CC1600 Conduction-Cooled Rectifier

Input: **100-120/200-240** Vac; **1200/1600W** capable; Output: 52V

RoHS 6/6 Compliant

Applications

- Wide band power amplifier
- Broadcast systems
- Lasers
- Acoustic noise sensitive systems
- LED signage

Features

- Efficiency exceeding 94%[1]
- Compact form factor 11.52"L x 5.29"W x 1.83"H with max 14.3 W/in^3 density
- 1600W from nominal 200-240V_{AC} <50ºC baseplate
- 1200W from nominal 100–120V_{AC} for V_O < 52V_{DC}, < 50ºC baseplate
- Output voltage programmable from 42V – 58V_{DC}
- "Floating" output for positive or negative polarity
- Remote ON/OFF control of the main output by RS485
- Comprehensive input, output and overtemperature protection
- Precision measurement reporting of input/output voltage & current
- Power factor correction (meets EN/IEC 61000-3-2 and EN 60555-2 requirements)
- Redundant, parallel operation with active load sharing
- Completely enclosed, conduction cooled
- Adapter card available with I/O screw terminals
- UL* Recognized, CAN/ CSA[†] C22.2 specified compliance with IEC60950-1
- CE mark meets 2006/95/EC directive[§]

Description

The CC1600 is a conduction-cooled, industrial-grade rectifier designed for reliable operation in both outdoor and indoor applications. With high-range ac input (200-240 Vac), it can deliver the maximum 1600W at case temperatures less than 50°C. With low-range ac input (100-120 Vac), it delivers up to 1200W at case temperatures less than 50°C.

The CC1600 has an extremely wide programmable output voltage capability. Featuring high-density, fully enclosed, conduction-cooled packaging, it is designed for minimal space utilization

CC1600 Conduction-Cooled Rectifier
Input: **100-120/200-240** Vac;   1200/1600W capable; Output: 52V

Absolute Maximum Ratings

Stresses in excess of the absolute maximum ratings can cause permanent damage to the device. These are absolute stress ratings only, functional operation of the device is not implied at these or any other conditions in excess of those given in the operations sections of the data sheet. Exposure to absolute maximum ratings for extended periods can adversely affect the device reliability.

Parameter	Symbol	Min	Max	Unit
Input Voltage: Continuous	V_{IN}	0	264	V_{AC}
Operating Case Temperature (sink side)[2]	T_C	-10	75	°C
Storage Temperature	T_{stg}	-40	85	°C
Input Isolation voltage to Frame (100% factory Hi-Pot tested)			1500	V_{AC}
Output Isolation voltage to Frame (100% factory Hi-Pot tested)			500	V_{AC}

Electrical Specifications

Unless otherwise indicated, specifications apply over all operating input voltage, Vo=52V_{DC}, resistive load, and case temperature T_C ≤ 50°C (where derating starts). T_C is measured in the middle of the heat-sink side.

Timing diagrams

Response to input fluctuations

T1 – ride through time – 0.5 to 1 cycles [10 – 20ms] V_{OUT} remains within regulation – load dependent

T2 – hold up time of the 8V_INT output @ full load – 5s – from the time when AC input is failed

T3 – AC failed delay time <320ms – from when the AC input failed to Fault signal be high

T4 – hold up time >10ms – V_{OUT} stays above $42V_{DC}$ for high line and >18ms for low line

T5 – delay time – 3.3s – from AC returns to regulation to restart of output

T6 – AC failed recovery time -400ms – from when the AC returns within regulation to Fault signal be low

T7 – rise time - 120ms – the time it takes for V_{OUT} to rise from 10% to 90% of regulation

T8 – turn on delay time of the 8V_INT output – 4.7s – 8V_INT is available at least 3s before the main output is within regulation

T9 – Alarm settle time for current limit– 140ms –from current limit to alarm signal be high.

T10 – Alarm recovery time for current limit – 1s –from releasing of current limitation to alarm signal be low

CC1600 Conduction-Cooled Rectifier
Input: **100-120/200-240** Vac;   1200/1600W capable; Output: 52V

Output Behavior

The rectifier produces power at the output-voltage set-point (either at the factory default when the input AC voltage is within the defined operating input voltage range.

Current limit. As shown by the Vo versus Io curve in the Electrical Specifications table, the maximum rectifier current follows a constant-power curve from 48V to 58V (unless the current limit is reset to less than 100%). Overcurrent protection is initiated at 5% above this maximum current. Between 48V and the under-voltage shutdown limit (36Vdc max), the maximum current is fixed. If the output voltage falls below the under-voltage shutdown limit, the rectifier shuts down and automatically attempt to restart. If the input voltage crosses 176 Vac, the current limits jump to new values as shown below the Vo versus Io curve.

Output Over-Current. Depending on the input voltage the output behavior shall follow the power curve as described in the Rectifier.

Once the output current limit has reached and the output voltage is <36V, the rectifier shall enter a hiccup. During restart if the output voltage is still <36V and over-current is re-triggered, the unit will attempt to restart for 14 seconds, then remain off for 14 seconds, then retry.

Output Over-Voltage. If the rectifier's output voltage exceeds the HVSD threshold, the rectifier shall shut down its output. It shall then attempt to restart 3 times. Once 3 successive restarts have been attempted, the rectifier shall be latched off. The rectifier shall remain latched off until either the AC input is cycled.

Input Over-Voltage. If the rectifier AC input voltage exceeds the internal over-voltage threshold then the rectifier shall latch shut-down. The rectifier shall remain off until the AC input voltage returns to the allowable input range.

Over-Temperature. The unit is protected from over-temperature at multiple internal sense points by shutting down, then restarting after all points have cooled to acceptable levels.

Restart after a latch off: To restart after a latch off, any of three restart mechanisms are available:

1. Remove and reinsert the unit.
2. Turn OFF and then turn ON AC power to the unit.
3. The unit may be commanded to restart via RS485 through the Operation command by first turning OFF then turning ON.

Each of these commands must keep the rectifier in the OFF state for at least 2 seconds, with the exception of changing to **restart**.

A successful restart shall clear all alarm registers.

Control and Status

Analog control inputs are provided only to share load current evenly between rectifiers connected in parallel. These signals are named SHARE+ and SHARE-, described in the "Pin Assignments" table near the end of this datasheet.

Signal Reference: There are three different signal "grounds" in the rectifier, Alarm-GND, Sig-GND, and Com-GND. Com- GND is connected to Sig-GND by a 10 ohm resistor inside the rectifier. Alarm-GND has 100V of functional isolation from the other two. Individual signals are referenced to one of these grounds as described in the "Pin Assignments" table near the end of this datasheet.

Com-GND and Sig-GND are connected internally by a 10-ohm resistor so they should never be driven to different potentials. Sig-GND is capacitively coupled to PE inside the rectifier; the voltage difference between them should be kept less than $100V_{DC}$. Likewise Alarm-GND should not be driven more than $100V_{DC}$ from Sig-Gnd or PE.

Analog Control Signals

Load share (Ishare+ and -): This is a two wire analog signal that is generated and acted upon automatically by rectifiers connected in parallel. Ishare pins should be connected to each other for rectifiers, if active current share among the rectifiers is desired. No resistors or capacitors should get connected to this pin.

8V_INT: Single wire connection between rectifiers, Provides bias to the DSP of an unpowered rectifier.

Digital Communications

CC1600 supports RS485 communication (with GP protocol). The details are not provided in this datasheet. GE will provide separate application notes on the Galaxy RS485 based protocol for users to interface to rectifier. Contact your local GE representative for details.

Item	Descrip	Part number
	Signal D SUB Matting Connector,15Pin,	TE Connector: 748364-1 Terminal: 1658670-2 Cable wire: 10368 or EQ, AWG 24
	AC Input Harness	Ring Terminal TE PN: 4-51864-1 or EQ Min ID: Φ4.3mm Max OD: Φ8.4mm AWG: 14GA
	DC Output Harness	Ring Terminal TE PN: 8-35787-2 or EQ Min ID: Φ4.3mm Max OD: Φ9.0mm AWG: 10GA

[[**Other desirable accessories**]]

☐   Signal-cable assembly (with male mini-DB15)
☐   (maybe) Thermal pad (offer with heatsinks)

CC1600 Conduction-Cooled Rectifier
Input: **100-120/200-240** Vac; 1200/1600W capable; Output: 52V

Ordering Information
Please contact your GE Sales Representative for pricing, availability and optional features.

Table 4: Device Codes

Item	Description	Comcode
CC1600AC52SXZ01A	1600W ACDC fanless 52V rectifier with screw terminals	CC1600AC52SXZ01A

Данный компонент на территории Российской Федерации

Вы можете приобрести в компании MosChip.

Для оперативного оформления запроса Вам необходимо перейти по данной ссылке:

http://moschip.ru/get-element

Вы можете разместить у нас заказ для любого Вашего проекта, будь то серийное   производство или разработка единичного прибора.

В нашем ассортименте представлены ведущие мировые производители активных и пассивных электронных компонентов.

Нашей специализацией является поставка электронной компонентной базы двойного назначения, продукции таких производителей как XILINX, Intel (ex.ALTERA), Vicor, Microchip, Texas Instruments, Analog Devices, Mini-Circuits, Amphenol, Glenair.

Сотрудничество с глобальными дистрибьюторами электронных компонентов, предоставляет возможность заказывать и получать с международных складов практически любой перечень компонентов в оптимальные для Вас сроки.

На всех этапах разработки и производства наши партнеры могут получить квалифицированную поддержку опытных инженеров.

Система менеджмента качества компании отвечает требованиям в соответствии с ГОСТ Р ИСО 9001, ГОСТ РВ 0015-002 и ЭС РД 009
