

Low Skew Zero Delay Buffer

FEATURES

- Frequency Range 10MHz to 220MHz
- Zero input - output delay.
- Low Output to Output Skew
- Optional Drive Strength:
Standard (8mA) *PL123E-09*
High (12mA) *PL123E-09H*
- 2.5V or 3.3V, $\pm 10\%$ operation.
- Available in 16-Pin SOP or TSSOP packages

DESCRIPTION

The PL123E-09 (-09H for High Drive) is a high performance, low skew, low jitter zero delay buffer designed to distribute high speed clocks. It has two low-skew output banks, of 4 outputs each, that are synchronized with the input. Control of the two banks of outputs is achieved by using the S1 and S2 inputs as shown in the Selector Definition table on page 2.

The synchronization is established via CLKOUT feed back to the input of the PLL. Since the skew between the input and output is less than $\pm 100\text{ps}$, the device acts as a zero delay buffer. The input output propagation delay can be advanced or delayed by adjusting the load on the CLKOUT pin.

These parts are not intended for 5V input-tolerant applications.

PIN DESCRIPTIONS

Name	Package Type		Type	Description
	TSSOP-16L	SOP-16L		
REF ^[1]	1	1	I	Input reference frequency.
CLKA1 ^[2]	2	2	O	Buffered clock output, Bank A
CLKA2 ^[2]	3	3	O	Buffered clock output, Bank A
VDD	4,13	4,13	P	VDD connection
GND	5,12	5,12	P	GND connection
CLKB1 ^[2]	6	6	O	Buffered clock output, Bank B
CLKB2 ^[2]	7	7	O	Buffered clock output, Bank B
S2 ^[3]	8	8	I	Selector input
S1 ^[3]	9	9	I	Selector input
CLKB3 ^[2]	10	10	O	Buffered clock output, Bank B
CLKB4 ^[2]	11	11	O	Buffered clock output, Bank B
CLKA3 ^[2]	14	14	O	Buffered clock output, Bank A
CLKA4 ^[2]	15	15	O	Buffered clock output, Bank A
CLKOUT ^[2]	16	16	O	Buffered clock output. Internal feedback on this pin.

Notes: 1: Weak pull-down. 2: Weak pull-down on all outputs. 3: Weak Pull-Up on S1 and S2

INPUT / OUTPUT SKEW CONTROL

The PL123E-09 will achieve Zero Delay from input to output when all the outputs are loaded equally. Adjustments to the input/output delay can be made by adding additional loading to the CLKOUT pin. Please contact Micrel for more information.

Low Skew Zero Delay Buffer**LAYOUT RECOMMENDATIONS**

The following guidelines are to assist you with a performance optimized PCB design:

Signal Integrity and Termination Considerations

- Keep traces short!
- Trace = Inductor. With a capacitive load this equals ringing!
- Long trace = Transmission Line. Without proper termination this will cause reflections (looks like ringing).
- Design long traces as “striplines” or “microstrips” with defined impedance.
- Match trace at one side to avoid reflections bouncing back and forth.

Decoupling and Power Supply Considerations

- Place decoupling capacitors as close as possible to the VDD pin(s) to limit noise from the power supply
- Addition of a ferrite bead in series with VDD can help prevent noise from other board sources
- Value of decoupling capacitor is frequency dependant. Typical values to use are 0.1 μF for designs using frequencies < 50MHz and 0.01 μF for designs using frequencies > 50MHz.

Typical CMOS termination

Place Series Resistor as close as possible to CMOS output

Вы можете разместить у нас заказ для любого Вашего проекта, будь то серийное производство или разработка единичного прибора.

В нашем ассортименте представлены ведущие мировые производители активных и пассивных электронных компонентов.

Нашей специализацией является поставка электронной компонентной базы двойного назначения, продукции таких производителей как XILINX, Intel (ex.ALTERA), Vicor, Microchip, Texas Instruments, Analog Devices, Mini-Circuits, Amphenol, Glenair.

Сотрудничество с глобальными дистрибьюторами электронных компонентов, предоставляет возможность заказывать и получать с международных складов практически любой перечень компонентов в оптимальные для Вас сроки.

На всех этапах разработки и производства наши партнеры могут получить квалифицированную поддержку опытных инженеров.

Система менеджмента качества компании отвечает требованиям в соответствии с ГОСТ Р ИСО 9001, ГОСТ РВ 0015-002 и ЭС РД 009
