface (SPI)
 - For boot FW and system configuration data Flash storage
- PCU – Universal Asynchronous Receiver/Transmitter (UART)PCU – System Management Bus (SMBus)
- PCU – Intel® Legacy Block (iLB) Overview

The PCU also implements some high level configuration features for BIOS/EFI boot.

29.1 Features

The key features of the individual blocks are as follows:

- Universal Asynchronous Receiver/Transmitter (UART)
 - 16550 controller compliant
 - Reduced Signal Count: TX and RX only
 - COM1 interface
- Serial Peripheral Interface (SPI)
 - For one or two SPI Flash, of up to 16MB size each, only. No other SPI peripherals are supported.
 - Stores boot FW and system configuration data

- Supports frequencies of 20 MHz, 33MHz and 50MHz.
- Power Management Controller (PMC)
 - Controls many of the power management features present in the SoC.
- Intel Legacy Block (iLB)
 - Supports legacy PC platform features
 - Sub-blocks include LPC, GPIO, 8259 PIC, IO-APIC, 8254 timers, HPET timers and the RTC.

30 PCU – Power Management Controller (PMC)

The Power Management Controller (PMC) controls many of the power management features present in the SoC.

30.1 Signal Descriptions

Please see [Chapter 2, “Physical Interfaces”](#) for additional details.

The signal description table has the following headings:

- **Signal Name:** The name of the signal/pin
- **Direction:** The buffer direction can be either input, output, or I/O (bidirectional)
- **Platform Power:** The reference power plane.
- **Description:** A brief explanation of the signal’s function

Table 290. PMC Signals (Sheet 1 of 3)

Signal Name	Direction Plat. Power	Description
PMC_ACPRESENT	I V1P8A	AC Present: This input pin indicates when the platform is plugged into AC power.
PMC_BATLOW#	I V1P8A	Battery Low: An input from the battery to indicate that there is insufficient power to boot the system. Assertion will prevent wake from the S5 state. This signal can also be enabled to cause an SMI# when asserted. In configurations without a battery, this signal should be tied high to V1P8_S5.

Table 290. PMC Signals (Sheet 2 of 3)

Signal Name	Direction Plat. Power	Description
PMC_CORE_PWROK	I VRTC	Core Power OK: When asserted, this signal is an indication to the SoC that all of its core power rails have been stable for 10 ms. It can be driven asynchronously. When it is negated, the SoC asserts PMC_PLTRST#. NOTE: It is required that the power rails associated with PCI Express (typically the 3.3V, 5V, and 12V core well rails) have been valid for 99 ms prior to PMC_CORE_PWROK assertion in order to comply with the 100 ms T_{PVPERL} PCI Express 2.0 specification on PMC_PLTRST# deassertion. NOTE: PMC_CORE_PWROK must not glitch, even if PMC_RSMRST# is low.
PMC_PLTRST#	O V1P8A	Platform Reset: The SoC asserts this signal to reset devices on the platform. The SoC asserts the signal during power-up and when software initiates a reset sequence through the Reset Control (RST_CNT) register when RST_CNT.sys_rst=1b.
PMC_PWRBTN#	I V1P8A	Power Button: The signal will cause SCI to indicate a system request to go to a sleep state. If the system is already in a sleep state, this signal will cause a wake event. If the signal is pressed for more than 4 seconds, this will cause an unconditional transition (power button override) to the S5 state. Override will occur even if the system is in the S3 & S4 states. This signal has an internal pull-up resistor and has an internal ~16 ms de-bounce on the input.
PMC_RSMRST#	I VRTC	Resume Well Reset: Used for resetting the resume well. An external RC circuit is required to guarantee that the resume well power is valid prior to this signal going high.
PMC_RSTBTN#	I V1P8S	System Reset: This signal forces an internal reset after being debounced (~16 ms).
PMC_SLP_S3#	O V1P8A	S3 Sleep Control: This signal is for power plane control. It can be used to control system power when it is in a S3 (Suspend To RAM), S4 (Suspend to Disk), or S5 (Soft Off) states.
PMC_SLP_S4#	O V1P8A	S4 Sleep Control: This signal is for power plane control. It can be used to control system power when it is in a S4 (Suspend to Disk) or S5 (Soft Off) state.
PMC_SUS_STAT#	O V1P8A	Suspend Status: This signal is asserted by the SoC to indicate that the system will be entering a low power state soon. This can be monitored by devices with memory that need to switch from normal refresh to suspend refresh mode. It can also be used by other peripherals as an indication that they should isolate their outputs that may be going to powered-off planes. <i>This signal is muxed and may be used by other functions.</i>

Table 290. PMC Signals (Sheet 3 of 3)

Signal Name	Direction Plat. Power	Description
PMC_SUSCLK	O V1P8A	Suspend Clock: This 32 kHz clock is an output of the RTC generator circuit for use by other chips for refresh clock. <i>This signal is muxed and may be used by other functions.</i>
PMC_SUSPWRDNA CK	O V1P8A	Suspend Power Down Acknowledge: Asserted by the SoC on S0 to S4/5 transition when it does not require its Suspend well to be powered. This pin requires a pull-up to UNCORE_V1P8_G3. <i>This signal is muxed and may be used by other functions.</i>
PMC_WAKE_PCIE[3 :0]#	I V1P8A	PCI Express* Port [3:0] Wake Event: Sideband wake signal on PCI Express asserted by a component requesting wake up. <i>This signal is muxed and may be used by other functions.</i>
PMC_PLT_CLK[5:0]	O V1P8S	Platform Clocks: Configurable single ended clocks, configurable to 25 MHz. <i>This signal is muxed and may be used by other functions.</i>

30.2 Features

30.2.1 Sx-G3-Sx, Handling Power Failures

Depending on when the power failure occurs and how the system is designed, different transitions could occur due to a power failure.

The GEN_PMCON1.AG3E bit provides the ability to program whether or not the system should boot once power returns after a power loss event. If the policy is to not boot, the system remains in an S5 state (unless previously in S4). There are only two possible events that will wake the system after a power failure.

- **PMC_PWRBTN#:** PMC_PWRBTN# is always enabled as a wake event. When RSMRST# is low (G3 state), the PM1_STS_EN.PWRBTN_STS bit is reset. When the SoC exits G3 after power returns (PMC_RSMRST# goes high), the PMC_PWRBTN# signal is already high (because the suspend plane goes high before PMC_RSMRST# goes high) and the PM1_STS_EN.PWRBTN_STS bit is 0b.
- **RTC Alarm:** The PM1_STS_EN.RTC_EN bit is in the RTC well and is preserved after a power loss. Like PM1_STS_EN.PWRBTN_STS the PM1_STS_EN.RTC_STS bit is cleared when PMC_RSMRST# goes low.

The SoC monitors both PMC_CORE_PWROK and PMC_RSMRST# to detect for power failures. If PMC_CORE_PWROK goes low, the GEN_PMCON1.PWR_FLR bit is set. If PMC_RSMRST# goes low, GEN_PMCON1.SUS_PWR_FLR is set.

**Table 291. Transitions Due to Power Failure**

State at Power Failure	GEN_PMCON1.AG3E bit	Transition When Power Returns
S0, S3	1 0	S5 S0
S4	1 0	S4 S0
S5	1 0	S5 S0

30.2.2 Event Input Signals and Their Usage

The SoC has various input signals that trigger specific events. This section describes those signals and how they should be used.

30.2.3 PCI Express* WAKE# Signal and PME Event Message

PCI Express ports can wake the platform from any sleep state (S3, S4, or S5) using the PMC_WAKE_PCIE[3:0]# pins.

Note: PMC_WAKE_PCIE[3:0]# functionality is disabled by setting PM1_STS_EN.PCIEXP_WAKE_DIS to 1b.

PCI Express ports have the ability to cause PME using messages. When a PME message is received, the SoC will set the GPE0a_STS.PCI_EXP_STS bit.

30.2.3.1 PMC_PWRBTN# (Power Button)

The PMC_PWRBTN# signal operates as a “Fixed Power Button” as described in the Advanced Configuration and Power Interface specification. The signal has a 16 ms debounce on the input. The state transition descriptions are included in [Table 292](#). Note that the transitions start as soon as the PMC_PWRBTN# is pressed (but after the debounce logic), and does not depend on when the power button is released.

Note: During the time that the PMC_SLP_S4# signal is stretched for the minimum assertion width (if enabled), the power button is not a wake event. Refer to note below for more details.

Table 292. Transitions Due to Power Button

Present State	Event	Transition/Action	Comment
S0/Cx	PMC_PWRBTN# goes low	SCI generated (depending on PM1_CNT.SCI_EN and PM1_STS_EN.PWRBTN_EN)	Software typically initiates a Sleep state
S3–S4/S5	PMC_PWRBTN# goes low	Wake Event. Transitions to S0 state	Standard wakeup
G3	PMC_PWRBTN# pressed	None	No effect since no power Not latched nor detected
S0, S3–S4	PMC_PWRBTN# held low for at least 4 consecutive seconds	Unconditional transition to S5 state	No dependence on processor or any other subsystem

Power Button Override Function

If PMC_PWRBTN# is observed active for at least four consecutive seconds, the state machine should unconditionally transition to the S5 state, regardless of present state (S0–S4), even if the PMC_CORE_PWROK is not active. In this case, the transition to the G2/S5 state should not depend on any particular response from the processor nor any similar dependency from any other subsystem.

The PMC_PWRBTN# status is readable to check if the button is currently being pressed or has been released. The status is taken after the de-bounce, and is readable using the GEN_PMC2.PWRBTN_LVL bit.

Note: The 4-second PMC_PWRBTN# assertion should only be used if a system lock-up has occurred. The 4-second timer starts counting when the SoC is in a S0 state. If the PMC_PWRBTN# signal is asserted and held active when the system is in a suspend state (S3–S4), the assertion causes a wake event. Once the system has resumed to the S0 state, the 4-second timer starts.

Note: During the time that the SLP_S4# signal is stretched for the minimum assertion width (if enabled by GEN_PMC1.S4ASE), the power button is not a wake event. As a result, it is conceivable that the user will press and continue to hold the power button waiting for the system to awake. Since a 4-second press of the power button is already defined as an unconditional power down, the power button timer will be forced to inactive while the power-cycle timer is in progress. Once the power-cycle timer has expired, the power button awakes the system. Once the minimum PMC_SLP_S4# power cycle expires, the power button must be pressed for another 4 to 5 seconds to create the override condition to S5.

30.2.3.2 Sleep Button

The Advanced Configuration and Power Interface specification defines an optional sleep button. It differs from the power button in that it only is a request to go from S0 to S3–S4 (not S5). Also, in an S5 state, the power button can wake the system, but the sleep button cannot.

Although the SoC does not include a specific signal designated as a sleep button, one of the GPIO signals can be used to create a “Control Method” sleep button. See the Advanced Configuration and Power Interface specification for implementation details.

30.2.3.3 PME_B0 (PCI Power Management Event Bus 0)

The GPE0a_STS.PME_B0_STS bit exists to implement PME#-like functionality for any internal device on Bus 0 with PCI power management capabilities.

30.2.3.4 PMC_RSTBTN# Signal

When the PMC_RSTBTN# pin is detected as active after the 16 ms debounce logic, the SoC attempts to perform a “graceful” reset, by waiting for the relevant internal devices to signal their idleness. If all devices are idle when the pin is detected active, the reset occurs immediately; otherwise, a counter starts. If at any point during the count all devices go idle the reset occurs. If the counter expires and any device is still active, a reset is forced upon the system even though activity is still occurring.

Once the reset is asserted, it remains asserted for 5 to 6 ms regardless of whether the PMC_RSTBTN# input remains asserted or not. It cannot occur again until PMC_RSTBTN# has been detected inactive after the debounce logic, and the system is back to a full S0 state with PMC_PLTRST# inactive. Note that if RST_CNT.FULL_RST is set then PMC_RSTBTN# will result in a Host Reset with Power Cycle.

30.2.4 System Power Planes

The system has several independent power planes, as described in [Table 293](#). Note that when a particular power plane is shut off, it should go to a 0 V level.

Table 293. System Power Planes (Sheet 1 of 2)

Plane	Controlled By	Description
CPU	PMC_SLP_S3#	The SLP_S3# signal can be used to cut the CORE_VCC_S3 rail completely.
Main	PMC_SLP_S3#	When SLP_S3# goes active, power can be shut off to any circuit not required to wake the system from the S3 state. Since the S3 state requires that the memory context be preserved, power must be retained to the main memory. Devices on LPC bus, PCI-Express, and SATA will typically be shut when the Main power plane is shut, although they may have small subsections powered.

Table 293. System Power Planes (Sheet 2 of 2)

Plane	Controlled By	Description
Devices and Memory	PMC_SLP_S4#	When PMC_SLP_S4# goes active, power can be shut off to any circuit not required to wake the system from the S4/S5. Since the memory context does not need to be preserved in the S4/S5 state, the power to the memory can also be shut down. S4 and S5 requests are treated the same so no PMC_SLP_S5# signal is implemented.
Devices	Implementation Specific	Individual subsystems may have their own power plane. For example, GPIO signals may be used to control the power to disk drives, audio amplifiers, or the display screen.
Suspend	PMC_SUSPWRDNACK	The suspend power planes are generally left on whenever the system has a charged main battery or is plugged in to AC power, even in S4/S5. In some cases, it may be preferable to disable the suspend power planes in S4/S5 states to save additional power. This requires some external logic (such as an embedded controller) to decide on the appropriate power plane control actions and ensure that a wake event is still possible (such as the power button).

30.2.4.1 Power Plane Control with PMC_SLP_S3#, PMC_SLP_S4#

The PMC_SLP_S3# output signal can be used to cut power to the system core supply, since it only goes active for the Suspend-to-RAM state (typically mapped to ACPI S3). Power must be maintained to the SoC suspend well, and to any other circuits that need to generate wake signals from the Suspend-to-RAM state. During S3 (Suspend-to-RAM) all signals attached to powered down plans will be tri-stated or driven low, unless they are pulled using a pull-up resistor. Cutting power to the core may be done using the power supply, or by external FETs on the motherboard.

The PMC_SLP_S4# output signal can be used to cut power to the system core supply, as well as power to the system memory, since the context of the system is saved on the disk. Cutting power to the memory may be done using the power supply, or by external FETs on the motherboard.

30.2.4.2 PMC_SLP_S4# and Suspend-To-RAM Sequencing

The PMC_SLP_S4# signal should be used to remove power to system memory. The PMC_SLP_S4# logic in the SoC provides a mechanism to fully cycle the power to the DRAM and/or detect if the power is not cycled for a minimum time.

Note: To use the minimum DRAM power-down feature that is enabled by the GEN_PMCON1.S4ASE bit, the DRAM power must be controlled by the PMC_SLP_S4# signal.

30.2.4.3 PMC_CORE_PWROK Signal

When asserted, PMC_CORE_PWROK is an indication to the SoC that its core well power rails are powered and stable. PMC_CORE_PWROK can be driven asynchronously. When PMC_CORE_PWROK is low, the SoC asynchronously asserts PMC_PLTRST#. PMC_CORE_PWROK must not glitch, even if PMC_RSMRST# is low.

It is required that the power rails associated with PCI Express have been valid for 99 ms prior to PWROK assertion in order to comply with the 100 ms T_{PVPERL} PCI Express 2.0 specification on PMC_PLTRST# deassertion.

Note: PMC_RSTBTN# is recommended for implementing the system reset button. This saves external logic that is needed if the PMC_CORE_PWROK input is used. Additionally, it allows for better handling of the processor resets and avoids improperly reporting power failures.

30.2.4.4 PMC_BATLOW# (Battery Low)

The PMC_BATLOW# input can inhibit waking from S3, S4, and S5 states if there is not sufficient power. It also causes an SMI if the system is already in an S0 state.

30.2.5 SMI#/SCI Generation

Upon any enabled SMI event taking place while the SMI_EN.EOS bit is set, the SoC will clear the EOS bit and assert SMI to the CPU core, which will cause it to enter SMM space. SMI assertion is performed using a Virtual Legacy Wire (VLW) message. Prior system generations (those based upon legacy processors) used an actual SMI# pin.

Once the SMI message has been delivered, the SoC takes no action on behalf of active SMI events until Host software sets the End of SMI (EOS) bit. At that point, if any SMI events are still active, the SoC will send another SMI message.

The SCI is a level-mode interrupt that is typically handled by an ACPI-aware operating system. In non-APIC systems (which is the default), the SCI IRQ is routed to one of the 8259 interrupts (IRQ 9, 10, or 11). The 8259 interrupt controller must be programmed to level mode for that interrupt.

In systems using the APIC, the SCI can be routed to interrupts IRQs[11:9] or IRQs[23:20]. The interrupt polarity changes depending on whether it is on an interrupt shareable with a PIRQ or not. The interrupt remains asserted until all SCI sources are removed.

Table 294 shows which events can cause an SMI and SCI. Note that some events can be programmed to cause either an SMI or SCI. The usage of the event for SCI (instead of SMI) is typically associated with an ACPI-based system. Each SMI or SCI source has a corresponding enable and status bit.

Table 294. Causes of SMI and SCI (Sheet 1 of 3)

Event	Status Indication ¹	Enable Condition	Interrupt Result			
			SMI_EN. GBL_SMI_EN=1b		SMI_EN. GBL_SMI_EN=0b

GPI[n] ¹⁰	ALT_GPIO_SMI. CORE_GPIO_SMI_STS[n] ² or ALT_GPIO_SMI. SUS_GPIO_SMI_STS[n] ²	GPIO_ROUT[n]=0 1b & ALT_GPIO_SMI. CORE_GPIO_SMI_EN[n] ² =1b or ALT_GPIO_SMI. SUS_GPIO_SMI_EN[n] ² =1b	SMI		None	
USB Per-Port Registers Write Enable bit is changed from 0b to 1b	UPRWC.WE_STS & SMI_STS. USB_IS_STS	UPRWC. WE_SMI_E=1b & SMI_EN. USB_IS_SMI_EN=1b	Sync SMI ⁶		None	

NOTES:

- Most of the status bits (except otherwise is noted) are set according to event occurrence regardless to the enable bit.
- GPIO status bits are set only if enable criteria is true. GPIO_ROUT[n]=10b & GPE0a_EN.x_GPIO_EN[n] for GPE0a_STS.x_GPIO_STS[n] (SCI). GPIO_ROUT[n]=01b & ALT_GPIO_SMI. x_GPIO_SMI_EN[n]=1b for ALT_GPIO_SMI.x_GPIO_SMI_STS[n] (SMI).
- When power button override occurs, the system will transition immediately to S5. The SCI will only occur after the next wake to S0 if the residual status bit (PM1_STS_EN.PWRBTNOR_STS) is not cleared prior to setting PM1_CNT.SCI_EN.
- PM1_STS_EN.GBL_STS being set will cause an SCI, even if the PM1_CNT.SCI_EN bit is not set. Software must take great care not to set the SMI_ENBIOS_RLS bit (which causes PM1_STS_EN.GBL_STS to be set) if the SCI handler is not in place.
- No enable bits for these SCI/SMI messages in the PMC. Enable capability should be implemented in the source unit.
- Sync SMI has the same message opcode toward T-Unit. Special treatment regarding this Sync SMI is holding completion to host till SYNC_SMI_ACK message is received from T-Unit.
- Sync SMI has the same message opcode toward T-Unit. Special treatment regarding this Sync SMI is holding the SSMI_ACK message to iLB till SYNC_SMI_ACK message is received from T-Unit.
- The G-Unit is an internal functional sub-block which forms part of the graphics functional block.
- The GPE0a_STS.CORE_GPIO_STS[31:24] & GPE0a_EN.CORE_GPIO_EN[31:24] register bits correspond to GPIO_S0_SC[7:0]. GPE0a_STS.SUS_GPIO_STS[23:16] & GPE0a_EN.SUS_GPIO_EN[23:16] correspond to GPIO_S5[7:0].
- The ALT_GPIO_SMI.CORE_GPIO_SMI_STS[31:24] & ALT_GPIO_SMI.CORE_GPIO_SMI_EN[15:8] register bits correspond to GPIO_S0_SC[7:0]. ALT_GPIO_SMI.SUS_GPIO_SMI_STS[23:16] & ALT_GPIO_SMI.SUS_GPIO_SMI_EN[7:0] correspond to GPIO_S5[7:0].

30.2.6 Platform Clock Support

The SoC supports up to 6 clocks (PMC_PLT_CLK[5:0]) with a frequency of either 19.2 MHz or 25 MHz. These clocks are available for general system use, where appropriate and each have Control & Frequency register fields associated with them.

Note: Intel recommends 25 MHz. 19.2 MHz is not validated.

30.2.7 INIT# (Initialization) Generation

The INIT# functionality is implemented as a 'virtual wire' internal to the SoC rather than a discrete signal. This virtual wire is asserted based on any one of the events described in below table. When any of these events occur, INIT# is asserted for 16 PCI clocks and then driven high.

INIT#, when asserted, resets integer registers inside the CPU cores without affecting its internal caches or floating-point registers. The cores then begin execution at the power on Reset vector configured during power on configuration.

Table 295. INIT# Assertion Causes

Cause	Comment
PORT92.INIT_NOW transitions from 0b to 1b.	
RST_CNT.SYS_RST = 0b and RST_CNT.RST_CPU transitions from 0b to 1b	

30.3 USB Per-Port Register Write Control

The PMC contains the UPRWC.USB_PER_PORT_WE (USB Per-Port Registers Write Enable) bit. When this bit is written from 0b to 1b, the UPRWC.WE_STS (Write Enable Status) bit is asserted. This transaction initiates sync-SMI if the UPRWC.WE_SMIEN (Write Enable SMI Enable) bit and the SMI_EN.USB_IS_SMI_EN (USB Intel Specific SMI Enable) bit are set to 1b.

30.5 Register Map

30.6 PCU PMC IO Registers

Table 296. Summary of PCI iLB PMC I/O Registers

Offset	Size	Register ID—Description	Default Value
92h	1	"PORT92: Init Register (PORT92)—Offset 92h" on page 4356	00h
B2h	1	"APM Register (APM)—Offset B2h" on page 4357	00h
B3h	1	"APM_STS Register (APM_STS)—Offset B3h" on page 4357	00h
CF9h	1	"RST_CNT: Reset Control Register (RST_CNT)—Offset CF9h" on page 4358	00h

30.6.1 PORT92: Init Register (PORT92)—Offset 92h

Access Method

Type: I/O Register
(Size: 8 bits)

PORT92: 92h

Default: 00h

7	4	0
0	0	0
reserved		alt_a20_gate
		init_now

Bit Range	Default & Access	Description
7:2	0b RO	reserved: Reserved.
1	0b RW	ALT_A20_GATE - Alternate A20 Gate (alt_a20_gate): Legacy bit - kept just in case DOS expects it to be read/write
0	0b RW	INIT_NOW (init_now): When this bit transitions from a 0 to a 1, PMC will sent an INIT# VLW to T-Unit

30.6.2 APM Register (APM)—Offset B2h

Access Method

Type: I/O Register
(Size: 8 bits)

APM: B2h

Default: 00h

7				4					0
0	0	0	0	0	0	0	0	0	0
					apm_reg				

Bit Range	Default & Access	Description
7:0	0b RW	APM_Register (apm_reg): TBD

30.6.3 APM_STS Register (APM_STS)—Offset B3h

Access Method

Type: I/O Register
(Size: 8 bits)

APM_STS: B3h

Default: 00h

7				4					0
0	0	0	0	0	0	0	0	0	0
					apm_sts				

Bit Range	Default & Access	Description
7:0	0b RW	APM_STS (apm_sts): Advanced Power Managment Status Port. used to pass data between the OS and the SMI handler. Basically, this is scratchpad register and is not effected by any other register or function (other than a PCI reset)

30.6.4 RST_CNT: Reset Control Register (RST_CNT)—Offset CF9h

Access Method

Type: I/O Register
(Size: 8 bits)

RST_CNT: CF9h

Default: 00h

7				4					0
0		0		0		0		0	0
reserved					full_rst	rst_cpu	sys_rst	reserved1	

Bit Range	Default & Access	Description
7:4	0b RO	reserved: Reserved.
3	0b RW	Full Reset (FULL_RST) (full_rst): When this bit is set to 1 and bit 1 is set to 1 (indicating Hard Reset, not Soft Reset), and the RST_CPU bit (bit 2) is written from 0 to 1, the PMC will do a full reset, including driving PMU_SLP_S3_B and PMU_SLP_S4_B active (low) for at least 3 (and no more than 5) seconds. When this bit is set, it also causes the full power cycle (PMU_SLP_S3/4_B assertion) in response to PMU_RESETBUTTON_B, COREPWROK, and Watchdog timer reset sources.
2	0b RW	Reset CPU (RST_CPU) (rst_cpu): This bit will cause either a hard or soft reset to the CPU depending on the state of the SYS_RST bit (bit 1 in this same register). The software will cause the reset by setting bit 2 from a 0 to a 1.
1	0b RW	System Reset (SYS_RST) (sys_rst): This bit determines the type of reset caused via RST_CPU (bit 2 of this register). If SYS_RST is 0 when RST_CPU goes from 0 to 1, then the PMC will force INIT# active for 16 PCI clocks. If SYS_RST is 1 when RST_CPU goes from 0 to 1, then the PMC will force PCI reset active for about 1 ms, however the PMU_SLP_S3_B and PMU_SLP_S4_B signals assertion is dependent on the value of the FULL_RST (bit3 of this register).
0	0b RO	reserved1: Reserved.

Bit Range	Default & Access	Description
31	0b RO	reserved4: Reserved.
30	0b RW	PCI Express Wake Disable (PCIEXP_WAKE_DIS) (pciexp_wake_dis): This bit disables the inputs to the PCIEXP_WAKE_STS bit in the PM1 Status register from waking the system. Modification of this bit has no impact on the value of the PCIEXP_WAKE_STS bit. reset_type=Resume Well Reset#
29	0b RW	USB clockless Wake Enable (USB_CLKLESS_EN) (usb_clkless_en): This bit enables the inputs to the USB_CLKLESS_STS bit in the PM1 Status register to wake the system. Modification of this bit has no impact on the value of the USB_CLKLESS_STS bit. reset_type=Resume Well Reset#
28:27	0b RO	reserved5: Reserved.
26	0b RW	RTC Alarm Enable (RTC_EN) (rtc_en): This is the RTC alarm enable bit. It works in conjunction with the SCI_EN bit: RTC_EN SCI_EN Effect when RTC_STS is set 0 x No SMI# or SCI. If system was in S1-S5, no wake even occurs. 1 0 SMI#. If system was in S1-S5, then a wake event occurs before the SMI#. 1 1 SCI. If system was in S1-S5, then a wake event occurs before the SCI. Note: This bit needs to be backed by the RTC well to allow an RTC event to wake after a power failure. In addition to being reset by SRTCST_B assertion, PMC also clears this bit due to certain events: - Power button override - CPU thermal trip reset_type=SRTCST_B
25	0b RO	reserved6: Reserved.
24	0b RW	Power Button Enable (PWRBTN_EN) (pwrbtn_en): This bit is the power button enable. It works in conjunction with the SCI_EN bit: PWRBTN_EN SCI_EN Effect when PWRBTN_STS is set 0 x No SMI# or SCI. 1 0 SMI#. 1 1 SCI. NOTE: PWRBTN_EN has no effect on the PWRBTN_STS bit being set by the assertion of the power button. The Power Button is always enabled as a Wake event. reset_type=Resume Well Reset#
23:22	0b RO	reserved7: Reserved.
21	0b RW	Global Enable (GBL_EN) (gbl_en): The global enable bit. When both the GBL_EN and the GBL_STS are set, PMC generates an SCI. reset_type=PMU_PLTRST_B
20:17	0b RO	reserved8: Reserved.
16	0b RW	Timer Overflow Interrupt Enable (TMROF_EN) (tmrof_en): This is the timer overflow interrupt enable bit. It works in conjunction with the SCI_EN bit: TMROF_EN SCI_EN Effect when TMROF_STS is set 0 x No SMI# or SCI. . 1 0 SMI#. 1 1 SCI. reset_type=PMU_PLTRST_B
15	0b RW	Wake Status (WAK_STS) (wak_sts): This bit is set when the system is in one of the Sleep states (via the SLP_EN bit) and an enabled Wake event occurs. Upon setting this bit, the PMC will transition the system to the ON state. This bit can only be set by hardware and can only be cleared by writing a one to this bit position. This bit is not affected by hard resets caused by a CF9 write, but is reset by RSMRST_B. If a power failure occurs (such as removed batteries) without the SLP_EN bit set, the WAK_STS bit will not be set when the power returns if the AFTER_G3 bit is 0. If the AFTER_G3 bit is 1, then the WAK_STS bit will be set after waking from a power failure. If necessary, the BIOS can clear the WAK_STS bit in this case This is based on discussions with Microsoft. That behavior is not in the ACPI spec. reset_type=RSMRST_B

Bit Range	Default & Access	Description
14	0b RW	PCI Express Wake Status (PCIEXP_WAKE_STS) (pciexp_wake_sts): This bit is set by hardware to indicate that the system woke due to a PCI Express wakeup event. This event can be caused by the PCI Express WAKE# pins (PMU_WAKE_B, PCI_WAKE1_B, PCI_WAKE2_B, PCI_WAKE3_B) being active, or one or more of the PCI Express ports being in beacon state, or receipt of a PCI Express PME message at root port. This bit should only be set when one of these events causes the system to transition from a non-S0 system power state to the S0 system power state. This bit is set independent of the PCIEXP_WAKE_DIS bit. Software writes a 1 to clear this bit. If one of the WAKE# pins is still active during the write or one or more PCI Express ports is in the beacon state or PME message received indication is not cleared in the root port, then the bit will remain Power Management active (i.e. all inputs to this bit are level sensitive) Note: This bit does not itself cause a wake event or prevent entry to a sleeping state. Thus if the bit is 1 and the system is put into a sleeping state, the system will not automatically wake. reset_type=pmc_global_rst_b
13	0b RW	USB clockless Wake Status (USB_CLKLESS_STS) (usb_clkless_sts): This bit is set by hardware to indicate that the system woke due to change in USB serial lines. This bit is set independent of the USB_CLKLESS_EN bit. Software writes a 1 to clear this bit. reset_type=pmc_global_rst_b
12	0b RO	reserved: Reserved.
11	0b RW	Power Button Override (PWRBTNOR_STS) (pwrbtnor_sts): This bit is set any time a Power Button Override Event occurs (i.e. the power button is pressed for at least 4 consecutive seconds), or due to an internal thermal sensor catastrophic condition. These events cause an unconditional transition to the S5 state. The BIOS or SCI handler clears this bit by writing a 1 to it. This bit is not affected by hard resets via CF9h writes, and is not reset by RSMRST_B. Thus, this bit is preserved through power failures. Note that this bit is still asserted when the global SCI_EN is set to '1' then an SCI will be generated. reset_type=SRTCST_B
10	0b RW	RTC Status (RTC_STS) (rtc_sts): This bit is set when the RTC generates an alarm (assertion of the IRQ8# signal), and is not affected by any other enable bit. See RTC_EN for the effect when RTC_STS goes active. This bit is only set by hardware and can only be reset by writing a one to this bit position. This bit is not affected by hard resets caused by a CF9 write, but is reset by RSMRST_B. reset_type=RSMRST_B
9	0b RO	reserved1: Reserved.
8	0b RW	Power Button Status (PWRBTN_STS) (pwrbtn_sts): This bit is set when the PMU_PWRBTN_B signal is asserted (low), independent of any other enable bit. See PWRBTN_EN for the effect when PWRBTN_STS goes active. PWRBTN_STS is always a wake event. This bit is only set by hardware and can be cleared by software writing a one to this bit position. This bit is not affected by hard resets caused by a CF9 write, but is reset by RSMRST_B. If the PMU_PWRBTN_B signal is held low for more than 4 seconds, the PMC clears the PWRBTN_STS bit, sets the PWRBTNOR_STS bit, the system transitions to the S5 state, and only PMU_PWRBTN_B is enabled as a wake event. If PWRBTN_STS bit is cleared by software while the PMU_PWRBTN_B pin is still held low, this will not cause the PWRBTN_STS bit to be set. The PMU_PWRBTN_B signal must go inactive and active again to set the PWRBTN_STS bit. Note that the CPU Thermal Trip and the Internal Thermal Sensors' Catastrophic Condition result in behavior matching the Powerbutton Override, which includes clearing this bit. reset_type=RSMRST_B
7:6	0b RO	reserved2: Reserved.
5	0b RW	GBL Status (GBL_STS) (gbl_sts): This bit is set when an SCI is generated due to the BIOS wanting the attention of the SCI handler. BIOS has a corresponding bit, BIOS_RLS, which will cause an SCI and set this bit. The SCI handler should then clear this bit by writing a 1 to it. This bit will not cause wake events or SMI#. This bit is not effected by SCI_EN. Note: GBL_STS being set will cause an SCI, even if the SCI_EN bit is not set. Software must take great care not to set the BIOS_RLS bit (which causes GBL_STS to be set) if the SCI handler is not in place. reset_type=PMU_PLTRST_B
4:1	0b RO	reserved3 (rserved3): reserved

Type: I/O Register

Bit Range	Default & Access	Description
31:14	0b RO	reserved: Reserved.
13	0b WO	Sleep Enable (SLP_EN) (slp_en): This is a write-only bit and reads to it always return a zero. Setting this bit causes the system to sequence into the Sleep state defined by the SLP_TYP field.
12:10	0b RW	Sleep Type (SLP_TYP) (slp_typ): This 3-bit field defines the type of Sleep the system should enter when the SLP_EN bit is set to 1. These bits are reset by SRTCST_B only. Bits Mode Typical Mapping 000 ON S0 001 Puts CPU in S1 state. S1 010 Reserved 011 Reserved 100 Reserved 101 Suspend-To-RAM S3 110 Suspend-To-Disk S4 111 Soft Off S5
9:3	0b RO	reserved1: Reserved.
2	0b RW	GBL_RLS (GBL_RLS) (gbl_rls): This bit is used by the ACPI software to raise an event to the BIOS software. BIOS software has a corresponding enable and status bits to control its ability to receive ACPI events. This bit always reads as 0.
1	0b RW	BM_RLD (BM_RLD) (bm_rld): This bit is treated as a scratchpad bit
0	0b RW	SCI Enable (SCI_EN) (sci_en): SCI Enable (SCI_EN): Selects the SCI interrupt or the SMI# for various events. When this bit is 1, then the events will generate an SCI interrupt. When this bit is 0, these events will generate an SMI#.

30.7.3 PM1_TMR - Power Management 1 Timer (PM1_TMR)—Offset 8h

Access Method

Type: I/O Register
(Size: 32 bits)

PM1_TMR: [ACPI_BASE_ADDRESS] + 8h

ACPI_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)

ACPI_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 40h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
reserved				tmr_val				

Bit Range	Default & Access	Description
31:24	0b RO	reserved: Reserved.
23:0	0b RO	Timer Value (TMR_VAL) (tmr_val): This read-only field returns the running count of the PM timer. This counter runs off a 3.579545 MHz clock (derived from 14.31818 MHz divided by 4). It is reset (to 0) during a Platform reset, and then continues counting as long as the system is in the S0 state. Anytime bit 22 of the timer goes HIGH to LOW (bits referenced from 0 to 23), the TMROF_STS bit is set. The High-to-Low transition will occur every 2.3435 seconds. Writes to this register have no effect.

30.7.4 GPE0a_STS - General Purpose Event 0 Status (GPE0a_STS)—Offset 20h

Note: This register is symmetrical to the General Purpose Event 0a Enable Register. Unless indicated otherwise below, if the corresponding _EN bit is set, then when the STS bit get set, the PMC will generate a Wake Event. Once back in an S0 state (or if already in an S0 state when the event occurs), the PMC will also generate an SCI if the SCI_EN bit is set, or an SMI# if the SCI_EN bit is not set. CLARIFICATION: Bits 15:0 should not be reset by CF9 write. Bits 31:16 are reset by CF9h full resets. reset_type=RSMRST_B

Access Method

Bit Range	Default & Access	Description
31	0b RW	CORE GPIO Status (CORE_GPIO_STS) (core_gpio_sts7): These bits are set any time the corresponding Core GPIO is set up as an input and the corresponding GPIO signal is asserted. Core GPIO pins are: SATA_GP0 (GPIO core 0) SATA_GP1 (GPIO core 1) SATA_LEDN (GPIO core 2) PCIE_CLKREQ0B (GPIO core 3) PCIE_CLKREQ1B (GPIO core 4) PCIE_CLKREQ2B (GPIO core 5) PCIE_CLKREQ3B (GPIO core 6) PCIE_CLKREQ4B (GPIO core 7) If the corresponding enable bit is set in the GPE0a_EN register, then when the CORE_GPIO_STS[n] bit is set, an SCI will be caused, depending on the GPIO_ROUT bits for the corresponding GPIO. These bits are sticky bits and are cleared by writing a 1 back to this bit position. reset_type=Resume Well Reset#
30	0b RW	CORE GPIO Status (CORE_GPIO_STS) (core_gpio_sts6): These bit is part of CORE GPIO Status (CORE_GPIO_STS)
29	0b RW	CORE GPIO Status (CORE_GPIO_STS) (core_gpio_sts5): These bit is part of CORE GPIO Status (CORE_GPIO_STS)
28	0b RW	CORE GPIO Status (CORE_GPIO_STS) (core_gpio_sts4): These bit is part of CORE GPIO Status (CORE_GPIO_STS)
27	0b RW	CORE GPIO Status (CORE_GPIO_STS) (core_gpio_sts3): These bit is part of CORE GPIO Status (CORE_GPIO_STS)
26	0b RW	CORE GPIO Status (CORE_GPIO_STS) (core_gpio_sts2): These bit is part of CORE GPIO Status (CORE_GPIO_STS)
25	0b RW	CORE GPIO Status (CORE_GPIO_STS) (core_gpio_sts1): These bit is part of CORE GPIO Status (CORE_GPIO_STS)
24	0b RW	CORE GPIO Status (CORE_GPIO_STS) (core_gpio_sts0): These bit is part of CORE GPIO Status (CORE_GPIO_STS)
23	0b RW	SUS GPIO Status (SUS_GPIO_STS) (sus_gpio_sts7): These bits are set any time the corresponding Sus GPIO is set up as an input and the corresponding GPIO signal is asserted. Sus GPIO pins are GPIO_SUS0-7. If the corresponding enable bit is set in the GPE0a_EN register, then when the SUS_GPIO_STS[n] bit is set: * If the system is in an S3-S5 state, the event will also wake the system. * If the system is in an S0 state (or upon waking back to an S0 state), an SCI will be caused, depending on the GPIO_ROUT bits for the corresponding GPI. These bits are sticky bits and are cleared by writing a 1 back to this bit position. reset_type=Resume Well Reset#
22	0b RW	SUS GPIO Status (SUS_GPIO_STS) (sus_gpio_sts6): These bits are part of SUS GPIO Status (SUS_GPIO_STS)
21	0b RW	SUS GPIO Status (SUS_GPIO_STS) (sus_gpio_sts5): These bits are part of SUS GPIO Status (SUS_GPIO_STS)
20	0b RW	SUS GPIO Status (SUS_GPIO_STS) (sus_gpio_sts4): These bits are part of SUS GPIO Status (SUS_GPIO_STS)
19	0b RW	SUS GPIO Status (SUS_GPIO_STS) (sus_gpio_sts3): These bits are part of SUS GPIO Status (SUS_GPIO_STS)
18	0b RW	SUS GPIO Status (SUS_GPIO_STS) (sus_gpio_sts2): These bits are part of SUS GPIO Status (SUS_GPIO_STS)
17	0b RW	SUS GPIO Status (SUS_GPIO_STS) (sus_gpio_sts1): These bits are part of SUS GPIO Status (SUS_GPIO_STS)
16	0b RW	SUS GPIO Status (SUS_GPIO_STS) (sus_gpio_sts0): These bits are part of SUS GPIO Status (SUS_GPIO_STS)
15:14	0b RO	reserved (reserved4): Reserved.

Bit Range	Default & Access	Description
13	0b RW	Power Management Event Bus 0 Status (PME_B0_STS) (pme_b0_sts): This bit will be set to 1 by the PMC when any internal device with PCI Power Management capabilities on bus 0 asserts the equivalent of the PME# signal. Additionally, if the PME_B0_EN and SCI_EN bits are set, and the system is in an S0 state, then the setting of the PME_B0_STS bit will generate an SCI (or SMI# if SCI_EN is not set). This bit is cleared by a software write of '1'. Internal devices which can set this bit: - Integrated LAN - HD Audio - SATA - USB
12:11	0b RO	reserved (reserved3): Reserved.
10	0b RW	Battery Low Status (BATLOW_STS) (batlow_sts): This bit will be set to 1 by hardware when the PMU_BATLOW_B signal goes low. Software clears the bit by writing a 1 to the bit position. In Desktop Mode, this bit will be treated as Reserved.
9	0b RW	PCI Express Status (PCI_EXP_STS) (pcie_exp_sts): This bit will be set to 1 by hardware to indicate that: - The PME event message was received on one or more of the PCI-Express Ports Note: The PCI PMU_WAKE_B pin and the PCI-Express Beacons have no impact on this bit. Software attempts to clear this bit by writing a 1 to this bit position. If the bit is not cleared and the corresponding PCI_EXP_EN bit is set, the leveltriggered SCI will remain active. Note that a race condition exists where the PCI Express device sends another PME message because the PCI Express device was not serviced within the time when it must resend the message. This may result in a spurious interrupt, and this is comprehended and approved by the PCI Express specification. The window for this race condition is approximately 95-105 milliseconds.
8	0b RW	PCI Express Wake3 Status (PCIE_WAKE3_STS) (pcie_wake3_sts): This bit is set by hardware to indicate that the PCI_WAKE3_B pin was asserted. Software writes a 1 to clear this bit. If PCI_WAKE3_B pin is still active during the write, then the bit will remain active (i.e. input to this bit is level sensitive). reset_type=pmc_global_rst_b
7	0b RW	PCI Express Wake2 Status (PCIE_WAKE2_STS) (pcie_wake2_sts): This bit is set by hardware to indicate that the PCI_WAKE2_B pin was asserted. Software writes a 1 to clear this bit. If PCI_WAKE2_B pin is still active during the write, then the bit will remain active (i.e. input to this bit is level sensitive). reset_type=pmc_global_rst_b
6	0b RW	PCI Express Wake1 Status (PCIE_WAKE1_STS) (pcie_wake1_sts): This bit is set by hardware to indicate that the PCI_WAKE1_B pin was asserted. Software writes a 1 to clear this bit. If PCI_WAKE1_B pin is still active during the write, then the bit will remain active (i.e. input to this bit is level sensitive). reset_type=pmc_global_rst_b
5	0b RW	GUNIT SCI status (GUNIT_SCI_STS) (gunit_sci_sts): This bit will be set if the Graphics Unit requests SCI
4	0b RW	PUNIT SCI status (PUNIT_SCI_STS) (punit_sci_sts): This bit will be set if the Power Management Unit requests SCI
3	0b RW	PCI Express Wake0 Status (PCIE_WAKE0_STS) (pcie_wake0_sts): This bit is set by hardware to indicate that the PMU_WAKE_B pin was asserted. Software writes a 1 to clear this bit. If PMU_WAKE_B pin is still active during the write, then the bit will remain active (i.e. input to this bit is level sensitive). reset_type=pmc_global_rst_b
2	0b RW	Software GPE Status (SWGPE_STS) (swgpe_sts): The SWGPE_CTRL bit (bit 1 of GPE_CTRL reg) acts as a level input to this bit.
1	0b RO	Hot Plug Status (HOT_PLUG_STS) (hot_plug_sts): This bit is set to 1 by hardware when a PCI-Express hotplug event occurs. This will cause an SCI if the HOT_PLUG_EN and SCI_EN bits are set. This bit is cleared by writing a 1 to this bit position. The following events cause this bit to set - Assert_GPE message received from any of the PCI_E ports in the SOC - Assert_HPGPE message received from any of the PCI_E ports in the SOC
0	0b RO	reserved: Reserved.

30.7.5 GPE0a_EN - General Purpose Event 0 Enables (GPE0a_EN)—Offset 28h

Note: This register is symmetrical to the General Purpose Event 0a Status Register.
reset_type=Resume Well Reset#

Access Method

Type: I/O Register
(Size: 32 bits)

GPE0a_EN: [ACPI_BASE_ADDRESS] + 28h

ACPI_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)

ACPI_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 40h

Default: 00000000h

31				28				24				20				16				12				8				4				0																																											
0				0				0				0				0				0				0				0				0				0																																							
core_gpio_en																sus_gpio_en								reserved3				pme_b0_en				reserved2				batlow_en				pci_exp_en				pcie_wake3_en				pcie_wake2_en				pcie_wake1_en				reserved1				pcie_wake0_en				swgpe_en				hot_plug_en				reserved			

Bit Range	Default & Access	Description
31:24	0b RW	CORE GPIO Enable (CORE_GPIO_EN) (core_gpio_en): These bits enable the corresponding CORE_GPIO_STS[n] bits being set to cause an SCI and/or wake event.
23:16	0b RW	SUS GPIO Enable (SUS_GPIO_EN) (sus_gpio_en): These bits enable the corresponding SUS_GPIO_STS[n] bits being set to cause an SCI and/or wake event.
15:14	0b RO	reserved (reserved3): Reserved.
13	0b RW	PME_B0 Enable (PME_B0_EN) (pme_b0_en): Enables the setting of the PME_B0_STS bit to generate a wake event and/or an SCI or SMI#. In addition to being reset by SRTCST_B assertion, the PMC also clears this bit due to certain events: - Power button override - CPU thermal trip reset_type=SRTCST_B
12:11	0b RO	reserved (reserved2): Reserved.
10	0b RW	Low Battery Enable (BATLOW_EN) (batlow_en): This bit enables the PMU_BATLOW_B signal to cause an SMI# or SCI (depending on the SCI_EN bit) when it goes low. This bit does not prevent the PMU_BATLOW_B signal from inhibiting the wake event. In Desktop Mode this bit will be treated as Reserved. In addition to being reset by SRTCST_B assertion, the PMC also clears this bit due to certain events: - Power button override - CPU thermal trip reset_type=SRTCST_B
9	0b RW	PCI Express Enable (PCI_EXP_EN) (pci_exp_en): Enables the PMC to cause an SCI when PCI_EXP_STS bit is set. This is used to allow the PCI Express ports, to cause an SCI due to wake/PME events
8	0b RW	PCI Express Wake3 Enable (PCIE_WAKE3_EN) (pcie_wake3_en): This bit, when set to 1, enables the PCIE_WAKE3_STS to to cause an SCI
7	0b RW	PCI Express Wake2 Enable (PCIE_WAKE2_EN) (pcie_wake2_en): This bit, when set to 1, enables the PCIE_WAKE2_STS to to cause an SCI
6	0b RW	PCI Express Wake1 Enable (PCIE_WAKE1_EN) (pcie_wake1_en): This bit, when set to 1, enables the PCIE_WAKE1_STS to to cause an SCI
5:4	0b RO	reserved (reserved1): Reserved.

Access Method

SMI STS: [ACPI BASE ADDRESS] + 34h

ACPI BASE ADDRESS Reference: [B:0, D:31, F:0] + 40h

[illegible]

Bit Range	Default & Access	Description
31:30	0b RO	reserved : Reserved.
29	0b RW	GUNIT SMI Status (GUNIT_SMI_STS): (gunit_smi_sts) : This bit will be set if Graphics unit is requesting an SMI#. Writing a '1' to this bit position clears this bit to '0'.
28	0b RW	PUNIT SMI Status (PUNIT_SMI_STS): (punit_smi_sts) : This bit will be set if Power Management is requesting an SMI#. Writing a '1' to this bit position clears this bit to '0'.
27	0b RO	reserved (reserved1) : Reserved.
26	0b RO	SPI_SMI Status (SPI_SMI_STS): (spi_smi_sts) : This bit will be set when the SPI logic is requesting an SMI#.
25:22	0b RO	reserved (reserved2) : Reserved.
21	0b RW	reserved (reserved5) : This bit is reserved for future use.
20	0b RO	PCI_EXP_SMI Status (PCI_EXP_SMI_STS): (pci_exp_smi_sts) : 1- PCI Express SMI event occurred. This could be due to a PCI Express PME event.
19	0b RO	reserved (reserved8) : Reserved.
18	0b RO	Intel USB2 Status (USB_IS_STS): (usb_is_sts) : This non-sticky read-only bit is a logical OR of each of the SMI status bits in the Intel-Specific USB2 SMI Status Register ANDed with the corresponding enable bits. Additionally, the Port Disable Write Enable SMI is reported in this bit; the specific status bit for this event is contained in the USB Per-Port Registers Write Control Register in this I/O space. This bit will not be active if the enable bits are not set. Writes to this bit will have no effect. All integrated USB2 Host Controllers are represented with this bit.
17	0b RO	USB Status (USB_STS): (usb_sts) : This bit will be set when the USB logic is requesting an SMI#.
16	0b RO	SMBUS_SMI Status (SMBUS_SMI_STS): (smbus_smi_sts) : This bit will be set when the SMBUS logic is requesting an SMI#.
15	0b RO	ILB_SMI Status (ILB_SMI_STS): (ilb_smi_sts) : This bit will be set when the ILB logic is requesting an SMI#.
14	0b RW	Periodic Status (PERIODIC_STS): (periodic_sts) : This bit will be set at the rate determined by the PER_SMI_SEL bits. If the PERIODIC_EN bit is also set, the PMC will generate an SMI#. This bit is cleared by writing a 1 to this bit position.
13	0b RW	TCO Status (TCO_STS): (tco_sts) : Indicates SMI was caused by the TCO logic. This bit is cleared by writing a 1 to this bit position.
12:10	0b RO	reserved (reserved3) : Reserved.
9	0b RO	GPE0a Status (GPE0a_STS): (gpe0_sts) : There are several status/enable bit pairs in GPE0a_STS/EN that are capable of triggering SMI. This bit is a logical OR of all of those pairs (i.e. this bit is asserted whenever at least one of those pairs has both the status and enable bit asserted). This bit is NOT sticky. Writes to this bit will have no effect. Note: The setting of this bit does not cause the SMI#.
8	0b RO	PM1 Status Register (PM1_STS_REG): (pm1_sts_reg) : This is an OR of the bits (except for bits 5 and 4) in the ACPI PM1_STS_EN Status Reg. Not sticky. Writes to this bit have no effect. Note: The setting of this bit does not cause the SMI#.
7	0b RO	reserved (reserved4) : Reserved.

Bit Range	Default & Access	Description
6	0b RW	Software SMI Timer Status (SWSMI_TMR_STS): (swsmi_tmr_sts): This bit will be set to 1 by the hardware when the Software SMI# Timer expires. This bit will remain 1 until the software writes a 1 to this bit.
5	0b RW	APM_STS (apm_sts): APM Status - SMI# was generated by a write access to the APM control register and if the APMC_EN bit is set. This bit is cleared by writing a one to its bit position.
4	0b RW	SMI_ON_SLP_EN Status (SMI_ON_SLP_EN_STS): (smi_on_slp_en_sts): This bit will be set by the PMC when a write access attempts to set the SLP_EN bit. This bit is cleared by writing a 1 to this bit position
3	0b RO	reserved (reserved6): Reserved.
2	0b RW	BIOS Status (BIOS_STS): (bios_sts): This bit gets set by hardware when a 1 is written by software to the GBL_RLS bit. When both BIOS_EN and the BIOS_STS bit are set, an SMI# will be generated. The BIOS_STS bit is cleared when software writes a 1 to this bit position.
1:0	0b RO	reserved (reserved7): Reserved.

30.7.8 ALT_GPIO_SMI - Alternate GPIO SMI Status and Enable Register. (ALT_GPIO_SMI)—Offset 38h

reset_type=Resume Well Reset#

Access Method

Type: I/O Register
(Size: 32 bits)

ALT_GPIO_SMI: [ACPI_BASE_ADDRESS] + 38h

ACPI_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)

ACPI_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 40h

Default: 00000000h

31	28	24	20	16	12	8	4	0

Bit Range	Default & Access	Description
31:24	0b RW	CORE GPIO SMI Status Setting (CORE_GPIO_SMI_STS): (core_gpio_smi_sts): These bits report the status of the corresponding GPIO's. 1 = active, -0 = inactive. These bits are sticky. If the following conditions are true, then an SMI# will be generated: 1. The corresponding enable bit in this register is set 2. The corresponding GPIO must be routed in the GPIO_ROUT register to cause an SMI. 3. The corresponding GPIO must be implemented. Core GPIO pins are: SATA_GP0 (GPIO core 0) SATA_GP1 (GPIO core 1) SATA_LEDN (GPIO core 2) PCIE_CLKREQ0B (GPIO core 3) PCIE_CLKREQ1B (GPIO core 4) PCIE_CLKREQ2B (GPIO core 5) PCIE_CLKREQ3B (GPIO core 6) PCIE_CLKREQ4B (GPIO core 7) All bits are in the resume well. Default for these bits are dependent on the state of the GPIO pins.

Bit Range	Default & Access	Description
23:16	0b RW	SUS GPIO SMI Status Setting (SUS_GPIO_SMI_STS): (sus_gpio_smi_sts): These bits report the status of the corresponding GPIO's. 1 = active, -0 = inactive. These bits are sticky. If the following conditions are true, then an SMI# will be generated: 1. The corresponding enable bit in this register is set 2. The corresponding GPIO must be routed in the GPIO_ROUT register to cause an SMI. 3. The corresponding GPIO must be implemented. Sus GPIO pins are GPIO_SUS0-7. All bits are in the resume well. Default for these bits are dependent on the state of the GPIO pins.
15:8	0b RW	CORE GPIO SMI Enable Setting (CORE_GPIO_SMI_EN): (core_gpio_smi_en): These bits are used to enable the corresponding GPIO to cause an SMI#.
7:0	0b RW	SUS GPIO SMI Enable Setting (SUS_GPIO_SMI_EN): (sus_gpio_smi_en): These bits are used to enable the corresponding GPIO to cause an SMI#.

30.7.9 UPRWC - USB Per-Port Registers Write Control (UPRWC)— Offset 3Ch

Access Method

Type: I/O Register
(Size: 32 bits)

UPRWC: [ACPI_BASE_ADDRESS] + 3Ch

ACPI_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)

ACPI_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 40h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
			reserved			we_sts	reserved1	usb_per_port_we
								we_smi_en

Bit Range	Default & Access	Description
31:9	0b RO	reserved: Reserved.
8	0b RW	Write Enable Status (WE_STS) (we_sts): This bit gets set by hardware when the Per-Port Registers Write Enable bit is written from 0 to 1. This bit is cleared by software writing a 1b to this bit location. The setting condition takes precedence over the clearing condition in the event that both occur at once. When this bit is 1b and bit 0 is 1b, the INTEL_USB2_STS bit is set in the SMI_STS register.
7:2	0b RO	reserved (reserved1): Reserved.
1	0b RW	USB Per-Port Registers Write Enable (USB_PER_PORT_WE) (usb_per_port_we): This bit controls whether writes are enabled to the USB Port Power Off and Port Disable Override registers
0	0b RW	Write Enable SMI Enable (WE_SMI_EN) (we_smi_en): This bit enables the generation of SMI when the Per-Port Registers Write Enable (bit 1) is written from 0 to 1. Once written to 1b, this bit can not be cleared by software.

30.7.10 GPE_CTRL - General Purpose Event Control (GPE_CTRL)—Offset 40h

Access Method

Type: I/O Register
(Size: 32 bits)

GPE_CTRL: [ACPI_BASE_ADDRESS] + 40h

ACPI_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)

ACPI_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 40h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
reserved				swgpe_ctrl	reserved1			RSVD0

Bit Range	Default & Access	Description
31:18	0b RO	reserved: Reserved.
17	0b RW	Software GPE Control (SWGPE_CTRL) (swgpe_ctrl): This bit allows software to control the assertion of SWGPE_STS bit. This bit is used by hardware as the level input signal for the SWGPE_STS bit in the GPE0a_STS register. When SWGPE_CTRL is 1, SWGPE_STS will be set to 1, and writes to SWGPE_STS with a value of 1 to clear SWGPE_STS will result in SWGPE_STS being set back to 1 by hardware. When SWGPE_CTRL is 0, writes to SWGPE_STS with a value of 1 will clear SWGPE_STS to 0. In addition to being reset by RSMRST_B assertion, the PMC also clears this bit due to certain events: - Power button override - CPU thermal trip
16:4	0b RO	reserved1: Reserved.
3:0	0b RO	RSVD0: Reserved

30.7.11 PM2A_CNT_BLK - PM2a Control Block (PM2A_CNT_BLK)—Offset 50h

Access Method

Type: I/O Register
(Size: 32 bits)

PM2A_CNT_BLK: [ACPI_BASE_ADDRESS] + 50h

ACPI_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)

ACPI_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 40h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
reserved								arb_dis

Bit Range	Default & Access	Description
31:1	0b RO	reserved: Reserved.
0	0b RW	ARB_DIS (ARB_DIS) (arb_dis): This bit is essentially just a scratchpad bit for legacy software compatibility.

30.7.12 TCO_RLD: TCO Reload Register (TCO_RLD)—Offset 60h

Access Method

Type: I/O Register
(Size: 32 bits)

TCO_RLD: [ACPI_BASE_ADDRESS] + 60h

ACPI_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)

ACPI BASE ADDRESS Reference: [B:0, D:31, F:0] + 40h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
reserved						RSVD0	tco_val	

Bit Range	Default & Access	Description
31:11	0b RO	reserved: Reserved.
10	0b RO	RSVD0: Reserved
9:0	0b RO	TCO Timer Value (TCO_TVAL) (tco_val): Reading this register will return the current count of the TCO timer. Writing any value to this register will reload the timer to prevent the timeout.

30.7.13 TCO_STS: TCO Timer Status (TCO_STS)—Offset 64h

Access Method

Type: I/O Register
(Size: 32 bits)

TCO_STS: [ACPI BASE ADDRESS] + 64h

ACPI_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)

ACPI_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 40h

Default: 00000000h

	31	28	24	20	16	12	8	4	0		
	0	0	0	0	0	0	0	0	0		
	reserved2				second_to_sts	reserved1				tco_timeout	reserved

Access Method

TCO1 CNT: [ACPI BASE ADDRESS] + 68h

ACPI BASE ADDRESS Reference: [B:0, D:31, F:0] + 40h

31				28				24				20				16				12				8				4				0			
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
reserved								os_policy								reserved2								tco_lock		tco_tmr_halt		reserved1							

Bit Range	Default & Access	Description
31:22	0b RO	reserved: Reserved.
21:20	0b RW	OS_POLICY (os_policy): OS-based software writes to these bits to select the policy that the BIOS will use after the platform resets due the WDT. The following convention is recommended for the BIOS and OS: 00 Boot normally 01 Shut down 10 Dont load OS. Hold in pre-boot state and use LAN to determine next step 11 Reserved
19:13	0b RO	reserved (reserved2): Reserved.
12	0b RW	TCO Lock (TCO_LOCK) (tco_lock): When set to 1, this bit prevents writes from changing the TCO_EN bit (in offset 30h of Power Management I/O space). Once this bit is set to 1, it can not be cleared by software writing a 0 to this bit location. A core-well reset is required to change this bit from 1 to 0. This bit defaults to 0.
11	0b RW	TCO Timer Halt (TCO_TMR_HALT) (tco_tmr_halt): 1 = The TCO timer will halt. It will not count, and thus cannot reach a value that would cause an SMI# or to cause the SECOND_TO_STS bit to be set. This will also prevent rebooting. 0 = The TCO timer is enabled to count. This is the default.

31 PCU – Serial Peripheral Interface (SPI)

The SoC implements a SPI controller as the interface for BIOS Flash storage. This SPI Flash device is also required to support firmware for the Trusted Execution Engine (required). The controller supports a maximum of two SPI Flash devices, using two chip select signals, with speeds of 20 MHz, 33 MHz or 50 MHz.

Note: The default interface speed is 20 MHz.

Note: SPI must operate in descriptor mode for correct operation of the SoC.

31.1 Signal Descriptions

Please see [Chapter 2, "Physical Interfaces"](#) for additional details.

The signal description table has the following headings:

- **Signal Name:** The name of the signal/pin
- **Direction:** The buffer direction can be either input, output, or I/O (bidirectional)
- **Platform Power:** The reference power plane.
- **Description:** A brief explanation of the signal's function

**Table 298. SPI Signals**

Signal Name	Direction Plat. Power	Description
PCU_SPI_CLK	O V1P8A	SPI Clock: When the bus is idle, the owner will drive the clock signal low.
PCU_SPI_CS[0]#	O V1P8A	SPI Chip Select 0: Used as the SPI bus request signal for the first SPI Flash device.
PCU_SPI_CS[1]#	O V1P8A	SPI Chip Select 1: Used as the SPI bus request signal for the second SPI Flash devices. <i>This signal is muxed and may be used by other functions.</i>
PCU_SPI_MISO	I V1P8A	SPI Master IN Slave OUT: Data input pin for the SoC.
PCU_SPI_MOSI	I/O V1P8A	SPI Master OUT Slave IN: Data output pin for the SoC. Operates as a second data input pin for the SoC when in Single Input, Dual Output Fast Read mode.

Note: All SPI signals are tri-stated with 20k ohm internal weak pull-up until PMC_CORE_PWROK is asserted.

31.2 Features

The SPI controller supports up to two SPI Flash devices using two separate chip select pins. Each SPI Flash device can be up to 16 MB. The SoC SPI interface supports 20 MHz, 33 MHz and 50 MHz SPI Flash devices. No other types of SPI devices are supported.

Communication on the SPI bus is done with a Master – Slave protocol. The Slave is connected to the SoC and is implemented as a tri-state bus.

Note: When GCS.BBS = 00b, LPC is selected as the location for BIOS. The SPI Flash may still contain data and firmware for other SoC functionality.

Note: When GCS.BBS = 11b and a SPI device is detected by the SoC, LPC based BIOS Flash is disabled.

31.2.1 Operation Mode Feature Overview

The SPI controller has two operational modes, Non-Descriptor and Descriptor.

31.2.1.1 Non-Descriptor Mode

If no valid signature is read (either because there is no SPI Flash, or there is an SPI Flash with no valid descriptor), the Flash Controller will operate in a Non-Descriptor mode.

The following features are not supported in Non-Descriptor mode:

- Trusted Execution Engine
- Secure Boot
- Soft Straps
- Two SPI Flash device support
- Hardware sequencing access
- Descriptor-based security access restrictions

Note: When operating in Non-Descriptor mode, software sequencing must be used to access the Flash.

Note: When operating in Non-Descriptor Mode, and a SPI Flash is attached to the SoC, it is required that the Flash Valid Signature, at offset 10h of the Flash Descriptor, does not equal the expected valid value (0FF0A55Ah) or the SPI Controller will wrongly interpret that it has a valid signature and that a Flash Descriptor has been implemented.

31.2.2 Descriptor Mode

Descriptor Mode is required to enable many features of the SoC:

- Trusted Execution Engine
- Secure Boot
- PCI Express* root port configuration
- Supports for two SPI components using two separate chip select pins
- Hardware enforced security restricting master accesses to different regions
- Soft Strap region providing the ability to use Flash NVM to remove the need for pull-up/pull-down resistors for strapping SoC features
- Support for the SPI Fast Read instruction and frequencies greater than 20 MHz
- Support for Single Input, Dual Output Fast reads
- Use of standardized Flash instruction set

SPI Flash Regions

In Descriptor Mode the Flash is divided into five separate regions:

Table 299. SPI Flash Regions

Region	Content
0	Flash Descriptor
1	BIOS
2	Trusted Execution Engine
3	Reserved
4	Platform Data

Only two masters can access the 3 regions: The SoC CPU core running BIOS code and the Trusted Execution Engine. The only required region is Region 0, the Flash Descriptor. Region 0 must be located in the first sector of Device 0.

Flash Regions Sizes

SPI Flash space requirements differ by platform and configuration. [Table 300](#) indicates the space needed in the Flash for each region.

Table 300. Region Size Versus Erase Granularity of Flash Components

Region	Size with 4 KB Blocks	Size with 8 KB Blocks	Size with 64 KB Blocks
Descriptor	4 KB	8 KB	64 KB
BIOS	Varies by Platform	Varies by Platform	Varies by Platform
Trusted Execution Engine	Varies by Platform	Varies by Platform	Varies by Platform

31.2.3 Flash Descriptor

The maximum size of the Flash Descriptor is 4 KB. If the block/sector size of the SPI Flash device is greater than 4 KB, the Flash descriptor will only use the first 4 KB of the first block. The Flash descriptor requires its own block at the bottom of memory (00h). The information stored in the Flash Descriptor can only be written during the manufacturing process as its read/write permissions must be set to Read only when the system containing the SoC leaves the manufacturing floor.

The Flash Descriptor is made up of eleven sections as indicated in below figure.

Figure 131. Flash Descriptor Sections

- The **Reserved** section at offset 0h is related to functionality not supported by the SoC.
- The **Signature** section selects Descriptor Mode as well as verifies if the Flash is programmed and functioning. The data at the bottom of the Flash (offset 10h) must be 0FF0A55Ah in order to be in Descriptor mode.
- The **Descriptor Map** section defines the logical structure of the Flash in addition to the number of components used.
- The **Component** section has information about the SPI Flash in the system including:
 - Density of each component
 - Illegal instructions (such as chip erase)
 - Frequencies for read, fast read and write/erase instructions.
- The **Region** section points to the four other regions as well as the size of each region.
- The **Master** region contains the security settings for the Flash, granting read/write permissions for each region and identifying each master by a requestor ID.
- The **Soft Straps** section contains parameter bits that can be used to configure SoC features and/or behaviors.

- The **Reserved** section between the top of the **Soft Straps** section and the bottom of the **VSCC Table** is reserved for future SoC usages.
- The **VSCC Table** section holds the JEDEC ID and the VSCC (Vendor Specific Component Capabilities) information of the entire SPI Flash supported by the NVM image.
- The **Descriptor Upper Map** section determines the length and base address of the **VSCC Table** section.
- The **OEM Section** is 256 Bytes reserved at the top of the Flash Descriptor for use by an OEM.

31.2.3.1 Master Section

The Master section defines read and write access setting for each region of the SPI device, when the SPI controller is running in Descriptor mode. The master region recognize two masters: SoC CPU core running BIOS code and the Trusted Execution Engine.

Note: Each master is only allowed to do direct reads of its primary regions. The Trusted Execution Engine is may also do a direct read of the BIOS region if it has been given read access to that region. See [Section 31.2.4.1, "Direct Access" on page 4382](#) for further details on direct reads.

Table 301. Region Access Control

Master Read/Write Access		
Region	BIOS	Trusted Execution Engine
Descriptor	N/A	N/A
BIOS	CPU core and BIOS can always read from and write to BIOS Region	Read / Write
Trusted Execution Engine	Read / Write	Trusted Execution can always read from and write to Trusted Execution Engine Region
Platform Data	N/A	N/A

31.2.3.2 Invalid Flash Descriptor Handling

The SoC will respond to an invalid Flash Descriptor with the following:

- The SPI controller will operate in Non-Descriptor mode.
- If the BBS strap (see [Section 31.2.2](#) for details) is set to 1, BIOS direct read access will be forwarded to the SPI Controller without any address translation.
- The HSFSTS.FDV register bits remains at 0b.

- All security checks are disabled and the entire Flash is open for reading and writing. No restriction on the 4k crossing.
- Trusted Execution Engine direct read accesses will not be handled, and the SPI controller will return all 1's.

Note: To ensure BIOS boot access even when the Flash Descriptor is invalid the BIOS region can be placed at the top of Flash Component 0. Placing the BIOS region in any other location will necessitate a full reprogramming of the Flash before boot is possible from that Flash.

31.2.3.3 Descriptor Security Override Strap

A strap is implemented on GPIO_S0_SC[065] to allow descriptor security to be overridden when the strap is sampled low.

If the strap is set (0b), it will have the following effect:

- The Master Region Read Access and Master Region Write Access permissions that were loaded from the Flash Descriptor Master Section will be overridden giving every master read and write permissions to the entire Flash component including areas outside the defined regions.
- BIOS Protected Range 4 (PR4), if enabled by soft strap, will be overridden so that all masters are able to write to the PR4. The PR4 base and limit addresses are fetched and received from soft strap.

31.2.4 Flash Access

There are two types of Flash accesses: Direct Access and Program Register Access.

31.2.4.1 Direct Access

- Direct writes are not allowed for any master.
- The SoC CPU core is only allowed to do a direct read of the BIOS region
- The Trusted Execution Engine is only allowed to do a direct read of the Trusted Execution Engine region. It may also do a direct read of the BIOS region if it has been given read access to that region.

Note: Trusted Execution Engine region direct reads are not supported when the SPI controller is operating in Non-Descriptor mode. The SPI controller returns all 1s if a direct read is attempted.

31.2.4.2 Security

- Calculated Flash Linear Address (FLA) must fall between primary region base/limit

Note: During non descriptor mode, the Flash Physical Address is used instead. Only the two BIOS ranges at the E0000h and F0000h segments just below 1MB are supported.

- Direct Read Cache contents are reset to 0's on a read from a different master

31.2.4.3 Program Register Access

- Reads, Writes and Erases are all supported.
- Program Register Access may use Hardware or Software Sequencing. See [Section 31.3.1, “Hardware vs. Software Sequencing” on page 4389](#) for further information.
- Program Register Accesses are not allowed to cross a 4 KB boundary and can not issue a command that might extend across two components
- Software programs the FLA corresponding to the region desired
 - Software must read the devices Primary Region Base/Limit address to create a FLA.

Each master accesses the Flash through a set of memory mapped registers that are dedicated to each device.

There are two separate control and status registers that software can use when using register access to the Flash. The Hardware Sequencing control/status registers rely on hardware to issue appropriate Flash instructions and atomic sequences. The Software Sequencer puts control into the hands of the software for what instructions to issue and when.

The goal is to support all Flash components through hardware sequencing. Software sequencing is intended only for a back-up strategy.

Note: Software sequencing is required when operating in a non-descriptor mode.

31.2.4.4 Security

- Only primary region masters can access the registers
- Masters are only allowed to read or write those regions they have read/write permission
- Using the Flash region access permissions, one master can give another master read/write permissions to their area
- Using the five Protected Range registers, each master can add separate read/write protection above that granted in the Flash Descriptor for their own accesses
 - Example: BIOS may want to protect different regions of BIOS from being erased
 - Ranges can extend across region boundaries

31.2.5 Serial Flash Device Compatibility Requirements

A variety of serial Flash devices exist in the market. For a serial Flash device to be compatible with the SoC SPI bus, it must meet the minimum requirements detailed in the following sections.

31.2.5.1 BIOS SPI Flash Requirements

The SPI Flash device must meet the following minimum requirements when used explicitly for system BIOS storage.

- Erase size capability of at least one of the following: 64 Kbytes, 8 Kbytes, 4 Kbytes, or 256 bytes.
- Device must support multiple writes to a page without requiring a preceding erase cycle (Refer to [Section 31.2.6.](#))
- Serial Flash device must ignore the upper address bits such that an address of FFFFFFFh aliases to the top of the Flash memory.
- SPI Compatible Mode 0 support (clock phase is 0 and data is latched on the rising edge of the clock).
- If the device receives a command that is not supported or incomplete (less than 8 bits), the device must complete the cycle gracefully without any impact on the Flash content.
- An erase command (page, sector, block, chip, etc.) must set all bits inside the designated area (page, sector, block, chip, etc.) to 1 (Fh).
- Status Register bit 0 must be set to 1 when a write, erase or write to status register is in progress and cleared to 0 when a write or erase is NOT in progress.
- Devices requiring the Write Enable command must automatically clear the Write Enable Latch at the end of Data Program instructions.
- Byte write must be supported. The flexibility to perform a write between 1 byte to 64 bytes is recommended.
- Hardware Sequencing requirements are optional in BIOS only platforms.
- SPI Flash devices that do not meet hardware sequencing command set requirements may work in BIOS only platforms using software sequencing.
- If implementing two SPI flash devices, both devices must have the same erasable block/sector size. Additionally, the first device must be of a binary size.

31.2.5.2 Intel Trusted Execution Engine Firmware SPI Flash Requirements

Intel Trusted Execution Engine Firmware must meet all the requirements in [Section 31.2.5.1](#) plus:

- Hardware sequencing
- The Flash device must have a uniform 4-KB erasable block throughout the entire device or have 64 KB blocks with the first block (lowest address) divided into 4-KB or 8-KB blocks.
- The write protection scheme must meet SPI Flash unlocking requirements for the Trusted Execution Engine

SPI Flash Unlocking Requirements for the Trusted Execution Engine

Flash devices must be globally unlocked (read, write and erase access on the Trusted Execution Engine region) from power on by writing 00h to the Flash's status register to disable write protection.

If the status register must be unprotected, it must use the enable write status register command 50h or write enable 06h.

Opcode 01h (write to status register) must then be used to write a single byte of 00h into the status register. This must unlock the entire device. If the SPI Flash's status register has non-volatile bits that must be written to, bits [5:2] of the Flash's status register must be all 0h to indicate that the Flash is unlocked.

If bits [5:2] return a non zero values, the Trusted Execution Engine firmware will send a write of 00h to the status register. This must keep the Flash part unlocked.

If there is no need to execute a write enable on the status register, then opcodes 06h and 50h must be ignored.

After global unlock, the BIOS has the ability to lock down small sections of the Flash as long as they do not involve the Trusted Execution Engine.

31.2.5.3 Hardware Sequencing Requirements

Below table contains a list of commands and the associated opcodes that a SPI-based serial Flash device must support in order to be compatible with hardware sequencing.

Table 302. Hardware Sequencing Commands and Opcode Requirements

Commands	Opcode	Notes
Write to Status Register	01h	Writes a byte to SPI Flash's status register. Enable Write to Status Register command must be run prior to this command.
Program Data	02h	Single byte or 64 byte write as determined by Flash part capabilities and software.
Read Data	03h	
Write Disable	04h	
Read Status	05h	Outputs contents of SPI Flash's status register
Write Enable	06h	
Fast Read	0Bh	
Enable Write to Status Register	50h	Enables a bit in the status register to allow an update to the status register
Erase	Programmable	Uses the value from LVSSC.LEO register or UVSSC.UEO register depending on the FLA and whether it is below or above the FPBA respectively

Single Input, Dual Output Fast Read

The SPI controller supports the functionality of a single input, dual output fast read: Opcode 3Bh. This instruction has the same timing (including a dummy byte) and the same frequencies as the Fast Read instruction, with the difference that the read data from the Flash is presented on both the MISO and MOSI pins. During a Dual Read instruction, the odd data bits are on the MISO pin and the even data bits are on the MOSI pin.

Note: When Dual Output Fast Read Support is enabled the Fast Read Support must be enabled as well.

Note: Micronix* SPI Flash uses a different opcode for dual fast read, and requires that during the address phase that the address bits are sent on both MOSI and MISO. The SoC does not support this implementation of the protocol.

Figure 132. Dual Output Fast Read Timing

JEDEC ID

Since each serial Flash device may have unique capabilities and commands, the JEDEC ID is the necessary mechanism for identifying the device so the uniqueness of the device can be comprehended by the controller (master). The JEDEC ID uses the opcode 9Fh and a specified implementation and usage model. This JEDEC Standard Manufacturer and Device ID read method is defined in Standard JESD21-C, PRN03-NV.

Error Correction and Detection

If the first 8 bits specify an opcode which is not supported the slave will not respond and wait for the next high to low transition on PCU_SPI_CS[1:0]#. The SPI controller should automatically discard 8 bit words that were not completely received upon de-assertion of the signal.

Any other error correction or detection mechanisms must be implemented in firmware and/or software.

31.2.6 Multiple Page Write Usage Model

The BIOS and Trusted Execution Engine firmware usage models require that the serial Flash device support multiple writes to a page (minimum of 512 writes) without requiring a preceding erase command. The BIOS commonly uses capabilities such as counters that are used for error logging and system boot progress logging. These counters are typically implemented by using byte-writes to 'increment' the bits within a page that have been designated as the counter. The Trusted Execution Engine firmware usage model requires the capability for multiple data updates within any given page. These data updates occur using byte-writes without executing a preceding erase to the given page. Both the BIOS and Trusted Execution Engine firmware multiple page write usage models apply to sequential and non-sequential data writes.

This usage model requirement is based on any given bit only being written once from a '1' to a '0' without requiring the preceding erase. An erase would be required to change bits back to the 1 state.

31.2.7 Soft Flash Protection

There are two types of Flash protection that are not defined in the Flash descriptor supported by the SPI controller:

1. Flash Range Read and Write Protection
2. Global Write Protection

31.2.7.1 Flash Range Read and Write Protection

The SPI controller provides a method for blocking reads and writes to specific ranges in the Flash when the Protected Ranges are enabled. This is achieved by checking the read or write cycle type and the address of the requested command against the base and limit fields of a Read or Write Protected range. Protected range registers are only applied to Programmed Register accesses and have no effect on Direct Reads.

Note: Once BIOS has locked down the Protected BIOS Range registers, this mechanism remains in place until the next system reset.

31.2.7.2 Global Write Protection

The SPI controller has a Write Protection Disable (BCR.WPD) configuration bit. When BCR.WPD=0b, BIOS is not able to perform any write or erase commands to the Flash. When BCR.WPD=1b, protection against BIOS erase and rewrite is disabled. When the lock enable (BCR.LE) bit is set, the BIOS can disable this protection only during System Management Mode (SMM) execution.

If BCR.LE=1b, the SPI controller confirms that only SMM code succeeds to set BCR.WPD=1b. In addition, if BCS.SMIWPEN=1b, the SPI controller should initiate an SMI when non SMM code tries to set BCR.WPD=1b.

31.2.8 SPI Flash Device Recommended Pinout

This table contains the recommended serial Flash device pin-out for an 8-pin device. Use of the recommended pin-out on an 8-pin device reduces complexities involved with designing the serial Flash device onto a motherboard and allows for support of a common footprint usage model (refer to [Section 31.2.9.1](#)).

Table 303. Recommended Pinout for 8-Pin Serial Flash Device

Pin #	Signal
1	Chips Select
2	Data Output
3	Write Protect
4	Ground
5	Data Input
6	Serial Clock
7	Hold / Reset
8	Supply Voltage

Although an 8-pin device is preferred over a 16-pin device due to footprint compatibility, [Table 304](#) contains the recommended serial Flash device pin-out for a 16-pin SOIC.

31.2.9 Serial Flash Device Package

Table 304. Recommended Pinout for 16-Pin Serial Flash Device

Pin #	Signal	Pin #	Signal
1	Hold / Reset	9	Write Protect
2	Supply Voltage	10	Ground
3	No Connect	11	No Connect
4	No Connect	12	No Connect
5	No Connect	13	No Connect

**Table 304. Recommended Pinout for 16-Pin Serial Flash Device**

Pin #	Signal	Pin #	Signal
6	No Connect	14	No Connect
7	Chip Select	15	Serial Data In
8	Serial Data Out	16	Serial Clock

31.2.9.1 Common Footprint Usage Model

To minimize platform motherboard redesign and to enable platform Bill of Material (BOM) selectability, many OEMs design their motherboard with a single common footprint. This common footprint allows the population of a soldered down device or a socket that accepts a leadless device. This enables the board manufacturer to support, using selection of the appropriate BOM, either of these solutions on the same system without requiring any board redesign.

The common footprint usage model is desirable during system debug and by Flash content developers since the leadless device can be easily removed and reprogrammed without damage to device leads. When the board and Flash content is mature for high-volume production, both the socketed leadless solution and the soldered down leadless solution are available through BOM selection.

31.2.9.2 Serial Flash Device Package Recommendations

It is highly recommended that the common footprint usage model be supported. An example of how this can be accomplished is as follows:

- The recommended pinout for 8-pin serial Flash devices is used (refer to [Table 303](#)).
- The 8-pin device is supported in either an 8-contact VDFPN (6x5 mm MLP) package or an 8-contact WSON (5x6 mm) package. These packages can fit into a socket that is land pattern compatible with the wide body SO8 package.
- The 8-pin device is supported in the SO8 (150 mil) and in the wide-body SO8 (200 mil) packages.
- The 16-pin device is supported in the SO16 (300 mil) package.

31.3 Use

31.3.1 Hardware vs. Software Sequencing

Hardware and Software sequencing are the two methods the SoC uses to communicate with the Flash via programming registers for each of the three masters.

31.3.1.1 Hardware Sequencing

Hardware sequencing has a predefined list of opcodes, see [Table 302](#) for more details, with only the erase opcode being programmable. This mode is only available if the descriptor is present and valid. Security Engine firmware must use HW sequencing, so

BIOS must properly set up the SoC to account for this. The Host VSCC registers and VSCC Table have to be correctly configured for BIOS and Security Engine have read/write access to SPI.

31.3.1.2 Software Sequencing

All commands other than the standard (memory) reads must be programmed by the software in the Software Sequencing Control, Flash Address, Flash Data, and Opcode configuration registers. Software must issue either Read ID or Read JEDEC ID, or a combination of the two to determine what Flash component is attached. Based on the Read ID, software can determine the appropriate Opcode instructions sets to set in the program registers and at what SPI frequency to run the command.

Software must program the Flash Linear Address for all commands, even for those commands that don't require address such as the Read ID or Read Status. This is because the SPI controller uses the address to determine which chip select to use.

The opcode type and data byte count fields determine how many clocks to run before deasserting the chip enable. The Flash data is always shifted in for the number of bytes specified and the Flash Data out is always shifted out for the number of data bytes specified. Note that the hardware restricts the burst lengths that are allowed.

A status bit indicates when the cycle has completed on the SPI port allowing the host to know when read results can be checked and/or when to initiate a new command.

The controller also provides the "Atomic Cycle Sequence" for performing erases and writes to the SPI Flash. When this bit is 1 (and the Go bit is written to 1), a sequence of cycles is performed on the SPI interface without allowing other SPI device to arbitrate and interleave cycles to the Flash device. In this case, the specified cycle is preceded by the Prefix Command (8-bit programmable Opcode) and followed by repeated reads to the Status Register (Opcode 05h) until bit 0 indicates the cycle has completed. The hardware does not attempt to check that the programmed cycle is a write or erase.

If a Programmed Access is initiated (Cycle Go written to 1) while the SPI controller is already busy with a Direct Memory Read, then the SPI Host hardware will hold the new Programmed Access pending until the preceding SPI access completes.

Once the SPI controller has committed to running a programmed access, subsequent writes to the programmed cycle registers that occur before it has completed will not modify the original transaction and will result in the assertion of the FCERR bit. Software should never purposely behave in this way and rely on this behavior. However, the FCERR bit provides basic error-reporting in this situation. Writes to the following registers cause the FCERR bit assertion in this situation:

- Software Sequencing Control
- Software Sequencing Address
- SPI Data

With the exception of Illegal Opcodes, the SPI controller does not police which opcodes are valid to be used in SW Sequencing. For example, if SW programs a Dual Output Fast Read opcode, then the Dual Output Fast Read cycle will be issued, independent of whether the Dual Output Fast Read enable bit was set in the component descriptor section.

31.4 Register Map

Refer to [Chapter 3, "Register Access Methods"](#) and [Chapter 4, "Mapping Address Spaces"](#) for additional information.

Figure 133.SIO - HSUART Register Map

31.5 PCU SPI for Firmware Memory Mapped I/O Registers

Table 305. Summary of PCU SPI for Firmware Memory Mapped I/O Registers—SPI_BASE_ADDRESS

31.5.2 HSFSTS (Hardware_Sequencing_Flash_Status_bios)—Offset 4h

Hardware sequencing flash status Note: If operating in Non-Descriptor mode, the Software Sequencing Flash Status register must be used.

Access Method

Type: Memory Mapped I/O Register
(Size: 16 bits)

Hardware_Sequencing_Flash_Status_bios: [SPI_BASE_ADDRESS] + 4h

SPI_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)

SPI_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 54h

Default: 0000h

15	12	8	4	0
0	0	0	0	0
FLOCKDN	FDV	FDOPSS	RSVD0	SCIP
			BERASE	AEL
				FCERR
				FDONE

Bit Range	Default & Access	Description
15	0b RW/L	Flash Configuration Lock-Down (FLOCKDN): When set to 1, those Flash Program Registers that are locked down by this FLOCKDN bit cannot be written. Once set to 1, this bit can only be cleared by a hardware reset.
14	0b RO	Flash Descriptor Valid (FDV): This bit is set to a 1 if the Flash Controller read the correct Flash Descriptor Signature. If the Flash Descriptor Valid bit is not 1, software cannot use the Hardware Sequencing registers, but must use the software sequencing registers. Any attempt to use the Hardware Sequencing registers will result in the FCERR bit being set.
13	0b RO	Flash Descriptor Override Pin-Strap Status (FDOPSS): This register reflects the value the Flash Descriptor Override Pin-Strap. '1': No override '0': The Flash Descriptor Override strap is set
12:6	0b RO	RSVD0: Reserved
5	0b RO	SPI Cycle In Progress (SCIP): Hardware sets this bit when software sets the Flash Cycle Go (FGO) bit in the Hardware Sequencing Flash Control register. This bit remains set until the cycle completes on the SPI interface. Hardware automatically sets and clears this bit so that software can determine when read data is valid and/or when it is safe to begin programming the next command. Software must only program the next command when this bit is 0.
4:3	00b RO	Block/Sector Erase Size (BERASE): This field identifies the erasable sector size for all Flash components. Valid Bit Settings: 00 : 256 Byte 01 : 4K Byte 10 : 8K Byte 11 : 64K Byte If the FLA (FPBA then this field reflects the value in the LVSCC.LBES register. If the FLA)= FPBA then this field reflects the value in the UVSCC.UBES register.
2	0b RW/1C	Access Error Log (AEL): Hardware sets this bit to a 1 when a direct read was made by BIOS that violated the security restrictions. Or, when a SB transaction to read/write one of the BIOS registers was accepted with bad SAI - see security table. This bit has no affect on indirect accesses. This bit is cleared by software writing a 1.
1	0b RW/1C	Flash Cycle Error (FCERR): Hardware sets this bit to 1 when an program register access is blocked to the FLASH due to one of the protection policies or when any of the programmed cycle registers is written while a programmed access is already in progress. This bit remains asserted until cleared by software writing a 1 or until hardware reset occurs. Software must clear this bit before setting the FLASH Cycle GO bit in this register.

Bit Range	Default & Access	Description
0	0b RW/1C	Flash Cycle Done (FDONE): The SPI controller sets this bit to 1 when the SPI Cycle completes after software previously set the FGO bit. This bit remains asserted until cleared by software writing a 1 or hardware reset. When this bit is set and the SPI SMI# Enable bit is set, an internal signal is asserted to the SMI# generation block. Software must make sure this bit is cleared prior to enabling the SPI SMI# assertion for a new programmed access.

31.5.3 HSFCTL (Hardware_Sequencing_Flash_Control_bios)—Offset 6h

Hardware sequencing flash control.

Access Method

Type: Memory Mapped I/O Register
(Size: 16 bits)

Hardware_Sequencing_Flash_Control_bios: [SPI_BASE_ADDRESS] + 6h

SPI_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)

SPI_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 54h

Default: 0000h

15	12	8	4	0
0	0	0	0	0
FSMIE	RSVD0	FDBC	RRWSP	FCYCLE
				FGO

Bit Range	Default & Access	Description
15	0b RW	Flash SPI SMI# Enable (FSMIE): When set to 1, the SPI asserts an SMI# request whenever the Flash Cycle Done bit is 1.
14	0b RO	RSVD0: Reserved
13:8	00h RW	Flash Data Byte Count (FDBC): This field specifies the number of bytes to shift in or out during the data portion of the SPI cycle. The contents of this register are 0s based with 0b representing 1 byte and 111111b representing 64 bytes. The number of bytes transferred is the value of this field plus 1. This field is ignored for the Block Erase command.
7:3	00h RW	Reserved RW Scratch Pad (RRWSP): Reserved: Scratch Pad bits that are R/W to be used during ECO
2:1	00b RW	FLASH Cycle (FCYCLE): This field defines the Flash SPI cycle type generated to the FLASH when the FGO bit is set as defined below: 00 Read (1 up to 64 bytes by setting FDBC) 01 Reserved 10 Write (1 up to 64 bytes by setting FDBC) 11 Block Erase Implementation Note: if reserved 2'b01 is programmed to this field, flash controller will handle it as if it is 00 (Read)
0	0b RW/SE	Flash Cycle Go (FGO): A write to this register with a 1 in this bit initiates a request to the Flash SPI Arbiter to start a cycle. This register is cleared by hardware when the cycle is granted by the SPI arbiter to run the cycle on the SPI bus. When the cycle is complete, the FDONE bit is set. Software is forbidden to write to any register in the HSFCTL register between the FGO bit getting set and the FDONE bit being cleared. Any attempt to violate this rule will be ignored by hardware. Hardware allows other bits in this register to be programmed for the same transaction when writing this bit to 1. This saves an additional memory write. This bit always returns 0 on reads.

Flash data #1

Access Method

Flash Data 1 bios: [SPI BASE ADDRESS] + 14h

SPI BASE ADDRESS Reference: [B:0, D:31, F:0] + 54h

Power Well: EPW

Default: 00000000h

Bit Range	Default & Access	Description
31:0	00000000h RW	Flash Data 1 (FD1): Similar definition as Flash Data 0. However, this register does not begin shifting until FD0 has completely shifted in/out.

31.5.7 FDATA2 (Flash_Data_2_bios)—Offset 18h

Flash data #2

Access Method

Flash Data 2 bios: [SPI BASE ADDRESS] + 18h

SPI BASE ADDRESS Reference: [B:0, D:31, F:0] + 54h

Power Well: EPW

Default: 00000000h

[illegible]

Bit Range	Default & Access	Description
31:0	00000000h RW	Flash Data 2 (FD2): Similar definition as Flash Data 0. However, this register does not begin shifting until FD1 has completely shifted in/out.

31.5.8 FDATA3 (Flash_Data_3_bios)—Offset 1Ch

Flash data #3

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Flash Data 3 bios: [SPI BASE ADDRESS] + 1Ch

SPI_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)

SPI_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 54h

Power Well: EPW

FD3								

Bit Range	Default & Access	Description
31:0	00000000h RW	Flash Data 3 (FD3): Similar definition as Flash Data 0. However, this register does not begin shifting until FD2 has completely shifted in/out.

31.5.9 FDATA4 (Flash_Data_4_bios)—Offset 20h

Flash data #4

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Flash_Data_4_bios: [SPI_BASE_ADDRESS] + 20h

SPI_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)

SPI BASE ADDRESS Reference: [B:0, D:31, F:0] + 54h

Power Well: EPW

Default: 00000000h

[illegible]

Bit Range	Default & Access	Description
31:0	00000000h RW	Flash Data 4 (FD4): Similar definition as Flash Data 0. However, this register does not begin shifting until FD3 has completely shifted in/out.

31.5.10 FDATA5 (Flash_Data_5_bios)—Offset 24h

Flash data #5

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Flash_Data_5_bios: [SPI_BASE_ADDRESS] + 24h

SPI_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)

SPI_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 54h

Power Well: EPW

Default: 00000000h

BMWAG

BMRAG

BRWA

BRRA

Bit Range	Default & Access	Description
31:24	00h RW/L	BIOS Master Write Access Grant (BMWAG): Each bit [lb]31:24[rb] corresponds to Master[lb]7:0[rb]. BIOS can grant one or more masters write access to the BIOS region 1, overriding the permissions in the Flash Descriptor. Master[lb]1[rb] is Host CPU/BIOS, Master[lb]2[rb] is SEC, Master[lb]3[rb] is GBE. Master[lb]0[rb] and Master[lb]7:4[rb] are reserved. The contents of this register are locked by the FLOCKDN or BMWAGLOCKDN bits.

Flash region 0 (flash descriptor)

Access Method

Flash Region 0 bios: [SPI BASE ADDRESS] + 54h

SPI BASE ADDRESS Reference: [B:0, D:31, F:0] + 54h

Default: 00001FFFh

Bit Range	Default & Access	Description
31:29	0b RO	RSVD0: Reserved
28:16	0000h RO	Region Limit (RL): This specifies address bits 24:12 for the Region 0 Limit. The value in this register is loaded from the contents in the Flash Descriptor.FLREG0.Region Limit
15:13	0b RO	RSVD1: Reserved
12:0	1FFFh RO	Region Base (RB): This specifies address bits 24:12 for the Region 0 Base. The value in this register is loaded from the contents in the Flash Descriptor.FLREG0.Region Base

31.5.23 FREG1 (Flash_Region_1_bios)—Offset 58h

Flash region 1 (BIOS)

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Flash_Region_1_bios: [SPI_BASE_ADDRESS] + 58h

SPI_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)

SPI_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 54h

Default: 00001FFFh

31.5.31 PR4 (Protected_Range_4_bios)—Offset 84h

Protected range #4. This register use for H/W range protection. All register values are coming from soft-straps, and the Write Protection Enable is controlled also by the Flash Security Override Pin Strap

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Protected_Range_4_bios: [SPI_BASE_ADDRESS] + 84h

SPI_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)

SPI_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 54h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
WPE	RSVD0	PRL				RPE	RSVD1	PRB

Bit Range	Default & Access	Description
26:24	000b RW/L	SPI Cycle Frequency (SCF): 000 : 20MHz 001 : 33MHz 010 : 66MHz (reserved - not supported on VLV) 011 : 25MHz (reserved - not supported on VLV) 100 : 50MHz (reserved - not supported on VLV-DC) All Others: Reserved This register sets frequency to use for all SPI Software Sequencing cycles (write, erase, fast read, read status, .etc) except for the Read cycle which always run at 20MHz. This register is locked when the SPI Configuration Lock-Down bit is set or when FREQLOCKDN bit is set.
23	0b RW	SPI SMI# Enable (SME): When set to 1, the SPI asserts an SMI# request whenever the Cycle Done Status bit is 1.
22	0b RW	Data Cycle (DC): When set to 1, there is data that corresponds to this transaction. When 0, no data is delivered for this cycle, and the DBC and data fields themselves are don't cares.
21:16	000000b RW	Data Byte Count (DBC): This field specifies the number of bytes to shift in or out during the data portion of the SPI cycle. The valid settings (in decimal) are any value from 0 to 63. The number of bytes transferred is the value of this field plus 1. Note that when this field is 00_0000b, then there is 1 byte to transfer and that 11_1111b means there are 64 bytes to transfer.
15	0b RO	RSVD0: Reserved
14:12	000b RW	Cycle Opcode Pointer (COP): This field selects one of the programmed opcodes in the Opcode Menu to be used as the SPI Command/Opcode. In the case of an Atomic Cycle Sequence, this determines the second command.
11	0b RW	Sequence Prefix Opcode Pointer (SPOP): This field selects one of the two programmed prefix opcodes for use when performing an Atomic Cycle Sequence. A value of 0 points to the opcode in the least significant byte of the Prefix Opcodes register. By making this programmable, the SPI controller supports flash devices that have different opcodes for enabling writes to the data space vs. status register.
10	0b RW	Atomic Cycle Sequence (ACS): When set to 1 along with the SCGO assertion, the SPI controller will execute a sequence of commands on the SPI interface without allowing the LAN component to arbitrate and interleave cycles. The sequence is composed of:) Atomic Sequence Prefix Command (8-bit opcode only)) Primary Command specified below by software (can include address and data)) Polling the Flash Status Register (opcode 8'h05) until bit 0 becomes 1'b0. The SPI Cycle in Progress bit remains set and the Cycle Done Status bit remains unset until the Busy bit in the Flash Status Register returns 0.
9	0b RW/SE	SPI Cycle Go (SCGO): This bit always returns 1'b0 on reads. However, a write to this register with a 1'b1 in this bit starts the SPI cycle defined by the other bits of this register. The SPI Cycle in Progress (SCIP) bit gets set by this action. Hardware must ignore writes to this bit while the Cycle In Progress bit is set. Hardware allows other bits in this register to be programmed for the same transaction when writing this bit to 1'b1. This saves an additional memory write.
8	0b RO	RSVD1: Reserved
7	0b RO/U	Fast Read Supported (FRS): This bit reflects the value of the Fast Read Support bit in the Flash Descriptor Component Section.
6	0b RO/U	Dual Output Fast Read Supported (DOFRS): This bit reflects the value of the Dual Output Fast Read Support bit in the Flash Descriptor Component Section.
5	0b RO	RSVD2: Reserved
4	0b RO	Access Error Log (AEL): This bit reflects the value of the Hardware Sequencing Status.AEL register.
3	0b RW/1C	Flash Cycle Error (FCERR): Hardware sets this bit to 1'b1 when a programmed access is blocked from running on the SPI interface due to one of the protection policies or when any of the programmed cycle registers is written while a programmed access is already in progress. This bit remains asserted until cleared by software writing a 1'b1 or hardware reset.

Bit Range	Default & Access	Description
2	0b RW/1C	Cycle Done Status (CDS): The SPI controller sets this bit to 1'b1 when the SPI Cycle completes i.e., SCIP bit is 1'b0) after software sets the GO bit. This bit remains asserted until cleared by software writing a 1'b1 or hardware reset. When this bit is set and the SPI SMI# Enable bit is set, an internal signal is asserted to the SMI# generation block. Software must make sure this bit is cleared prior to enabling the SPI SMI# assertion for a new programmed access.
1	0b RO	RSVD3: Reserved
0	0b RO	SPI Cycle In Progress (SCIP): Hardware sets this bit when software sets the SPI Cycle Go bit in the Command register. This bit remains set until the cycle completes on the SPI interface. Hardware automatically sets and clears this bit so that software can determine when read data is valid and/or when it is safe to begin programming the next command. Software must only program the next command when this bit is 1'b0.

31.5.33 PREOP (Prefix Opcode Configuration bios)—Offset 94h

Prefix opcode configuration. This register is not writable when the SPI Configuration Lock-Down bit is set or when the PREOPLOCKDN bit is set.

Access Method

Type: Memory Mapped I/O Register
(Size: 16 bits)

Prefix_Opcode_Configuration_bios: [SPI_BASE_ADDRESS] + 94h

SPI_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)

SPI BASE ADDRESS Reference: [B:0, D:31, F:0] + 54h

Power Well: EPW

Default: 0000h

15			12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
PO1							PO0								

Bit Range	Default & Access	Description
15:8	00h RW/L	Prefix Opcode 1 (PO1): Software programs an SPI opcode into this field that is permitted to run as the first command in an atomic cycle sequence.
7:0	00h RW/L	Prefix Opcode 0 (PO0): Prefix Opcode 0: Software programs an SPI opcode into this field that is permitted to run as the first command in an atomic cycle sequence.

31.5.34 OPTYPE (Opcode_Type_Configuration_bios)—Offset 96h

Opcode type configuration. This register is not writable when the Flash Configuration Lock-Down bit is set or when the OPTYPELOCKDN bit is set. Entries in this register correspond to the entries in the Opcode Menu Configuration register. Note that the definition below only provides write protection for opcodes that have addresses associated with them. Therefore, any erase or write opcodes that do not use an address should be avoided (for example, Chip Erase and Auto-Address Increment Byte Program).

Access Method

Type: Memory Mapped I/O Register
(Size: 16 bits)

Opcode_Type_Configuration_bios: [SPI_BASE_ADDRESS] + 96h

SPI_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)

SPI_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 54h

Power Well: EPW

Default: 0000h

15	12	8	4	0
0	0	0	0	0
OT7	OT6	OT5	OT4	OT3

Bit Range	Default & Access	Description
15:14	00b RW/L	Opcode Type 7 (OT7): See the description for bits 1:0
13:12	00b RW/L	Opcode Type 6 (OT6): See the description for bits 1:0
11:10	00b RW/L	Opcode Type 5 (OT5): See the description for bits 1:0
9:8	00b RW/L	Opcode Type 4 (OT4): See the description for bits 1:0
7:6	00b RW/L	Opcode Type 3 (OT3): See the description for bits 1:0
5:4	00b RW/L	Opcode Type 2 (OT2): See the description for bits 1:0
3:2	00b RW/L	Opcode Type 1 (OT1): See the description for bits 1:0
1:0	00b RW/L	Opcode Type 0 (OT0): This field specifies information about the corresponding Opcode 0. This information allows the hardware to 1) know whether to use the address field and 2) provide BIOS and Shared Flash protection capabilities. The hardware implementation also uses the read vs. write information for modifying the behavior of the SPI interface logic. The encoding of the two bits is: 00 = No Address associated with this Opcode and Read Cycle type 01 = No Address associated with this Opcode and Write Cycle type 10 = Address required, Read cycle type 11 = Address required, Write cycle type

31.5.35 OPMENU0 (Opcode_Menu_Configuration_0_bios)—Offset 98h

Opcode (0-3) Menu Configuration. This register is not writable when the SPI Configuration Lock-Down bit is set or when OPMENULOCKDN bit is set. Four entries are available in this register and four are available in OPMENU1 register to give BIOS a sufficient set of commands for communicating with the flash device, while also restricting what malicious software can do. This keeps the hardware flexible enough to operate with a wide variety of SPI devices. It is recommended that BIOS avoid programming Write Enable opcodes in this menu. Malicious software could then perform writes and erases to the SPI flash without using the atomic cycle mechanism. This could cause functional failures in a shared flash environment. Write Enable opcodes should only be programmed in the Prefix Opcodes.

Access Method

10	1b RW	FCGDIS: Functional clock gating disable, chicken bit for the func_clk_gating FSM
9	0b RW	SBCGCDEF: SideBanb Control Gating Clock Defeature .Clock gate defeature bit which allows the ISM to transition to idle, but prevents the final clock masking from occurring. The value of this bit goes to the 'cgctrl_clkgatedef' port of the SideBand EndPoint
8	1b RW	SBCGEN: SideBanb Control Gating Clock Enable. Clock gate enable which prevents ISM from leaving ACTIVE. Also prevents the clocks from being gated. The value of this bit goes to the 'cgctrl_clkgaten' port of the SideBand EndPoint
7:0	10h RW	SBCGCNT: SideBanb Control Gating Clock Counter. Idle count limit for ISM which is used to determine the block is idle.Recommended value 8'd16 . The value of those bits goes to the 'cgctrl_idlecnt' ports of the SideBand EndPoint

32 PCU – Universal Asynchronous Receiver/Transmitter (UART)

This section describes the Universal Asynchronous Receiver/Transmitter (UART) serial port integrated into the PCU. The UART may be controlled through programmed IO.

Note: Only a minimal ball-count, comprising receive & transmit signals, UART port is implemented. Further, a maximum baud rate of only 115,200 bps is supported. For this reason, it is recommended that the UART port be used for debug purposes only.

32.1 Signal Descriptions

Please see [Chapter 2, "Physical Interfaces"](#) for additional details.

The signal description table has the following headings:

- **Signal Name:** The name of the signal/pin
- **Direction:** The buffer direction can be either input, output, or I/O (bidirectional)
- **Platform Power:** The reference power plane.
- **Description:** A brief explanation of the signal's function

Table 306. UART Signals

Signal Name	Direction Plat. Power	Description
PCU_UART_RXD	I V1P8S	COM1 Receive: Serial data input from device pin to the receive port. <i>This signal is muxed and may be used by other functions.</i>
PCU_UART_TXD	O V1P8S	COM1 Transmit: Serial data output from transmit port to the device pin. <i>This signal is muxed and may be used by other functions.</i>

32.2 Features

The serial port consists of a UART which supports a subset of the functions of the 16550 industry standard.

The UART performs serial-to-parallel conversion on data characters received from a peripheral device and parallel-to-serial conversion on data characters received from the processor. The processor may read the complete status of the UART at any time during the functional operation. Available status information includes the type and condition of the transfer operations being performed by the UART and any error conditions.

The serial port may operate in either FIFO or non-FIFO mode. In FIFO mode, a 16-byte transmit FIFO holds data from the processor to be transmitted on the serial link and a 16-byte Receive FIFO buffers data from the serial link until read by the processor.

The UART includes a programmable baud rate generator which is capable of generating a baud rate of between 50 bps and 115,200 bps from a fixed baud clock input of 1.8432 MHz. The baud rate is calculated as follows:

Baud Rate Calculation:

$$\text{BaudRate} = \frac{1.8432 \times 10^6}{16 \times \text{Divisor}}$$

The divisor is defined by the Divisor Latch LSB and Divisor Latch MSB registers. Some common values are shown in [Table 307](#).

Table 307. Baud Rate Examples

Desired Baud Rate	Divisor	Divisor Latch LSB Register	Divisor Latch MSB Register
115,200	1	1h	0h
57,600	2	2h	0h
38,400	3	3h	0h
19,200	6	6h	0h
9,600	12	Ch	0h
4,800	24	18h	0h
2,400	48	30h	0h
1,200	96	60h	0h
300	384	80h	1h
50	2,304	0h	9h

The UART has interrupt support and those interrupts may be programmed to the user's requirements, minimizing the computing required to handle the communications link. Each UART may operate in a polled or an interrupt driven environment as configured by software.

32.2.1 FIFO Operation

32.2.1.1 FIFO Interrupt Mode Operation

Receiver Interrupt

When the Receive FIFO and receiver interrupts are enabled (FIFO Control Register, bit 0 = 1b and Interrupt Enable Register (IIR), bit 0 = 1b), receiver interrupts occur as follows:

- The receive data available interrupt is invoked when the FIFO has reached its programmed trigger level. The interrupt is cleared when the FIFO drops below the programmed trigger level.
- The IIR receive data available indication also occurs when the FIFO trigger level is reached, and like the interrupt, the bits are cleared when the FIFO drops below the trigger level.
- The receiver line status interrupt (IIR = C6h), as before, has the highest priority. The receiver data available interrupt (IIR = C4h) is lower. The line status interrupt occurs only when the character at the top of the FIFO has errors.
- The COM1_LSR.DR bit is set to 1b as soon as a character is transferred from the shift register to the Receive FIFO. This bit is reset to 0b when the FIFO is empty.

Character Time Out Interrupt

When the receiver FIFO and receiver time out interrupt are enabled, a character time out interrupt occurs when all of the following conditions exist:

- At least one character is in the FIFO.
- The last received character was longer than four continuous character times ago (if 2 stop bits are programmed the second one is included in this time delay).
- The most recent processor read of the FIFO was longer than four continuous character times ago.
- The receiver FIFO trigger level is greater than one.

The maximum time between a received character and a timeout interrupt is 160 ms at 300 baud with a 12-bit receive character (i.e., 1 start, 8 data, 1 parity, and 2 stop bits).

When a time out interrupt occurs, it is cleared and the timer is reset when the processor reads one character from the receiver FIFO. If a time out interrupt has not occurred, the time out timer is reset after a new character is received or after the processor reads the receiver FIFO.

Transmit Interrupt

When the transmitter FIFO and transmitter interrupt are enabled (FIFO Control Register, bit 0 = 1b and Interrupt Enable Register, bit 0 = 1b), transmit interrupts occur as follows:

The Transmit Data Request interrupt occurs when the transmit FIFO is half empty or more than half empty. The interrupt is cleared as soon as the Transmit Holding Register is written (1 to 16 characters may be written to the transmit FIFO while servicing the interrupt) or the Interrupt Identification Register is read.

32.2.1.2 FIFO Polled Mode Operation

With the FIFOs enabled (FIFO Control register, bit 0 = 1b), setting Interrupt Enable register (IER), bits 3:0 = 000b puts the serial port in the FIFO polled mode of operation. Since the receiver and the transmitter are controlled separately, either one or both may be in the polled mode of operation. In this mode, software checks receiver and transmitter status through the Line Status Register (LSR). As stated in the register description:

- LSR[0] is set as long as there is one byte in the receiver FIFO.
- LSR[1] through LSR[4] specify which error(s) has occurred for the character at the top of the FIFO. Character error status is handled the same way as interrupt mode. The Interrupt Identification Register is not affected since IER[2] = 0b.
- LSR[5] indicates when the transmitter FIFO needs data.
- LSR[6] indicates that both the transmitter FIFO and shift register are empty.
- LSR[7] indicates whether there are any errors in the receiver FIFO.

32.3 Use

32.3.1 Base I/O Address

32.3.1.1 COM1

The base I/O address for the COM1 UART is fixed to 3F8h.

32.3.2 Legacy Interrupt

32.3.2.1 COM1

The legacy interrupt assigned to the COM1 UART is fixed to IRQ4.

32.4 UART Enable/Disable

The COM1 UART may be enabled or disabled using the UART_CONT.COM1EN register bit. By default, the UART is disabled.

Note: It is recommended that the UART be disabled during normal platform operation since it is a PIO device and, as such, can prevent residency in lower power states by the processor.

32.5 IO Mapped Registers

There are 12 registers associated with the UART. These registers share eight address locations in the IO address space. Table 308 shows the registers and their addresses as offsets of a base address. Note that the state of the COM1_LCR.DLAB register bit, which is the most significant bit (MSB) of the Serial Line Control register, affects the selection of certain of the UART registers. The COM1_LCR.DLAB register bit must be set high by the system software to access the Baud Rate Generator Divisor Latches.

Table 308. Register Access List

Register Address (Offset to Base IO Address)	COM1_LCR.DLAB B Value	Register Access Type	Register Accessed
0h	0b	RO	Receiver Buffer ¹
0h	0b	WO	Transmitter Holding ¹
0h	1b	RW	Divisor Latch LSB (Lowest Significant Bit) ¹
1h	0b	RW	Interrupt Enable ²
1h	1b	RW	Divisor Latch MSB (Most Significant Bit) ²
2h	xb	RO	Interrupt Identification ³
2h	xb	WO	FIFO Control ³
3h	xb	RW	Line Control
4h	xb	RW	Modem Control ⁴
5h	xb	RO	Line Status
6h	xb	RO	Modem Status ⁴
7h	xb	RW	Scratchpad

Notes:

1. These registers are consolidated in the Receiver Buffer / Transmitter Holding Register (COM1_RX_TX_BUFFER)
2. These registers are consolidated in the Interrupt Enable Register (COM1_IER)
3. These registers are consolidated in the Interrupt Identification / FIFO Control Register (COM1_IIR)
4. These registers are implemented but unused since the UART signals related to modem interaction are not implemented.

32.6 PCU iLB UART IO Registers

Table 309. Summary of PCU iLB UART I/O Registers—

Offset	Size	Register ID—Description	Default Value
3F8h	1	"Receiver Buffer / Transmitter Holding Register (COM1_Rx_Tx_Buffer)—Offset 3F8h" on page 4432	00h

3FEh	1	"Modem Status Register (COM1_MSR)—Offset 3FEh" on page 4438	00h
3FFh	1	"Scratchpad Register (COM1_SCR)—Offset 3FFh" on page 4440	00h

32.6.1 Receiver Buffer / Transmitter Holding Register (COM1_Rx_Tx_Buffer)—Offset 3F8h

This register is a combination of three registers: the receiver buffer register (RBR) that is a read-only register when DLAB=0, the transmitter holding register (THR) that is a write-only register when DLAB=0 and the divisor latch LSB (DLL) register when DLAB=1.

Access Method

Type: I/O Register
(Size: 8 bits)

COM1_Rx_Tx_Buffer: 3F8h

Default: 00h

7			4				0
0	0	0	0	0	0	0	0
				RBR_THR_DLL			

Bit Range	Default & Access	Description																																												
7:0	00h RW	Receiver buffer / transmitter holding (RBR_THR_DLL): When reading from this register and DLAB=1'b0, it contains the byte received if no FIFO is used, or the oldest unread byte with FIFO's. If FIFO buffering is used, each new read action of the register will return the next byte, until no more bytes are present. Bit 0 in the LSR line status register can be used to check if all received bytes have been read. This bit will change to zero if no more bytes are present. When writing to this register and DLAB=1'b0, it is used to buffer outgoing characters. If no FIFO buffering is used, only one character can be stored. Otherwise the amount of characters depends on the type of UART. Bit 5 in the LSR, line status register can be used to check if new information must be written to this register. The value 1'b1 indicates that the register is empty. If FIFO buffering is used, more than one character can be written to the transmitter holding register when the bit signals an empty state. There is no indication of the amount of bytes currently present in the transmitter FIFO. This register is not used to transfer the data directly. The byte is first transferred to a shift register where the information is broken in single bits which are sent one by one. If DLAB=1'b1, this register is used as DLL (Divisor Latch LSB). For generating its timing information, each UART uses an oscillator generating a frequency of about 1.8432 MHz. This frequency is divided by 16 to generate the time base for communication. Because of this division, the maximum allowed communication speed is 115200 bps. Modern UARTS like the 16550 are capable of handling higher input frequencies up to 24 MHz which makes it possible to communicate with a maximum speed of 1.5 Mbps. On PC's higher frequencies than the 1.8432 MHz are rarely seen because this would be software incompatible with the original XT configuration. This 115200 bps communication speed is not suitable for all applications. To change the communication speed, the frequency can be further decreased by dividing it by a programmable value. For very slow communications, this value can go beyond 255. Therefore, the divisor is stored in two separate bytes, the divisor latch registers DLL and DLM which contain the least, and most significant byte. For error free communication, it is necessary that both the transmitting and receiving UART use the same time base. Default values have been defined which are commonly used. The table shows the most common values with the appropriate settings of the divisor latch bytes. Note that these values only hold for a PC compatible system where a clock frequency of 1.8432 MHz is used. <table><thead><tr><th>Speed(bps)</th><th>Divisor</th><th>DLL</th><th>DLM</th></tr></thead><tbody><tr><td>50</td><td>2,304</td><td>0x00</td><td>0x09</td></tr><tr><td>300</td><td>384</td><td>0x80</td><td>0x01</td></tr><tr><td>1,200</td><td>96</td><td>0x60</td><td>0x00</td></tr><tr><td>2,400</td><td>48</td><td>0x30</td><td>0x00</td></tr><tr><td>4,800</td><td>24</td><td>0x18</td><td>0x00</td></tr><tr><td>9,600</td><td>12</td><td>0x0C</td><td>0x00</td></tr><tr><td>19,200</td><td>6</td><td>0x06</td><td>0x00</td></tr><tr><td>38,400</td><td>3</td><td>0x03</td><td>0x00</td></tr><tr><td>57,600</td><td>2</td><td>0x02</td><td>0x00</td></tr><tr><td>115,200</td><td>1</td><td>0x01</td><td>0x00</td></tr></tbody></table>	Speed(bps)	Divisor	DLL	DLM	50	2,304	0x00	0x09	300	384	0x80	0x01	1,200	96	0x60	0x00	2,400	48	0x30	0x00	4,800	24	0x18	0x00	9,600	12	0x0C	0x00	19,200	6	0x06	0x00	38,400	3	0x03	0x00	57,600	2	0x02	0x00	115,200	1	0x01	0x00

32.6.2 Interrupt Enable Register (COM1_IER)—Offset 3F9h

This register is a combination of two registers: the interrupt enable register (IER) when DLAB=0 and the divisor latch MSB (DLM) register when DLAB=1.

Access Method

Type: I/O Register
(Size: 8 bits)

COM1_IER: 3F9h

Default: 00h

7	6	5	4	3	2	1	0
0	0	0	0	0	0	0	0
				IER_DLM			

Bit Range	Default & Access	Description
7:0	00h RW	Interrupt Enable (IER_DLM): If DLAB=1'b0 , This field is used as interrupt enable register. The smartest way to perform serial communications on a PC is using interrupt driven routines. In that configuration, it is not necessary to poll the registers of the UART periodically for state changes. The UART will signal each change by generating a processor interrupt. A software routine must be present to handle the interrupt and to check what state change was responsible for it. Interrupts are not generated, unless the UART is told to do so. This is done by setting bits in the IER, interrupt enable register. A bit value 1 indicates, that an interrupt may take place. Bit Description 0 ERBFI - Enable Received Data Available Interrupt. This is used to enable/disable the generation of Received Data Available Interrupt and the Character Timeout Interrupt (if in FIFO mode and FIFOs enabled). These are the second highest priority interrupts. 1 ETBEI - Enable Transmit Holding Register Empty Interrupt. This is used to enable/disable the generation of Transmitter Holding Register Empty Interrupt. This is the third highest priority interrupt. 2 ELSI - Enable Receiver Line Status Interrupt. This is used to enable/disable the generation of Receiver Line Status Interrupt. This is the highest priority interrupt. 3 EDSSI - Enable Modem Status Interrupt. This is used to enable/disable the generation of Modem Status Interrupt. This is the fourth highest priority interrupt. 4 Reserved and read as zero 5 Reserved and read as zero 6 Reserved and read as zero 7 PTIME - Programmable THRE Interrupt Mode Enable that can be written to only when THRE_MODE_USER == Enabled, always readable. This is used to enable/disable the generation of THRE Interrupt. If DLAB=1'b1 , this register is used as DLM (Divisor Latch MSB). See DLL field description in the Rx_Tx_Buffer register.

32.6.3 Interrupt Identification / FIFO Control Register (COM1_IIR)—Offset 3FAh

This register is a combination of two registers: the interrupt identification register (IIR) that is a read-only register and the FIFO control register (FCR) that is a write-only register. If FIFOs are not implemented, the FIFO control register does not exist and writing to this register address has no effect.

Access Method

Type: I/O Register
(Size: 8 bits)

COM1_IIR: 3FAh

Default: 01h

7	4	0
0	0	0
FERT	TET	IIR

Bit Range	Default & Access	Description
7:6	00b RO	FIFOs Enabled / RCVR Trigger (FERT): Read from this field is used to indicate whether the FIFOs are enabled or disabled. '00' - disabled '11' - enabled Write to this field is used to select the trigger level in the receiver FIFO at which the Received Data Available Interrupt is generated. In auto flow control mode it is used to determine when the rts_n signal is de-asserted. The following trigger levels are supported: '00' - 1 character in the FIFO '01' - FIFO 1/4 full '10' - FIFO 1/2 full '11' - FIFO 2 less than full
5:4	00b RO	TX Empty Trigger (TET): Read from this field is reserved and should return zero Write to this field is used to select the empty threshold level at which the THRE Interrupts are generated when the mode is active. The following trigger levels are supported: '00' - FIFO empty '01' - 2 characters in the FIFO '10' - FIFO 1/4 full '11' - FIFO 1/2 full

Bit Range	Default & Access	Description
3:0	0001b RO	Interrupt ID (IIR): Read from this field indicates the highest priority pending interrupt which can be one of the following types: '0000' - modem status '0001' - no interrupt pending '0010' - THR empty '0100' - received data available '0110' - receiver line status '0111' - busy detect '1100' - character timeout Write to this field is split to four bits: Bit Description 3 DMA Mode, determines the DMA signalling mode used: '0' - mode 0, '1' - mode 1 2 XMIT FIFO Reset, resets the control portion of the transmit FIFO and treats the FIFO as empty. 1 RCVR FIFO Reset, resets the control portion of the receive FIFO and treats the FIFO as empty. 0 FIFO Enable. This enables/disables the transmit (XMIT) and receive (RCVR) FIFOs. Whenever the value of this bit is changed both the XMIT and RCVR controller portion of FIFOs is reset.

32.6.4 Line Control Register (COM1_LCR)—Offset 3FBh

The LCR, line control register is used at initialisation to set the communication parameters. Parity and number of data bits can be changed for example. The register also controls the accessibility of the DLL and DLM registers. These registers are mapped to the same I/O port as the RBR, THR and IER registers. Because they are only accessed at initialisation when no communication occurs this register swapping has no influence on performance.

Access Method

Type: I/O Register
(Size: 8 bits)

COM1_LCR: 3FBh

Default: 00h

7			4				0
0	0	0	0	0	0	0	0
DLAB	BC	SP	EPS	PEN	STOP		DLS

Bit Range	Default & Access	Description
7	0b RW	Divisor Latch Access Bit (DLAB): This field is used to enable reading and writing of the Divisor Latch register (DLL and DLH) to set the baud rate of the UART. This bit must be cleared after initial baud rate setup in order to access other registers. '0' - RBR, THR and IER accessible '1' - DLL and DLM accessible See Rx_Tx_Buffer and IER registers description for more details.
6	0b RW	Break Control (BC): This is used to cause a break condition to be transmitted to the receiving device. If set to one the serial output is forced to the spacing (logic 0) state. When not in Loopback Mode, as determined by MCR[4], the serial output is forced low until the Break bit is cleared. If SIR_MODE == Enabled and active (MCR[6] set to one) the sir_out_n line is continuously pulsed. When in Loopback Mode, the break condition is internally looped back to the receiver and the sir_out_n line is forced low.
5	0b RO	Stick Parity (SP): Reserved and read as zero
4	0b RW	Even Parity Select (EPS): This is used to select between even and odd parity, when parity is enabled (PEN set to one). If set to one, an even number of logic 1s is transmitted or checked. If set to zero, an odd number of logic 1s is transmitted or checked.
3	0b RW	Parity Enable (PEN): This is used to enable and disable parity generation and detection in transmitted and received serial character respectively. '0' - parity disabled '1' - parity enabled

Bit Range	Default & Access	Description
2	0b RW	Number of Stop bits (STOP): This is used to select the number of stop bits per character that the peripheral transmits and receives. If set to zero, one stop bit is transmitted in the serial data. If set to one and the data bits are set to 5 (LCR[1:0] set to zero) one and a half stop bits is transmitted. Otherwise, two stop bits are transmitted. Note that regardless of the number of stop bits selected, the receiver checks only the first stop bit. '0' - 1 stop bit '1' - 1.5 stop bits when DLS (LCR[1:0]) is zero, else 2 stop bit
1:0	00b RW	Data Length Select (DLS): This is used to select the number of data bits per character that the peripheral transmits and receives. The number of bit that may be selected areas follows: '00' - 5 bits '01' - 6 bits '10' - 7 bits '11' - 8 bits

32.6.5 Modem Control Register (COM1_MCR)—Offset 3FCh

The MCR, modem control register is used to perform handshaking actions with the attached device. In the original UART series including the 16550, setting and resetting of the control signals must be done by software. The new 16750 is capable of handling flow control automatically, thereby reducing the load on the processor.

Access Method

Type: I/O Register
(Size: 8 bits)

COM1_MCR: 3FCh

Default: 00h

7			4				0
0	0	0	0	0	0	0	0
RSVD0	SIRE	AFCE	LB	OUT2	OUT1	RTS	DTR

Bit Range	Default & Access	Description
7	0b RO	RSVD0: Reserved
6	0b RW	SIR Mode Enable (SIRE): Writeable only when SIR_MODE == Enabled, always readable. This is used to enable/disable the IrDA SIR Mode features as described in 'IrDA 1.0 SIR Protocol' on Synopsys UART specification. '0' - IrDA SIR Mode disabled '1' - IrDA SIR Mode enabled
5	0b RW	Auto Flow Control Enable (AFCE): Writeable only when AFCE_MODE == Enabled, always readable. When FIFOs are enabled and the Auto Flow Control Enable (AFCE) bit is set, Auto Flow Control features are enabled as described in 'Auto Flow Control' on Synopsys UART specification. '0' - Auto Flow Control Mode disabled '1' - Auto Flow Control Mode enabled
4	0b RW	LoopBack (LB): This is used to put the UART into a diagnostic mode for test purposes. If operating in UART mode (SIR_MODE != Enabled or not active, MCR[6] set to zero), data on the sout line is held high, while serial data output is looped back to the sin line, internally. In this mode all the interrupts are fully functional. Also, in loopback mode, the modem control inputs (dsr_n, cts_n, ri_n, dcd_n) are disconnected and the modem control outputs (dtr_n, rts_n, out1_n, out2_n) are looped back to the inputs, internally. If operating in infrared mode (SIR_MODE == Enabled AND active, MCR[6] set to one), data on the sir_out_n line is held low, while serial data output is inverted and looped back to the sir_in line.
3	0b RW	Auxiliary output 2 (OUT2): This is used to directly control the user-designated Output2 (out2_n) output. The value written to this location is inverted and driven out on out2_n, that is: '0' - out2_n de-asserted (logic 1) '1' - out2_n asserted (logic 0) Note that in Loopback mode (MCR[4] set to one), the out2_n output is held inactive high while the value of this location is internally looped back to an input.

Bit Range	Default & Access	Description
2	0b RW	Auxiliary output 1 (OUT1): This is used to directly control the user-designated Output1 (out1_n) output. The value written to this location is inverted and driven out on out1_n, that is: '0' - out1_n de-asserted (logic 1) '1' - out1_n asserted (logic 0) Note that in Loopback mode (MCR[4] set to one), the out1_n output is held inactive high while the value of this location is internally looped back to an input.
1	0b RW	Request to Send (RTS): This is used to directly control the Request to Send (rts_n) output. The Request To Send (rts_n) output is used to inform the modem or data set that the UART is ready to exchange data. When Auto RTS Flow Control is not enabled (MCR[5] set to zero), the rts_n signal is set low by programming MCR[1] (RTS) to a high. In Auto Flow Control, AFCE_MODE == Enabled and active (MCR[5] set to one) and FIFOs enable (FCR[0] set to one), the rts_n output is controlled in the same way, but is also gated with the receiver FIFO threshold trigger (rts_n is inactive high when above the threshold). The rts_n signal is de-asserted when MCR[1] is set low. Note that in Loopback mode (MCR[4] set to one), the rts_n output is held inactive high while the value of this location is internally looped back to an input. Note that PCU-UART does not implement the Request to Send (rts_n) output.
0	0b RW	Data Terminal Ready (DTR): This is used to directly control the Data Terminal Ready (dtr_n) output. The value written to this location is inverted and driven out on dtr_n, that is: '0' - dtr_n de-asserted (logic 1) '1' - dtr_n asserted (logic 0) The Data Terminal Ready output is used to inform the modem or data set that the UART is ready to establish communications. Note that in Loopback mode (MCR[4] set to one), the dtr_n output is held inactive high while the value of this location is internally looped back to an input. Note that PCU-UART does not implement the Data Terminal Ready (dtr_n) output.

32.6.6 Line Status Register (COM1_LSR)—Offset 3FDh

The LSR, line status register shows the current state of communication. Errors are reflected in this register. The state of the receive and transmit buffers is also available.

Access Method

Type: I/O Register
(Size: 8 bits)

COM1_LSR: 3FDh

Default: 60h

7	4	0
0	1	0
RFE	TEMT	THRE
BI	FE	PE
OE	DR	

Bit Range	Default & Access	Description
7	0b RO	Receiver FIFO Error (RFE): This bit is only relevant when FIFO_MODE != NONE AND FIFOs are enabled (FCR[0] set to one). This is used to indicate if there is at least one parity error, framing error, or break indication in the FIFO. '0' - no error in RX FIFO '1' - error in RX FIFO This bit is cleared when the LSR is read and the character with the error is at the top of the receiver FIFO and there are no subsequent errors in the FIFO.
6	1b RO	Transmitter Empty (TEMT): If in FIFO mode (FIFO_MODE != NONE) and FIFOs enabled (FCR[0] set to one), this bit is set whenever the Transmitter Shift Register and the FIFO are both empty. If in non-FIFO mode or FIFOs are disabled, this bit is set whenever the Transmitter Holding Register and the Transmitter Shift Register are both empty.

Bit Range	Default & Access	Description
5	1b RO	Transmit Holding Register Empty (THRE): If THRE_MODE_USER == Disabled or THRE mode is disabled (IER[7] set to zero) and regardless of FIFO's being implemented/enabled or not, this bit indicates that the THR or TX FIFO is empty. This bit is set whenever data is transferred from the THR or TX FIFO to the transmitter shift register and no new data has been written to the THR or TX FIFO. This also causes a THRE Interrupt to occur, if the THRE Interrupt is enabled. If THRE_MODE_USER == Enabled AND FIFO_MODE != NONE and both modes are active (IER[7] set to one and FCR[0] set to one respectively), the functionality is switched to indicate the transmitter FIFO is full, and no longer controls THRE interrupts, which are then controlled by the FCR[5:4] threshold setting.
4	0b RO	Break Interrupt (BI): This is used to indicate the detection of a break sequence on the serial input data. If in UART mode (SIR_MODE == Disabled), it is set whenever the serial input, sin, is held in a logic '0' state for longer than the sum of start time + data bits + parity + stop bits. If in infrared mode (SIR_MODE == Enabled), it is set whenever the serial input, sir_in, is continuously pulsed to logic '0' for longer than the sum of start time + data bits + parity + stop bits. A break condition on serial input causes one and only one character, consisting of all zeros, to be received by the UART. In the FIFO mode, the character associated with the break condition is carried through the FIFO and is revealed when the character is at the top of the FIFO. Reading the LSR clears the BI bit. In the non-FIFO mode, the BI indication occurs immediately and persists until the LSR is read.
3	0b RO	Framing Error (FE): This is used to indicate the occurrence of a framing error in the receiver. A framing error occurs when the receiver does not detect a valid STOP bit in the received data. In the FIFO mode, since the framing error is associated with a character received, it is revealed when the character with the framing error is at the top of the FIFO. When a framing error occurs, the UART tries to resynchronize. It does this by assuming that the error was due to the start bit of the next character and then continues receiving the other bit i.e. data, and/or parity and stop. It should be noted that the Framing Error (FE) bit (LSR[3]) is set if a break interrupt has occurred, as indicated by Break Interrupt (BI) bit (LSR[4]). '0' - no framing error '1' - framing error Reading the LSR clears the FE bit.
2	0b RO	Parity Error (PE): This is used to indicate the occurrence of a parity error in the receiver if the Parity Enable (PEN) bit (LCR[3]) is set. In the FIFO mode, since the parity error is associated with a character received, it is revealed when the character with the parity error arrives at the top of the FIFO. It should be noted that the Parity Error (PE) bit (LSR[2]) is set if a break interrupt has occurred, as indicated by Break Interrupt (BI) bit (LSR[4]). '0' - no parity error '1' - parity error Reading the LSR clears the PE bit.
1	0b RO	Overrun Error (OE): This is used to indicate the occurrence of an overrun error. This occurs if a new data character was received before the previous data was read. In the non-FIFO mode, the OE bit is set when a new character arrives in the receiver before the previous character was read from the RBR. When this happens, the data in the RBR is overwritten. In the FIFO mode, an overrun error occurs when the FIFO is full and a new character arrives at the receiver. The data in the FIFO is retained and the data in the receive shift register is lost. '0' - no overrun error '1' - overrun error Reading the LSR clears the OE bit.
0	0b RO	Data Ready (DR): This is used to indicate that the receiver contains at least one character in the RBR or the receiver FIFO. '0' - no data ready '1' - data ready This bit is cleared when the RBR is read in non-FIFO mode, or when the receiver FIFO is empty, in FIFO mode.

32.6.7 Modem Status Register (COM1_MSR)—Offset 3FEh

The MSR, modem status register contains information about the four incoming modem control lines on the device. The information is split in two nibbles. The four most significant bits contain information about the current state of the inputs where the least significant bits are used to indicate state changes. The four LSB's are reset, each time the register is read. Whenever bits 0, 1, 2 or 3 are set to logic one, to indicate a change on the modem control inputs, a modem status interrupt is generated if enabled through the IER, regardless of when the change occurred. Since the delta

bits (bits 0, 1, 3) can get set after a reset if their respective modem signals are active (see individual bits for details), a read of the MSR after reset can be performed to prevent unwanted interrupts.

Access Method

Type: I/O Register
(Size: 8 bits)

COM1_MSR: 3FEh

Default: 00h

7				4				0
0	0	0	0	0	0	0	0	0
DCD	RI	DSR	CTS	DDCD	TERI	DDSR	DCTS	

Bit Range	Default & Access	Description
7	0b RO	Data Carrier Detect (DCD): This is used to indicate the current state of the modem control line dcd_n. This bit is the complement of dcd_n. When the Data Carrier Detect input (dcd_n) is asserted it is an indication that the carrier has been detected by the modem or data set. '0' - dcd_n input is de-asserted (logic 1) '1' - dcd_n input is asserted (logic 0) In Loopback Mode (MCR[4] set to one), DCD is the same as MCR[3] (Out2). Note that PCU-UART does not implement the Data Carrier Detect (dcd_n) input.
6	0b RO	Ring Indicator (RI): This is used to indicate the current state of the modem control line ri_n. This bit is the complement of ri_n. When the Ring Indicator input (ri_n) is asserted it is an indication that a telephone ringing signal has been received by the modem or data set. '0' - ri_n input is de-asserted (logic 1) '1' - ri_n input is asserted (logic 0) In Loopback Mode (MCR[4] set to one), RI is the same as MCR[2] (Out1). Note that PCU-UART does not implement the Ring Indicator (ri_n) input.
5	0b RO	Data Set Ready (DSR): This is used to indicate the current state of the modem control line dsr_n. This bit is the complement of dsr_n. When the Data Set Ready input (dsr_n) is asserted it is an indication that the modem or data set is ready to establish communications with the DW_apb_uart. '0' - dsr_n input is de-asserted (logic 1) '1' - dsr_n input is asserted (logic 0) In Loopback Mode (MCR[4] set to one), DSR is the same as MCR[0] (DTR). Note that PCU-UART does not implement the Data Set Ready (dsr_n) input.
4	0b RO	Clear to Send (CTS): This is used to indicate the current state of the modem control line cts_n. This bit is the complement of cts_n. When the Clear to Send input (cts_n) is asserted it is an indication that the modem or data set is ready to exchange data with the DW_apb_uart. '0' - cts_n input is de-asserted (logic 1) '1' - cts_n input is asserted (logic 0) In Loopback Mode (MCR[4] = 1), CTS is the same as MCR[1] (RTS). Note that PCU-UART does not implement the Clear to Send (cts_n) input.
3	0b RO	Delta Data Carrier Detect (DDCD): This is used to indicate that the modem control line dcd_n has changed since the last time the MSR was read. '0' - no change on dcd_n since last read of MSR '1' - change on dcd_n since last read of MSR Reading the MSR clears the DDCD bit. In Loopback Mode (MCR[4] = 1), DDCCD reflects changes on MCR[3] (Out2). Note, if the DDCCD bit is not set and the dcd_n signal is asserted (low) and a reset occurs (software or otherwise), then the DDCCD bit is set when the reset is removed if the dcd_n signal remains asserted. Note that PCU-UART does not implement the Data Carrier Detect (dcd_n) input.
2	0b RO	Trailing Edge of Ring Indicator (TERI): This is used to indicate that a change on the input ri_n (from an active-low to an inactive-high state) has occurred since the last time the MSR was read. '0' - no change on ri_n since last read of MSR '1' - change on ri_n since last read of MSR Reading the MSR clears the TERI bit. In Loopback Mode (MCR[4] = 1), TERI reflects when MCR[2] (Out1) has changed state from a high to a low. Note that PCU-UART does not implement the Ring Indicator (ri_n) input.

Bit Range	Default & Access	Description
1	0b RO	Delta Data Set Ready (DDSR): This is used to indicate that the modem control line dsr_n has changed since the last time the MSR was read. '0' - no change on dsr_n since last read of MSR '1' - change on dsr_n since last read of MSR Reading the MSR clears the DDSR bit. In Loopback Mode (MCR[4] = 1), DDSR reflects changes on MCR[0] (DTR). Note, if the DDSR bit is not set and the dsr_n signal is asserted (low) and a reset occurs (software or otherwise), then the DDSR bit is set when the reset is removed if the dsr_n signal remains asserted. Note that PCU-UART does not implement the Data Set Ready (dsr_n) input.
0	0b RO	Delta Clear to Send (DCTS): This is used to indicate that the modem control line cts_n has changed since the last time the MSR was read. '0' - no change on cts_n since last read of MSR '1' - change on cts_n since last read of MSR Reading the MSR clears the DCTS bit. In Loopback Mode (MCR[4] = 1), DCTS reflects changes on MCR[1] (RTS). Note, if the DCTS bit is not set and the cts_n signal is asserted (low) and a reset occurs (software or otherwise), then the DCTS bit is set when the reset is removed if the cts_n signal remains asserted. Note that PCU-UART does not implement the Clear to Send (cts_n) input.

32.6.8 Scratchpad Register (COM1_SCR)—Offset 3FFh

Access Method

Type: I/O Register
(Size: 8 bits)

COM1_SCR: 3FFh

Default: 00h

7	4	0
0	0	0
SC		

Bit Range	Default & Access	Description
7:0	00h RW	Scratchpad (SC): This register is for programmers to use as a temporary storage space.

33 PCU – System Management Bus (SMBus)

The SoC provides a System Management Bus (SMBus) 2.0 host controller. The host controller provides a mechanism for the processor to initiate communications with SMBus peripherals (slaves). The SoC is also capable of operating in a mode in which it can communicate with I²C compatible devices.

The SoC can perform SMBus messages with packet error checking (PEC) enabled or disabled. The actual PEC calculation and checking can be performed in either hardware or software.

The SMBus Address Resolution Protocol (ARP) is supported by using the existing host controller commands through software, except for the Host Notify command (which is actually a received message).

The programming model of the host controller is combined into two portions: a PCI configuration portion, and a system I/O mapped portion. All static configuration, such as the I/O base address, is done using the PCI configuration space. Real-time programming of the Host interface is done in system I/O space.

33.1 Signal Descriptions

Please see [Chapter 2, "Physical Interfaces"](#) for additional details.

The signal description table has the following headings:

- **Signal Name:** The name of the signal/pin
- **Direction:** The buffer direction can be either input, output, or I/O (bidirectional)
- **Platform Power:** The reference power plane.
- **Description:** A brief explanation of the signal's function

Table 310. SMBus Signal Names

Signal Name	Direction Plat. Power	Description
PCU_SMB_ALERT#	I/OD V1P8S	SMBus Alert: This signal is used to generate internal SMI#. <i>This signal is muxed and may be used by other functions.</i>
PCU_SMB_CLK	I/OD V1P8S	SMBus Clock: External pull-up resistor is required. <i>This signal is muxed and may be used by other functions.</i>
PCU_SMB_DATA	I/OD V1P8S	SMBus Data: External pull-up resistor is required. <i>This signal is muxed and may be used by other functions.</i>

33.2 Features

33.2.1 Host Controller

The SMBus host controller is used to send commands to other SMBus slave devices. Software sets up the host controller with an address, command, and, for writes, data and optional PEC; and then tells the controller to start. When the controller has finished transmitting data on writes, or receiving data on reads, it generates an SMI# or interrupt, if enabled.

The host controller supports 8 command protocols of the SMBus interface (see *System Management Bus (SMBus) Specification, Version 2.0*): Quick Command, Send Byte, Receive Byte, Write Byte/Word, Read Byte/Word, Process Call, Block Read/Write and Block Write-Block Read Process Call. Additionally, it supports 1 command protocol for I²C devices: I²C Read.

The SMBus host controller requires that the various data and command fields be setup for the type of command to be sent. When software sets the START bit, the SMBus Host controller performs the requested transaction, and interrupts the processor (or generates an SMI#) when the transaction is completed. Once a START command has been issued, the values of the “active registers” (Host Control (SMB_Mem_HCTL), Host Command (SMB_Mem_HCMD), Transmit Slave Address (SMB_Mem_TSA), Data 0 (SMB_Mem_HD0), Data 1 (SMB_Mem_HD1)) should not be changed or read until the interrupt status message (SMB_Mem_HSTS.INTR) has been set (indicating the completion of the command). Any register values needed for computation purposes should be saved prior to issuing of a new command, as the SMBus host controller updates all registers while completing the new command.

33.2.1.1 Command Protocols

In all of the following commands, the Host Status (SMB_Mem_HSTS) register is used to determine the progress of the command. While the command is in operation, the SMB_Mem_HSTS.HBSY bit is set. If the command completes successfully, the SMB_Mem_HSTS.INTR bit will be set. If the device does not respond with an

acknowledge, and the transaction times out, the SMB_Mem_HSTS.DEVERR bit is set. If software sets the SMB_Mem_HCTL.KILL bit while the command is running, the transaction will stop and the SMB_Mem_HSTS.FAILED bit will be set.

Quick Command

When programmed for a Quick Command, the Transmit Slave Address (SMB_Mem_TSA) register is sent. The PEC byte is never appended to the Quick Protocol. Software should force the SMB_Config_HCTL.PECEN bit to 0b when performing the Quick Command. Software must force the SMB_Config_HCFG.I2C_EN bit to 0b when running this command. See section 5.5.1 of the *System Management Bus (SMBus) Specification*, Version 2.0 for the format of the protocol.

Send Byte / Receive Byte

For the Send Byte command, the Transmit Slave Address (SMB_Mem_TSA) and Host Command (SMB_Mem_HCMTD) registers are sent. For the Receive Byte command, the Transmit Slave Address (SMB_Mem_TSA) register is sent. The data received is stored in the Data 0 (SMB_Mem_HD0) register. Software must force the SMB_Config_HCFG.I2C_EN bit to 0b when running this command.

The Receive Byte is similar to a Send Byte, the only difference is the direction of data transfer. See sections 5.5.2 and 5.5.3 of the *System Management Bus (SMBus) Specification*, Version 2.0 for the format of the protocol.

Write Byte/Word

The first byte of a Write Byte/Word access is the command code. The next 1 or 2 bytes are the data to be written. When programmed for a Write Byte/Word command, the Transmit Slave Address (SMB_Mem_TSA), Host Command (SMB_Mem_HCMTD), and Data 0 (SMB_Mem_HD0) registers are sent. In addition, the Data 1 (SMB_Mem_HD1) register is sent on a Write Word command. Software must force the SMB_Config_HCFG.I2C_EN bit to 0 when running this command. See section 5.5.4 of the *System Management Bus (SMBus) Specification*, Version 2.0 for the format of the protocol.

Read Byte/Word

Reading data is slightly more complicated than writing data. First the SoC must write a command to the slave device. Then it must follow that command with a repeated start condition to denote a read from that device's address. The slave then returns 1 or 2 bytes of data. Software must force the SMB_Config_HCFG.I2C_EN bit to 0b when running this command.

When programmed for the read byte/word command, the Transmit Slave Address (SMB_Mem_TSA) and Host Command (SMB_Mem_HCMTD) registers are sent. Data is received into the Data 0 (SMB_Mem_HD0) on the read byte, and the Data 0

(SMB_Mem_HD0) and Data 1 (SMB_Mem_HD1) registers on the read word. See section 5.5.5 of the *System Management Bus (SMBus) Specification*, Version 2.0 for the format of the protocol.

Process Call

The process call is so named because a command sends data and waits for the slave to return a value dependent on that data. The protocol is simply a Write Word followed by a Read Word, but without a second command or stop condition.

When programmed for the Process Call command, the SoC transmits the Transmit Slave Address (SMB_Mem_TSA), Host Command (SMB_Mem_HCMD), Data 0 (SMB_Mem_HD0) and Data 1 (SMB_Mem_HD1) registers. Data received from the device is stored in the Data 0 (SMB_Mem_HD0) and Data 1 (SMB_Mem_HD1) registers. The Process Call command with SMB_Config_HCFG.I2C_EN set and the SMB_Config_HCTL.PECEN bit set produces undefined results. Software must force either SMB_Config_HCFG.I2C_EN or SMB_Config_HCTL.PECEN & SMB_Mem_AUXC.AAC to 0b when running this command. See section 5.5.6 of the *System Management Bus (SMBus) Specification*, Version 2.0 for the format of the protocol.

Note: For process call command, the value written into SMB_Mem_TSA.RW needs to be 0b.

Note: If the SMB_Config_HCFG.I2C_EN bit is set, the protocol sequence changes slightly: the Command Code (Bits 18:11 in the bit sequence) are not sent - as a result, the slave will not acknowledge (Bit 19 in the sequence).

Block Read/Write

The SoC contains a 32-byte buffer for read and write data which can be enabled by setting SMB_Mem_AUXC.E32B, as opposed to a single byte of buffering. This 32-byte buffer is filled with write data before transmission, and filled with read data on reception. In the SoC, the interrupt is generated only after a transmission or reception of 32 bytes, or when the entire byte count has been transmitted/received.

Note: When operating in I²C mode (SMB_Config_HCFG.I2C_EN bit is set), the SoC will never use the 32-byte buffer for any block commands.

The byte count field is transmitted but ignored by the SoC as software will end the transfer after all bytes it cares about have been sent or received.

For a Block Write, software must either force the SMB_Config_HCFG.I2C_EN bit or both the SMB_Config_HCTL.PECEN and SMB_Mem_AUXC.AAC bits to 0b when running this command.

The block write begins with a slave address and a write condition. After the command code the SoC issues a byte count describing how many more bytes will follow in the message. If a slave had 20 bytes to send, the first byte would be the number 20 (14h), followed by 20 bytes of data. The byte count may not be 0. A Block Read or Write is allowed to transfer a maximum of 32 data bytes.

When programmed for a block write command, the Transmit Slave Address (SMB_Mem_TSA), Host Command (SMB_Mem_HCMD) and Data 0 (SMB_Mem_HD0) registers are sent. Data is then sent from the Host Block Data (SMB_Mem_HBD) register; the total data sent being the value stored in the Data 0 (SMB_Mem_HD0) register. On block read commands, the first byte received is stored in the Data 0 (SMB_Mem_HD0) register, and the remaining bytes are stored in the Host Block Data (SMB_Mem_HBD) register. See section 5.5.7 of the *System Management Bus (SMBus) Specification*, Version 2.0 for the format of the protocol.

Note: For Block Write, if the SMB_Config_HCFG.I2C_EN bit is set, the format of the command changes slightly. The SoC will still send the number of bytes (on writes) or receive the number of bytes (on reads) indicated in the Data 0 (SMB_Mem_HD0) register. However, it will not send the contents of the Data 0 (SMB_Mem_HD0) register as part of the message. Also, the Block Write protocol sequence changes slightly: the Byte Count (bits 27:20 in the bit sequence) are not sent - as a result, the slave will not acknowledge (bit 28 in the sequence).

Block Write–Block Read Process Call

The block write-block read process call is a two-part message. The call begins with a slave address and a write condition. After the command code the host issues a write byte count (M) that describes how many more bytes will be written in the first part of the message. If a master has 6 bytes to send, the byte count field will have the value 6 (0000 0110b), followed by the 6 bytes of data. The write byte count (M) cannot be 0.

The second part of the message is a block of read data beginning with a repeated start condition followed by the slave address and a Read bit. The next byte is the read byte count (N), which may differ from the write byte count (M). The read byte count (N) cannot be 0.

The combined data payload must not exceed 32 bytes. The byte length restrictions of this process call are summarized as follows:

- $M \geq 1$ byte
- $N \geq 1$ byte
- $M + N \leq 32$ bytes

The read byte count does not include the PEC byte. The PEC is computed on the total message beginning with the first slave address and using the normal PEC computational rules. It is highly recommended that a PEC byte be used with the Block Write-Block Read Process Call. Software must do a read to the Host Command (SMB_Mem_HCMD) register to reset the 32 byte buffer pointer prior to reading the Host Block Data (SMB_Mem_HBD) register.

Note that there is no STOP condition before the repeated START condition, and that a NACK signifies the end of the read transfer.

Note: The SMB_Mem_AUXC.E32B bit in the Auxiliary Control register must be set when using this protocol.

See section 5.5.8 of the *System Management Bus (SMBus) Specification, Version 2.0* for the format of the protocol.

I²C Read

This command allows the SoC to perform block reads to certain I²C devices, such as serial EEPROMs. The SMBus Block Read supports the 7-bit addressing mode only.

However, this does not allow access to devices using the I²C “Combined Format” that has data bytes after the address. Typically these data bytes correspond to an offset (address) within the serial memory chips.

Note: This command is supported independent of the setting of the SMB_Config_HCFG.I2C_EN bit. The I²C Read command with the SMB_Config_HCTL.PECEN bit set produces undefined results. Software must force both the SMB_Config_HCTL.PECEN and SMB_Mem_AUXC.AAC bit to 0b when running this command.

For I²C Read command, the value written into SMB_Mem_TSA.RW needs to be 1b. The format that is used for the command is shown in below table.

Table 311. I²C Block Read

Bit	Description
1	Start
8:2	Slave Address – 7 bits
9	Write
10	Acknowledge from slave
18:11	Send Data 1 (SMB_Mem_HD1) register
19	Acknowledge from slave
20	Repeated Start
27:21	Slave Address – 7 bits
28	Read
29	Acknowledge from slave
37:30	Data byte 1 from slave – 8 bits
38	Acknowledge
46:39	Data byte 2 from slave – 8 bits
47	Acknowledge
–	Data bytes from slave / Acknowledge
–	Data byte N from slave – 8 bits
–	NOT Acknowledge
–	Stop

The SoC will continue reading data from the peripheral until the NAK is received.

33.2.2 Bus Arbitration

Several masters may attempt to get on the bus at the same time by driving the PCU_SMB_DATA line low to signal a start condition. The SoC continuously monitors the PCU_SMB_DATA line. When the SoC is attempting to drive the bus to a 1 by letting go of the PCU_SMB_DATA line, and it samples PCU_SMB_DATA low, then some other master is driving the bus and the SoC will stop transferring data.

If the SoC sees that it has lost arbitration, the condition is called a collision. The SoC will set SMB_Mem_HSTS.BERR, and if enabled, generate an interrupt or SMI#. The processor is responsible for restarting the transaction.

The SoC, as a SMBus master, drives the clock. When the SoC is sending address or command or data bytes on writes, it drives data relative to the clock it is also driving. It will not start toggling the clock until the start or stop condition meets proper setup and hold time. The SoC will also ensure minimum time between SMBus transactions as a master.

33.2.3 Bus Timing

33.2.3.1 Clock Stretching

Some devices may not be able to handle their clock toggling at the rate that the SoC as an SMBus master would like. They have the capability of stretching the low time of the clock. When the SoC attempts to release the clock (allowing the clock to go high), the clock will remain low for an extended period of time.

The SoC monitors the SMBus clock line after it releases the bus to determine whether to enable the counter for the high time of the clock. While the bus is still low, the high time counter must not be enabled. Similarly, the low period of the clock can be stretched by an SMBus master if it is not ready to send or receive data.

33.2.3.2 Bus Time Out (SoC as SMBus Master)

If there is an error in the transaction, such that an SMBus device does not signal an acknowledge, or holds the clock lower than the allowed time-out time, the transaction will time out. The SoC will discard the cycle and set the SMB_Mem_HSTS.DEVERR bit. The time out minimum is 25 ms (800 RTC clocks). The time-out counter inside the SoC will start after the last bit of data is transferred by the SoC and it is waiting for a response.

The 25-ms time-out counter will not count under the following conditions:

1. The SMB_Mem_HSTS.BYTE_DONE_STS bit is set
2. The TCO_STS.SECOND_TO_STS bit is not set (this indicates that the system has not locked up).

33.2.4 Interrupts / SMI#

The SoC SMBus controller uses INTB as its virtual interrupt wire. However, the system can alternatively be set up to generate SMI# instead of an interrupt, by setting the SMB_Config_HCFG.SMI_EN bit.

Below tables specify how the various enable bits in the SMBus function control the generation of the interrupt and Host SMI internal signals. The rows in the tables are additive, which means that if more than one row is true for a particular scenario then the Results for all of the activated rows will occur.

Table 312. Enable for PCU_SMB_ALERT#

Event	SMB_Mem_HCTL.INTREN	SMB_Config_HCFG.SMI_EN	SMB_Mem_SCMD.SMBALTDIS	Result
PCU_SMB_ALERT# asserted low (always reported in SMB_Mem_HSTS.SMBALERT)	X	1	0	Slave SMI# generated (SMBUS_SMI_STS)
	1	0	0	Interrupt generated

Table 313. Enables for SMBus Host Events

Event	SMB_Mem_HCTL.INTREN	SMB_Config_HCFG.SMI_EN	Event
Any combination of SMB_Mem_HSTS.FAILED, SMB_Mem_HSTS.BERR, SMB_Mem_HSTS.DEVERR, SMB_Mem_HSTS.INTR asserted	0	X	None
	1	0	Interrupt generated
	1	1	Host SMI# generated

Table 314. Enables for the Host Notify Command

SMB_Mem_SCMD.HNINTREN	SMB_Config_HCFG.SMI_EN	SMB_Mem_SCMD.HNWAKEEN	Result
0	X	0	None
1	0	X	Interrupt generated
1	1	X	Slave SMI# generated (SMBUS_SMI_STS)

33.2.5 PCU_SMB_ALERT#

PCU_SMB_ALERT# is multiplexed with GPIO_S0_SC[53]. When enabled and the signal is asserted, the SoC can generate an interrupt or an SMI#.

Note: Using this signal as a wake event from is not supported.

33.2.6 SMBus CRC Generation and Checking

If the SMB_Mem_AUXC.AAC is set, the SoC automatically calculates and drives CRC at the end of the transmitted packet for write cycles, and will check the CRC for read cycles. It will not transmit the contents of the Packet Error Check Data Register (SMB_Mem_PEC) PEC register for CRC. The SMB_Mem_HCTL.PECEN bit must not be set if this bit is set, or unspecified behavior will result.

If the read cycle results in a CRC error, the SMB_Mem_HSTS.DEVERR bit and the SMB_Mem_AUXS.CRCE bit will be set.

33.2.7 SMBus Slave Interface

The SoC does not implement a complete SMBus slave interface. Only the Host Notify Command is implemented to maintain specification compatibility.

33.2.7.1 Format of Host Notify Command

The SoC tracks and responds to the standard Host Notify command as specified in the System Management Bus (SMBus) Specification, Version 2.0. The host address for this command is fixed to 0001000b. If the SoC already has data for a previously-received host notify command which has not been serviced yet by the host software (as indicated by the SMB_Mem_SSTS.HNST bit), then it will NACK following the host address byte of the protocol. This allows the host to communicate non-acceptance to the master and retain the host notify address and data values for the previous cycle until host software completely services the interrupt.

Note: Host software must always clear the SMB_Mem_SSTS.HNST bit after completing any necessary reads of the address and data registers.

Below table shows the Host Notify format.

Table 315. Host Notify Format (Sheet 1 of 2)

Bit	Description	Driven By	Comment
1	Start	External Master	
8:2	SMB Host Address – 7 bits	External Master	Always 0001_000
9	Write	External Master	Always 0
10	ACK (or NACK)	SoC	SoC NACKs if SMB_Mem_SSTS.HNST is 1
17:11	Device Address – 7 bits	External Master	Indicates the address of the master; loaded into the Notify Device Address Register (SMB_Mem_NDA)
18	Unused – Always 0	External Master	7-bit-only address; this bit is inserted to complete the byte
19	ACK	SoC	

Table 315. Host Notify Format (Sheet 2 of 2)

Bit	Description	Driven By	Comment
27:20	Data Byte Low – 8 bits	External Master	Loaded into the Notify Data Low Byte Register (SMB_Mem_NDLB)
28	ACK	SoC	
36:29	Data Byte High – 8 bits	External Master	Loaded into the Notify Data High Byte Register (SMB_Mem_NDHB)
37	ACK	SoC	
38	Stop	External Master	

33.3 Use

33.3.1 Function Disable

The SMBus interface may be disabled by setting FUNC_DIS_2.SMB_DIS to 1b.

33.3.2 SPD Write Disable

DRAM memory modules contain a 256-byte EEPROM, called SPD, accessible via SMBus used to store configuration information such as timing, physical size and more. A malicious user with administrative privileges can change and permanently lock invalid settings which could then lead to a permanent denial of service attack or a memory aliasing attack.

Write access to the SPI should be disabled by setting SMB_Config_HCFG.SPD_WD to 1b.

15:0	0000h RW/O	SID: Subsystem ID

33.6.14 D31_F3_CAP_POINTER (SMB_Config_CAP_POINTER)—Offset 34h

This optional register is used to point to a linked list of new capabilities implemented by this device. This register is only valid if the Capabilities List bit in the Status Register is set. If implemented, the bottom two bits are reserved and should be set to 00b. Software should mask these bits off before using this register as a pointer in Configuration Space to the first entry of a linked list of new capabilities.

Access Method

Type: PCI Configuration Register
(Size: 8 bits)

SMB_Config_CAP_POINTER: [B:0, D:31, F:3] + 34h

Default: 50h

7	4	0
0	1	0
CAP		

Bit Range	Default & Access	Description
7:0	50h RO	Capability Pointer (CP): Indicates the offset of the first Capability Item.

33.6.15 D31_F3_Interrupt Line (SMB_Config_INTLN)—Offset 3Ch

This data is not used

Access Method

Type: PCI Configuration Register
(Size: 8 bits)

SMB_Config_INTLN: [B:0, D:31, F:3] + 3Ch

Default: 00h

7	4	0
0	0	0
INTLN		

Bit Range	Default & Access	Description
7:0	00h RW	INTLN: Interrupt Line

33.6.16 D31_F3_Interrupt Pin (SMB_Config_INTPN)—Offset 3Dh

This register reflects the D31IP.SMIP in chipset configuration space

Access Method

Type: PCI Configuration Register
(Size: 8 bits)

SMB_Config_INTPN: [B:0, D:31, F:3] + 3Dh

Default: 02h

7	4	0
0	0	0
INTPN		

Bit Range	Default & Access	Description
7:0	02h RO	INTPN: The 4 msb bits are hardwired to 0, and the 4 lsb bits are hardwired to 4'h2 indicates the INTB is used by the SMBus controller

33.6.17 D31_F3_Host Configuration (SMB_Config_HCFG)—Offset 40h

Host Configuration Register

Access Method

Type: PCI Configuration Register
(Size: 8 bits)

SMB_Config_HCFG: [B:0, D:31, F:3] + 40h

Default: 00h

7	4	0
0	0	0
RSV1	SPD_WD	SSRST
		I2C_EN
		SMI_EN
		HST_EN

Bit Range	Default & Access	Description
7:5	000b RO	Reserved (RSV1): Reserved
4	0b RW/O	SPD write disable (SPD_WD): This bit is must be set to 1b1 to disable writes to SPD which are on Host SMB address ranges 0xA0 0xAE. The SMBus range is unwriteable until next platform reset HW Default is 1b0. Note: This bit is locked on 1b1 and will be reset on PLTRST# reset. This should be set by BIOS memory reference code to 1b1. SW can only program this bit when both HCTL[6] = 1b0 (START) and HSTS[0] = 1b0 (HBSY), else it may result in an undefined behavior.
3	0b RW	SSRST: Soft SMBus Reset - When this bit is 1, the SMBus state machine and logic is reset. The HW will reset this bit to 0 when reset operation is completed
2	0b RW	I2C_EN: When this bit is 1, the SMBus host is enabled to communicate with I2C devices. This will change the formatting of some commands. When this bit is 0, behavior is for SMBus
1	0b RW	SMI_EN: When this bit is set, any source of an SMB interrupt will instead be routed to generate an SMI

Bit Range	Default & Access	Description
0	0b RW	HST_EN: When set, the SMB Host Controller interface is enabled to execute commands. The SMB_Mem_HCTL.INTREN bit needs to be enabled in order for the SMB Host Controller to interrupt or SMI#. Additionally, the SMB Host Controller will not respond to any new requests until all interrupt requests have been cleared

33.6.18 D31_F3_PID (SMB_Config_CAP_ID)—Offset 50h

Power Management Capability ID

Access Method

Type: PCI Configuration Register
(Size: 16 bits)

SMB_Config_CAP_ID: [B:0, D:31, F:3] + 50h

Default: 0001h

15	12	8	4	0
0	0	0	0	1
Next_Item_Ptr				Cap_ID

Bit Range	Default & Access	Description
15:8	00h RO	Next Item Pointer (Next_Item_Ptr): This field provides an offset into the functions PCI Configuration Space pointing to the location of next item in the functions capability list. If there are no additional items in the Capabilities List, this register is set to 00h.
7:0	01h RO	Capability Identifier (Cap_ID): This field, when 01h identifies the linked list item as being the PCI Power Management registers.

33.6.19 D31_F3_PC (SMB_Config_PMC)—Offset 52h

Power Management Capabilities

Access Method

Type: PCI Configuration Register
(Size: 16 bits)

SMB_Config_PMC: [B:0, D:31, F:3] + 52h

Default: 0003h

33.7.1 Host Status Register (SMB_Mem_HSTS)—Offset 0h

All status bits are set by hardware and cleared by the software writing a one to the particular bit position. Writing a zero to any bit position has no affect

Access Method

Type: Memory Mapped I/O Register
(Size: 8 bits)

SMB_Mem_HSTS: [MBARL] + 0h

MBARL Type: PCI Configuration Register (Size: 32 bits)

MBARL Reference: [B:0, D:31, F:3] + 10h

Default: 00h

7			4				0
0	0	0	0	0	0	0	0
BDS	IUS	SMB_ALERTB	FAILED	BERR	DEVERR	INTR	HBSY

Bit Range	Default & Access	Description
7	0b RW	BDS: BYTE_DONE_STS (BDS) - This bit will be set to 1 when the host controller has received a byte (for Block Read commands) or if it has completed transmission of a byte (for Block Write commands) when the 32-byte buffer is not being used. Note that this bit will be set, even on the last byte of the transfer. Software clears the bit by writing a 1 to the bit position. This bit has no meaning for block transfers when the 32-byte buffer is enabled. Note: When the last byte of a block message is received, the host controller will set this bit. However, it will not immediately set the INTR bit (bit 1 in this register). When the interrupt handler clears the BYTE_DONE_STS bit, the message is considered complete, and the host controller will then set the INTR bit (and generate another interrupt). Thus, for a block message of n bytes, the SMBus host will generate n+1 interrupts. The interrupt handler needs to be implemented to handle these cases.
6	0b RW	IUS: In Use Status (IUS) - After a full PCI reset, a read to this bit returns a 0. After the first read, subsequent reads will return a 1. A write of a 1 to this bit will reset the next read value to 0. Writing a 0 to this bit has no effect. Software can poll this bit until it reads a 0, and will then own the usage of the host controller. This bit has no other effect on the hardware, and is only used as semaphore among various independent software threads that may need to use the SMBus host
5	0b RW	SMB_ALERTB: the SOC sets this bit to a '1' to indicates source of the interrupt or SMI# was the SMB_ALERTB signal. Software resets this bit by writing a 1 to this location.
4	0b RW	FAILED: Failed (FAIL) - When set, this indicates that the source of the interrupt or SMI was a failed bus transaction. This is set in response to the KILL bit being set to terminate the host transaction.
3	0b RW	BERR: Bus Error (BERR) - When set, this indicates the source of the interrupt or SMI was a transaction collision.
2	0b RW	DEVERR: Device Error (DERR) - When set, this indicates that the source of the interrupt or SMI was due one of the following: Illegal Command Field Unclaimed Cycle (host initiated) Host Device Time-out Error. CRC Error Write Protection Access Error (START bit will be cleared, Device Error will be set and Host Busy is never set because SMB Transaction never took place).
1	0b RW	INTR: Interrupt (INTR) - When set, this indicates that the source of the interrupt or SMI was the successful completion of its last command.
0	0b RW	HBSY: Host Busy (HBSY) - A '1' indicates that the SMBus host is running a command from the host interface. No SMB registers should be accessed while this bit is set. Exception: The BLOCK DATA REGISTER can be accessed when this bit is set ONLY when the SMB_CMD bits (in Host control register) are programmed for Block command or I2C Read command. This is necessary in order to check the DONE_STS bit.

33.7.2 Host Control Register (SMB_Mem_HCTL)—Offset 2h

Host Control Register

Note: A read to this register will clear the pointer in the 32-byte buffer.

Access Method

Type: Memory Mapped I/O Register
(Size: 8 bits)

SMB_Mem_HCTL: [MBARL] + 2h

MBARL Type: PCI Configuration Register (Size: 32 bits)

MBARL Reference: [B:0, D:31, F:3] + 10h

Default: 00h

7			4			0
0	0	0	0	0	0	0
PECEN	SATRT	LBYTE	SMBCMD		KILL	INTREN

Bit Range	Default & Access	Description
7	0b RW	PECEN: PEC_EN: When set to '1', this bit causes the host controller to perform the SMBus transaction with the Packet Error Checking phase appended. For writes, the value of the PEC byte is transferred from the PEC Register. For reads, the PEC byte is loaded in to the PEC Register. When this bit is cleared to '0', the SMBus host controller does not perform the transaction with the PEC phase appended. This bit must be written prior to the write in which the START bit is set.
6	0b WO	START (SATRT): START: This write-only bit is used to initiate the command described in the SMB_CMD field. All registers should be setup prior to writing a '1' to this bit position. This bit always reads zero. The HOST_BUSY bit in the Host Status register (offset 00h) can be used to identify when the SMBus controller has finished the command.
5	0b RW	LBYTE: LAST_BYTE: Used for I2C Read commands as an indication that the next byte will be the last one to be received for that block. The algorithm and usage model for this bit will be as follows (assume a message of n bytes): A. When the software sees the BYTE_DONE_STS bit set (bit 7 in the SMBus Host Status Register) for each of bytes 1 through n-2 of the message, the software should then read the Block Data Byte Register to get the byte that was just received. B. After reading each of bytes 1 to n-2 of the message, the software will then clear the BYTE_DONE_STS bit. C. After receiving byte n-1 of the message, the software will then set the 'LAST BYTE' bit. The software will then clear the BYTE_DONE_STS bit. D. The Intel SOC will then receive the last byte of the message (byte n). However, the Intel SOC state machine will see the LAST_BYTE bit set, and instead of sending an ACK after receiving the last byte, it will instead send a NAK. E. After receiving the last byte (byte n), the software will still clear the BYTE_DONE_STS bit. However, the LAST_BYTE bit will be irrelevant at that point. Note: This bit may be set when the TCO timer causes the SECOND_TO_STS bit to be set. See the TCO_STS.SECOND_TO_STS register, for more details on that bit. The SMBus device driver should clear the LAST_BYTE bit (if it is set) before starting any new command. Note: In addition to I2C Read Commands, the LAST_BYTE bit will also cause Block Read/Write cycles to stop prematurely (at the end of the next byte).

Bit Range	Default & Access	Description
4:2	000b RW	SMBCMD: SMB_CMD - As shown by the bit encoding below, indicates which command the SMBus host is to perform. If enabled, the SMBus host will generate an interrupt or SMI when the command has completed. If the value is for a non-supported or reserved command, the SMBus host will set the device error (DEV_ERR) status bit and generate an interrupt when the START bit is set. The SMBus controller will perform no command, and will not operate until DEV_ERR is cleared. 3'b000 - Quick The slave address and read/write value (bit 0) are stored in the tx slave address register 3'b001 - Byte This command uses the transmit slave address and command registers. Bit 0 of the slave address register determines if this is a read or write command. If it is a read, after the command completes the DATA0 register will contain the read data. 3'b010 - Byte Data This command uses the transmit slave address, command, and DATA0 registers. Bit 0 of the slave address register determines if this is a read or write command. If it is a read, the DATA0 register will contain the read data 3'b011 - Word Data This command uses the transmit slave address, command, DATA0 and DATA1 registers. Bit 0 of the slave address register determines if this is a read or write command. If it is a read, after the command completes the DATA0 and DATA1 registers will contain the read data. 3'b100 - Process Call This command uses the transmit slave address, command, DATA0 and DATA1 registers. Bit 0 of the slave address register determines if this is a read or write command. After the command completes, the DATA0 and DATA1 registers will contain the read data. 3'b101 - Block This command uses the transmit slave address, command, and DATA0 registers, and the Block Data Byte register. For block write, the count is stored in the DATA0 register and indicates how many bytes of data will be transferred. For block reads, the count is received and stored in the DATA0 register. Bit 0 of the slave address register selects if this is a read or write command. For writes, data is retrieved from the first n (where n is equal to the specified count) addresses of the SRAM array. For reads, the data is stored in the Block Data Byte register. 3'b110 - I2C Read This command uses the transmit slave address, command, DATA0, DATA1 registers, and the Block Data Byte register. The read data is stored in the Block Data Byte register. The Intel SOC will continue reading data until the NAK is received. 3'b111 - Block Process This command uses the transmit slave address, command, DATA0 and the Block Data Byte register. For block write, the count is stored in the DATA0 register and indicates how many bytes of data will be transferred. For block read, the count is received and stored in the DATA0 register. Bit 0 of the slave address register always indicate a write command. For writes, data is retrieved from the first m (where m is equal to the specified count) addresses of the SRAM array. For reads, the data is stored in the Block Data Byte register. Note: E32B bit in the Auxiliary Control Register must be set for this command to work.
1	0b RW	KILL: KILL - When set, kills the current host transaction taking place, sets the FAILED status bit, and asserts the interrupt (or SMI) selected by the SMB_Cfg_HCFG.SMI_EN field. This bit, once set, must be cleared to allow the SMB Host Controller to function normally
0	0b RW	INTREN: Enable the generation of an interrupt or SMI upon the completion of the command. Enables also other interrupt sendings , like ALERT and HOST_NOTIFY

33.7.3 Host Command Register (SMB_Mem_HCMD)—Offset 3h

This eight bit field is transmitted by the host controller in the command field of the SMB protocol during the execution of any command.

Access Method

Type: Memory Mapped I/O Register
(Size: 8 bits)

SMB_Mem_HCMD: [MBARL] + 3h

MBARL Type: PCI Configuration Register (Size: 32 bits)

MBARL Reference: [B:0, D:31, F:3] + 10h

Bit Range	Default & Access	Description
7:0	00h RW	HCMD: Command to be transmitted

33.7.4 Transmit Slave Address Register (SMB_Mem_TSA)—Offset 4h

This register is transmitted by the host controller in the slave address field of the SMB protocol. This is the address of the target

Access Method

Type: Memory Mapped I/O Register
(Size: 8 bits)

SMB_Mem_TSA: [MBARL] + 4h

MBARL Type: PCI Configuration Register (Size: 32 bits)

MBARL Reference: [B:0, D:31, F:3] + 10h

Default: 00h

7	4	0
0	0	0
ADDR		RW

Bit Range	Default & Access	Description
7:1	0000000b RW	ADDR: 7-bit address of the targeted slave
0	0b RW	RW: Direction of the host transfer. 1 = read, 0 = write Note: Writes to TSA values of 0xA0 0xAE are blocked depending on the setting of the SPD write disable bit in HCFG D31_F3_HostConfiguration.

33.7.5 Data 0 Register (SMB_Mem_HD0)—Offset 5h

Access Method

Type: Memory Mapped I/O Register
(Size: 8 bits)

SMB_Mem_HD0: [MBARL] + 5h

MBARL Type: PCI Configuration Register (Size: 32 bits)

MBARL Reference: [B:0, D:31, F:3] + 10h

Default: 00h

7				4				0
0	0	0	0	0	0	0	0	0
HD0								

Bit Range	Default & Access	Description
7:0	00h RW	HD0: DATA0/COUNT - This field contains the eight bit data sent in the DATA0 field of the SMB protocol. For block write commands, this register reflects the number of bytes to transfer. This register should be programmed to a value between 1 and 32 for block counts. A count of 0 or a count above 32 will result in unpredictable behavior. The host controller does not check or log illegal block counts.

33.7.6 Data 1 Register (SMB_Mem_HD1)—Offset 6h

Access Method

Type: Memory Mapped I/O Register
(Size: 8 bits)

SMB_Mem_HD1: [MBARL] + 6h

MBARL Type: PCI Configuration Register (Size: 32 bits)

MBARL Reference: [B:0, D:31, F:3] + 10h

Default: 00h

7				4				0
0	0	0	0	0	0	0	0	0
HD1								

Bit Range	Default & Access	Description
7:0	00h RW	HD1: DATA1 - This eight bit register is transmitted in the DATA1 field of the SMB protocol during the execution of any command.

33.7.7 Host Block Data (SMB_Mem_HBD)—Offset 7h

Access Method

Type: Memory Mapped I/O Register
(Size: 8 bits)

SMB_Mem_HBD: [MBARL] + 7h

MBARL Type: PCI Configuration Register (Size: 32 bits)

MBARL Reference: [B:0, D:31, F:3] + 10h

Default: 00h

7	4	0
0	0	0
HBD		
Bit Range	Default & Access	Description
7:0	00h RW	HBD: Block Data (BDTA) - This is either a register, or a pointer into a 32-byte block array, depending upon whether the E32B bit is set in the Auxiliary Control register. When the E32B bit is cleared, this is a register containing a byte of data to be sent on a block write or read from on a block read, just as it behaved on the INTEL SOC. When the E32B bit is set, reads and writes to this register are used to access the 32-byte block data storage array. An internal index pointer is used to address the array, which is reset to 0 by reading the HCTL register (offset 02h). The index pointer then increments automatically upon each access to this register. The transfer of block data into (read) or out of (write) this storage array during an SMBus transaction always starts at index address 0. When the E32B bit is set, for writes, software will write up to 32-bytes to this register as part of the setup for the command. After the Host Controller has sent the Address, Command, and Byte Count fields, it will send the bytes in the SRAM pointed to by this register. When the E32B bit is cleared for writes, software will place a single byte in this register. After the host controller has sent the address, command, and byte count fields, it will send the byte in this register. If there is more data to send, software will write the next series of bytes to the FIFO pointed to by this register and clear the DONE_STS bit. The controller will then send the next byte. During the time between the last byte being transmitted to the next byte being transmitted, the controller will insert wait-states on the interface. When the E32B bit is set for reads, after receiving the byte count into the Data0 register, the first series of data bytes go into the FIFO pointed to by this register. If the byte count has been exhausted or the 32-byte FIFO has been filled, the controller will generate an SMI or interrupt (depending on configuration) and set the DONE_STS bit. Software will then read the data. During the time between when the last byte is read from the FIFO to when the DONE_STS bit is cleared, the controller will insert wait-states on the interface.

33.7.8 Packet Error Check Data Register (SMB_Mem_PEC)—Offset 8h

This register contains the 8-bit CRC value that is used as the Packet Error Check on SMBus. For writes, this register is written by software prior to running the command. For reads, this register is read by software after the read command is completed on SMBus.

Access Method

Type: Memory Mapped I/O Register
(Size: 8 bits)

SMB_Mem_PEC: [MBARL] + 8h

MBARL Type: PCI Configuration Register (Size: 32 bits)

MBARL Reference: [B:0, D:31, F:3] + 10h

Default: 00h

7	4	0
0	0	0
PEC		
Bit Range	Default & Access	Description
7:0	00h RW	PEC: This 8-bit register is written with the SMBus PEC data prior to a write transaction. For read transactions, the PEC data is loaded from the SMBus into this register and is then read by software. Software must ensure that the IUS bit is properly maintained to avoid having this field over-written by a write transaction following a read transaction.

33.7.9 Auxiliary Status (SMB_Mem_AUXS)—Offset Ch

Access Method

Type: Memory Mapped I/O Register
(Size: 8 bits)

SMB_Mem_AUXS: [MBARL] + Ch

MBARL Type: PCI Configuration Register (Size: 32 bits)

MBARL Reference: [B:0, D:31, F:3] + 10h

Default: 00h

7				4					0
0		0		0		0		0	0
RSVD									CRCE

Bit Range	Default & Access	Description
7:1	000000b RO	Reserved (RSVD): Reserved.
0	0b RW	CRCE: CRC Error (CRCE) - This bit is set if a received message contained a CRC error. When this bit is set, the DEVERR bit of the host status register will also be set. This bit will be set by the controller if a software abort occurs in the middle of the CRC portion of the cycle or an abort happens after SMBus controller has received the final data bit transmitted by external slave.

33.7.10 Auxiliary Control (SMB_Mem_AUXC)—Offset Dh

Access Method

Type: Memory Mapped I/O Register
(Size: 8 bits)

SMB_Mem_AUXC: [MBARL] + Dh

MBARL Type: PCI Configuration Register (Size: 32 bits)

MBARL Reference: [B:0, D:31, F:3] + 10h

Default: 00h

7				4					0
0		0		0		0		0	0
RSV1									E32B
									AAC

Bit Range	Default & Access	Description
7:2	000000b RO	Reserved (RSV1): Reserved
1	0b RW	E32B: Enable 32-byte Buffer (E32B) - When set, the Host Block Data register is a pointer into a 32-byte buffer, as opposed to a single register. This enables the block commands to transfer or receive up to 32-bytes before the controller generates an interrupt
0	0b RW/O	AAC: Automatically Append CRC (AAC) - When set, the SMBus controller will automatically append the CRC. This bit must not be changed during SM Bus transactions, or undetermined behavior will result. It should be programmed only once during the lifetime of the function.

33.7.11 SMBUS_PIN_CTL Register (SMB_Mem_SMBC)—Offset Fh

Software bus accesses register

Access Method

Type: Memory Mapped I/O Register
(Size: 8 bits)

SMB_Mem_SMBC: [MBARL] + Fh

MBARL Type: PCI Configuration Register (Size: 32 bits)

MBARL Reference: [B:0, D:31, F:3] + 10h

Default: 07h

7	4	0
0	0	1
RSV1		SMBCLK

Bit Range	Default & Access	Description
7:3	00000b RO	Reserved (RSV1): Reserved
2	1b RW	SMBCLKCTL: This Read/Write bit has a default of 1. 0 = SMBus controller will drive the SMB_CLK pin low, independent of what the other SMB logic would otherwise indicate for the SMB_CLK pin. 1 = The SMB_CLK pin is Not overdriven low. The other SMBus logic controls the state of the pin.
1	1b RO	SMBDAT: This pin returns the value on the SMB_DATA pin. It will be 1 to indicate high, 0 to indicate low. This allows software to read the current state of the pin.
0	1b RO	SMBCLK: This pin returns the value on the SMB_CLK pin. It will be 1 to indicate high, 0 to indicate low. This allows software to read the current state of the pin.

33.7.12 Slave Status Register (SMB_Mem_SSTS)—Offset 10h

All bits in this register are implemented in the 64 kHz clock domain. Therefore, software must poll the register until a write takes effect before assuming that a write has completed internally

Access Method

Type: Memory Mapped I/O Register
(Size: 8 bits)

SMB_Mem_SSTS: [MBARL] + 10h

MBARL Type: PCI Configuration Register (Size: 32 bits)

MBARL Reference: [B:0, D:31, F:3] + 10h

Default: 00h

7	4	0
0	0	0
RSV1		HNST

Bit Range	Default & Access	Description
7:1	0000000b RO	Reserved (RSV1): Reserved
0	0b RW	HNST: HOST_NOTIFY_STS: The SMBus controller sets this bit to a 1 when it has completely received a successful Host Notify Command on the SMBus pins. Software reads this bit to determine that the source of the interrupt or SMI# was the reception of the Host Notify Command. Software clears this bit after reading any information needed from the Notify address and data registers by writing a 1 to this bit. Note that the SMBus controller will allow the Notify Address and Data registers to be over-written once this bit has been cleared. When this bit is 1, the SMBus controller will NACK the first byte (host address) of any new 'Host Notify' commands on the SMBus. Writing a 0 to this bit has no effect.

33.7.13 Slave Command Register (SMB_Mem_SCMD)—Offset 11h

All bits in this register are implemented in a slow (64khz) clock domain. Therefore, software must poll the register until a write takes effect before assuming that a write has completed internally. Also, software must confirm the prior written value before writing to the register again.

Access Method

Type: Memory Mapped I/O Register
(Size: 8 bits)

SMB_Mem_SCMD: [MBARL] + 11h

MBARL Type: PCI Configuration Register (Size: 32 bits)

MBARL Reference: [B:0, D:31, F:3] + 10h

Default: 00h

7	4	0
0	0	0
RSV1		
SMBALTDIS		
HNWAKEEN		
HNINTREN		

Bit Range	Default & Access	Description
7:3	00000b RO	Reserved (RSV1): Reserved
2	0b RW	SMBALTDIS: Software sets this bit to 1 to block the generation of the interrupt or SMI# due to the SMB_ALERTB source. This bit is logically inverted and 'AND'ed with the SMB_ALERTB bit of HSTS register. The resulting signal is distributed to the SMI# and/or interrupt generation logic.
1	0b RW	HNWAKEEN: Software sets this bit to 1 to enable the reception of a Host Notify command as a wake event.
0	0b RW	HNINTREN: Software sets this bit to 1 to enable the generation of interrupt or SMI when HOST_NOTIFY_STS is 1. This enable does not affect the setting of the HOST_NOTIFY_STS bit. When the interrupt is generated, either INTRB or SMI is generated, depending on the value of the SMI_EN bit (D31, F3, Off40h, B1). If the HOST_NOTIFY_STS bit is set when this bit is written to a 1, then the interrupt (or SMI) will be generated. The interrupt (or SMI) is logically generated by AND'ing the STS and INTREN bits.

33.7.14 Notify Device Address Register (SMB_Mem_NDA)—Offset 14h

Access Method

Type: Memory Mapped I/O Register
(Size: 8 bits)

SMB_Mem_NDA: [MBARL] + 14h

MBARL Type: PCI Configuration Register (Size: 32 bits)

MBARL Reference: [B:0, D:31, F:3] + 10h

Default: 00h

7	4	0
0	0	0
NDA		RSV1

Bit Range	Default & Access	Description
7:1	0000000b RO	NDA: DEVICE_ADDRESS - This field contains the 7-bit device address received during the Host Notify protocol of the SMBus 2.0 specification. Software should only consider this field valid when the HOST_NOTIFY_STS bit is set to 1.
0	0b RO	Reserved (RSV1): Reserved

33.7.15 Notify Data Low Byte Register (SMB_Mem_NDLB)—Offset 16h

Access Method

Type: Memory Mapped I/O Register
(Size: 8 bits)

SMB_Mem_NDLB: [MBARL] + 16h

MBARL Type: PCI Configuration Register (Size: 32 bits)

MBARL Reference: [B:0, D:31, F:3] + 10h

Default: 00h

7	4	0
0	0	0
NDLB		

Bit Range	Default & Access	Description
7:0	00h RO	NDLB: DATA_LOW_BYTE - This field contains the first (low) byte of data received during the Host Notify protocol of the SMBus 2.0 specification. Software should only consider this field valid when the HOST_NOTIFY_STS bit is set to 1.

33.7.16 Notify Data High Byte Register (SMB_Mem_NDHB)—Offset 17h

Access Method

Type: Memory Mapped I/O Register
(Size: 8 bits)

SMB_Mem_NDHB: [MBARL] + 17h

MBARL Type: PCI Configuration Register (Size: 32 bits)

MBARL Reference: [B:0, D:31, F:3] + 10h

Default: 00h

7				4					0
0	0	0	0	0	0	0	0	0	0
					NDHB				

Bit Range	Default & Access	Description
7:0	00h RO	NDHB: DATA_HIGH_BYTE - This field contains the second (high) byte of data received during the Host Notify protocol of the SMBus 2.0 specification. Software should only consider this field valid when the HOST_NOTIFY_STS bit is set to 1.

33.8 PCU SMBUS I/O Registers

Table 318. Summary of PCU SMBUS I/O Registers—SMB_Config_IOBAR

Offset	Size	Register ID—Description	Default Value

17h	1	"Notify Data High Byte Register (SMB_Mem_NDHB_io)—Offset 17h" on page 4489	00h

33.8.1 Host Status Register (SMB_Mem_HSTS_io)—Offset 0h

All status bits are set by hardware and cleared by the software writing a one to the particular bit position. Writing a zero to any bit position has no affect

Access Method

Type: I/O Register
(Size: 8 bits)

SMB_Mem_HSTS_io: [IOBAR] + 0h

IOBAR Type: PCI Configuration Register (Size: 32 bits)

IOBAR Reference: [B:0, D:31, F:3] + 20h

Default: 00h

7			4				0
0	0	0	0	0	0	0	0
BDS	IUS	SMB_ALERTB	FAILED	BERR	DEVERR	INTR	HBSY

Bit Range	Default & Access	Description
7	0b RW	BDS: BYTE_DONE_STS (BDS) - This bit will be set to 1 when the host controller has received a byte (for Block Read commands) or if it has completed transmission of a byte (for Block Write commands) when the 32-byte buffer is not being used. Note that this bit will be set, even on the last byte of the transfer. Software clears the bit by writing a 1 to the bit position. This bit has no meaning for block transfers when the 32-byte buffer is enabled. Note: When the last byte of a block message is received, the host controller will set this bit. However, it will not immediately set the INTR bit (bit 1 in this register). When the interrupt handler clears the BYTE_DONE_STS bit, the message is considered complete, and the host controller will then set the INTR bit (and generate another interrupt). Thus, for a block message of n bytes, the SMBus host will generate n+1 interrupts. The interrupt handler needs to be implemented to handle these cases.
6	0b RW	IUS: In Use Status (IUS) - After a full PCI reset, a read to this bit returns a 0. After the first read, subsequent reads will return a 1. A write of a 1 to this bit will reset the next read value to 0. Writing a 0 to this bit has no effect. Software can poll this bit until it reads a 0, and will then own the usage of the host controller. This bit has no other effect on the hardware, and is only used as semaphore among various independent software threads that may need to use the SMBus host
5	0b RW	SMB_ALERTB: the SOC sets this bit to a '1' to indicates source of the interrupt or SMI# was the SMB_ALERTB signal. Software resets this bit by writing a 1 to this location.
4	0b RW	FAILED: Failed (FAIL) - When set, this indicates that the source of the interrupt or SMI was a failed bus transaction. This is set in response to the KILL bit being set to terminate the host transaction.
3	0b RW	BERR: Bus Error (BERR) - When set, this indicates the source of the interrupt or SMI was a transaction collision.
2	0b RW	DEVERR: Device Error (DERR) - When set, this indicates that the source of the interrupt or SMI was due one of the following: Illegal Command Field Unclaimed Cycle (host initiated) Host Device Time-out Error. CRC Error Write Protection Access Error (START bit will be cleared, Device Error will be set and Host Busy is never set because SMB Transaction never took place).
1	0b RW	INTR: Interrupt (INTR) - When set, this indicates that the source of the interrupt or SMI was the successful completion of its last command.
0	0b RW	HBSY: Host Busy (HBSY) - A '1' indicates that the SMBus host is running a command from the host interface. No SMB registers should be accessed while this bit is set. Exception: The BLOCK DATA REGISTER can be accessed when this bit is set ONLY when the SMB_CMD bits (in Host control register) are programmed for Block command or I2C Read command. This is necessary in order to check the DONE_STS bit.

33.8.2 Host Control Register (SMB_Mem_HCTL_io)—Offset 2h

Host Control Register

Note: A read to this register will clear the pointer in the 32-byte buffer.

Access Method

Type: I/O Register
(Size: 8 bits)

SMB_Mem_HCTL_io: [IOBAR] + 2h

IOBAR Type: PCI Configuration Register (Size: 32 bits)

IOBAR Reference: [B:0, D:31, F:3] + 20h

Default: 00h

7			4			0
0	0	0	0	0	0	0
PECEN	SATRT	LBYTE	SMBCMD		KILL	INTREN

Bit Range	Default & Access	Description
7	0b RW	PECEN: PEC_EN: When set to '1', this bit causes the host controller to perform the SMBus transaction with the Packet Error Checking phase appended. For writes, the value of the PEC byte is transferred from the PEC Register. For reads, the PEC byte is loaded in to the PEC Register. When this bit is cleared to '0', the SMBus host controller does not perform the transaction with the PEC phase appended. This bit must be written prior to the write in which the START bit is set.
6	0b WO	START (SATRT): START: This write-only bit is used to initiate the command described in the SMB_CMD field. All registers should be setup prior to writing a '1' to this bit position. This bit always reads zero. The HOST_BUSY bit in the Host Status register (offset 00h) can be used to identify when the SMBus controller has finished the command.
5	0b RW	LBYTE: LAST_BYTE: Used for I2C Read commands as an indication that the next byte will be the last one to be received for that block. The algorithm and usage model for this bit will be as follows (assume a message of n bytes): A. When the software sees the BYTE_DONE_STS bit set (bit 7 in the SMBus Host Status Register) for each of bytes 1 through n-2 of the message, the software should then read the Block Data Byte Register to get the byte that was just received. B. After reading each of bytes 1 to n-2 of the message, the software will then clear the BYTE_DONE_STS bit. C. After receiving byte n-1 of the message, the software will then set the 'LAST BYTE' bit. The software will then clear the BYTE_DONE_STS bit. D. The Intel PCH will then receive the last byte of the message (byte n). However, the Intel PCH state machine will see the LAST_BYTE bit set, and instead of sending an ACK after receiving the last byte, it will instead send a NAK. E. After receiving the last byte (byte n), the software will still clear the BYTE_DONE_STS bit. However, the LAST_BYTE bit will be irrelevant at that point. Note: This bit may be set when the TCO timer causes the SECOND_TO_STS bit to be set. See the TCO2_STS Register in Volume 1, bit 1 for more details on that bit. The SMBus device driver should clear the LAST_BYTE bit (if it is set) before starting any new command. Note: In addition to I2C Read Commands, the LAST_BYTE bit will also cause Block Read/Write cycles to stop prematurely (at the end of the next byte).

Bit Range	Default & Access	Description
4:2	000b RW	SMBCMD: SMB_CMD - As shown by the bit encoding below, indicates which command the SMBus host is to perform. If enabled, the SMBus host will generate an interrupt or SMI when the command has completed. If the value is for a non-supported or reserved command, the SMBus host will set the device error (DEV_ERR) status bit and generate an interrupt when the START bit is set. The SMBus controller will perform no command, and will not operate until DEV_ERR is cleared. 3'b000 - Quick The slave address and read/write value (bit 0) are stored in the tx slave address register 3'b001 - Byte This command uses the transmit slave address and command registers. Bit 0 of the slave address register determines if this is a read or write command. If it is a read, after the command completes the DATA0 register will contain the read data. 3'b010 - Byte Data This command uses the transmit slave address, command, and DATA0 registers. Bit 0 of the slave address register determines if this is a read or write command. If it is a read, the DATA0 register will contain the read data 3'b011 - Word Data This command uses the transmit slave address, command, DATA0 and DATA1 registers. Bit 0 of the slave address register determines if this is a read or write command. If it is a read, after the command completes the DATA0 and DATA1 registers will contain the read data. 3'b100 - Process Call This command uses the transmit slave address, command, DATA0 and DATA1 registers. Bit 0 of the slave address register determines if this is a read or write command. After the command completes, the DATA0 and DATA1 registers will contain the read data. 3'b101 - Block This command uses the transmit slave address, command, and DATA0 registers, and the Block Data Byte register. For block write, the count is stored in the DATA0 register and indicates how many bytes of data will be transferred. For block reads, the count is received and stored in the DATA0 register. Bit 0 of the slave address register selects if this is a read or write command. For writes, data is retrieved from the first n (where n is equal to the specified count) addresses of the SRAM array. For reads, the data is stored in the Block Data Byte register. 3'b110 - I2C Read This command uses the transmit slave address, command, DATA0, DATA1 registers, and the Block Data Byte register. The read data is stored in the Block Data Byte register. The Intel PCH will continue reading data until the NAK is received. 3'b111 - Block Process This command uses the transmit slave address, command, DATA0 and the Block Data Byte register. For block write, the count is stored in the DATA0 register and indicates how many bytes of data will be transferred. For block read, the count is received and stored in the DATA0 register. Bit 0 of the slave address register always indicate a write command. For writes, data is retrieved from the first m (where m is equal to the specified count) addresses of the SRAM array. For reads, the data is stored in the Block Data Byte register. Note: E32B bit in the Auxiliary Control Register must be set for this command to work.
1	0b RW	KILL: KILL - When set, kills the current host transaction taking place, sets the FAILED status bit, and asserts the interrupt (or SMI) selected by the SMB_INTRSEL field. This bit, once set, must be cleared to allow the SMB Host Controller to function normally
0	0b RW	INTREN: Enable the generation of an interrupt or SMI upon the completion of the command. Enables also other interrupt sendings , like ALERT and HOST_NOTIFY

33.8.3 Host Command Register (SMB_Mem_HCMD_io)—Offset 3h

This eight bit field is transmitted by the host controller in the command field of the SMB protocol during the execution of any command.

Access Method

Type: I/O Register
(Size: 8 bits)

SMB_Mem_HCMD_io: [IOBAR] + 3h

IOBAR Type: PCI Configuration Register (Size: 32 bits)

IOBAR Reference: [B:0, D:31, F:3] + 20h

Default: 00h

0	0	0
HCMD		

Bit Range	Default & Access	Description
7:0	00h RW	HCMD: Command to be transmitted

33.8.4 Transmit Slave Address Register (SMB_Mem_TSA_io)—Offset 4h

This register is transmitted by the host controller in the slave address field of the SMB protocol. This is the address of the target

Access Method

Type: I/O Register
(Size: 8 bits)

SMB_Mem_TSA_io: [IOBAR] + 4h

IOBAR Type: PCI Configuration Register (Size: 32 bits)

IOBAR Reference: [B:0, D:31, F:3] + 20h

Default: 00h

7	4	0
0	0	0
ADDR		RW

Bit Range	Default & Access	Description
7:1	0000000b RW	ADDR: 7-bit address of the targeted slave
0	0b RW	RW: Direction of the host transfer. 1 = read, 0 = write Note: Writes to TSA values of 0xA0 0xAE are blocked depending on the setting of the SPD write disable bit in HCFG D31_F3_HostConfiguration.

33.8.5 Data 0 Register (SMB_Mem_HD0_io)—Offset 5h

Access Method

Type: I/O Register
(Size: 8 bits)

SMB_Mem_HD0_io: [IOBAR] + 5h

IOBAR Type: PCI Configuration Register (Size: 32 bits)

IOBAR Reference: [B:0, D:31, F:3] + 20h

Default: 00h

7				4					0
0	0	0	0	0	0	0	0	0	0
HD0									

Bit Range	Default & Access	Description
7:0	00h RW	HD0: DATA0/COUNT - This field contains the eight bit data sent in the DATA0 field of the SMB protocol. For block write commands, this register reflects the number of bytes to transfer. This register should be programmed to a value between 1 and 32 for block counts. A count of 0 or a count above 32 will result in unpredictable behavior. The host controller does not check or log illegal block counts.

33.8.6 Data 1 Register (SMB_Mem_HD1_io)—Offset 6h

Access Method

Type: I/O Register
(Size: 8 bits)

SMB_Mem_HD1_io: [IOBAR] + 6h

IOBAR Type: PCI Configuration Register (Size: 32 bits)

IOBAR Reference: [B:0, D:31, F:3] + 20h

Default: 00h

7				4					0
0	0	0	0	0	0	0	0	0	0
HD1									

Bit Range	Default & Access	Description
7:0	00h RW	HD1: DATA1 - This eight bit register is transmitted in the DATA1 field of the SMB protocol during the execution of any command.

33.8.7 Host Block Data (SMB_Mem_HBD_io)—Offset 7h

Access Method

Type: I/O Register
(Size: 8 bits)

SMB_Mem_HBD_io: [IOBAR] + 7h

IOBAR Type: PCI Configuration Register (Size: 32 bits)

IOBAR Reference: [B:0, D:31, F:3] + 20h

Default: 00h

7		4		0
0	0	0	0	0
HBD				
Bit Range	Default & Access	Description		
7:0	00h RW	HBD: Block Data (BDTA) - This is either a register, or a pointer into a 32-byte block array, depending upon whether the E32B bit is set in the Auxiliary Control register. When the E32B bit is cleared, this is a register containing a byte of data to be sent on a block write or read from on a block read, just as it behaved on the INTEL SOC. When the E32B bit is set, reads and writes to this register are used to access the 32-byte block data storage array. An internal index pointer is used to address the array, which is reset to 0 by reading the HCTL register (offset 02h). The index pointer then increments automatically upon each access to this register. The transfer of block data into (read) or out of (write) this storage array during an SMBus transaction always starts at index address 0. When the E32B bit is set, for writes, software will write up to 32-bytes to this register as part of the setup for the command. After the Host Controller has sent the Address, Command, and Byte Count fields, it will send the bytes in the SRAM pointed to by this register. When the E32B bit is cleared for writes, software will place a single byte in this register. After the host controller has sent the address, command, and byte count fields, it will send the byte in this register. If there is more data to send, software will write the next series of bytes to the FIFO pointed to by this register and clear the DONE_STS bit. The controller will then send the next byte. During the time between the last byte being transmitted to the next byte being transmitted, the controller will insert wait-states on the interface. When the E32B bit is set for reads, after receiving the byte count into the Data0 register, the first series of data bytes go into the FIFO pointed to by this register. If the byte count has been exhausted or the 32-byte FIFO has been filled, the controller will generate an SMI or interrupt (depending on configuration) and set the DONE_STS bit. Software will then read the data. During the time between when the last byte is read from the FIFO to when the DONE_STS bit is cleared, the controller will insert wait-states on the interface.		

33.8.8 Packet Error Check Data Register (SMB_Mem_PEC_io)—Offset 8h

This register contains the 8-bit CRC value that is used as the Packet Error Check on SMBus. For writes, this register is written by software prior to running the command. For reads, this register is read by software after the read command is completed on SMBus.

Access Method

Type: I/O Register
(Size: 8 bits)

SMB_Mem_PEC_io: [IOBAR] + 8h

IOBAR Type: PCI Configuration Register (Size: 32 bits)

IOBAR Reference: [B:0, D:31, F:3] + 20h

Default: 00h

7		4		0
0	0	0	0	0
PEC				
Bit Range	Default & Access	Description		
7:0	00h RW	PEC: This 8-bit register is written with the SMBus PEC data prior to a write transaction. For read transactions, the PEC data is loaded from the SMBus into this register and is then read by software. Software must ensure that the IUS bit is properly maintained to avoid having this field over-written by a write transaction following a read transaction.		

33.8.9 Auxiliary Status (SMB_Mem_AUXS_io)—Offset Ch

Access Method

Type: I/O Register
(Size: 8 bits)

SMB_Mem_AUXS_io: [IOBAR] + Ch

IOBAR Type: PCI Configuration Register (Size: 32 bits)

IOBAR Reference: [B:0, D:31, F:3] + 20h

Default: 00h

7	4	0
0	0	0
RSVD		CRCE

Bit Range	Default & Access	Description
7:1	0000000b RO	Reserved (RSVD): Reserved.
0	0b RW	CRCE: CRC Error (CRCE) - This bit is set if a received message contained a CRC error. When this bit is set, the DEVERR bit of the host status register will also be set. This bit will be set by the controller if a software abort occurs in the middle of the CRC portion of the cycle or an abort happens after SMBus controller has received the final data bit transmitted by external slave.

33.8.10 Auxiliary Control (SMB_Mem_AUXC_io)—Offset Dh

Access Method

Type: I/O Register
(Size: 8 bits)

SMB_Mem_AUXC_io: [IOBAR] + Dh

IOBAR Type: PCI Configuration Register (Size: 32 bits)

IOBAR Reference: [B:0, D:31, F:3] + 20h

Default: 00h

7	4	0
0	0	0
RSV1		E32B AAC

Bit Range	Default & Access	Description
7:2	000000b RO	Reserved (RSV1): Reserved
1	0b RW	E32B: Enable 32-byte Buffer (E32B) - When set, the Host Block Data register is a pointer into a 32-byte buffer, as opposed to a single register. This enables the block commands to transfer or receive up to 32-bytes before the controller generates an interrupt
0	0b RW/O	AAC: Automatically Append CRC (AAC) - When set, the SMBus controller will automatically append the CRC. This bit must not be changed during SM Bus transactions, or undetermined behavior will result. It should be programmed only once during the lifetime of the function.

33.8.11 SMBUS_PIN_CTL Register (SMB_Mem_SMBC_io)—Offset Fh

Software bus accesses register

Access Method

Type: I/O Register
(Size: 8 bits)

SMB_Mem_SMBC_io: [IOBAR] + Fh

IOBAR Type: PCI Configuration Register (Size: 32 bits)

IOBAR Reference: [B:0, D:31, F:3] + 20h

Default: 07h

7	4	0
0	0	1
RSV1		SMBCLK

Bit Range	Default & Access	Description
7:3	0000b RO	Reserved (RSV1): Reserved
2	1b RW	SMBCLKCTL: This Read/Write bit has a default of 1. 0 = SMBus controller will drive the SMB_CLK pin low, independent of what the other SMB logic would otherwise indicate for the SMB_CLK pin. 1 = The SMB_CLK pin is Not overdriven low. The other SMBus logic controls the state of the pin.
1	1b RO	SMBDAT: This pin returns the value on the SMB_DATA pin. It will be 1 to indicate high, 0 to indicate low. This allows software to read the current state of the pin.
0	1b RO	SMBCLK: This pin returns the value on the SMB_CLK pin. It will be 1 to indicate high, 0 to indicate low. This allows software to read the current state of the pin.

33.8.12 Slave Status Register (SMB_Mem_SSTS_io)—Offset 10h

All bits in this register are implemented in the 64 kHz clock domain. Therefore, software must poll the register until a write takes effect before assuming that a write has completed internally

Access Method

Type: I/O Register
(Size: 8 bits)

SMB_Mem_SSTS_io: [IOBAR] + 10h

IOBAR Type: PCI Configuration Register (Size: 32 bits)

IOBAR Reference: [B:0, D:31, F:3] + 20h

Default: 00h

7	4	0
0	0	0
RSV1		HNST

Bit Range	Default & Access	Description
7:1	0000000b RO	Reserved (RSV1): Reserved
0	0b RW	HNST: HOST_NOTIFY_STS: The SMBus controller sets this bit to a 1 when it has completely received a successful Host Notify Command on the SMBus pins. Software reads this bit to determine that the source of the interrupt or SMI# was the reception of the Host Notify Command. Software clears this bit after reading any information needed from the Notify address and data registers by writing a 1 to this bit. Note that the SMBus controller will allow the Notify Address and Data registers to be over-written once this bit has been cleared. When this bit is 1, the SMBus controller will NACK the first byte (host address) of any new 'Host Notify' commands on the SMBus. Writing a 0 to this bit has no effect.

33.8.13 Slave Command Register (SMB_Mem_SCMD_io)—Offset 11h

All bits in this register are implemented in a slow (64khz) clock domain. Therefore, software must poll the register until a write takes effect before assuming that a write has completed internally. Also, software must confirm the prior written value before writing to the register again.

Access Method

Type: I/O Register
(Size: 8 bits)

SMB_Mem_SCMD_io: [IOBAR] + 11h

IOBAR Type: PCI Configuration Register (Size: 32 bits)

IOBAR Reference: [B:0, D:31, F:3] + 20h

Default: 00h

7	4	0
0	0	0
RSV1		
SMBALTDIS		
HNWAKEEN		
HNINTREN		

Bit Range	Default & Access	Description
7:3	00000b RO	Reserved (RSV1): Reserved
2	0b RW	SMBALTDIS: Software sets this bit to 1 to block the generation of the interrupt or SMI# due to the SMB_ALERTB source. This bit is logically inverted and 'AND'ed with the SMB_ALERTB bit of HSTS register. The resulting signal is distributed to the SMI# and/or interrupt generation logic.
1	0b RW	HNWAKEEN: Software sets this bit to 1 to enable the reception of a Host Notify command as a wake event.
0	0b RW	HNINTREN: Software sets this bit to 1 to enable the generation of interrupt or SMI when HOST_NOTIFY_STS is 1. This enable does not affect the setting of the HOST_NOTIFY_STS bit. When the interrupt is generated, either INTRB or SMI is generated, depending on the value of the SMI_EN bit (D31, F3, Off40h, B1). If the HOST_NOTIFY_STS bit is set when this bit is written to a 1, then the interrupt (or SMI) will be generated. The interrupt (or SMI) is logically generated by AND'ing the STS and INTREN bits.

33.8.14 Notify Device Address Register (SMB_Mem_NDA_io)—Offset 14h

Access Method

Type: I/O Register
(Size: 8 bits)

SMB_Mem_NDA_io: [IOBAR] + 14h

IOBAR Type: PCI Configuration Register (Size: 32 bits)

IOBAR Reference: [B:0, D:31, F:3] + 20h

Default: 00h

7	4	0
0	0	0
NDA		RSV1

Bit Range	Default & Access	Description
7:1	0000000b RO	NDA: DEVICE_ADDRESS - This field contains the 7-bit device address received during the Host Notify protocol of the SMBus 2.0 specification. Software should only consider this field valid when the HOST_NOTIFY_STS bit is set to 1.
0	0b RO	Reserved (RSV1): Reserved

33.8.15 Notify Data Low Byte Register (SMB_Mem_NDLB_io)—Offset 16h

Access Method

Type: I/O Register
(Size: 8 bits)

SMB_Mem_NDLB_io: [IOBAR] + 16h

IOBAR Type: PCI Configuration Register (Size: 32 bits)

IOBAR Reference: [B:0, D:31, F:3] + 20h

Default: 00h

7	4	0
0	0	0
NDLB		

Bit Range	Default & Access	Description
7:0	00h RO	NDLB: DATA_LOW_BYTE - This field contains the first (low) byte of data received during the Host Notify protocol of the SMBus 2.0 specification. Software should only consider this field valid when the HOST_NOTIFY_STS bit is set to 1.

33.8.16 Notify Data High Byte Register (SMB_Mem_NDHB_io)—Offset 17h

Access Method

Type: I/O Register
(Size: 8 bits)

SMB_Mem_NDHB_io: [IOBAR] + 17h

IOBAR Type: PCI Configuration Register (Size: 32 bits)

IOBAR Reference: [B:0, D:31, F:3] + 20h

Default: 00h

7				4					0
0	0	0	0	0	0	0	0	0	0
NDHB									

Bit Range	Default & Access	Description
7:0	00h RO	NDHB: DATA_HIGH_BYTE - This field contains the second (high) byte of data received during the Host Notify protocol of the SMBus 2.0 specification. Software should only consider this field valid when the HOST_NOTIFY_STS bit is set to 1.

34 PCU – Intel® Legacy Block (iLB) Overview

The Intel Legacy Block (iLB) is a collection of disparate functional blocks that are critical for implementing the legacy PC platform features. These blocks include:

- PCU – iLB – Low Pin Count (LPC) Bridge
- PCU – iLB – Real Time Clock (RTC)
- PCU – iLB – 8254 Timers
- PCU – iLB – High Precision Event Timer (HPET)
- PCU – iLB – GPIO
- PCU – iLB – IO APIC
- PCU – iLB – 8259 Programmable Interrupt Controllers (PIC)

The iLB also implements a register range for configuration of some of those blocks along with support for Non-Maskable Interrupts (NMI).

34.1 Signal Descriptions

Please see [Chapter 2, “Physical Interfaces”](#) for additional details as well as the subsequent sections.

The signal description table has the following headings:

- **Signal Name:** The name of the signal/pin
- **Direction:** The buffer direction can be either input, output, or I/O (bidirectional)
- **Platform Power:** The reference power plane.
- **Description:** A brief explanation of the signal’s function

Table 319. iLB Signals

Signal Name	Direction Plat. Power	Description
ILB_NMI	I V1P8S	Non-Maskable Interrupt: This is an NMI event indication into the SoC. <i>This signal is muxed and may be used by other functions.</i>

34.2 Features

34.2.1 Key Features

The key features of various blocks are as follows:

- Subtractive agent for the PCU
- LPC Interface
 - Supports Low Pin Count (LPC) 1.1 Specification
 - No support for DMA or bus mastering
 - Supports Trusted Platform Module (TPM) 1.2 and 2.0
 - Subtractive agent for the Intel Legacy Block
- General Purpose Input Output
 - Control interface for SoC GPIOs
 - I/O mapped registers
- 8259 Programmable Interrupt Controller
 - Legacy interrupt support
 - 15 total interrupts through two cascaded controllers
 - I/O and Memory mapped registers
- I/O Advanced Programmable Interrupt Controller
 - Legacy-free interrupt support
 - 87 total interrupts
 - Memory mapped registers
- 8254
 - Legacy timer support
 - Three timers with fixed uses: System Timer, Refresh Request Signal and Speaker Tone
 - I/O mapped registers
- HPET - High Performance Event Timers
 - Legacy-free timer support

- Three timers and one counter
- Memory mapped registers
- Real-Time Clock (RTC)
 - 242 byte RAM backed by battery (aka CMOS RAM)
 - Can generate wake/interrupt when time matches programmed value
 - I/O and indexed registers

34.2.2 Non-Maskable Interrupt

NMI support is enabled by setting the NMI Enable (NMI_EN) bit, at IO Port 70h, Bit 7, to 0b.

Non-Maskable Interrupts (NMIs) can be generated by several sources, as described in [Table 320](#).

Table 320. NMI Sources

NMI Source	NMI Source Enabler/ Disabler	NMI Source Status	Alternate Configuration
SERR# goes active NOTE: A SERR# is only generated internally in the SoC)	NSC.SNE	NSC.SNS	All NMI sources may, alternatively, generate a SMI by setting GNMI.NMI2SMIEN=1b The SoC uses GNMI.NMI2SMIST for observing SMI status
IOCHK# goes active NOTE: A IOCHK# is only generated as a SERIRQ# frame	NSC.INE	NSC.INS	
ILB_NMI goes active NOTE: Active can be defined as being on the positive or negative edge of the signal using the GNMI.GNMIED register bit.	GNMI.GNMIED	GNMI.GNMIS	
Software sets the GNMI.NMIN register bit	GNMI.NMIN	GNMI.NMINS	

34.3 PCU iLB Interrupt Decode and Route

34.3.7 PIRQE—Offset Ch

PIRQE Routing Control

Access Method

Type: Memory Mapped I/O Register
(Size: 8 bits)

PIRQE: [ILB_BASE_ADDRESS] + Ch

ILB_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)

ILB_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 50h

Default: 80h

7		4	0
1	0	0	0
REN		RSVD0	IR

Bit Range	Default & Access	Description
7	1b RW	REN: Interrupt Routing Enable (REN): When cleared, the corresponding PIRQx is routed to one of the legacy interrupts specified in bits[3:0]. When set, the PIRQx is not routed to the 8259.
6:4	0b RO	RSVD0: Reserved
3:0	0b RW	IR: IRQ Routing (IR): Indicates how to route PIRQx Bits Mapping Bits Mapping 0h Reserved 8h Reserved 1h Reserved 9h IRQ9 2h Reserved Ah IRQ10 3h IRQ3 Bh IRQ11 4h IRQ4 Ch IRQ12 5h IRQ5 Dh Reserved 6h IRQ6 Eh IRQ14 7h IRQ7 Fh IRQ15

34.3.8 PIRQF—Offset Dh

PIRQF Routing Control

Access Method

Type: Memory Mapped I/O Register
(Size: 8 bits)

PIRQF: [ILB_BASE_ADDRESS] + Dh

ILB_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)

ILB_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 50h

Default: 80h

7		4	0
1	0	0	0
REN		RSVD0	IR

Bit Range	Default & Access	Description
7	1b RW	REN: Interrupt Routing Enable (REN): When cleared, the corresponding PIRQx is routed to one of the legacy interrupts specified in bits[3:0]. When set, the PIRQx is not routed to the 8259.

34.3.9 PIRQG—Offset Eh

PIRQG Routing Control

Access Method

Type: Memory Mapped I/O Register
(Size: 8 bits)

PIRQG: [ILB_BASE_ADDRESS] + Eh

ILB_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)

ILB_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 50h

Default: 80h

7		4		0
1	0	0	0	0
REN		RSVD0		IR

Bit Range	Default & Access	Description
7	1b RW	REN: Interrupt Routing Enable (REN): When cleared, the corresponding PIRQx is routed to one of the legacy interrupts specified in bits[3:0]. When set, the PIRQx is not routed to the 8259.
6:4	0b RO	RSVD0: Reserved

34.3.10 PIRQH—Offset Fh

PIRQH Routing Control

Access Method

Type: Memory Mapped I/O Register
(Size: 8 bits)

PIRQH: [ILB_BASE_ADDRESS] + Fh

ILB_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)

ILB_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 50h

Default: 80h

Bit Range	Default & Access	Description
7	1b RW	REN: Interrupt Routing Enable (REN): When cleared, the corresponding PIRQx is routed to one of the legacy interrupts specified in bits[3:0]. When set, the PIRQx is not routed to the 8259.
6:4	0b RO	RSVD0: Reserved

34.3.11 SCNT—Offset 10h

SCNT - Serial IRQ Control

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

SCNT: [ILB_BASE_ADDRESS] + 10h

ILB_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)

ILB_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 50h

Default: 00000000h

Bit Range	Default & Access	Description
31:8	0b RO	RSVD0: Reserved
7	0b RW	MD: Mode (MD): When set, the SERIRQ is in continuous mode. When cleared, SERIRQ is in quiet mode. This bit must be set to guarantee that the first action of SERIRQ is a start frame.
6:0	0b RO	RSVD1: Reserved

34.3.12 KMC—Offset 14h

USB Legacy Keyboard/Mouse Control

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

KMC: [ILB_BASE_ADDRESS] + 14h

ILB_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)

ILB_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 50h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
RSVD0						TRAPBY64W	TRAPBY64R	TRAPBY60W
						TRAPBY60R	RSVD1	R64WEN
								R64REN
								R60WEN
								R60REN

Bit Range	Default & Access	Description
31:12	0b RO	RSVD0: Reserved
11	0b RW/1C	TRAPBY64W: TRAPBY64W - SMI Caused by Port 64 Write: Indicates if the event occurred. Note that even if the corresponding enable bit is not set in the Bit 3, then this bit will still be active. It is up to the SMM code to use the enable bit to determine the exact cause of the SMI#. Writing a 1 to this bit will clear the latch.
10	0b RW/1C	TRAPBY64R: TRAPBY64R - SMI Caused by Port 64 Read: Indicates if the event occurred. Note that even if the corresponding enable bit is not set in the Bit 2, then this bit will still be active. It is up to the SMM code to use the enable bit to determine the exact cause of the SMI#. Writing a 1 to this bit will clear the latch.
9	0b RW/1C	TRAPBY60W: TRAPBY60W - SMI Caused by Port 60 Write: Indicates if the event occurred. Note that even if the corresponding enable bit is not set in the Bit 1, then this bit will still be active. It is up to the SMM code to use the enable bit to determine the exact cause of the SMI#. Writing a 1 to this bit will clear the latch.
8	0b RW/1C	TRAPBY60R: TRAPBY60R - SMI Caused by Port 60 Read: Indicates if the event occurred. Note that even if the corresponding enable bit is not set in the Bit 0, then this bit will still be active. It is up to the SMM code to use the enable bit to determine the exact cause of the SMI#. Writing a 1 to this bit will clear the latch.
7:4	0b RO	RSVD1: Reserved
3	0b RW	R64WEN: R64WEN - SMI on Port 64 Writes Enable: When set, a 1 in bit 11 will cause an SMI event.
2	0b RW	R64REN: R64REN - SMI on Port 64 Reads Enable: When set, a 1 in bit 10 will cause an SMI event.
1	0b RW	R60WEN: R60WEN - SMI on Port 60 Writes Enable: When set, a 1 in bit 9 will cause an SMI event.
0	0b RW	R60REN: R60REN - SMI on Port 60 Reads Enable: When set, a 1 in bit 8 will cause an SMI event.

34.3.13 FS—Offset 18h

FS - FWH ID Select

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

FS: [ILB_BASE_ADDRESS] + 18h

ILB_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)

ILB_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 50h

Default: 00112233h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	1	1
IF8	IF0	IE8	IE0	ID8	ID0	IC8	IC0	

Bit Range	Default & Access	Description
31:28	0h RO	IF8: F8-FF IDSEL (IF8): IDSEL to use in FWH cycle for range enabled by BDE.EF8. The Address ranges are: FFF80000h - FFFFFFFFh, FFB80000h - FFBFFFFFh and 000E0000h - 000FFFFFh
27:24	0h RW	IF0: F0-F7 IDSEL (IF0): IDSEL to use in FWH cycle for range enabled by BDE.EF0. The Address ranges are: FFF00000h - FFF7FFFFh, FFB00000h - FFB7FFFFh
23:20	1h RW	IE8: E8-EF IDSEL (IE8): IDSEL to use in FWH cycle for range enabled by BDE.EE8. The Address ranges are: FFE80000h - FFEFFFFFh, FFA80000h - FFAFFFFFh
19:16	1h RW	IE0: E0-E7 IDSEL (IE0): IDSEL to use in FWH cycle for range enabled by BDE.EE0. The Address ranges are: FFE00000h - FFE7FFFFh, FFA00000h - FFA7FFFFh
15:12	2h RW	ID8: D8-DF IDSEL (ID8): IDSEL to use in FWH cycle for range enabled by BDE.ED8. The Address ranges are: FFD80000h - FFDFFFFFh, FF980000h - FF9FFFFFh
11:8	2h RW	ID0: D0-D7 IDSEL (ID0): IDSEL to use in FWH cycle for range enabled by BDE.ED0. The Address ranges are: FFD00000h - FFD7FFFFh, FF900000h - FF97FFFFh
7:4	3h RW	IC8: C8-CF IDSEL (IC8): IDSEL to use in FWH cycle for range enabled by BDE.EC8. The Address ranges are: FFC80000h - FFCFFFFFh, FF880000h - FF8FFFFFh
3:0	3h RW	IC0: C0-C7 IDSEL (IC0): IDSEL to use in FWH cycle for range enabled by BDE.EC0. The Address ranges are: FFC00000h - FFC7FFFFh, FF800000h - FF87FFFFh

34.3.14 BC—Offset 1Ch

BC - BIOS Control

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

BC: [ILB_BASE_ADDRESS] + 1Ch

ILB_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)

ILB_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 50h

Default: 00000100h

31	28	24	20	16	12	8	4	0	
0	0	0	0	0	0	0	0	0	
RSVD0						PFE	RSVD1	LE	WP

Bit Range	Default & Access	Description
31:9	0b RO	RSVD0: Reserved
8	1b RW	PFE: Prefetch Enable (PFE): When set, BIOS prefetching is enabled. An access to BIOS causes a 64-byte fetch of the line starting at that region. Subsequent accesses within that region result in data being returned from the prefetch buffer. The prefetch buffer is invalidated when this bit is cleared, or a BIOS access occurs to a different line than what is currently in the buffer.
7:2	0b RO	RSVD1: Reserved
1	0b RW	LE: Lock Enable (LE): When set, setting the WP bit will cause SMIs. When cleared, setting the WP bit will not cause SMIs. Once set, this bit can only be cleared by a PMU_PLTRST_B#.
0	0b RW	WP: Write Protect (WP): When set, access to BIOS is enabled for both read and write cycles. When cleared, only read cycles are permitted to BIOS. When written from a 0 to a 1 and LE is also set, an SMI# is generated. This ensures that only SMM code can update BIOS.

34.3.15 IR0—Offset 20h

IR0 - Interrupt Routing Device 0

Access Method

Type: Memory Mapped I/O Register
(Size: 16 bits)

IR0: [ILB BASE ADDRESS] + 20h

ILB_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)

ILB_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 50h

Default: 0000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	1
0	0	0	0	0	0	0	0	1
RSVD0								IRQ12C
								IRQ1C

Bit Range	Default & Access	Description
31:2	0b RO	RSVD0: Reserved
1	1b RW	IRQ12_CAUSE (IRQ12C): When software sets the bit to 1, IRQ12 will be high (asserted), When software set bit to 0,IRQ12 will be low (deasserted). default for this bit is 1
0	1b RW	IRQ1_CAUSE (IRQ1C): When software sets the bit to 1, IRQ11 will be high (asserted), When software set bit to 0,IRQ1 will be low (deasserted). default for this bit is 1

34.3.51 NMI (GNMI)—Offset 80h

NMI register

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

GNMI: [ILB_BASE_ADDRESS] + 80h

ILB_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)

ILB_BASE_ADDRESS Reference: [B:0, D:31, F:0] + 50h

Default: 00000004h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	1
RSVD0								NMI2SMIEN
								NMI2SMIST
								NMIN
								NMINS
								GNMIED
								GNMIE
								GNMIS

Bit Range	Default & Access	Description
31:7	0b RO	RSVD0: Reserved
6	0b RW	NMI2SMIEN: NMI to SMI Enable (NMI2SMIEN): When set, instead of NMI messgae SMI message will be sent.
5	0b RO	NMI2SMIST: NMI to SMI bit Status (NMI2SMIST)
4	0b RW/1C	NMIN: NMI NOW (NMIN): When set, NMI messgae will be sent. Writing 1'b1 to NMI_NOW inverts NMI_MOW and NMI_NOW_STS value
3	0b RO	NMINS: NMI_NOW_STS is a result of the NMI_NOW configuration bit. Writing 1'b1 to NMI_NOW inverts NMI_NOW_STS value. Resulting that the first time NMI_NOW is written sets the NMI_NOW_STS and initiates NMI. Next writing clears the NMI_NOW_STS and allows initiating NMI by the next writing to NMI_NOW
2	1b RW	GNMIED: GPIO NMI Edge Detction (GNMIED): When set, NMI messgae will be sent on NMI GPIO posedge. when cleared the NMI message will be sent on negedge
1	0b RW	GNMIE: GPIO NMI Enable (GNMIE): When set, NMI messgae will be sent when NMI GPIO occured. when cleared the message will not be sent
0	0b RW/1C	GNMS (GNMIS): GPIO NMI Status (GNMIS), when NMI is recieved from GPIO this bit is set. write '1' to this register to clear the status bit

34.3.52 LPCC—Offset 84h

LPC Control register

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

LPCC: [ILB_BASE_ADDRESS] + 84h

35 PCU – iLB – Low Pin Count (LPC) Bridge

The SoC implements an LPC Interface as described in the LPC 1.1 Specification. The Low Pin Count (LPC) bridge function of the SoC resides in PCI Device 31, Function 0.

Note: In addition to the LPC bridge interface function, D31:F0 contains other functional units including interrupt controllers, timers, power management, system management, GPIO, and RTC.

35.1 Signal Descriptions

Please see [Chapter 2, "Physical Interfaces"](#) for additional details.

The signal description table has the following headings:

- **Signal Name:** The name of the signal/pin
- **Direction:** The buffer direction can be either input, output, or I/O (bidirectional)
- **Platform Power:** The reference power plane.
- **Description:** A brief explanation of the signal's function

Note: If the VGA interfaces is used, VLPC must have a nominal voltage of 3.3V.

Table 322. LPC Signals

Signal Name	Direction Plat. Power	Description
ILB_LPC_AD[3:0]	I/O VLPC	LPC Multiplexed Command, Address, Data: Internal pull-ups are provided for these signals. <i>These signals are muxed and may be used by other functions.</i>
ILB_LPC_CLK[0]	O VLPC	LPC Clock [0] Out: 33 MHz PCI-like clock driven to LPC peripherals. <i>These signals are muxed and may be used by other functions.</i>
ILB_LPC_CLK[1]	O or I VLPC	LPC Clock [1] Out: 33 MHz PCI-like clock driven to LPC peripherals. Can be configured as an input to compensate for board routing delays through Soft Strap. <i>These signals are muxed and may be used by other functions.</i>
ILB_LPC_CLKRUN#	I/OD VLPC	LPC Clock Run: Input to determine the status of ILB_LPC_CLK and an open drain output used to request starting or speeding up ILB_LPC_CLK. This is a sustained tri-state signal used by the central resource to request permission to stop or slow ILB_LPC_CLK. The central resource is responsible for maintaining the signal in the asserted state when ILB_LPC_CLK is running and deasserts the signal to request permission to stop or slow ILB_LPC_CLK. An internal pull-up is provided for this signal. <i>This signal is muxed and may be used by other functions.</i>
ILB_LPC_FRAME#	O VLPC	LPC Frame: This signal indicates the start of an LPC cycle, or an abort. <i>This signal is muxed and may be used by other functions.</i>
ILB_LPC_SERIRQ	I/O V1P8S	Serial Interrupt Request: This signal implements the serial interrupt protocol. <i>This signal is muxed and may be used by other functions.</i>

35.2 Features

The LPC interface to the SoC is shown in [Figure 135](#). Note that the SoC implements all of the signals that are shown as optional, but peripherals are not required to do so.

Note: The LPC controller does not implement bus mastering cycles or DMA.

Note: The LPC controller is the subtractive agent of the Intel Legacy Block. All transactions not claimed elsewhere are sent to the LPC controller.

Figure 135. LPC Interface Diagram**NOTES:**

1. The General Purpose Input (GPI) must use a SMI capable GPIO: GPIO_S0_SC[7:0].

35.2.1 Memory Cycle Notes

For cycles below 16M, the LPC Controller will perform standard LPC memory cycles. For cycles targeting firmware (BIOS/EFI code only), firmware memory cycles are used. Only 8-bit transfers are performed. If a larger transfer appears, the LPC controller will break it into multiple 8-bit transfers until the request is satisfied.

If the cycle is not claimed by any peripheral (and subsequently aborted), the LPC Controller will return a value of all 1's to the CPU.

35.2.2 Trusted Platform Module (TPM) 1.2 Support

The LPC interface supports accessing Trusted Platform Module (TPM) 1.2 and 2.0 devices via the LPC TPM START encoding. Memory addresses within the range FED40000h to FED40FFFh will be accepted by the LPC Bridge and sent on LPC as TPM special cycles. No additional checking of the memory cycle is performed.

Note: This is different to the FED00000h to FED4BFFFh range implemented on some other Intel components since no Intel® Trusted Execution Technology (Intel® TXT) transactions are supported.

35.2.3 FWH Cycle Notes

If the LPC controller receives any SYNC returned from the device other than short (0101), long wait (0110), or ready (0000) when running a FWH cycle, indeterminate results may occur. A FWH device is not allowed to assert an Error SYNC.

BIOS/EFI boot from LPC is not supported when Secure Boot is enabled.

35.2.4 Other Notes

All cycles that are not decoded internally, and are not targeted for LPC (i.e. configuration cycles and IO cycles above 64kb) will be sent to LPC with ILB_LPC_FRAME# not asserted. Memory cycles above 16 MB that are not decoded internally, and are not targeted for LPC will be sent to LPC with ILB_LPC_FRAME# asserted.

35.2.5 POST Code Redirection

Writes to addresses 80h - 8Fh in IO register space will also be passed to the LPC bus.

Note: Reads of these addresses do not result in any LPC transactions.

35.2.6 Power Management

35.2.6.1 LPCPD# Protocol

Same timings as for PMC_SUS_STAT#. After driving PMC_SUS_STAT# active, the SoC drives ILB_LPC_FRAME# low, and tri-states (or drives low) ILB_LPC_AD[3:0].

Note: The Low Pin Count Interface Specification, Revision 1.1 defines the LPCPD# protocol where there is at least 30 μ s from LPCPD# assertion to LRST# assertion. This specification explicitly states that this protocol only applies to entry/exit of low power states which does not include asynchronous reset events. The SoC asserts both PMC_SUS_STAT# (connects to LPCPD#) and ILB_PLTRST# (connects to LRST#) at the same time during a global reset. This is not inconsistent with the LPC LPCPD# protocol.

35.2.6.2 Clock Run (CLKRUN)

When there are no pending LPC cycles, and SERIRQ is in quiet mode, the SoC can shut down the LPC clock. The SoC indicates that the LPC clock is going to shut down by de-asserting the ILB_LPC_CLKRUN# signal. LPC devices that require the clock to stay running should drive ILB_LPC_CLKRUN# low within 4 clocks of its de-assertion. If no device drives the signal low within 4 clocks, the LPC clock will stop. If a device asserts ILB_LPC_CLKRUN#, the SoC will start the LPC clock and assert ILB_LPC_CLKRUN#.

Note: The CLKRUN protocol is disabled by default. See [Section 35.3.2.2, "Clock Run Enable" on page 4534](#) for further details.

35.2.7 Serialized IRQ (SERIRQ)

35.2.7.1 Overview

The interrupt controller supports a serial IRQ scheme. The signal used to transmit this information is shared between the interrupt controller and all peripherals that support serial interrupts. The signal line, ILB_LPC_SERIRQ, is synchronous to LPC clock, and follows the sustained tri-state protocol that is used by LPC signals. The serial IRQ protocol defines this sustained tri-state signaling in the following fashion:

- **S - Sample Phase:** Signal driven low
- **R - Recovery Phase:** Signal driven high
- **T - Turn-around Phase:** Signal released

The interrupt controller supports 21 serial interrupts. These represent the 15 ISA interrupts (IRQ0- 1, 3-15), the four PCI interrupts, and the control signals SMI# and IOCHK#. Serial interrupt information is transferred using three types of frames:

- **Start Frame:** ILB_LPC_SERIRQ line driven low by the interrupt controller to indicate the start of IRQ transmission
- **Data Frames:** IRQ information transmitted by peripherals. The interrupt controller supports 21 data frames.
- **Stop Frame:** ILB_LPC_SERIRQ line driven low by the interrupt controller to indicate end of transmission and next mode of operation.

35.2.7.2 Start Frame

The serial IRQ protocol has two modes of operation which affect the start frame:

- **Continuous Mode:** The interrupt controller is solely responsible for generating the start frame
- **Quiet Mode:** Peripheral initiates the start frame, and the interrupt controller completes it.

These modes are entered via the length of the stop frame.

Continuous mode must be entered first, to start the first frame. This start frame width is 8 LPC clocks. This is a polling mode.

In Quiet mode, the ILB_LPC_SERIRQ line remains inactive and pulled up between the Stop and Start Frame until a peripheral drives ILB_LPC_SERIRQ low. The interrupt controller senses the line low and drives it low for the remainder of the Start Frame. Since the first LPC clock of the start frame was driven by the peripheral, the interrupt controller drives ILB_LPC_SERIRQ low for 1 LPC clock less than in continuous mode. This mode of operation allows for lower power operation.

35.2.7.3 Data Frames

Once the Start frame has been initiated, the ILB_LPC_SERIRQ peripherals start counting frames based on the rising edge of ILB_LPC_SERIRQ. Each of the IRQ/DATA frames has exactly 3 phases of 1 clock each:

- **Sample Phase:** During this phase, a device drives ILB_LPC_SERIRQ low if its corresponding interrupt signal is low. If its corresponding interrupt is high, then the ILB_LPC_SERIRQ devices tri-state ILB_LPC_SERIRQ. ILB_LPC_SERIRQ remains high due to pull-up resistors.
- **Recovery Phase:** During this phase, a device drives ILB_LPC_SERIRQ high if it was driven low during the Sample Phase. If it was not driven during the sample phase, it remains tri-stated in this phase.
- **Turn-around Phase:** The device tri-states ILB_LPC_SERIRQ.

35.2.7.4 Stop Frame

After the data frames, a Stop Frame will be driven by the interrupt controller. ILB_LPC_SERIRQ will be driven low for two or three LPC clocks. The number of clocks is determined by the SCNT.MD register bit. The number of clocks determines the next mode, as indicated in [Table 323](#).

Table 323. SERIRQ, Stop Frame Width to Operation Mode Mapping

Stop Frame Width	Next Mode
Two LPC clocks	Quiet Mode: Any SERIRQ device initiates a Start Frame
Three LPC clocks	Continuous Mode: Only the interrupt controller initiates a Start Frame

35.2.7.5 Serial Interrupts Not Supported

There are four interrupts on the serial stream which are not supported by the interrupt controller. These interrupts are:

- IRQ0: Heartbeat interrupt generated off of the internal 8254 counter 0.
- IRQ8: RTC interrupt can only be generated internally.
- IRQ13: This interrupt (floating point error) is not supported.
- IRQ14: Interrupt can only be generated by the SATA controller in Legacy mode.

The interrupt controller will ignore the state of these interrupts in the stream.

35.2.7.6 Data Frame Format and Issues

Table below shows the format of the data frames. The decoded INT[A:D]# values are ANDed with the corresponding PCI-express input signals (PIRQ[A:D]#). This way, the interrupt can be shared.

The other interrupts decoded via SERIRQ are also ANDed with the corresponding internal interrupts. For example, if IRQ10 is set to be used as the SCI, then it is ANDed with the decoded value for IRQ10 from the SERIRQ stream.

Table 324. SERIRQ Interrupt Mapping

Data Frame #	Interrupt	Clocks Past Start Frame	Comment
1	IRQ0	2	Ignored. Can only be generated via the internal 8524
2	IRQ1	5	Before port 60h latch
3	SMI#	8	Causes SMI# if low. Sets SMI_STS.ILB_SMI_STS register bit.
4	IRQ3	11	
5	IRQ4	14	
6	IRQ5	17	
7	IRQ6	20	
8	IRQ7	23	
9	IRQ8	26	Ignored. IRQ8# can only be generated internally
10	IRQ9	29	
11	IRQ10	32	
12	IRQ11	35	
13	IRQ12	38	Before port 60h latch
14	IRQ13	41	Ignored
15	IRQ14	44	Ignored
16	IRQ15	47	
17	IOCHCK#	50	Same as ISA IOCHCK# going active.
18	PCI INTA#	53	
19	PCI INTB#	56	
20	PCI INTC#	59	
21	PCI INTD#	62	

35.3 Use

35.3.1 LPC Clock Delay Compensation

In order to meet LPC interface AC timing requirements, a LPC clock loop back is required. The operation of this loop back can be configured in two ways:

1. On the SOC: In this configuration, ILB_LPC_CLK[0] is looped back on itself on the SOC pad.

- a. Benefit:

ILB_LPC_CLK[0] and ILB_LPC_CLK[1] are both available for system clocking

b. Drawback:

Clock delay compensation is less effective at compensating for mainboard delay

c. Soft Strap & Register Requirements:

Soft Strap LPCCLK_SLC = 0b

Configuration is reflected by register bit LPCC.LPCCLK_SLC=0b

Soft Strap LPCCLK1_ENB = 0b (ILB_LPC_CLK[1] disabled) or 1b (ILB_LPC_CLK[1] enabled)

2. Configuration is reflected by register bit LPCC.LPCCLK1EN=0b (ILB_LPC_CLK[1] disabled) or 1b (ILB_LPC_CLK[1] enabled)

3. On the main board: In this configuration, ILB_LPC_CLK[0] is looped back to ILB_LPC_CLK[1] on the main board.

a. Benefit:

Clock delay compensation is more effective at compensating for main board delay

b. Drawback:

Only ILB_LPC_CLK[0] is available for system clocking. ILB_LPC_CLK[1] must be disabled.

c. Soft Strap & Register Requirements:

Soft Strap LPCCLK_SLC = 1b

Configuration is reflected by register bit LPCC.LPCCLK_SLC=1b

Soft Strap LPCCLK1_ENB = 0b (ILB_LPC_CLK[1] disabled)

Configuration is reflected by register bit LPCC.LPCCLK1EN=0b

35.3.2 LPC Power Management

35.3.2.1 Clock Enabling

The LPC clocks can be enabled or disabled by setting or clearing, respectively, the LPCC.LPCCLK[1:0]EN bits.

35.3.2.2 Clock Run Enable

The Clock Run protocol is disabled by default and should only be enabled once all LPC devices have been initialized. The Clock Run protocol is enabled by setting the LPCC.CLKRUN_EN register bit.

35.3.3 SERIRQ Disable

Serialized IRQ support may be disabled by setting the OIC.SIRQEN bit to 0b.

Bit Range	Default & Access	Description
7	0b RO	Wait Cycle Control (WCC): Reserved as '0' per PCI-Express spec
6	0b RW	Parity Error Response Enable (PERE): This bit controls the device's response to parity errors. When the bit is set, the device must take its normal action when a parity error is detected. When the bit is 0, the device sets its Detected Parity Error status bit (bit 15 in the Status register) when an error is detected, but does not assert PERR# and continues normal operation.
5	0b RO	VGA Palette Snoop (VGA_PSE): This bit controls how VGA compatible and graphics devices handle accesses to VGA palette registers. When this bit is 1, palette snooping is enabled (i.e., the device does not respond to palette register writes and snoops the data). When the bit is 0, the device should treat palette write accesses like all other accesses. Reserved as '0' per PCI-Express spec
4	0b RO	Memory Write and Invalidate Enable (MWIE): This is an enable bit for using the Memory Write and Invalidate command. When this bit is 1, masters may generate the command. When it is 0, Memory Write must be used instead. Reserved as '0' per PCI-Express spec
3	0b RO	Special Cycle Enable (SCE): Controls a device's action on Special Cycle operations. A value of 0 causes the device to ignore all Special Cycle operations. A value of 1 allows the device to monitor Special Cycle operations. Reserved as '0' per PCI-Express spec
2	1b RO	Bus Master Enable (BME): Controls a device's ability to act as a master on the PCI bus. A value of 0 disables the device from generating PCI accesses. A value of 1 allows the device to behave as a bus master. Bus master cannot be disabled on LPC
1	1b RO	Memory Space Enable (MSE): Controls a device's response to Memory Space accesses. A value of 0 disables the device response. A value of 1 allows the device to respond to Memory Space accesses. Memory space cannot be disable on LPC
0	1b RO	I/O Space Enable (IOSE): Controls a device's response to I/O Space accesses. A value of 0 disables the device response. A value of 1 allows the device to respond to I/O Space accesses. I/O space cannot be disable on LPC

35.6.3 Status (PCIE_REG_STATUS)—Offset 6h

The Status register is used to record status information for PCI bus related events. Reads to this register behave normally. Writes are slightly different in that bits can be reset, but not set. A one bit is reset (if it is not read-only) whenever the register is written, and the write data in the corresponding bit location is a 1. For instance, to clear bit 14 and not affect any other bits, write the value 0100_0000_0000_0000b to the register.

Access Method

Type: PCI Configuration Register
(Size: 16 bits)

PCIE_REG_STATUS: [B:0, D:31, F:0] + 6h

Default: 0210h

15	12	8	4	0
0	0	0	0	0
0	0	1	0	0
0	0	0	1	0
0	0	0	0	0
DPE	SSE	RMA	RTA	STA
				DTS
				DPD
				FBC
				RSVD0
				C66
				CLIST
				IS
				RSVD1

Bit Range	Default & Access	Description
15	0b RW	Detected Parity Error (DPE): This bit must be set by the device whenever it detects a parity error, even if parity error handling is disabled (as controlled by bit 6 in the Command register).

Bit Range	Default & Access	Description
14	0b RW	Signaled System Error (SSE): This bit must be set whenever the device asserts SERR#. Set when the LPC bridge signals a system error to the internal SERR# logic.
13	0b RW	Received Master Abort (RMA): This bit must be set by a master device whenever its transaction (except for Special Cycle) is terminated with Master-Abort. All master devices must implement this bit.
12	0b RW	Received Target Abort (RTA): This bit must be set by a master device whenever its transaction is terminated with Target-Abort. All master devices must implement this bit.
11	0b RW	Signaled Target Abort (STA): This bit must be set by a target device whenever it terminates a transaction with Target-Abort. Devices that will never signal Target- Abort do not need to implement this bit.
10:9	01b RO	DEVSEL# Timing Status (DTS): These bits encode the timing of DEVSEL#. These are encoded as 00b for fast, 01b for medium, and 10b for slow (11b is reserved). These bits Indicate medium timing, although this has no meaning on the backbone
8	0b RW	Data Parity Error Detected (DPD): This bit is only implemented by bus masters. It is set when three conditions are met: 1) the bus agent asserted PERR# itself (on a read) or observed PERR# asserted (on a write); 2) the agent setting the bit acted as the bus master for the operation in which the error occurred; and 3) the Parity Error Response bit (Command register) is set.
7	0b RO	Fast Back to Back Capable (FBC): This optional read-only bit indicates whether or not the target is capable of accepting fast back-to-back transactions when the transactions are not to the same agent. This bit can be set to 1 if the device can accept these transactions and must be set to 0 otherwise. This bit has no meaning on internal backbone.
6	0b RO	RSVD0: Reserved
5	0b RO	66 MHz Capable (C66): This optional read-only bit indicates whether or not this device is capable of running at 66 MHz. A value of zero indicates 33 MHz. A value of 1 indicates that the device is 66 MHz capable. This bit has no meaning on internal backbone
4	1b RO	Capabilities List (CLIST): This optional read-only bit indicates whether or not this device implements the pointer for a New Capabilities linked list at offset 34h. A value of zero indicates that no New Capabilities linked list is available. A value of one indicates that the value read at offset 34h is a pointer in Configuration Space to a linked list of new capabilities. There is a capabilities list in the LPC bridge.
3	0b RO	Interrupt Status (IS): This read-only bit reflects the state of the interrupt in the device/function. Only when the Interrupt Disable bit in the command register is a 0 and this Interrupt Status bit is a 1, will the device's/function's INTx# signal be asserted. Setting the Interrupt Disable bit to a 1 has no effect on the state of this bit. The LPC bridge does not generate interrupts
2:0	0b RO	RSVD1: Reserved

35.6.4 Revision ID and Class Code (PCIE_REG_REVISION_ID_CLASS_CODE)—Offset 8h

This register is a combination of two registers the Revision ID register and the Class Code register. The revision ID register specifies a device specific revision identifier. The value is chosen by the vendor. Zero is an acceptable value. The Class Code register is read-only and is used to identify the generic function of the device and, in some cases, a specific registerlevel programming interface.

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

PCIE_REG_REVISION_ID_CLASS_CODE: [B:0, D:31, F:0] + 8h

Default: 06010000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	1	1	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
BCC				SCC				Pi
								RIS

Bit Range	Default & Access	Description
31:24	06h RO	Base Class Code (BCC): This field is a base class code which broadly classifies the type of function the device performs. Indicates the device is a bridge device.
23:16	01h RO	Sub-Class Code (SCC): This field is a sub-class code which identifies more specifically the function of the device. Indicates the device a PCI to ISA bridge
15:8	00h RO	Programming Interface (PI): This field identifies a specific register-level programming interface if any) so that device independent software can interact with the device. The LPC bridge has no programming interface.
7:0	X RO	Revision ID (RIS): This register specifies a device specific revision identifier. The value is chosen by the vendor. Zero is an acceptable value. This field should be viewed as a vendor defined extension to the Device ID. This field is controlled by the LPC RID fuses. Coming from the SETIDVALUE message Revision ID field

35.6.5 Master Latency Timer (PCIE_REG_MASTER_LAT_TIMER)—Offset Dh

This register specifies, in units of PCI bus clocks, the value of the Latency Timer for this PCI bus master. This register is implemented as read-only, the register must be initialized to 0.

Access Method

Type: PCI Configuration Register
(Size: 8 bits)

PCIE_REG_MASTER_LAT_TIMER: [B:0, D:31, F:0] + Dh

Default: 00h

7	4	0
0	0	0
0	0	0
MLC		RSVD0

Bit Range	Default & Access	Description
7:3	00h RO	Master Latency Count (MLC): Reserved per PCIe spec.
2:0	0b RO	RSVD0: Reserved

35.6.6 Header Type (PCIE_REG_HEADER_TYPE)—Offset Eh

This byte identifies the layout of the second part of the predefined header (beginning at byte 10h in Configuration Space) and also whether or not the device contains multiple functions.

Access Method

Type: PCI Configuration Register
(Size: 8 bits)

PCIE_REG_HEADER_TYPE: [B:0, D:31, F:0] + Eh

Default: 80h

7				4					0
1	0	0	0	0	0	0	0	0	0
MFD	HTYPE								

Bit Range	Default & Access	Description
7	1b RO	Multi-function Device (MFD): This field is used to identify a multi-function device. If the bit is 0, then the device is single function. If the bit is 1, then the device has multiple functions.
6:0	00h RO	Header Type (HTYPE): This field identifies the layout of the second part of the predefined header. The encoding 00h specifies the standard layout.

35.6.7 Subsystem ID and Vendor ID (PCIE_REG_SUBSYS_VENDOR_ID)—Offset 2Ch

This register is used to uniquely identify the add-in card or subsystem where the PCI device resides. It provides a mechanism for add-in card vendors to distinguish their add-in cards from one another even though the add-in cards may have the same PCI controller on them (and, therefore, the same Vendor ID and Device ID). Implementation of this register is required for all PCI devices except those that have a base class 6 with sub class 0-4 (0, 1, 2, 3, 4), or a base class 8 with sub class 0-3 (0, 1, 2, 3). Subsystem Vendor IDs can be obtained from the PCI SIG and are used to identify the vendor of the add-in card or subsystem. Values for the Subsystem ID are vendor specific. Values in these registers must be loaded and valid prior to the system firmware or any system software accessing the PCI Configuration Space. How these values are loaded is not specified but could be done during the manufacturing process or loaded from external logic (e.g., strapping options, serial ROMs, etc.). These values must not be loaded using expansion ROM software because expansion ROM software is not guaranteed to be run during POST in all systems. Devices are responsible for guaranteeing the data is valid before allowing reads to these registers to complete. This can be done by responding to any accesses with Retry until the data is valid. If a device is designed to be used exclusively on the system board, the system vendor may use system specific software to initialize these registers after each power-on. This register can be written only once after PMU_PLTRST_B de-assertion.

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

PCIE_REG_SUBSYS_VENDOR_ID: [B:0, D:31, F:0] + 2Ch

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
SSID								SSVID

Bit Range	Default & Access	Description
31:16	0000h RW	Subsystem ID (SSID): This is written by BIOS. No hardware action taken on this value. This field could be written only once.
15:0	0000h RW	Subsystem Vendor ID (SSVID): This is written by BIOS. No hardware action taken on this value. This field could be written only once.

35.6.8 Capability List Pointer (PCIE_REG_CAP_POINTER)—Offset 34h

This optional register is used to point to a linked list of new capabilities implemented by this device. This register is only valid if the Capabilities List bit in the Status Register is set. If implemented, the bottom two bits are reserved and should be set to 00b. Software should mask these bits off before using this register as a pointer in Configuration Space to the first entry of a linked list of new capabilities.

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

PCIE_REG_CAP_POINTER: [B:0, D:31, F:0] + 34h

Default: 000000E0h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	1	1
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
RSVD0							CP	

Bit Range	Default & Access	Description
31:8	0b RO	RSVD0: Reserved
7:0	E0h RO	Capability Pointer (CP): Indicates the offset of the first Capability Item.

35.6.9 ABASE (ACPI_BASE_ADDRESS)—Offset 40h

ACPI is mapped into I/O space. It is used by the PMC. Base Address registers that map into I/O Space are always 32 bits wide with bit 0 hardwired to a 1. Bit 1 is used to enable IO range pointed by this base address. Bits 31:16 are reserved and must return 0 on reads and the other bits could be used to map the device into I/O Space.

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

ACPI_BASE_ADDRESS: [B:0, D:31, F:0] + 40h

Default: 00000001h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	1
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
RSVD0							BA	EN
							RSVD1	MEMI

Bit Range	Default & Access	Description
31:16	0b RO	RSVD0: Reserved
15:7	000h RW	Base Address (BA): Provides the 128 bytes of I/O space for ACPI and TCO logic
6:2	0b RO	RSVD1: Reserved

Bit Range	Default & Access	Description
1	0b RW	Enable (EN): When set, decode of the IO range pointed to by the ABASE is enabled.
0	1b RO	Memory Space Indication (MEMI): This read-only bit always is 1, indicating that this BAR is IO mapped

35.6.10 PBASE (PMC_BASE_ADDRESS)—Offset 44h

PMC registers are mapped into memory space. It is used by the PMC. Base Address registers that map into Memory Space are always 32 bits wide bit 0 hardwired to a 0. Bit 1 is used to enable memory range pointed by this base address. For Memory Base Address registers, bit 2 indicates if base address could be on 64 bit space or only on 32 bit space. Bit 3 should be set to 1 if the data is prefetchable and reset to 0 otherwise

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

PMC_BASE_ADDRESS: [B:0, D:31, F:0] + 44h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
BA						RSVD0	PREF	ADDRNG
							EN	MEMI

Bit Range	Default & Access	Description
31:9	000000h RW	Base Address (BA): Provides 512 byte system memory base address for the PMC logic
8:4	0b RO	RSVD0: Reserved
3	0b RO	Prefetchable (PREF): Hardwired to 0. Indicated that this BAR is not prefetchable. Set to one, only if there are no side effects on reads, the device returns all bytes on reads regardless of the byte enables, and host bridges can merge processor writes into this range without causing errors.
2	0b RO	Address Range (ADDRNG): If set indicates that this BAR can be located in 64 bit address space, if clear indicates that this BAR can be located only in 32 bit address space.
1	0b RW	Enable (EN): When set, decode of the memory range pointed to by the PBASE is enabled.
0	0b RO	Memory Space Indication (MEMI): This read-only bit always is 0, indicating that this BAR is memory mapped

35.6.11 GBASE (GPIO_BASE_ADDRESS)—Offset 48h

GPIO registers are mapped into I/O space. It is used by the Proxy agent (to IO controllers). Base Address registers that map into I/O Space are always 32 bits wide with bit 0 hardwired to a 1. Bit 1 is used to enable IO range pointed by this base address. Bits 31:16 are reserved and must return 0 on reads and the other bits could be used to map the device into I/O Space.

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

GPIO_BASE_ADDRESS: [B:0, D:31, F:0] + 48h

Default: 00000001h

31	28	24	20	16	12	8	4	0	
0	0	0	0	0	0	0	0	1	
RSVD0				BA				EN	MEMT

Bit Range	Default & Access	Description
31:16	0b RO	RSVD0: Reserved
15:8	00h RW	Base Address (BA): Provides the 256 bytes of I/O space for GPIO logic
7:2	0b RO	RSVD1: Reserved
1	0b RW	Enable (EN): When set, decode of the IO range pointed to by the GBASE is enabled.
0	1b RO	Memory Space Indication (MEMI): This read-only bit always is 1, indicating that this BAR is IO mapped

35.6.12 IOBASE (IO_CONTROLLER_BASE_ADDRESS)—Offset 4Ch

IO Controllers registers are mapped into memory space. It is used by the Proxy agent (to IO controllers). Base Address registers that map into Memory Space are always 32 bits wide bit 0 hardwired to a 0. Bit 1 is used to enable memory range pointed by this base address. For Memory Base Address registers, bit 2 indicates if base address could be on 64 bit space or only on 32 bit space. Bit 3 should be set to 1 if the data is prefetchable and reset to 0 otherwise

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

IO_CONTROLLER_BASE_ADDRESS: [B:0, D:31, F:0] + 4Ch

Default: 00000000h

31	28	24	20	16	12	8	4	0			
0	0	0	0	0	0	0	0	0			
BA					RSVD0			PREF	ADDRNG	EN	MEMI

Bit Range	Default & Access	Description
31:14	00000h RW	Base Address (BA): Provides 8K byte system memory base address for the IO controllers logic
13:4	0b RO	RSVD0: Reserved

35.6.14 SBASE (SPI_BASE_ADDRESS)—Offset 54h

SPI registers are mapped into memory space. It is used by the SPI. Base Address registers that map into Memory Space are always 32 bits wide bit 0 hardwired to a 0. Bit 1 is used to enable memory range pointed by this base address. For Memory Base Address registers, bit 2 indicates if base address could be on 64 bit space or only on 32 bit space. Bit 3 should be set to 1 if the data is prefetchable and reset to 0 otherwise

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

SPI_BASE_ADDRESS: [B:0, D:31, F:0] + 54h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
BA							RSVD0	PREF ADDRNG EN MEMI

Bit Range	Default & Access	Description
31:9	000000h RW	Base Address (BA): Provides 512 byte system memory base address for the SPI logic
8:4	0b RO	RSVD0: Reserved
3	0b RO	Prefetchable (PREF): Hardwired to 0. Indicated that this BAR is not prefetchable. Set to one, only if there are no side effects on reads, the device returns all bytes on reads regardless of the byte enables, and host bridges can merge processor writes into this range without causing errors.
2	0b RO	Address Range (ADDRNG): If set indicates that this BAR can be located in 64 bit address space, if clear indicates that this BAR can be located only in 32 bit address space.
1	0b RW	Enable (EN): When set, decode of the memory range pointed to by the SBASE is enabled.
0	0b RO	Memory Space Indication (MEMI): This read-only bit always is 0, indicating that this BAR is memory mapped

35.6.15 MPBASE (MPHY_BASE_ADDRESS)—Offset 58h

M-phys registers are mapped into memory space. It is used by the Proxy agent (to M-phys). Base Address registers that map into Memory Space are always 32 bits wide bit 0 hardwired to a 0. Bit 1 is used to enable memory range pointed by this base address. For Memory Base Address registers, bit 2 indicates if base address could be on 64 bit space or only on 32 bit space. Bit 3 should be set to 1 if the data is prefetchable and reset to 0 otherwise

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

MPHY_BASE_ADDRESS: [B:0, D:31, F:0] + 58h

Default: 00000000h

35.7 PCU iLB LPC BIOS Control Memory Mapped I/O Registers

Table 326. Summary of PCU iLB LPC BIOS Control Memory Mapped I/O Registers—RCRB_BASE_ADDRESS

Offset	Size	Register ID—Description	Default Value
0h	4	"GCS (RCRB_GENERAL_CONTROL)—Offset 0h" on page 4555	00000000h

35.7.1 GCS (RCRB_GENERAL_CONTROL)—Offset 0h

General Control and Status - contains BIOS configuration and status

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

RCRB_GENERAL_CONTROL: [RCRB_BASE_ADDRESS] + 0h

RCRB_BASE_ADDRESS Type: PCI Configuration Register (Size: 32 bits)

RCRB_BASE_ADDRESS Reference: [B:0, D:31, F:0] + F0h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
RSVD0	BBSize	RSVD1				BBS	RSVD2	TS BILD

Bit Range	Default & Access	Description
31	0b RO	RSVD0: Reserved
30:29	X RO	Boot Block Size (BBSize): This field determines the size of the BIOS boot block. Default is controlled by 'Boot Block Size' soft strap. 00 : 64KB (Default) : Invert A16 if Top Swap is enabled 01 : 128KB : Invert A17 if Top Swap is enabled 10 : 256KB : Invert A18 if Top Swap is enabled 11 : Reserved This soft strap only applies when booting from SPI. Boot from LPC (FWH) only supports a 64KB boot block size (Invert A16) and this soft strap value is a don't care.
28:12	0b RO	RSVD1: Reserved
11:10	X RW	Boot BIOS Straps (BBS): This field determines the destination of accesses to the BIOS memory range. Default is controlled by 'Boot BIOS Straps' pin strap. 00 LPC 01 Reserved 10 Reserved 11 SPI The value in this field can be overwritten by software as long as the BIOS Interface Lock-Down (bit 0) is not set.
9:2	0b RO	RSVD2: Reserved
1	X RW	Top Swap (TS): When set, PCU EP will invert either A16, A17, or A18 for cycles going to the BIOS space (but not the feature space) in the FWH. When cleared, PCU EP will not invert A16. If booting from LPC (FWH), then the Boot Block size is 64KB and A16 is inverted if Top Swap is enabled. If booting from SPI, then the BOOT_BLOCK_SIZE soft strap determines if A16, A17, or A18 should be inverted if Top Swap is enabled. If Top-Swap pin-strap is active, then this bit cannot be cleared by software. This bit should be kept in RTC well and should be reset only by SRTCRST_b
0	0h RW	BIOS Interface Lock-Down (BILD): When set, prevents GCS.TS and GCS.BBS from being changed. This bit can only be written from 0 to 1 once.

36 PCU – iLB – Real Time Clock (RTC)

The SoC contains a Motorola MC146818B-compatible real-time clock with 242 bytes of battery-backed RAM. The real-time clock performs two key functions—keeping track of the time of day and storing system data, even when the system is powered down. The RTC operates on a 32.768 kHz crystal and a 3.3 V battery.

The RTC supports two lockable memory ranges. By setting bits in the configuration space, two 8-byte ranges can be locked to read and write accesses. This prevents unauthorized reading of passwords or other system security information.

The RTC supports a date alarm that allows for scheduling a wake up event up to 30 days in advance.

36.1 Signal Descriptions

Please see [Chapter 2, “Physical Interfaces”](#) for additional details.

The signal description table has the following headings:

- **Signal Name:** The name of the signal/pin
- **Direction:** The buffer direction can be either input, output, or I/O (bidirectional)
- **Platform Power:** The reference power plane.
- **Description:** A brief explanation of the signal’s function

Table 327. RTC Signals

Signal Name	Direction Plat. Power	Description
ILB_RTC_X1	I VRTC	Crystal Input 1: This signal is connected to the 32.768 kHz crystal. If no external crystal is used, the signal can be driven with the desired clock rate.
ILB_RTC_X2	I VRTC	Crystal Input 2: This signal is connected to the 32.768 kHz crystal. If no external crystal is used, the signal should be left floating.
ILB_RTC_RST#	I VRTC	RTC Reset: An external RC circuit creates a time delay for the signal such that it will go high (de-assert) sometime after the battery voltage is valid. The RC time delay should be in the 18-25 ms range. Contact your Intel representative for details. When asserted, this signal resets all register bits in the RTC well except for GEN_PMC1.RPS. NOTE: Unless registers are being cleared (only to be done in the G3 power state), the signal input must always be high when all other RTC power planes are on. NOTE: In the case where the RTC battery is dead or missing on the platform, the signal should be deasserted before the PMC_RSMRST# signal is deasserted.
ILB_RTC_TEST#	I VRTC	RTC Battery Test: An external RC circuit creates a time delay for the signal such that it will go high (de-assert) sometime after the battery voltage is valid. The RC time delay should be in the 18-25 ms range. Contact your Intel representative for details. If the battery is missing/weak, this signal appears low (asserted) at boot just after the suspend power rail (V3P3A) is up since it will not have time to meet Vih when V3P3A is high. The weak/missing battery condition is reported in the GEN_PMC1.RPS (RTC Power Status) register. When asserted, BIOS may clear the RTC CMOS RAM. NOTE: Unless CMOS is being cleared (only to be done in the G3 power state) or the battery is low, the signal input must always be high when all other RTC power planes are on. NOTE: This signal may also be used for debug purposes, as part of a XDP port. Contact your Intel representative for details.
ILB_RTC_EXTPAD	I VRTC	External capacitor connection

36.2 Features

The Real Time Clock (RTC) module provides a battery backed-up date and time keeping device. Three interrupt features are available: time of day alarm with once a second to once a month range, periodic rates of 122 us to 500 ms, and end of update cycle notification. Seconds, minutes, hours, days, day of week, month, and year are counted.

The hour is represented in twelve or twenty-four hour format, and data can be represented in BCD or binary format. The design is meant to be functionally compatible with the Motorola MS146818B. The time keeping comes from a 32.768 kHz oscillating source, which is divided to achieve an update every second. The lower 14 bytes on the lower RAM block have very specific functions. The first ten are for time and date information. The next four (0Ah to 0Dh) are registers, which configure and report RTC functions. A host-initiated write takes precedence over a hardware update in the event of a collision.

36.2.1 Update Cycles

An update cycle occurs once a second, if the B.SET bit is not asserted and the divide chain is properly configured. During this procedure, the stored time and date are incremented, overflow checked, a matching alarm condition is checked, and the time and date are rewritten to the RAM locations. The update cycle starts at least 488 us after A.UIP is asserted, and the entire cycle does not take more than 1984 us to complete. The time and date RAM locations (00h to 09h) are disconnected from the external bus during this time.

36.3 Interrupts

The real-time clock interrupt is internally routed within the SoC both to the I/O APIC and the 8259. It is mapped to interrupt vector 8. This interrupt does not leave the SoC, nor is it shared with any other interrupt. IRQ8# from the ILB_LPC_SERIRQ stream is ignored. However, the High Performance Event Timers can also be mapped to IRQ8#; in this case, the RTC interrupt is blocked.

36.3.1 Lockable RAM Ranges

The RTC battery-backed RAM supports two 8-byte ranges that can be locked: the RC.UL and RC.LL register bits. When the locking bits are set, the corresponding range in the RAM is not readable or writable. A write cycle to those locations will have no effect. A read cycle to those locations will not return the location's actual value (resultant value is undefined).

Once a range is locked, the range can be unlocked only by a hard reset, which will invoke the BIOS and allow it to re-lock the RAM range.

36.3.2 Clearing Battery-Backed RTC CMOS RAM

Clearing CMOS RAM in an SoC-based platform can be done by using a jumper on ILB_RTC_TEST# or a GPI. Implementations should not attempt to clear CMOS by using a jumper to pull RTC_VCC low.

Note: The entire Extended Bank and bytes 0Eh-7Fh of the Standard Bank will be cleared.

36.3.2.1 Using ILB_RTC_TEST# to Clear the RTC CMOS RAM

A jumper on ILB_RTC_TEST# can be used to clear CMOS values. When ILB_RTC_TEST# is low, the GEN_PMC1.RPS register bit will be set. BIOS can monitor the state of this bit, and manually clear the RTC CMOS array once the system is booted. The normal position will cause ILB_RTC_TEST# to be pulled up through a weak pull-up resistor. This ILB_RTC_TEST# jumper technique allows the jumper to be moved and then replaced—all while the system is powered off. Then, once booted, the GEN_PMC1.RPS bit can be detected in the set state.

36.3.3 Using a GPI to Clear CMOS

A jumper on a GPI can also be used to clear CMOS values. BIOS should detect the setting of this GPI on system boot-up, and manually clear the CMOS array.

Note: The GPI strap technique to clear CMOS requires multiple steps to implement. The system is booted with the jumper in new position, then powered back down. The jumper is replaced back to the normal position, then the system is rebooted again.

Warning: Do not implement a jumper on RTC_VCC to clear CMOS.

36.3.4 Clearing Battery Backed RTC Registers

Clearing Battery Backed RTC Registers in an SoC based platform can be done by using a jumper on ILB_RTC_RST#. Implementations should not attempt to clear the registers by using a jumper to pull RTC_VCC low. A jumper on ILB_RTC_RST# pulled to ground can be used to reset the state of those Battery Backed RTC Register configurations bit that reside in the RTC power well to their default state. [Table 328](#) shows which bits are set to their default state when ILB_RTC_RST# is asserted low.

Table 328. Register Bits Reset by ILB_RTC_RST# Assertion (Sheet 1 of 2)

Register Bit	Bit(s)	Default State
RCRB_GENERAL_CONTROL.TS	1	xb

Accessing the Real Time Clock Registers and the NMI Enable Bit: <http://download.intel.com/design/intarch/PAPERS/321088.pdf>

36.5 Register Map

36.6 IO Mapped Registers

The RTC internal registers and RAM is organized as two banks of 128 bytes each, called the standard and extended banks.

Note: It is not possible to disable the extended bank.

The first 14 bytes of the standard bank contain the RTC time and date information along with four registers, A - D, that are used for configuration of the RTC. The extended bank contains a full 128 bytes of battery backed SRAM. All data movement between the host CPU and the RTC is done through registers mapped to the standard I/O space.

Note: Registers reg_RTC_IR_type and reg_RTC_TR_type are used for data movement to and from the standard bank. Registers reg_RTC_RIR_type and reg_RTC_RTR_type are used for data movement to and from the extended bank. All of these registers have alias I/O locations, as indicated in Table 329.

Table 329. I/O Registers Alias Locations

Register	Original I/O Location	Alias I/O Location
reg_RTC_IR_type	70h	74h
reg_RTC_TR_type	71h	75h
reg_RTC_RIR_type	72h	76h
reg_RTC_RTR_type	73h	77h

36.7 Indexed Registers

The RTC contains indexed registers that are accessed via the reg_RTC_IR_type and reg_RTC_TR_type registers.

**Table 330. RTC Indexed Registers**

37 PCU – iLB – 8254 Timers

The 8254 contains three counters which have fixed uses including system timer and speaker tone. The reference clock for the counters (1.19318 MHz) is generated from a 14.318 MHz clock divided by 12.

37.1 Signal Descriptions

Please see [Chapter 2, “Physical Interfaces”](#) for additional details.

The signal description table has the following headings:

- **Signal Name:** The name of the signal/pin
- **Direction:** The buffer direction can be either input, output, or I/O (bidirectional)
- **Platform Power:** The reference power plane.
- **Description:** A brief explanation of the signal’s function

Table 332. 8254 Signals

Signal Name	Direction Plat. Power	Description
ILB_8254_SPKR	O V1P8S	Speaker: The signal drives an external speaker driver device, which in turn drives the system speaker. Upon PMC_PLTRST#, its output state is 0. <i>This signal is muxed and may be used by other functions.</i>

37.2 Features

37.2.1 Counter 0, System Timer

This counter functions as the system timer by controlling the state of IRQ0 and is programmed for Mode 3 operation. The counter produces a square wave with a period equal to the product of the counter period (838 ns) and the initial count value. The counter loads the initial count value one counter period after software writes the count value to the counter I/O address. The counter initially asserts IRQ0 and decrements the count value by two each counter period. The counter negates IRQ0 when the count value reaches 0. It then reloads the initial count value and again decrements the initial count value by two each counter period. The counter then asserts IRQ0 when the count value reaches 0, reloads the initial count value, and repeats the cycle, alternately asserting and negating IRQ0.

37.2.2 Counter 1, Refresh Request Signal

This counter is programmed for Mode 2 operation and impacts the period of the NSC.RTS register bit. Programming the counter to anything other than Mode 2 results in undefined behavior.

37.2.3 Counter 2, Speaker Tone

This counter provides the speaker tone and is typically programmed for Mode 3 operation. The counter provides a speaker frequency equal to the counter clock frequency (1.193 MHz) divided by the initial count value. The speaker must be enabled by a write to the NSC.SDE register bit.

37.3 Use

37.3.1 Timer Programming

The counter/timers are programmed in the following fashion:

1. Write a control word to select a counter.
2. Write an initial count for that counter.
3. Load the least and/or most significant bytes (as required by Control Word Bits 5, 4) of the 16-bit counter.
4. Repeat with other counters.

Only two conventions need to be observed when programming the counters. First, for each counter, the control word must be written before the initial count is written. Second, the initial count must follow the count format specified in the control word (least significant byte only, most significant byte only, or least significant byte and then most significant byte).

A new initial count may be written to a counter at any time without affecting the counter's programmed mode. Counting is affected as described in the mode definitions. The new count must follow the programmed count format.

If a counter is programmed to read/write two-byte counts, the following precaution applies: A program must not transfer control between writing the first and second byte to another routine which also writes into that same counter. Otherwise, the counter will be loaded with an incorrect count.

The Control Word Register at port 43h controls the operation of all three counters. Several commands are available:

- **Control Word Command.** Specifies which counter to read or write, the operating mode, and the count format (binary or BCD).
- **Counter Latch Command.** Latches the current count so that it can be read by the system. The countdown process continues.
- **Read Back Command.** Reads the count value, programmed mode, the current state of the OUT pins, and the state of the Null Count Flag of the selected counter.

Table 333 lists the six operating modes for the interval counters.

Table 333. Counter Operating Modes

Mode	Function	Description
0	Out signal on end of count (=0)	Output is 0. When count goes to 0, output goes to 1 and stays at 1 until counter is reprogrammed.
1	Hardware re-triggerable one-shot	Output is 0. When count goes to 0, output goes to 1 for one clock time.
2	Rate generator (divide by n counter)	Output is 1. Output goes to 0 for one clock time, then back to 1 and counter is reloaded.
3	Square wave output	Output is 1. Output goes to 0 when counter rolls over, and counter is reloaded. Output goes to 1 when counter rolls over, and counter is reloaded, etc.
4	Software triggered strobe	Output is 1. Output goes to 0 when count expires for one clock time.
5	Hardware triggered strobe	Output is 1. Output goes to 0 when count expires for one clock time.

37.3.2 Reading from the Interval Timer

It is often desirable to read the value of a counter without disturbing the count in progress. There are three methods for reading the counters: a simple read operation, counter Latch command, and the Read-Back command. Each is explained below.

With the simple read and counter latch command methods, the count must be read according to the programmed format; specifically, if the counter is programmed for two byte counts, two bytes must be read. The two bytes do not have to be read one right after the other. Read, write, or programming operations for other counters may be inserted between them.

37.3.2.1 Simple Read

The first method is to perform a simple read operation. The counter is selected through Port 40h (Counter 0), 41h (Counter 1), or 42h (Counter 2).

Note: Performing a direct read from the counter does not return a determinate value, because the counting process is asynchronous to read operations. However, in the case of Counter 2, the count can be stopped by writing 0b to the NSC.TC2E register bit.

37.3.2.2 Counter Latch Command

The Counter Latch command, written to Port 43h, latches the count of a specific counter at the time the command is received. This command is used to ensure that the count read from the counter is accurate, particularly when reading a two-byte count. The count value is then read from each counter's Count register as was programmed by the Control register.

The count is held in the latch until it is read or the counter is reprogrammed. The count is then unlatched. This allows reading the contents of the counters on the fly without affecting counting in progress. Multiple Counter Latch Commands may be used to latch more than one counter. Counter Latch commands do not affect the programmed mode of the counter in any way.

If a counter is latched and then, some time later, latched again before the count is read, the second Counter Latch command is ignored. The count read is the count at the time the first Counter Latch command was issued.

37.3.2.3 Read Back Command

The Read Back command, written to Port 43h, latches the count value, programmed mode, and current states of the OUT pin and Null Count flag of the selected counter or counters. The value of the counter and its status may then be read by I/O access to the counter address.

The Read Back command may be used to latch multiple counter outputs at one time. This single command is functionally equivalent to several counter latch commands, one for each counter latched. Each counter's latched count is held until it is read or reprogrammed. Once read, a counter is unlatched. The other counters remain latched until they are read. If multiple count Read Back commands are issued to the same counter without reading the count, all but the first are ignored.

The Read Back command may additionally be used to latch status information of selected counters. The status of a counter is accessed by a read from that counter's I/O port address. If multiple counter status latch operations are performed without reading the status, all but the first are ignored.

Both count and status of the selected counters may be latched simultaneously. This is functionally the same as issuing two consecutive, separate Read Back commands. If multiple count and/or status Read Back commands are issued to the same counters without any intervening reads, all but the first are ignored.

If both count and status of a counter are latched, the first read operation from that counter returns the latched status, regardless of which was latched first. The next one or two reads, depending on whether the counter is programmed for one or two type counts, returns the latched count. Subsequent reads return unlatched count.

37.4 Register Map

37.5 IO Mapped Registers

The IO ports listed in Table 334 have multiple register functions depending on the current programmed state of the 8254. The port numbers referenced in the register descriptions following Table 334 is one possible combination but not the only one.

Table 334. Register Aliases

Port	Alias	Register Name	Default Value	Access
40h	50h	Counter 0 Interval Time Status Byte Format (C0TS)	0xxxxxxb	RO
		Counter 0 Counter Access Port Register (C0AP)	Undefined	RW
41h	51h	Counter 1 Interval Time Status Byte Format (C1TS)	0xxxxxxb	RO

Bit Range	Default & Access	Description
7:0	X RW	CP: Counter Port: Each counter port address is used to program the 16-bit Count Register. The order of programming, either LSB only, MSB only, or LSB then MSB, is defined with the Interval Counter Control Register at port 43h. The counter port is also used to read the current count from the Count Register, and return the status of the counter programming following a Read Back Command.

37.6.8 NSC—Offset 61h

NMI Status and Control

Access Method

Type: I/O Register
(Size: 8 bits)

NSC: 61h

Default: 20h

7			4				0
0	0	1	0	0	0	0	0
SNS	INS	T2S	RTS	INE	SNE	SDE	TC2E

Bit Range	Default & Access	Description
7	0b RO	SNS: SERR# NMI Status (SNS): Set on errors from a PCIe port or internal functions that generate SERR#. SNE in this register must be cleared in order for this bit to be set. To reset the interrupt, set bit 2 to 1 and then set it to 0.
6	0b RO	INS: IOCHK NMI Status (INS): Set when SERIRQ asserts IOCHK# and INE in this register is cleared. To reset the interrupt, set bit 3 to 1 and then set it to 0.
5	1b RO	RTS (T2S): Timer Counter 2 Status (T2S): Reflects the current state of the 8254 counter 2 outputs. Counter 2 must be programmed for this bit to have a determinate value.
4	0b RO	RTS: Refresh Cycle Toggle Status (RTS): Reflects the current state of 8254 counter 1
3	X RW	INE: IOCHK NMI Enable (INE): When set, IOCHK# NMIs are disabled. When cleared, IOCHK# NMIs are enabled.
2	0b RW	SNE: SERR# NMI Enable (SNE): When set, SERR# NMIs are disabled. When cleared, SERR# NMIs are enabled.
1	0b RW	SDE: Speaker Data Enable (SDE): When this bit is a 0, the SPKR output is a 0. When this bit is a 1, the SPKR output is equivalent to the Counter 2 OUT signal value.
0	0b RW	TC2E: Timer Counter 2 Enable (TC2E): When cleared, counter 2 counting is disabled. When set, counting is enabled.

38 PCU – iLB – High Precision Event Timer (HPET)

This function provides a set of timers that to be used by the operating system for timing events. One timer block is implemented, containing one counter and three timers.

38.1 Features

38.1.1 Non-Periodic Mode - All Timers

This mode can be thought of as creating a one-shot. When a timer is set up for non-periodic mode, it generates an interrupt when the value in the main counter matches the value in the timer's comparator register. As timers 1 and 2 are 32-bit, they will generate another interrupt when the main counter wraps.

T0CV cannot be programmed reliably by a single 64-bit write in a 32-bit environment unless only the periodic rate is being changed. If T0CV needs to be re-initialized, the following algorithm is performed:

1. Set T0C.TVS
2. Set T0CV[31:0]
3. Set T0C.TVS
4. Set T0CV[63:32]

Every timer is required to support the non-periodic mode of operation.

38.1.2 Periodic Mode - Timer 0 only

When set up for periodic mode, when the main counter value matches the value in T0CV, an interrupt is generated (if enabled). Hardware then increases T0CV by the last value written to T0CV. During run-time, T0CV can be read to find out when the next periodic interrupt will be generated. Software is expected to remember the last value written to T0CV.

Example: if the value written to T0CV is 00000123h, then

- An interrupt will be generated when the main counter reaches 00000123h.
- T0CV will then be adjusted to 00000246h.
- Another interrupt will be generated when the main counter reaches 00000246h.
- T0CV will then be adjusted to 00000369h.

When the incremented value is greater than the maximum value possible for T0CV, the value will wrap around through 0. For example, if the current value in a 32-bit timer is FFFF0000h and the last value written to this register is 20000, then after the next interrupt the value will change to 00010000h.

If software wants to change the periodic rate, it writes a new value to T0CV. When the timer's comparator matches, the new value is added to derive the next matching point. If software resets the main counter, the value in the comparator's value register must also be reset by setting T0C.TVS. To avoid race conditions, this should be done with the main counter halted. The following usage model is expected:

1. Software clears GCFG.EN to prevent any interrupts.
2. Software clears the main counter by writing a value of 00h to it.
3. Software sets T0C.TVS.
4. Software writes the new value in T0CV.
5. Software sets GCFG.EN to enable interrupts.

38.1.2.1 Interrupts

If each timer has a unique interrupt and the timer has been configured for edge-triggered mode, then there are no specific steps required. If configured to level-triggered mode, then its interrupt must be cleared by software by writing a '1' back to the bit position for the interrupt to be cleared.

Interrupts associated with the various timers have several interrupt mapping options. Software should mask GCFG.LRE when reprogramming HPET interrupt routing to avoid spurious interrupts.

38.1.2.2 Mapping Option #1: Legacy Option (GCFG.LRE set)

This forces the following mapping:

**Table 336. 8254 Interrupt Mapping**

Time r	8259 Mapping	APIC Mapping	Comment
0	IRQ0	IRQ2	The 8254 timer will not cause any interrupts
1	IRQ8	IRQ8	RTC will not cause any interrupts.
2	T2C.IR	T2C.IRC	

38.1.2.3 Mapping Option #2: Standard Option (GCFG.LRE cleared)

Each timer has its own routing control. The interrupts can be routed to various interrupts in the I/O APIC. T[2:0]C.IRC indicates which interrupts are valid options for routing. If a timer is set for edge-triggered mode, the timers should not be shared with any other interrupts.

38.5.1 GCID (HPET_GCID)—Offset FED00000h

General Capabilities and ID

Access Method

Type: Memory Mapped I/O Register
(Size: 64 bits)

HPET_GCID: FED00000h

Default: 0429B17F8086A201h

6	6	5	5	4	4	4	3	3	2	2	2	1	1	8	4	0
3	0	6	2	8	4	0	6	2	8	4	0	6	2			
0	0	0	1	0	0	1	1	0	1	1	1	1	0	0	0	1
CTP								VID				LRC	RESERVED	CS	NT	RID

Bit Range	Default & Access	Description
63:32	0429B17Fh RO	CTP: Counter Tick Period (CTP): Indicates a period of 69.841279ns, (14.1318 MHz clock period)
31:16	8086h RO	VID: Vendor ID (VID): Value of 8086h indicates Intel.
15	1b RO	LRC: Legacy Rout Capable (LRC): Indicates support for Legacy Interrupt Rout.
14	0b RO	RESERVED: Reserved.
13	1b RO	CS: Counter Size (CS): This bit is set to indicate that the main counter is 64 bits wide.

38.5.2 GCFG (HPET_GCFG)—Offset FED00010h

General Configuration

Access Method

Type: Memory Mapped I/O Register
(Size: 64 bits)

HPET GCFG: FED00010h

Default: 0000000000000000h

Bit Range	Default & Access	Description
63:2	0b RO	RESERVED: Reserved.
1	0b RW	LRE: Legacy Rout Enable (LRE): When set, interrupts will be routed as follows: Timer 0 will be routed to IRQ0 in 8259 or IRQ2 in the I/O APIC Timer 1 will be routed to IRQ8 in 8259 and I/O APIC Timer 2 will be routed as per the routing in T2C When set, the T[1:0]C.IR will have no impact for timers 0 and 1.
0	0b RW	EN: Overall Enable (EN): When set, the timers can generate interrupts. When cleared, the main counter will halt and no interrupts will be caused by any timer. For level-triggered interrupts, if an interrupt is pending when this bit is cleared, the GIS.Tx will not be cleared.

38.5.3 GIS (HPET_GIS)—Offset FED00020h

General Interrupt Status

Access Method

Type: Memory Mapped I/O Register
(Size: 64 bits)

HPET_GIS: FED00020h

Default: 0000000000000000h

Diagram illustrating the IEEE 754-2008 double-precision floating-point format (64 bits). The format is divided into three main fields: Sign (S), Exponent (E), and Fraction (F). The Fraction field is further divided into four sub-fields, each corresponding to a hex digit. The diagram shows the bit patterns for the hex values 0x0000000000000000, 0x0000000000000001, 0x0000000000000002, and 0x0000000000000003. The first three values have a 1 in the sign bit, while the last value has a 1 in the least significant bit of the fraction field. The word "RESERVED" is written vertically across the middle of the diagram.

Bit Range	Default & Access	Description
63:3	0b RO	RESERVED: Reserved.
2	0b RW	T2: Timer 2 Status (T2): Same functionality as T0, for timer 2.
1	0b RW	T1: Timer 1 Status (T1): Same functionality as T0, for timer 1.
0	0b RW	T0: Timer 0 Status (T0): In edge triggered mode, this bit always reads as 0. In level triggered mode, this bit is set when an interrupt is active.

38.5.4 MCV (HPET_MCV)—Offset FED000F0h

Main Counter Value

Access Method

Type: Memory Mapped I/O Register
(Size: 64 bits)

HPET_MCV: FED000F0h

Default: 0000000000000000h

63	6	5	5	4	4	4	3	3	2	2	2	1	1	8	4	0
3	0	6	2	8	4	0	6	2	8	4	0	6	2			
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit Range	Default & Access	Description
63:0	0b RW	CV: Counter Value (CV): Reads return the current value of the counter. Writes load the new value to the counter. Timers 1 and 2 return 0 for the upper 32-bits of this register.

38.5.5 TOC (HPET_TOC)—Offset FED00100h

Timer 0 Config and Capabilities

Access Method

Type: Memory Mapped I/O Register
(Size: 64 bits)

HPET_TOC: FED00100h

Default: 00F0000000000030h

63	6	5	5	4	4	4	3	3	2	2	2	1	1	8	4	0
3	0	6	2	8	4	0	6	2	8	4	0	6	2

39 PCU – iLB – GPIO

102 GPIOs are available for use during the S0 ACPI state, and 44 are available for use from S5 to S0 (SUS). Most of these GPIOs can be used as legacy GPIOs through IO registers.

39.1 Signal Descriptions

Please see [Chapter 2, “Physical Interfaces”](#) for additional details.

The signal description table has the following headings:

- **Signal Name:** The name of the signal/pin
- **Direction:** The buffer direction can be either input, output, or I/O (bidirectional)
- **Platform Power:** The reference power plane
- **Description:** A brief explanation of the signal’s function

Table 338. GPIO Signals

Signal Name	Direction Plat. Power	Description
GPIO_S0_SC[101:0]	I/O Varies	These GPIO pins are powered and active in S0 only. Many of these are multiplexed with other functions and may have different default pin names.
GPIO_S5[43:0]	I/O Varies	These GPIO pins are powered and active in S5-S0 (SUS). Many of these are multiplexed with other functions and may have different default pin names. Some are used as straps.

39.2 Features

GPIOs can generate general purpose events (GPEs) on rising and/or falling edges.

39.3 Legacy Use

Each GPIO has six registers that control how it is used, or report its status:

- Use Select
- I/O Select
- GPIO Level
- Trigger Positive Edge
- Trigger Negative Edge
- Trigger Status

The Use Select register selects a GPIO pin as a GPIO, or leaves it as its programmed function. This register must be set for all other registers to affect the GPIO.

The I/O Select register determines the direction of the GPIO.

The Trigger Positive Edge and Trigger Negative Edge registers enable general purpose events on a rising and falling edge respectively. This only applies to GPIOs set as input.

The Trigger Status register is used by software to determine if the GPIO triggered a GPE. This only applies to GPIOs set as input and with one or both of the Trigger modes enabled.

Additionally, there is one additional register for each S5 GPIO:

- Wake Enable

This register allows S5 GPIOs to trigger a wake event based on the Trigger registers' settings.

39.4 Memory Mapped Use

Each GPIO has two registers that control how it is used, or report its status:

- Pad Configuration (PCONF0)
- Pad Value (PAD_VAL)

Note: These registers are also implemented for the available Virtual GPIOs (vGPIOs).

The Pad Configuration register has the following functions:

- Configure the function of the pin as a GPIO or multiplexed native functions
- Configure pull resistors
- Configure electrical behavior
- Configure edge detection
- Configure interrupt handling

Note: The PCONF0 register is valid irrespective of whether or not the pin is configured as a GPIO

The Pad Value register has the following functions:

- Reads the GPIO value, when configured as a GPI
- Writes the GPIO value, when configured as a GPO
- Enables/disables input and output capabilities

Note: The Pad Value register is only valid when the pin is configured as a GPIO in the Pad Configuration register.

Additionally, there are a number of general configuration registers that control groups of GPIOs or report their status. These include:

- IRQ Status (IRQ_TS)
- Direct IRQ Multiplexer (DIRECT_IRQ)

The IRQ Status register indicates if an IRQ associated with a GPIO has been triggered.

The Direct IRQ Multiplexer register allows for a selection of GPIOs to be assigned a dedicated APIC interrupt.

The GPIO South CORE and GPIO South SUS families have 16 dedicated IRQ outputs for each. Each of these 16 has a mux with an 8 bit select that can pick which of the input pads are mapped to that direct IRQ (the pad would still need to be programmed). Refer to the Intel Bios Writers Guide. This programming is done with the Direct IRQ 0 - 3 registers for SCORE and SSUS domains listed in the GPIO Family Register section.

The 16 GPSCORE direct IRQs are mapped to IOAPIC_IRQ [66:51].

The 16 GPSSUS direct IRQs are mapped to IOAPIC_IRQ [82:67].

For example:

1. Programming GPSCORE Direct IRQ 0 [dirq0] = 4 will map GPIO_S0_SC[004]/pCIE_CLKREQ[1#] to IRQ51.
2. Programming GPSCORE Direct IRQ 0 [dirq1] = 8 will map GPIO_S0_SC[008]/I2S0_CLK to IRQ52.

39.5 Register Map

Figure 137.SIO - I²C Register Map

39.6 GPIO Registers

Registers are broken into two groups: memory mapped and legacy IO registers. Memory mapped registers are used by BIOS and firmware to select the configurable function of the GPIO and setup analog states needed for that function's operation. They

are named based on the pin/ball name. Legacy IO registers are the more traditional GPIO control/status type, and are used when the function selected is a traditional GPIO (direction, level, use registers). They are numbered based on the GPIO number.

Each group is further broken down into SCORE (internal partition naming) and SSUS. SCORE are for the GPIO's named GPIO_S0_SC[xxx], while SSUS are for the GPIO's named GPIO_S5[xx].

Note: All GPIO registers must be accessed as double words. Unpredictable results will occur otherwise.

Note: All memory mapped GPIO *_PAD_VAL's must set Ienenb = 0 in order to read the pad_val of the GPIO. This applies to RO GPIO's as well.

Note: vGPIO's are virtual GPIO's for use by software to generate interrupts. They are not tied to physical pins.

Note: When a GPIO is selected via the IO USE_SEL, Memory accesses are denied (pconf0, pconf1 and pad_val).

§

39.7 PCU iLB GPIO S0 IO Addressed Registers

39.7.5 South Core Trigger Negative Enable 1 (cfio_ioreg_SC_TNE_31_0)—Offset 10h

Trigger Negative Edge Enable: When set to a 1, the corresponding GPIO signal (if enabled in the GPIO_USE_SEL register) will case an GPE or SMI when a 1 to 0 transition occurs. When set to 0, the GPIO signal is not enabled to trigger an GPE or SMI on a 1 to 0 transition. - Only the 8 lsb are used in VLV

39.7.6 South Core Trigger Status 1 (cfio_ioreg_SC_TS_31_0)—Offset 14h

Access via PCU proxy, when set to a 1, the corresponding GPIO (if enabled in the GPIO_USE_SEL register) if enabled as input via IO_SEL(n), triggered an GPE or SMI. This will be set if a 0 to 1 transition occurred and TPE(n) was set, or a 1 to 0 transition occurred and TNE(n) was set. If both TPE(n) and TNE(n) are set, then this bit will be set on both a 0 to 1 and a 1 to 0 transition. This bit will not be set if the GPIO is configured as an output. - Only the 8 lsb are used in VLV and it cannot be tested by the host

39.7.7 South Core Use Select 2 (cfio_ioreg_SC_USE_SEL_63_32_)—Offset 20h

Access via PCU proxy, the register is setting the corresponding GPIO to be selected and to be changed to IO access instead of the default Memory access. Bit 0 will set GPIO[32], and bit 1 will set GPIO[33] and so on. The default of IO GPIO pad is input so pull must be activated in the pad pconf0 register.

31:0	000000000 000000000 000000000 00000b RW	Tne (tne): bit 31 - PWM1 bit 30 - PWM0 bit 29 - I2C_NFC_SCL bit 28 - I2C_NFC_SDA bit 27 - I2C6_SCL bit 26 - I2C6_SDA bit 25 - I2C5_SCL bit 24 - I2C5_SDA bit 23 - I2C4_SCL bit 22 - I2C4_SDA bit 21 - I2C3_SCL bit 20 - I2C3_SDA bit 19 - I2C2_SCL bit 18 - I2C2_SDA bit 17 - I2C1_SCL bit 16 - I2C1_SDA bit 15 - I2C0_SCL bit 14 - I2C0_SDA bit 13 - UART2_CTS_B bit 12 - UART2_RTS_B bit 11 - UART2_TXD bit 10 - UART2_RXD bit 9 - UART1_CTS_B bit 8 - UART1_RTS_B bit 7 - UART1_TXD bit 6 - UART1_RXD bit 5 - SPI1_CLK bit 4 - SPI1_MOSI bit 3 - SPI1_MISO bit 2 - SPI1_CS0_B bit 1 - GP_SSP_2_TXD bit 0 - GP_SSP_2_RXD

39.7.18 South Core Trigger Status 3 (cfio_ioreg_SC_TS_95_64_)—Offset 54h

When set to a 1, the corresponding GPIO (if enabled in the GPIO_USE_SEL register) if enabled as input via IO_SEL(n), triggered an GPE or SMI. This will be set if a 0 to 1 transition occurred and TPE(n) was set, or a 1 to 0 transition occurred and TNE(n) was set. If both TPE(n) and TNE(n) are set, then this bit will be set on both a 0 to 1 and a 1 to 0 transition. This bit will not be set if the GPIO is configured as an output. - Only the 8 lsb are used in VLV

39.7.22 South Core Trigger Positive Edge Enable 4 (cfio_ioreg_SC_TPE_127_96_)—Offset 6Ch

Access via PCU proxy, the register trigger Positive Edge Enable: When set to a 1, the corresponding GPIO signal (if enabled in the GPIO_USE_SEL register) will case an GPE or SMI when a 0 to 1 transition occurs. When set to 0, the GPIO signal is not enabled to trigger an GPE or SMI on a 0 to 1 transition. - Only the 8 lsb are used in VLV

								RSVD
								RSVD
								RSVD
								func_pin_mux

Bit Range	Default & Access	Field Name (ID): Description
31	0b RO	Reserved (RSVD): Reserved.
30	0b RO	Reserved (RSVD): Reserved.
29	1b RW	Disable Second Mask (disable_second_mask): Reserved as one
28	0b RO	Reserved (RSVD): Reserved.
27	0b RW	Direct Irq En (direct_irq_en): If this bit is set, interrupt will use direct wire and not shared. This bit should be cleared if io access mode is selected for this pad
26	0b RW	Gd Tne (gd_tne): Negative edge detect for general detect event. 0 - No falling edge detect. 1 - Detect falling edge. For level interrupt mode it will enable active low level irq
25	0b RW	Gd Tpe (gd_tpe): Positive edge detect for general detect event. 0 - No rising edge detect. 1 - Detect rising edge. For level interrupt mode it will enable active high level irq
24	0b RW	Gd Level (gd_level): When this bit is set a level irq will be choose and not edge irq
23	0b RO	Reserved (RSVD): Reserved.
22:21	0h RO	Reserved (RSVD): Reserved.

Bit Range	Default & Access	Field Name (ID): Description
20	0b RW	Debounce (debounce): Enabling the debouncer for this pad. Debounce time will be according to the community setting at the debounce control register
19	0b RW	Filter En (filter_en): Enabling the glitch filter.
18	0b RW	Filter Slow (filter_slow): Switchg to slow mode glitch filter, using 32KHz clock with 62.5us glitch window filter.
17	1b RW	Slow Clkgate (slow_clkgate): Reserved as 1
16	1b RW	Fast Clkgate (fast_clkgate): Reserved as 1
15	1b RO	Reserved (RSVD): Reserved.
14:13	10b RW	Ihysctl (ihysctl): Hysteresis control. 00: min vil(V) - 0.61254 max vih(V) - 1.19637 min vil(%) - 36.9 max vih(%) - 63.9 min hysteresis(V) - 0.25232 01: min vil(V) - 0.6391 max vih(V) - 1.19637 min vil(%) - 38.5 max vih(%) - 63.9 min hysteresis(V) - 0.21912 10: min vil(V) - 0.61254 max vih(V) - 1.16991 min vil(%) - 36.9 max vih(%) - 62.3 min hysteresis(V) - 0.22244 11: min vil(V) - 0.6391 max vih(V) - 1.16991 min vil(%) - 38.5 max vih(%) - 62.3 min hysteresis(V) - 0.18924
12	0b RO	Reserved (RSVD): Reserved.
11	1b RO	Bypass Flop (bypass_flop): Reserved as 1
10:9	10b RW	Pull Str (pull_str): Pull strength: 00 - 2K 01 - reserved 10 - 20K 11 - reserved
8:7	01b RW	Pull Assign (pull_assign): Pull assignment is only applicable when pad is in input mode. 00 - Non pull 01 - Pull up 10 - Pull down 11 - reserved

RSVD	RSVD	bypass_flop	pull_str	pull_assign	RSVD	RSVD	RSVD	func_pin_mux

Bit Range	Default & Access	Field Name (ID): Description
31	0b RO	Reserved (RSVD): Reserved.
30	0b RO	Reserved (RSVD): Reserved.
29	1b RW	Disable Second Mask (disable_second_mask): Reserved as one

Bit Range	Default & Access	Field Name (ID): Description
28	0b RO	Reserved (RSVD): Reserved.
27	0b RW	Direct Irq En (direct_irq_en): If this bit is set, interrupt will use direct wire and not shared. This bit should be cleared if io access mode is selected for this pad
26	0b RW	Gd Tne (gd_tne): Negative edge detect for general detect event. 0 - No falling edge detect. 1 - Detect falling edge. For level interrupt mode it will enable active low level irq
25	0b RW	Gd Tpe (gd_tpe): Positive edge detect for general detect event. 0 - No rising edge detect. 1 - Detect rising edge. For level interrupt mode it will enable active high level irq
24	0b RW	Gd Level (gd_level): When this bit is set a level irq will be choose and not edge irq
23	0b RO	Reserved (RSVD): Reserved.
22:21	0h RO	Reserved (RSVD): Reserved.
20	0b RW	Debounce (debounce): Enabling the debouncer for this pad. Debounce time will be according to the community setting at the debounce control register
19	0b RW	Filter En (filter_en): Enabling the glitch filter.
18	0b RW	Filter Slow (filter_slow): Switchg to slow mode glitch filter, using 32KHz clock with 62.5us glitch window filter.
17	1b RW	Slow Clkgate (slow_clkgate): Reserved as 1
16	1b RW	Fast Clkgate (fast_clkgate): Reserved as 1
15	1b RO	Reserved (RSVD): Reserved.

Bit Range	Default & Access	Field Name (ID): Description
14:13	10b RW	Ihysctl (ihysctl): Hysteresis control. 00: min vil(V) - 0.61254 max vih(V) - 1.19637 min vil(%) - 36.9 max vih(%) - 63.9 min hysteresis(V) - 0.25232 01: min vil(V) - 0.6391 max vih(V) - 1.19637 min vil(%) - 38.5 max vih(%) - 63.9 min hysteresis(V) - 0.21912 10: min vil(V) - 0.61254 max vih(V) - 1.16991 min vil(%) - 36.9 max vih(%) - 62.3 min hysteresis(V) - 0.22244 11: min vil(V) - 0.6391 max vih(V) - 1.16991 min vil(%) - 38.5 max vih(%) - 62.3 min hysteresis(V) - 0.18924
12	0b RO	Reserved (RSVD): Reserved.

Document Number: 538136, Rev. 4.3

Bit Range	Default & Access	Field Name (ID): Description
0	0b RW	Pad Val (pad_val): Use this bit to set the output value or to read the pin state in memory mapped GPIO mode. Memory mapped GPIO mode is enabled when this configurable pad is set to the GPIO function via its respective func_pin_mux field and only accessed via memory mapped registers. When used as a memory mapped GPIO output, clear both ioutenb and iinenb bits. Even when used as output, the iinenb bit must be cleared to allow this register to reflect the output state.

39.8.25 Gp Ssp 2 Fs Pad Configuration (cfio_regs_pad_gp_ssp_2_fs_PCONF0)—Offset C0h

PADs Memory space configuration register

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [IOBASE] + C0h

IOBASE Type: PCI Configuration Register (Size: 32 bits)

IOBASE Reference: [B:0, D:31, F:0] + 4Ch

Default: 2003CC80h

Memory mapped GPIO mode is enabled when this configurable pad is set to the GPIO function via its respective func_pn_mux field and only accessed via memory mapped registers. When used as a memory mapped GPIO output, clear both ioutenb and iinenb bits. Even when used as output, the iinenb bit must to cleared to allow this register to reflect the output state.

39.8.178 Ilb Serirq Pad Configuration (cfio_regs_pad_ilb_serirq_PCONF0)—Offset 560h

PADs Memory space configuration register

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [IOBASE] + 560h

IOBASE Type: PCI Configuration Register (Size: 32 bits)

IOBASE Reference: [B:0, D:31, F:0] + 4Ch

Default: 2003CC80h

0	0b RW	Pad Val (pad_val): Use this bit to set the output value or to read the pin state in memory mapped GPIO mode. Memory mapped GPIO mode is enabled when this configurable pad is set to the GPIO function via its respective func_pn_mux field and only accessed via memory mapped registers. When used as a memory mapped GPIO output, clear both ioutenb and iinenb bits. Even when used as output, the iinenb bit must to cleared to allow this register to reflect the output state.

39.8.258 Vgpios 18 Pad Value (cfio_regs_pad_vgpios_18_PAD_VAL)–Offset 7D8h

PADs Memory space Value register

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [IOBASE] + 7D8h

IOBASE Type: PCI Configuration Register (Size: 32 bits)

IOBASE Reference: [B:0, D:31, F:0] + 4Ch

Default: 00000004h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	Reserved (RSVD): Reserved.
21:3	0h RO	Reserved (RSVD): Reserved.
2	1b RO	Reserved (RSVD): Reserved.
1	0b RW	Ioutenb (ioutenb): output disable. 0 - output enabled 1 - output disabled.
0	0b RW	Pad Val (pad_val): Use this bit to set the output value or to read the pin state in memory mapped GPIO mode. Memory mapped GPIO mode is enabled when this configurable pad is set to the GPIO function via its respective func_pn_mux field and only accessed via memory mapped registers. When used as a memory mapped GPIO output, clear both ioutenb and iinenb bits. Even when used as output, the iinenb bit must to cleared to allow this register to reflect the output state.

31:0	00000000h RW	To Select (io_sel): bit 31 - USB_ULPI_0_CLK bit 30 - GPIO_DFX8 bit 29 - GPIO_DFX7 bit 28 - GPIO_DFX6 bit 27 - GPIO_DFX5 bit 26 - GPIO_DFX4 bit 25 - GPIO_DFX3 bit 24 - GPIO_DFX2 bit 23 - GPIO_DFX1 bit 22 - GPIO_DFX0 bit 21 - SPI_CS1_B bit 20 - USB_OC1_B bit 19 - USB_OC0_B bit 18 - SUS_STAT_B bit 17 - PMU_WAKE_LAN_B bit 16 - PMU_PWRBTN_B bit 15 - PMU_WAKE_B bit 14 - PMU_SLP_LAN_B bit 13 - PMU_SLP_S0IX_B bit 12 - PMU_SUSCLK bit 11 - SUSPWRDNACK bit 10 - SEC_GPIO_SUS10 bit 9 - SEC_GPIO_SUS9 bit 8 - SEC_GPIO_SUS8 bit 7 - GPIO_SUS7 bit 6 - GPIO_SUS6 bit 5 - GPIO_SUS5 bit 4 - GPIO_SUS4 bit 3 - GPIO_SUS3 bit 2 - GPIO_SUS2 bit 1 - GPIO_SUS1 bit 0 - GPIO_SUS0

39.9.3 Sus Gpio Level 1 (cfio_ioreg_SUS_GP_LVL_31_0_)—Offset 8h

Access via PCU Proxy, the registers are implemented as dual read/write with dedicated storage for write. Write value will be stored in the write register, while read is coming from the pad directly. If GPIO(n) is programmed to be an output (via the corresponding bit in the GP_IO_SEL register), then the corresponding GP_LVL(n) write register value will drive a high or low value on the output pin. 1 = high, 0 = low. - Only the 8 lsb are used in VLV

Access Method

Type: I/O Register
(Size: 32 bits)

tpe								

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	Tpe (tpe): bit 31 - USB_ULPI_0_CLK bit 30 - GPIO_DFX8 bit 29 - GPIO_DFX7 bit 28 - GPIO_DFX6 bit 27 - GPIO_DFX5 bit 26 - GPIO_DFX4 bit 25 - GPIO_DFX3 bit 24 - GPIO_DFX2 bit 23 - GPIO_DFX1 bit 22 - GPIO_DFX0 bit 21 - SPI_CS1_B bit 20 - USB_OC1_B bit 19 - USB_OC0_B bit 18 - SUS_STAT_B bit 17 - PMU_WAKE_LAN_B bit 16 - PMU_PWRBTN_B bit 15 - PMU_WAKE_B bit 14 - PMU_SLP_LAN_B bit 13 - PMU_SLP_SOIX_B bit 12 - PMU_SUSCLK bit 11 - SUSPWRDNACK bit 10 - SEC_GPIO_SUS10 bit 9 - SEC_GPIO_SUS9 bit 8 - SEC_GPIO_SUS8 bit 7 - GPIO_SUS7 bit 6 - GPIO_SUS6 bit 5 - GPIO_SUS5 bit 4 - GPIO_SUS4 bit 3 - GPIO_SUS3 bit 2 - GPIO_SUS2 bit 1 - GPIO_SUS1 bit 0 - GPIO_SUS0

39.9.5 Sus Trigger Negative Edge Enable 1 (cfio ioreq SUS TNE 31 0)—Offset 10h

Access via PCU Proxy, When set to a 1, the corresponding GPIO (if enabled in the GPIO_USE_SEL register) if enabled as input via IO_SEL(n), triggered an GPE or SMI. This will be set if a 0 to 1 transition occurred and TPE(n) was set, or a 1 to 0 transition occurred and TNE(n) was set. If both TPE(n) and TNE(n) are set, then this bit will be set on both a 0 to 1 and a 1 to 0 transition. This bit will not be set if the GPIO is configured as an output. - Only the 8 lsb are used in VLV and it cannot be tested by the host

Access Method

Type: I/O Register
(Size: 32 bits)

Offset: [GBASE + 80h] + 14h

GBASE Type: PCI Configuration Register (Size: 32 bits)

GBASE Reference: [B:0, D:31, F:0] + 48h

Default: 00000000h

0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h WOC	Ts (ts): bit 31 - USB_ULPI_0_CLK bit 30 - GPIO_DFX8 bit 29 - GPIO_DFX7 bit 28 - GPIO_DFX6 bit 27 - GPIO_DFX5 bit 26 - GPIO_DFX4 bit 25 - GPIO_DFX3 bit 24 - GPIO_DFX2 bit 23 - GPIO_DFX1 bit 22 - GPIO_DFX0 bit 21 - SPI_CS1_B bit 20 - USB_OC1_B bit 19 - USB_OC0_B bit 18 - SUS_STAT_B bit 17 - PMU_WAKE_LAN_B bit 16 - PMU_PWRBTN_B bit 15 - PMU_WAKE_B bit 14 - PMU_SLP_LAN_B bit 13 - PMU_SLP_S0IX_B bit 12 - PMU_SUSCLK bit 11 - SUSPWRDNACK bit 10 - SEC_GPIO_SUS10 bit 9 - SEC_GPIO_SUS9 bit 8 - SEC_GPIO_SUS8 bit 7 - GPIO_SUS7 bit 6 - GPIO_SUS6 bit 5 - GPIO_SUS5 bit 4 - GPIO_SUS4 bit 3 - GPIO_SUS3 bit 2 - GPIO_SUS2 bit 1 - GPIO_SUS1 bit 0 - GPIO_SUS0

39.9.8 Sus Use Select 2 (cfio_ioreg_SUS_USE_SEL_43_32_)—Offset 20h

Access via PCU Proxy, the register is setting the corresponding GPIO to be selected and to be changed to IO access instead of the default Memory access. Bit 0 will set GPIO[0], and bit 1 will set GPIO[1] and so on. The default of IO GPIO pad is input so pull must be activated in the pad pconf0 register.

Access Method

Type: I/O Register
(Size: 32 bits)

Offset: [GBASE + 80h] + 20h

GBASE Type: PCI Configuration Register (Size: 32 bits)

GBASE Reference: [B:0, D:31, F:0] + 48h

39.9.9 Sus Io Select 2 (cfio_ioreg_SUS_IO_SEL_43_32_)—Offset 24h

Access via PCU Proxy, it defines Input Output Select: When set to a 1, the corresponding GPIO signal (if enabled in the GPIO_USE_SEL register) is programmed as an input. When set to 0, the GPIO signal is programmed as an output - Only the 8 lsb are used in VLV. Default values will be read as 0 if IO is not used

Access Method

39.9.10 Sus Gpio Level 2 (cfio_ioreg_SUS_GP_LVL_43_32_)—Offset 28h

This registers are implemented as dual read/write with dedicated storage for write. Write value will be stored in the write register, while read is coming from the pad directly. If GPIO(n) is programmed to be an output (via the corresponding bit in the GP_IO_SEL register), then the corresponding GP_LVL(n) write register value will drive a high or low value on the output pin. 1 = high, 0 = low. - Only the 8 lsb are used in VLV

Access Method

39.10.1 Usb Oc1 B Pad Configuration (cfio_regs_pad_usb_oc1_b_PCONF0)—Offset 0h

PADs Memory space configuration register

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [IOBASE + 0x2000] + 0h

IOBASE + 0x2000 Type: PCI Configuration Register (Size: 32 bits)

IOBASE + 0x2000 Reference: [B:0, D:31, F:0] + 4Ch

Default: 2003CC80h

31				28				24				20				16				12				8				4				0																																																			
0 0 1 0				0 0 0 0				0 0 0 0				0 0 0 0				0 0 1 1				1 1 0 0				1 1 0 0				1 0 0 0				1 0 0 0				0 0 0 0																																															
RSVD				direct_irq_en				gd_tne				gd_tpe				gd_level				RSVD				RSVD				filter_en				filter_slow				slow_clkgate				fast_clkgate				RSVD				ihysctl				RSVD				bypass_flop				pull_str				pull_assign				RSVD				RSVD				RSVD				func_pin_mux			

Bit Range	Default & Access	Field Name (ID): Description
31	0b RO	Reserved (RSVD): Reserved.
30	0b RO	Reserved (RSVD): Reserved.
29	1b RW	Disable Second Mask (disable_second_mask): Reserved as one
28	0b RO	Reserved (RSVD): Reserved.
27	0b RW	Direct Irq En (direct_irq_en): If this bit is set, interrupt will use direct wire and not shared. This bit should be cleared if io access mode is selected for this pad

Bit Range	Default & Access	Field Name (ID): Description
26	0b RW	Gd Tne (gd_tne): Negative edge detect for general detect event. 0 - No falling edge detect. 1 - Detect falling edge. For level interrupt mode it will enable active low level irq
25	0b RW	Gd Tpe (gd_tpe): Positive edge detect for general detect event. 0 - No rising edge detect. 1 - Detect rising edge. For level interrupt mode it will enable active high level irq
24	0b RW	Gd Level (gd_level): When this bit is set a level irq will be choose and not edge irq
23	0b RO	Reserved (RSVD): Reserved.
22:21	0h RO	Reserved (RSVD): Reserved.
20	0b RO	Reserved (RSVD): Reserved.
19	0b RW	Filter En (filter_en): Enabling the glitch filter.
18	0b RW	Filter Slow (filter_slow): Switchg to slow mode glitch filter, using 32KHz clock with 62.5us glitch window filter.
17	1b RW	Slow Clkgate (slow_clkgate): Reserved as 1
16	1b RW	Fast Clkgate (fast_clkgate): Reserved as 1
15	1b RO	Reserved (RSVD): Reserved.
14:13	10b RW	Ihysctl (ihysctl): Hysteresis control. 00: min vil(V) - 0.61254 max vih(V) - 1.19637 min vil(%) - 36.9 max vih(%) - 63.9 min hysteresis(V) - 0.25232 01: min vil(V) - 0.6391 max vih(V) - 1.19637 min vil(%) - 38.5 max vih(%) - 63.9 min hysteresis(V) - 0.21912 10: min vil(V) - 0.61254 max vih(V) - 1.16991 min vil(%) - 36.9 max vih(%) - 62.3 min hysteresis(V) - 0.22244 11: min vil(V) - 0.6391 max vih(V) - 1.16991 min vil(%) - 38.5 max vih(%) - 62.3 min hysteresis(V) - 0.18924

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	Reserved (RSVD): Reserved.
21:3	0h RO	Reserved (RSVD): Reserved.
2	0b RW	Iinenb (iinenb): input disable. 0 - input enabled 1 - input disabled. This bit must be cleared if output readback is required
1	1b RW	Ioutenb (ioutenb): output disable. 0 - output enabled 1 - output disabled.
0	0b RW	Pad Val (pad_val): Use this bit to set the output value or to read the pin state in memory mapped GPIO mode. Memory mapped GPIO mode is enabled when this configurable pad is set to the GPIO function via its respective func_pn_mux field and only accessed via memory mapped registers. When used as a memory mapped GPIO output, clear both ioutenb and iinenb bits. Even when used as output, the iinenb bit must be cleared to allow this register to reflect the output state.

39.10.3 Pmu Wake B Pad Configuration (cfio_regs_pad_pmu_wake_b_PCONF0)—Offset 10h

2	0b RW	Iinenb (iinenb): input disable. 0 - input enabled 1 - input disabled. This bit must be cleared if output readback is required
1	1b RW	Ioutenb (ioutenb): output disable. 0 - output enabled 1 - output disabled.

Bit Range	Default & Access	Field Name (ID): Description
0	0b RW	Pad Val (pad_val): Use this bit to set the output value or to read the pin state in memory mapped GPIO mode. Memory mapped GPIO mode is enabled when this configurable pad is set to the GPIO function via its respective func_pn_mux field and only accessed via memory mapped registers. When used as a memory mapped GPIO output, clear both ioutenb and iinenb bits. Even when used as output, the iinenb bit must to cleared to allow this register to reflect the output state.

39.10.18 Suspwrdsnack Pad Test (cfio_regs_pad_suspwrdsnack_PAD_DFT)—Offset 7Ch

PADs Memory space Value register

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [IOBASE + 0x2000] + 7Ch

IOBASE + 0x2000 Type: PCI Configuration Register (Size: 32 bits)

Bit Range	Default & Access	Field Name (ID): Description
0	0b RW	Pad Val (pad_val): Use this bit to set the output value or to read the pin state in memory mapped GPIO mode. Memory mapped GPIO mode is enabled when this configurable pad is set to the GPIO function via its respective func_pin_mux field and only accessed via memory mapped registers. When used as a memory mapped GPIO output, clear both ioutenb and iinenb bits. Even when used as output, the iinenb bit must be cleared to allow this register to reflect the output state.

40 *PCU – iLB – Interrupt Decoding and Routing*

The interrupt decoder is responsible for receiving interrupt messages from other devices in the SoC and decoding them for consumption by the interrupt router, the [PCU – iLB – 8259 Programmable Interrupt Controllers \(PIC\)](#) and/or the [PCU – iLB – IO APIC](#).

The interrupt router is responsible for mapping each incoming interrupt to the appropriate PIRQx, for consumption by the [PCU – iLB – 8259 Programmable Interrupt Controllers \(PIC\)](#) and/or [PCU – iLB – IO APIC](#).

40.1 Features

40.1.1 Interrupt Decoder

The interrupt decoder receives interrupt messages from devices in the SoC. These interrupts can be split into two primary groups:

- For consumption by the interrupt router
- For consumption by the 8259 PIC

40.1.1.1 For Consumption by the Interrupt Router

When a PCI-mapped device in the SoC asserts or de-asserts an INT[A:D] interrupt, an interrupt message is sent to the decoder. This message is decoded to indicate to the interrupt router which specific interrupt is asserted or de-asserted and which device the INT[A:D] interrupt originated from.

40.1.1.2 For Consumption by the 8259 PIC

When a device in the SoC asserts or de-asserts a legacy interrupt (IRQ), an interrupt message is sent to the decoder. This message is decoded to indicate to the 8259 PIC, which specific interrupt (IRQ[3, 14 or 15]) was asserted or de-asserted.

40.1.2 Interrupt Router

The interrupt router aggregates the INT[A:D] interrupts for each PCI-mapped device in the SoC, received from the interrupt decoder, and the INT[A:D] interrupts direct from the Serialized IRQ controller. It then maps these aggregated interrupts to 8 PCI based interrupts: PIRQ[A:H]. This mapping is configured using the IR[31:0] registers.

PCI based interrupts PIRQ[A:H] are then available for consumption by either the 8259 PICs or the IO-APIC, depending on the configuration of the 8 PIRQx Routing Control Registers: PIRQA, PIQRB, PIRQC, PIRQD, PIRQE, PIRQF, PIRQG, PIRQH.

40.1.2.1 Routing PCI Based Interrupts to 8259 PIC

The interrupt router can be programmed to allow PIRQA-PIRQH to be routed internally to the 8259 as ISA compatible interrupts IRQ 3–7, 9–12 & 14–15. The assignment is programmable through the 8 PIRQx Routing Control Registers: PIRQA, PIQRB, PIRQC, PIRQD, PIRQE, PIRQF, PIRQG, PIRQH. One or more PIRQs can be routed to the same IRQ input. If ISA Compatible Interrupts are not required, the Route registers can be programmed to disable steering.

The PIRQx# lines are defined as active low, level sensitive. When a PIRQx# is routed to specified IRQ line, software must change the IRQ's corresponding ELCR bit to level sensitive mode. The SoC internally inverts the PIRQx# line to send an active high level to the PIC. When a PCI interrupt is routed onto the PIC, the selected IRQ can no longer be used by an active high device (through SERIRQ). However, active low interrupts can share their interrupt with PCI interrupts.

§

41 PCU – iLB – IO APIC

The IO Advanced Programmable Interrupt Controller (APIC) is used to support line interrupts more flexibly than the 8259 PIC. Line interrupts are routed to it from multiple sources, including legacy devices, via the interrupt decoder and serial IRQs, or they are routed to it from the interrupt router in the iLB. These line based interrupts are then used to generate interrupt messages targeting the local APIC in the processor.

41.1 Features

- 87 interrupt lines
 - IRQ0-86
- Edge or level trigger mode per interrupt
- Active low or high polarity per interrupt
- Works with local APIC in processor via MSIs
- MSIs can target specific processor core
- Established APIC programming model

Figure 138. Detailed Block Diagram

MSIs generated by the I/O APIC are sent as 32-bit memory writes to the Local APIC. The address and data of the write transaction are used as follows.

Figure 139. MSI Address and Data

Destination ID (DID) and Extended Destination ID (EDID) are used to target a specific processor core's local APIC.

41.2 Use

The I/O APIC contains indirectly accessed I/O APIC registers and normal memory mapped registers. There are three memory mapped registers:

- Index Register (IDX)
- Window Register (WDW)
- End Of Interrupt Register (EOI)

The Index register selects an indirect I/O APIC register (ID/VS/RTE[n]) to appear in the Window register.

The Window register is used to read or write the indirect register selected by the Index register.

The EOI register is written to by the Local APIC in the processor. The I/O APIC compares the lower eight bits written to the EOI register to the Vector set for each interrupt (RTE.VCT). All interrupts that match this vector will have their RTE.RIRR register cleared. All other EOI register bits are ignored.

41.3 Indirect I/O APIC Registers

These registers are selected with the IDX register, and read/written through the WDW register. Accessing these registers must be done as DW requests, otherwise unspecified behavior will result. Software should not attempt to write to reserved registers. Reserved registers may return non-zero values when read.

Note: There is one pair of redirection (RTE) registers per interrupt line. Each pair forms a 64-bit RTE register.

Note: Specified offsets should be placed in IDX, not added to IDX.

§

41.4 PCU iLB IO APIC Memory Mapped I/O Registers

Table 343. Summary of PCU iLB I/O APIC Memory Mapped I/O Registers—

Offset	Size	Register ID—Description	Default Value
FEC00000h	1	"IDX (IOAPIC_IDX)—Offset FEC00000h" on page 5302	00h
FEC00010h	4	"WDW (IOAPIC_WDW)—Offset FEC00010h" on page 5302	00000000h

RESERVED1							EOI	

Bit Range	Default & Access	Description
31:8	0b WO	RESERVED (RESERVED1): Reserved.
7:0	0h WO	EOI: When a write is issued to this register, the IOxAPIC will check the lower 8 bits written to this register, and compare it with the vector field for each entry in the I/O Redirection Table. When a match is found, RTE.RIRR for that entry will be cleared. If multiple entries have the same vector, each of those entries will have RTE.RIRR cleared.

The SoC provides an ISA-compatible programmable interrupt controller (PIC) that incorporates the functionality of two, cascaded 8259 interrupt controllers.

In addition to providing support for ISA compatible interrupts, this interrupt controller can also support PCI based interrupts (PIRQs) by mapping the PCI interrupt onto a compatible ISA interrupt line. Each 8259 controller supports eight interrupts, numbered 0–7. [Table 344](#) shows how the controllers are connected.

Note: The SoC does not implement any external PIRQ# signals. The PIRQs referred to in this chapter originate from the interrupt routing unit.

**Table 344. Interrupt Controller Connections**

8259	8259 Input	Connected Pin / Function
Master	0	Internal Timer / Counter 0 output or HPET #0; determined by GCFG.LRE register bit
	1	IRQ1 using SERIRQ, Keyboard Emulation
	2	Slave controller INTR output
	3	IRQ3 via SERIRQ or PIRQx
	4	IRQ4 SERIRQ, PIRQx or PCU UART
	5	IRQ5 via SERIRQ or PIRQx
	6	IRQ6 via SERIRQ or PIRQx
	7	IRQ7 via SERIRQ or PIRQx
Slave	0	Inverted IRQ8# from internal RTC or HPET
	1	IRQ9 via SERIRQ, SCI or PIRQx
	2	IRQ10 via SERIRQ, SCI or PIRQx
	3	IRQ11 via SERIRQ, SCI, HPET or PIRQx
	4	IRQ12 via SERIRQ, PIRQx or mouse emulation
	5	None
	6	PIRQx or IRQ14 from SATA controller
	7	IRQ15 via SERIRQ or PIRQx or IRQ15 from SATA controller

The SoC cascades the slave controller onto the master controller through master controller interrupt input 2. This means there are only 15 possible interrupts for the SoC PIC.

Interrupts can be programmed individually to be edge or level, except for IRQ0, IRQ2 and IRQ8#.

Note: Active-low interrupt sources (such as a PIRQ#) are inverted inside the SoC. In the following descriptions of the 8259s, the interrupt levels are in reference to the signals at the internal interface of the 8259s, after the required inversions have occurred. Therefore, the term “high” indicates “active,” which means “low” on an originating PIRQ#.

42.1.1 Interrupt Handling

42.1.1.1 Generating Interrupts

The PIC interrupt sequence involves three bits, from the IRR, ISR, and IMR, for each interrupt level. These bits are used to determine the interrupt vector returned, and status of any other pending interrupts. [Table 345](#) defines the IRR, ISR, and IMR.

Table 345. Interrupt Status Registers

Bit	Description
IRR	Interrupt Request Register. This bit is set on a low to high transition of the interrupt line in edge mode, and by an active high level in level mode.
ISR	Interrupt Service Register. This bit is set, and the corresponding IRR bit cleared, when an interrupt acknowledge cycle is seen, and the vector returned is for that interrupt.
IMR	Interrupt Mask Register. This bit determines whether an interrupt is masked. Masked interrupts will not generate INTR.

42.1.1.2 Acknowledging Interrupts

The processor generates an interrupt acknowledge cycle that is translated into a Interrupt Acknowledge Cycle to the SoC. The PIC translates this command into two internal INTA# pulses expected by the 8259 controllers. The PIC uses the first internal INTA# pulse to freeze the state of the interrupts for priority resolution. On the second INTA# pulse, the master or slave sends the interrupt vector to the processor with the acknowledged interrupt code. This code is based upon the ICW2.IVBA bits, combined with the ICW2.IRL bits representing the interrupt within that controller.

Note: References to ICWx and OCWx registers are relevant to both the master and slave 8259 controllers.

Table 346. Content of Interrupt Vector Byte

Master, Slave Interrupt	Bits [7:3]	Bits [2:0]
IRQ7,15	ICW2.IVBA	111
IRQ6,14		110
IRQ5,13		101
IRQ4,12		100
IRQ3,11		011
IRQ2,10		010
IRQ1,9		001
IRQ0,8		000

42.1.1.3 Hardware/Software Interrupt Sequence

1. One or more of the Interrupt Request lines (IRQ) are raised high in edge mode, or seen high in level mode, setting the corresponding IRR bit.
2. The PIC sends INTR active to the processor if an asserted interrupt is not masked.
3. The processor acknowledges the INTR and responds with an interrupt acknowledge cycle.

4. Upon observing the special cycle, the SoC converts it into the two cycles that the internal 8259 pair can respond to. Each cycle appears as an interrupt acknowledge pulse on the internal INTA# pin of the cascaded interrupt controllers.
5. Upon receiving the first internally generated INTA# pulse, the highest priority ISR bit is set and the corresponding IRR bit is reset. On the trailing edge of the first pulse, a slave identification code is broadcast by the master to the slave on a private, internal three bit wide bus. The slave controller uses these bits to determine if it must respond with an interrupt vector during the second INTA# pulse.
6. Upon receiving the second internally generated INTA# pulse, the PIC returns the interrupt vector. If no interrupt request is present because the request was too short in duration, the PIC returns vector 7 from the master controller.
7. This completes the interrupt cycle. In AEOI mode the ISR bit is reset at the end of the second INTA# pulse. Otherwise, the ISR bit remains set until an appropriate EOI command is issued at the end of the interrupt subroutine.

42.1.2 Initialization Command Words (ICWx)

Before operation can begin, each 8259 must be initialized. In the SoC, this is a four byte sequence. The four initialization command words are referred to by their acronyms: ICW1, ICW2, ICW3, and ICW4.

The base address for each 8259 initialization command word is a fixed location in the I/O memory space: 20h for the master controller, and A0h for the slave controller.

42.1.2.1 ICW1

A write to the master or slave controller base address with data bit 4 equal to 1 is interpreted as a write to ICW1. Upon sensing this write, the PIC expects three more byte writes to 21h for the master controller, or A1h for the slave controller, to complete the ICW sequence.

A write to ICW1 starts the initialization sequence during which the following automatically occur:

1. Following initialization, an interrupt request (IRQ) input must make a low-to-high transition to generate an interrupt.
2. The Interrupt Mask Register is cleared.
3. IRQ7 input is assigned priority 7.
4. The slave mode address is set to 7.
5. Special mask mode is cleared and Status Read is set to IRR.

42.1.2.2 ICW2

The second write in the sequence (ICW2) is programmed to provide bits [7:3] of the interrupt vector that will be released during an interrupt acknowledge. A different base is selected for each interrupt controller.

42.1.2.3 ICW3

The third write in the sequence (ICW3) has a different meaning for each controller.

- For the master controller, ICW3 is used to indicate which IRQ input line is used to cascade the slave controller. Within the SoC, IRQ2 is used. Therefore, MICW3.CCC is set to a 1, and the other bits are set to 0s.
- For the slave controller, ICW3 is the slave identification code used during an interrupt acknowledge cycle. On interrupt acknowledge cycles, the master controller broadcasts a code to the slave controller if the cascaded interrupt won arbitration on the master controller. The slave controller compares this identification code to the value stored in its ICW3, and if it matches, the slave controller assumes responsibility for broadcasting the interrupt vector.

42.1.2.4 ICW4

The final write in the sequence (ICW4) must be programmed for both controllers. At the very least, ICW4.MM must be set to a 1 to indicate that the controllers are operating in an Intel Architecture-based system.

42.1.3 Operation Command Words (OCW)

These command words reprogram the Interrupt controller to operate in various interrupt modes.

- OCW1 masks and unmasks interrupt lines.
- OCW2 controls the rotation of interrupt priorities when in rotating priority mode, and controls the EOI function.
- OCW3 sets up ISR/IRR reads, enables/disables the special mask mode (SMM), and enables/disables polled interrupt mode.

42.1.4 Modes of Operation

42.1.4.1 Fully Nested Mode

In this mode, interrupt requests are ordered in priority from 0 through 7, with 0 being the highest. When an interrupt is acknowledged, the highest priority request is determined and its vector placed on the bus. Additionally, the ISR for the interrupt is set. This ISR bit remains set until: the processor issues an EOI command immediately before returning from the service routine; or if in AEOI mode, on the trailing edge of the second INTA#. While the ISR bit is set, all further interrupts of the same or lower priority are inhibited, while higher levels generate another interrupt.

Interrupt priorities can be changed in the rotating priority mode.

42.1.4.2 Special Fully-Nested Mode

This mode is used in the case of a system where cascading is used, and the priority has to be conserved within each slave. In this case, the special fully-nested mode is programmed to the master controller. This mode is similar to the fully-nested mode with the following exceptions:

- When an interrupt request from a certain slave is in service, this slave is not locked out from the master's priority logic and further interrupt requests from higher priority interrupts within the slave are recognized by the master and initiate interrupts to the processor. In the normal-nested mode, a slave is masked out when its request is in service.
- When exiting the Interrupt Service routine, software has to check whether the interrupt serviced was the only one from that slave. This is done by sending a Non-Specific EOI command to the slave and then reading its ISR. If it is 0, a non-specific EOI can also be sent to the master.

42.1.4.3 Automatic Rotation Mode (Equal Priority Devices)

In some applications, there are a number of interrupting devices of equal priority. Automatic rotation mode provides for a sequential 8-way rotation. In this mode, a device receives the lowest priority after being serviced. In the worst case, a device requesting an interrupt has to wait until each of seven other devices are serviced at most once.

There are two ways to accomplish automatic rotation using OCW2.REOI; the Rotation on Non-Specific EOI Command (OCW2.REOI=101b) and the rotate in automatic EOI mode which is set by (OCW2.REOI=100b).

42.1.4.4 Specific Rotation Mode (Specific Priority)

Software can change interrupt priorities by programming the bottom priority. For example, if IRQ5 is programmed as the bottom priority device, then IRQ6 is the highest priority device. The Set Priority Command is issued in OCW2 to accomplish this, where: OCW2.REOI=11xb, and OCW2.ILS is the binary priority level code of the bottom priority device.

In this mode, internal status is updated by software control during OCW2. However, it is independent of the EOI command. Priority changes can be executed during an EOI command by using the Rotate on Specific EOI Command in OCW2 (OCW2.REOI=111b) and OCW2.ILS=IRQ level to receive bottom priority.

42.1.4.5 Poll Mode

Poll mode can be used to conserve space in the interrupt vector table. Multiple interrupts that can be serviced by one interrupt service routine do not need separate vectors if the service routine uses the poll command. Poll mode can also be used to expand the number of interrupts. The polling interrupt service routine can call the appropriate service routine, instead of providing the interrupt vectors in the vector

table. In this mode, the INTR output is not used and the microprocessor internal Interrupt Enable flip-flop is reset, disabling its interrupt input. Service to devices is achieved by software using a Poll command.

The Poll command is issued by setting OCW3.PMC. The PIC treats its next I/O read as an interrupt acknowledge, sets the appropriate ISR bit if there is a request, and reads the priority level. Interrupts are frozen from the OCW3 write to the I/O read. The byte returned during the I/O read contains a 1 in Bit 7 if there is an interrupt, and the binary code of the highest priority level in Bits 2:0.

42.1.4.6 Edge and Level Triggered Mode

In ISA systems this mode is programmed using ICW1.LTIM, which sets level or edge for the entire controller. In the SoC, this bit is disabled and a register for edge and level triggered mode selection, per interrupt input, is included. This is the Edge/Level control Registers ELCR1 and ELCR2.

If an ELCR bit is 0, an interrupt request will be recognized by a low-to-high transition on the corresponding IRQ input. The IRQ input can remain high without generating another interrupt. If an ELCR bit is 1, an interrupt request will be recognized by a high level on the corresponding IRQ input and there is no need for an edge detection. The interrupt request must be removed before the EOI command is issued to prevent a second interrupt from occurring.

In both the edge and level triggered modes, the IRQ inputs must remain active until after the falling edge of the first internal INTA#. If the IRQ input goes inactive before this time, a default IRQ7 vector is returned.

42.1.5 End of Interrupt (EOI) Operations

An EOI can occur in one of two fashions: by a command word write issued to the PIC before returning from a service routine, the EOI command; or automatically when the ICW4.AEOI bit is set to 1.

42.1.5.1 Normal End of Interrupt

In normal EOI, software writes an EOI command before leaving the interrupt service routine to mark the interrupt as completed. There are two forms of EOI commands: Specific and Non-Specific. When a Non-Specific EOI command is issued, the PIC clears the highest ISR bit of those that are set to 1. Non-Specific EOI is the normal mode of operation of the PIC within the SoC, as the interrupt being serviced currently is the interrupt entered with the interrupt acknowledge. When the PIC is operated in modes that preserve the fully nested structure, software can determine which ISR bit to clear by issuing a Specific EOI.

An ISR bit that is masked is not cleared by a Non-Specific EOI if the PIC is in the special mask mode. An EOI command must be issued for both the master and slave controller.

42.1.5.2 Automatic End of Interrupt Mode

In this mode, the PIC automatically performs a Non-Specific EOI operation at the trailing edge of the last interrupt acknowledge pulse. From a system standpoint, this mode should be used only when a nested multi-level interrupt structure is not required within a single PIC. The AEOI mode can only be used in the master controller and not the slave controller.

Note: Both the master and slave PICs have an AEOI bit: MICW4.AEOI and SICW4.AEOI respectively. Only the MICW4.AEOI bit should be set by software. The SICW4.AEOI bit should not be set by software.

42.1.6 Masking Interrupts

42.1.6.1 Masking on an Individual Interrupt Request

Each interrupt request can be masked individually by the Interrupt Mask Register (IMR). This register is programmed through OCW1. Each bit in the IMR masks one interrupt channel. Masking IRQ2 on the master controller masks all requests for service from the slave controller.

42.1.6.2 Special Mask Mode

Some applications may require an interrupt service routine to dynamically alter the system priority structure during its execution under software control. For example, the routine may wish to inhibit lower priority requests for a portion of its execution but enable some of them for another portion.

The special mask mode enables all interrupts not masked by a bit set in the Mask register. Normally, when an interrupt service routine acknowledges an interrupt without issuing an EOI to clear the ISR bit, the interrupt controller inhibits all lower priority requests. In the special mask mode, any interrupts may be selectively enabled by loading the Mask Register with the appropriate pattern.

The special mask mode is set by OCW3.ESMM=1b & OCW3.SMM=1b, and cleared where OCW3.ESMM=1b & OCW3.SMM=0b.

42.2 IO Mapped Registers

The interrupt controller registers are located at 20h and 21h for the master controller (IRQ0 - 7), and at A0h and A1h for the slave controller (IRQ8 - 13). These registers have multiple functions, depending upon the data written to them. [Table 347](#) is a description of the different register possibilities for each address.

Note: The register descriptions after [Table 347](#) represent one register possibility.

Table 347. I/O Registers Alias Locations

42.3 PCU iLB 8259 Interrupt Controller (PIC) I/O Registers

Table 348. Summary of PCU iLB 8259 Interrupt Controller (PIC) I/O Registers—

Offset	Size	Register ID—Description	Default Value
20h	1	"MICW1—Offset 20h" on page 5313	00h
21h	1	"MICW2—Offset 21h" on page 5314	00h
24h	1	"MOCW2—Offset 24h" on page 5314	20h
25h	1	"MICW3—Offset 25h" on page 5315	00h
28h	1	"MOCW3—Offset 28h" on page 5315	22h
29h	1	"MICW4—Offset 29h" on page 5316	01h
2Dh	1	"MOCW1—Offset 2Dh" on page 5317	00h
A0h	1	"SICW1—Offset A0h" on page 5317	00h
A1h	1	"SICW2—Offset A1h" on page 5318	00h
A4h	1	"SOCW2—Offset A4h" on page 5319	20h
A5h	1	"SICW3—Offset A5h" on page 5319	00h
A8h	1	"SOCW3—Offset A8h" on page 5320	22h
A9h	1	"SICW4—Offset A9h" on page 5320	01h
ADh	1	"SOCW1—Offset ADh" on page 5321	00h
4D0h	1	"ELCR1—Offset 4D0h" on page 5321	00h
4D1h	1	"ELCR2—Offset 4D1h" on page 5322	00h

42.3.1 MICW1—Offset 20h

Master Initialization Command Word 1.A write to Initialization Command Word 1 starts the interrupt controller initialization sequence, during which the following occurs: * The Interrupt Mask register is cleared. * IRQ7 input is assigned priority 7. * The slave mode address is set to 7. * Special Mask Mode is cleared and Status Read is set to IRR. Once this write occurs, the controller expects writes to ICW2, ICW3, and ICW4 to complete the initialization sequence.

Access Method

Type: I/O Register
(Size: 8 bits)

MICW1: 20h

Default: 00h

7	4	0
0	0	0
MCS85	ICWOCWSEL	LTIM
		ADI
		SNGL
		IC4

Bit Range	Default & Access	Description
7:5	X WO	MCS85: These bits are MCS-85 specific, and not needed. Should be programmed to 000

Bit Range	Default & Access	Description
4	X WO	ICWOCWSEL: ICW/OCW select: This bit must be a 1 to select ICW1 and enable the ICW2, ICW3, and ICW4 sequence.
3	X WO	LTIM: Edge/Level Bank Select (LTIM): Disabled. Replaced by ELCR1 and ELCR2.
2	X WO	ADI: ADI. Ignored for VLV. Should be programmed to 0.
1	X WO	SNGL: Single or Cascade (SNGL): Must be programmed to a 0 to indicate two controllers operating in cascade mode.
0	X WO	IC4: wICW4 Write Required (IC4): This bit must be programmed to a 1 to indicate that ICW4 needs to be programmed.

42.3.2 MICW2—Offset 21h

Master ICW2 is used to initialize the interrupt controller with the five most significant bits of the interrupt vector address. The value programmed for bits[7:3] is used by the CPU to define the base address in the interrupt vector table for the interrupt routines associated with each IRQ on the controller. Typical ISA ICW2 values are 08h for the master controller and 70h for the slave controller.

Access Method

Type: I/O Register
(Size: 8 bits)

MICW2: 21h

Default: 00h

7	4	0
0	0	0
IVBA		IRL

Bit Range	Default & Access	Description
7:3	X WO	IVBA: Interrupt Vector Base Address: Bits [7:3] define the base address in the interrupt vector table for the interrupt routines associated with each interrupt request level input.
2:0	X WO	IRL: Interrupt Request Level: When writing ICW2, these bits should all be 0. During an interrupt acknowledge cycle, these bits are programmed by the interrupt controller with the interrupt to be serviced. This is combined with bits [7:3] to form the interrupt vector driven onto the data bus during the second INTA# cycle. The code is a three bit binary code: Code Master Interrupt Slave Interrupt 000 IRQ0 IRQ8 001 IRQ1 IRQ9 010 IRQ2 IRQ10 011 IRQ3 IRQ11 100 IRQ4 IRQ12 101 IRQ5 IRQ13 110 IRQ6 IRQ14 111 IRQ7 IRQ15

42.3.3 MOCW2—Offset 24h

Master Operational Control Word 2 (Interrupt Mask).Following a part reset or ICW initialization, the controller enters the fully nested mode of operation. Non-specific EOI without rotation is the default. Both rotation mode and specific EOI mode are disabled following initialization.

Access Method

Type: I/O Register
(Size: 8 bits)

MOCW2: 24h

Default: 20h

7			4				0
0	0	1	0	0	0	0	0
REOI			OCW2S	ILS			

Bit Range	Default & Access	Description
7:5	001b WO	REOI: Rotate and EOI Codes: R, SL, EOI - These three bits control the Rotate and End of Interrupt modes and combinations of the two. A chart of these combinations is listed above under the bit definition. 000 - Rotate in Auto EOI Mode (Clear) 001 - Non-specific EOI command 010 - No Operation 011 - *Specific EOI Command 100 - Rotate in Auto EOI Mode (Set) 101 - Rotate on Non-Specific EOI Command 110 - *Set Priority Command 111 - *Rotate on Specific EOI Command *L0 - L2 Are Used
4:3	X WO	OCW2S: OCW2 Select: When selecting OCW2, bits 4:3 = 00
2:0	X WO	ILS: Interrupt Level Select (L2, L1, L0): L2, L1, and L0 determine the interrupt level acted upon when the SL bit is active. A simple binary code, outlined above, selects the channel for the command to act upon. When the SL bit is inactive, these bits do not have a defined function; programming L2, L1 and L0 to 0 is sufficient in this case. Bits Interrupt Level Bits Interrupt Level 000 IRQ0/8 100 IRQ4/12 001 IRQ1/9 101 IRQ5/13 010 IRQ2/10 110 IRQ6/14 011 IRQ3/11 111 IRQ7/15

42.3.4 MICW3—Offset 25h

Master Initialization Command Word 3

Access Method

Type: I/O Register
(Size: 8 bits)

MICW3: 25h

Default: 00h

7			4				0
0	0	0	0	0	0	0	0
MBZ				CCC	MBZ1		

Bit Range	Default & Access	Description
7:3	X WO	MBZ: These bits must be programmed to zero.
2	X WO	CCC: Cascaded Controller Connection (CCC): This bit must always be programmed to a 1 to indicate the slave controller for interrupts 8 15 is cascaded on IRQ2.
1:0	X WO	MBZ (MBZ1): These bits must be programmed to zero.

42.3.5 MOCW3—Offset 28h

Master Operational Control Word 3

Access Method

Type: I/O Register
(Size: 8 bits)

MOCW3: 28h

Default: 22h

7			4				0
0	0	1	0	0	0	1	0
RESERVED	SMM	ESMM	O3S	PMC	RRC		

Bit Range	Default & Access	Description
7	0b RO	RESERVED: Reserved. Must be 0.
6	0b WO	SMM: Special Mask Mode (SMM): If this bit is set, the Special Mask Mode can be used by an interrupt service routine to dynamically alter the system priority structure while the routine is executing, through selective enabling/ disabling of the other channel's mask bits. Bit 6, the ESMM bit, must be set for this bit to have any meaning.
5	1b WO	ESMM: Enable Special Mask Mode (ESMM): When set, the SMM bit is enabled to set or reset the Special Mask Mode. When cleared, the SMM bit becomes a don't care.
4:3	X WO	O3S: OCW3 Select (O3S): When selecting OCW3, bits 4:3 = 01
2	X WO	PMC: Poll Mode Command (PMC): When cleared, poll command is not issued. When set, the next I/O read to the interrupt controller is treated as an interrupt acknowledge cycle. An encoded byte is driven onto the data bus, representing the highest priority level requesting service.
1:0	10b WO	RRC: Register Read Command (RRC): These bits provide control for reading the ISR and Interrupt IRR. When bit 1=0, bit 0 will not affect the register read selection. Following ICW initialization, the default OCW3 port address read will be read IRR. To retain the current selection (read ISR or read IRR), always write a 0 to bit 1 when programming this register. The selected register can be read repeatedly without reprogramming OCW3. To select a new status register, OCW3 must be reprogrammed prior to attempting the read. 00 No Action 01 No Action 10 Read IRQ Register 11 Read IS Register

42.3.6 MICW4—Offset 29h

Master Initialization Command Word 4

Access Method

Type: I/O Register
(Size: 8 bits)

MICW4: 29h

Default: 01h

7			4				0
0	0	0	0	0	0	0	1
	MBZ		SFNM	BUF	MSBM	AEOT	MM

Bit Range	Default & Access	Description
7:5	X WO	MBZ: These bits must be programmed to zero.
4	0b WO	SFNM: Special Fully Nested Mode (SFNM): Should normally be disabled by writing a 0 to this bit. If SFNM=1, the special fully nested mode is programmed.

Bit Range	Default & Access	Description
3	0b WO	BUF: Buffered Mode (BUF): Must be cleared for non-buffered mode. Writing 1 will result in undefined behavior.
2	0b WO	MSBM: Master/Slave in Buffered Mode (MSBM): Not used. Should always be programmed to 0.
1	0b WO	AEOI: Automatic End of Interrupt (AEOI): This bit should normally be programmed to 0. This is the normal end of interrupt. If this bit is 1, the automatic end of interrupt mode is programmed.
0	1b WO	MM: Microprocessor Mode (MM): This bit must be written to 1 to indicate that the controller is operating in an Intel Architecture-based system. Writing 0 will result in undefined behavior.

42.3.7 MOCW1—Offset 2Dh

Master Operational Control Word 1 (Interrupt Mask)

Access Method

Type: I/O Register
(Size: 8 bits)

MOCW1: 2Dh

Default: 00h

7	4	0
0	0	0
IRM		

Bit Range	Default & Access	Description
7:0	00h RW	IRM: Interrupt Request Mask (IRM): When a 1 is written to any bit in this register, the corresponding IRQ line is masked. When a 0 is written to any bit in this register, the corresponding IRQ mask bit is cleared, and interrupt requests will again be accepted by the controller. Masking IRQ2 on the master controller will also mask the interrupt requests from the slave controller.

42.3.8 SICW1—Offset A0h

Slave Initialization Command Word 1. A write to Initialization Command Word 1 starts the interrupt controller initialization sequence, during which the following occurs: * The Interrupt Mask register is cleared. * IRQ7 input is assigned priority 7. * The slave mode address is set to 7. * Special Mask Mode is cleared and Status Read is set to IRR. Once this write occurs, the controller expects writes to ICW2, ICW3, and ICW4 to complete the initialization sequence.

Access Method

Type: I/O Register
(Size: 8 bits)

SICW1: A0h

Default: 00h

7			4				0
0	0	0	0	0	0	0	0
MCS85			ICWOCWSEL	LTIM	ADI	SNGL	IC4

Bit Range	Default & Access	Description
7:5	X WO	MCS85: These bits are MCS-85 specific, and not needed. Should be programmed to 000.
4	X WO	ICWOCWSEL: ICW/OCW select: This bit must be a 1 to select ICW1 and enable the ICW2, ICW3, and ICW4 sequence.
3	X WO	LTIM: Edge/Level Bank Select (LTIM): Disabled. Replaced by ELCR1 and ELCR2.
2	X WO	ADI: ADI. Ignored for VLV. Should be programmed to 0.
1	X WO	SNGL: Single or Cascade (SNGL): Must be programmed to a 0 to indicate two controllers operating in cascade mode.
0	X WO	IC4: wICW4 Write Required (IC4): This bit must be programmed to a 1 to indicate that ICW4 needs to be programmed.

42.3.9 SICW2—Offset A1h

Slave ICW2 is used to initialize the interrupt controller with the five most significant bits of the interrupt vector address. The value programmed for bits[7:3] is used by the CPU to define the base address in the interrupt vector table for the interrupt routines associated with each IRQ on the controller. Typical ISA ICW2 values are 08h for the master controller and 70h for the slave controller.

Access Method

Данный компонент на территории Российской Федерации

Вы можете приобрести в компании MosChip.

Для оперативного оформления запроса Вам необходимо перейти по данной ссылке:

<http://moschip.ru/get-element>

Вы можете разместить у нас заказ для любого Вашего проекта, будь то серийное производство или разработка единичного прибора.

В нашем ассортименте представлены ведущие мировые производители активных и пассивных электронных компонентов.

Нашей специализацией является поставка электронной компонентной базы двойного назначения, продукции таких производителей как XILINX, Intel (ex.ALTERA), Vicor, Microchip, Texas Instruments, Analog Devices, Mini-Circuits, Amphenol, Glenair.

Сотрудничество с глобальными дистрибьюторами электронных компонентов, предоставляет возможность заказывать и получать с международных складов практически любой перечень компонентов в оптимальные для Вас сроки.

На всех этапах разработки и производства наши партнеры могут получить квалифицированную поддержку опытных инженеров.

Система менеджмента качества компании отвечает требованиям в соответствии с ГОСТ Р ИСО 9001, ГОСТ РВ 0015-002 и ЭС РД 009
