

**128Kx16 LOW VOLTAGE,
 ULTRA LOW POWER CMOS STATIC RAM**

KEY FEATURES

- High-speed access time: 45ns, 55ns
- CMOS low power operation
 - Operating Current: 18 mA (max) at 85°C
 - CMOS Standby Current: 5.4uA (typ) at 25°C
- TTL compatible interface levels
- Single power supply
 - 1.65V-2.2V V_{DD} (IS62WV12816EALL)
 - 2.2V-3.6V V_{DD} (IS62/65WV12816EBLL)
- Three state outputs
- Industrial and Automotive temperature support
- Lead-free available

DESCRIPTION

The *ISSI* IS62/65WV12816EALL/EBLL are high-speed, 2M bit static RAMs organized as 128K words by 16 bits. It is fabricated using *ISSI*'s high-performance CMOS technology. This highly reliable process coupled with innovative circuit design techniques, yields high-performance and low power consumption devices.

When CS1# is HIGH (deselected) or when CS2 is LOW (deselected) or when CS1# is LOW, CS2 is HIGH and both LB# and UB# are HIGH, the device assumes a standby mode at which the power dissipation can be reduced down with CMOS input levels.

Easy memory expansion is provided by using Chip Enable and Output Enable inputs. The active LOW Write Enable (WE#) controls both writing and reading of the memory. A data byte allows Upper Byte (UB#) and Lower Byte (LB#) access.

The IS62/65WV12816EALL/EBLL are packaged in the JEDEC standard 48-pin mini BGA (6mm x 8mm) and 44-Pin TSOP (TYPE II)

FUNCTION DESCRIPTION

SRAM is one of random access memories. Each byte or word has an address and can be accessed randomly. SRAM has three different modes supported. Each function is described below with Truth Table.

STANDBY MODE

Device enters standby mode when deselected (CS1# HIGH or CS2 LOW or both UB# and LB# are HIGH). The input and output pins (I/O0-15) are placed in a high impedance state. The current consumption in this mode will be ISB1 or ISB2. CMOS input in this mode will maximize saving power.

WRITE MODE

Write operation issues with Chip selected (CS1# LOW and CS2 HIGH) and Write Enable (WE#) input LOW. The input and output pins (I/O0-15) are in data input mode. Output buffers are closed during this time even if OE# is LOW. UB# and LB# enables a byte write feature. By enabling LB# LOW, data from I/O pins (I/O0 through I/O7) are written into the location specified on the address pins. And with UB# being LOW, data from I/O pins (I/O8 through I/O15) are written into the location.

READ MODE

Read operation issues with Chip selected (CS1# LOW and CS2 HIGH) and Write Enable (WE#) input HIGH. When OE# is LOW, output buffer turns on to make data output. Any input to I/O pins during READ mode is not permitted. UB# and LB# enables a byte read feature. By enabling LB# LOW, data from memory appears on I/O0-7. And with UB# being LOW, data from memory appears on I/O8-15.

In the READ mode, output buffers can be turned off by pulling OE# HIGH. In this mode, internal device operates as READ but I/Os are in a high impedance state. Since device is in READ mode, active current is used.

ABSOLUTE MAXIMUM RATINGS AND OPERATING RANGE

ABSOLUTE MAXIMUM RATINGS ⁽¹⁾

| Symbol | Parameter | Value | Unit |
|---------------------------------|--------------------------------------|-------------------------------------|------|
| Vterm | Terminal Voltage with Respect to GND | -0.2 to +3.9(V _{DD} +0.3V) | V |
| tBIAS | Temperature Under Bias | -55 to +125 | °C |
| V _{DD} | V _{DD} Related to GND | -0.2 to +3.9(V _{DD} +0.3V) | V |
| tStg | Storage Temperature | -65 to +150 | °C |
| I _{OUT} ⁽²⁾ | DC Output Current (LOW) | 20 | mA |

Notes:

1. Stress greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.
2. This condition is not per pin. Total current of all pins must meet this value.

OPERATING RANGE ⁽¹⁾

| Range | Device Marking | Ambient Temperature | V _{DD} |
|------------|-----------------|---------------------|-----------------|
| Commercial | IS62WV12816EALL | 0°C to +70°C | 1.65V-2.2V |

Notes:

1. Tested with the load in Figure 1.
2. Tested with the load in Figure 2. Transition is measured ± 500 mV from steady-state voltage. tHZOE, tHZCS, tHZB, and tHZWE transitions are measured when the output enters a high impedance state. Not 100% tested.
3. The internal write time is defined by the overlap of CS1# = LOW, CS2=HIGH, UB# or LB# = LOW, and WE# = LOW. All four conditions must be in valid states to initiate a Write, but any condition can go inactive to terminate the Write. The Data Input Setup and Hold timing are referenced to the rising or falling edge of the signal that terminates the write.
4. tPWE > tHZWE + tSD when OE# is LOW.
5. Address inputs must meet V_{IH} and V_{IL} SPEC during this period. Any glitch or unknown inputs are not permitted. Unknown input with standby mode is acceptable.
6. Data retention characteristics are defined later in DATA RETENTION CHARACTERISTICS.

TIMING DIAGRAM

READ CYCLE NO. 1⁽¹⁾ (ADDRESS CONTROLLED, CS1# = OE# = UB# = LB# = LOW, CS2 = WE# = HIGH)

Note:

1. The device is continuously selected.

READ CYCLE NO.2⁽¹⁾ (OE# CONTROLLED)

Note:

1. Address is valid prior to or coincident with CS1# LOW or CS2 HIGH transition.

WRITE CYCLE NO.1 ^(1,2) (CS1# , CS2 Controlled, OE# = HIGH or LOW)

Notes:

- t_{HZWE} is based on the assumption when $t_{SA}=0nS$ after READ operation. Actual DOUT for t_{HZWE} may not appear if OE# goes high before Write Cycle. t_{HZOE} is the time DOUT goes to High-Z after OE# goes high.
- During this period, the I/Os are in output state. Do not apply input signals.

WRITE CYCLE NO. 2 ^(1,2) (WE# CONTROLLED: OE# IS HIGH DURING WRITE CYCLE)

Notes:

- t_{HZOE} is the time DOUT goes to High-Z after OE# goes high.
- During this period, the I/Os are in output state. Do not apply input signals.

WRITE CYCLE NO. 3 ⁽¹⁾ (WE# CONTROLLED: OE# IS LOW DURING WRITE CYCLE)

Notes:

3. If OE# is low during write cycle, tHZWE must be met in the application. Do not apply input signal during this period. Data output from the previous READ operation will drive IO BUS.

WRITE CYCLE NO. 4 ^(1, 2, 3) (UB# & LB# Controlled, OE# = LOW)

Notes:

1. If OE# is low during write cycle, t_{HZWE} must be met in the application. Do not apply input signal during this period. Data output from the previous READ operation will drive IO BUS.
2. Due to the restriction of note1, OE# is recommended to be HIGH during write period.
3. WE# stays LOW in this example. If WE# toggles, t_{PWE} and t_{HZWE} must be considered.
