

General Description

The MAX512/MAX513 contain three 8-bit, voltage-output digital-to-analog converters (DAC A, DAC B, and DAC C). Output buffer amplifiers for DACs A and B provide voltage outputs while reducing external component count. The output buffer for DAC A can source or sink 5mA to within 0.5V of V $_{\rm DD}$ or V $_{\rm SS}$. The buffer for DAC B can source or sink 0.5mA to within 0.5V of V $_{\rm DD}$ or V $_{\rm SS}$. DAC C is unbuffered, providing a third voltage output with increased accuracy. The MAX512 operates with a single +5V ±10% supply, and the MAX513 operates with a +2.7V to +3.6V supply. Both devices can also operate with split supplies.

The 3-wire serial interface has a maximum operating frequency of 5MHz and is compatible with SPI™, QSPI™, and Microwire™. The serial input shift register is 16 bits long and consists of 8 bits of DAC input data and 8 bits for DAC selection and shutdown. DAC registers can be loaded independently or in parallel at the positive edge of \overline{CS} . A latched logic output is also available for auxiliary control.

Ultra-low power consumption and small packages (14-pin DIP/SO) make the MAX512/MAX513 ideal for portable and battery-powered applications. Supply current is only 1mA, dropping to less than $1\mu A$ in shutdown. Any of the three DACs can be independently shut down. In shutdown mode, the DAC's R-2R ladder network is disconnected from the reference input, minimizing system power consumption.

Applications

_Pin Description

PIN	NAME	FUNCTION
1	DIN	Serial Data Input of the 16-bit shift register. Data is clocked into the register on the rising edge of SCLK.
2	CS	Chip Select (active low). Enables data to be shifted into the 16-bit shift register. Programming commands are executed at the rising edge of CS.
3	SCLK	Serial Clock Input. Data is clocked in on the rising edge of SCLK.
4	RESET	Asynchronous reset input (active low). Clears all registers to their default state (FFhex for DAC A and DAC B registers); all other registers are reset to 0 (including the input shift register).
5	V _{DD}	Positive Power Supply (2.7V to 5.5V). Bypass with 0.22µF to GND.
6	GND	Ground
7	Vss	Negative Power Supply 0V or (-1.5V to -5.5V). Tie to GND for single supply operation. If a negative supply is applied, bypass with $0.22\mu F$ to GND.
8	OUTA	DAC A Output Voltage (Buffered). Resets to full scale. Connect 0.1µF capacitor or greater to GND.
9	OUTB	DAC B Output Voltage (Buffered). Resets to full scale. Connect 0.01µF capacitor or greater to GND.
10	OUTC	DAC C Output Voltage (Unbuffered). Resets to zero.
11	REFC	DAC C Reference Voltage
12	REFAB	DAC A/B Reference Voltage
13	I.C.	Internally connected. Do not make connections to this pin.
14	LOUT	Logic Output (latched)

_Detailed Description

Analog Section

The MAX512/MAX513 contain three 8-bit, voltage-out-put, digital-to-analog converters (DACs). The DACs are "inverted" R-2R ladder networks using complementary switches that convert 8-bit digital inputs into equivalent analog output voltages in proportion to the applied reference voltages.

The MAX512/MAX513 have two reference inputs: one is shared by DAC A and DAC B and the other is used by DAC C. These inputs allow different full-scale output voltages and different output voltage polarities for the DAC pair A/B and DAC C.

The MAX512/MAX513 include output buffer amplifiers for DACs A and B and input logic for simple microprocessor (µP) and CMOS interfaces.

The MAX512/MAX513 operate in either single-supply or dual-supply mode, as determined by V_{SS} . If V_{SS} is within approximately -0.5V of GND, single-supply mode is assumed. If V_{SS} is below -1.5V, the devices are in dual-supply mode.

Reference Inputs and DAC Output Range

The voltage at REF_ sets the full-scale output of the DACs. The input impedance of the REF_ inputs is code dependent. The lowest value, approximately $12k\Omega$ for REFC (8k Ω for REFAB), occurs when the input code is 01010101 (55hex). The maximum value of infinity occurs when the input code is zero.

In shutdown mode, the selected DAC output is set to zero while the value stored in the DAC register remains unchanged. This removes the load from the reference input to save power. Bringing the MAX512/MAX513 out of shutdown mode restores the DAC output voltage. Because the input resistance at REF_ is code dependent, the DAC's reference sources should have an output impedance of no more than 5Ω . The input capacitance at the REF_ pins is also code dependent and typically does not exceed 25pF.

The reference voltage on REFAB can range anywhere between the supply rails. In dual-supply mode, a positive reference input voltage on REFAB should be less than (V_{DD} - 1.5V) to avoid saturating the buffer amplifiers. The reference voltage includes the negative supply rail. See the *Output Buffer Amplifier* section for more information. The REFC input accepts positive voltages up to V_{DD} and should not be forced below ground.

The absolute difference between any reference voltage and GND should not exceed 6V.

Figure 1. DAC Simplified Circuit Diagram

Output Buffer Amplifiers (DAC A / DAC B)

DAC A and DAC B voltage outputs are internally buffered. The buffer amplifiers have a rail-to-rail (V_{SS} to V_{DD}) output voltage range.

In single-supply mode, the DAC outputs A and B are internally divided by two and the buffer is set to a gain of two, eliminating the need for a buffer input voltage range to the positive supply rail.

In dual-supply mode, the DAC outputs are not attenuated and the buffer is set to unity gain.

Although only necessary for negative output voltages, the dual-supply mode may be used even if the desired DAC output voltage is positive. Possible errors associated with the divide-by-two attenuator and gain-of-two buffers in single-supply mode are eliminated in dual-supply mode. In this case, do not use reference voltages higher than (VDD - 1.5V).

DAC A's output amplifier can source and sink up to 5mA of current (0.5mA for DAC B buffer). See the Total Unadjusted Error vs. Digital Code graph in the *Typical Operating Characteristics* for dual and single supplies. The amplifier is unity-gain stable with a capacitive load of 0.05µF (0.01µF for DAC B buffer) or greater. The slew rate is limited by the load capacitor and is typically 0.1V/µs with a 0.1µF load (0.01µF for DAC B buffer).

Unbuffered Output (DAC C)

The output of DAC C is unbuffered and has a typical output impedance of $24 k\Omega$. It can be used to drive a high-impedance load, such as an op amp or comparator, and has 35µs typical settling time to 1/2LSB with a single 3V supply. Use DAC C if a quick dynamic response is required.

Shutdown Mode

When programmed to shutdown mode, the outputs of DAC A and B go into a high-impedance state. Virtually no current flows into or out of the buffer amplifiers in that state. The output of DAC C goes to 0V when shut down. In shutdown mode, the REF_ inputs are high impedance (2M Ω typ) to conserve current drain from the system reference; therefore, the system reference does not have to be powered down. The logic output LOUT remains active in shutdown.

Coming out of shutdown, the DAC outputs return to the values kept in the registers. The recovery time is equivalent to the DAC settling time.

Reset

The RESET input is active low. When asserted (RESET = 0), DACs A and B are set to full scale (FFhex) and active, while DAC C is set to zero code (00hex) and active. The 16-bit serial register is cleared to 0000hex. LOUT is reset to zero.

Serial Interface

An active-low chip select $\overline{(CS)}$ enables the shift register to receive data from the serial data input. Data is clocked into the shift register on every rising edge of the serial clock signal (SCLK). The clock frequency can be as high as 5MHz.

Data is sent MSB first and can be transmitted in one 16-bit word. The write cycle can be interrupted at any time when $\overline{\text{CS}}$ is kept active (low) to allow, for example, two 8-bit-wide transfers. After clocking all 16 bits into

Serial-Input Data Format and Control Codes

Table 2 lists the serial-input data format. The 16-bit input word consists of an 8-bit control byte and an 8-bit data byte. The 8-bit control byte is not decoded internally. Every control bit performs one function. Data is clocked in starting with Q2 (uncommitted bit), followed by the remaining control bits and the data byte. The LSB of the data byte (B0) is the last bit clocked into the shift register (Figure 2).

Example of a 16-bit input word:

	ade First												_	oac	
Q2	Q1	sc	SB	SA	LC	LB	LA	В7	В6	В5	В4	ВЗ	B2	В1	В0
Х	0	1	0	0	0	1	1	1	0	0	0	0	0	0	0

The example above performs the following functions:

- 80hex (128 decimal) loaded into DAC registers A and B.
- Content of the DAC C register remains unchanged.
- · DAC A and DAC B are active.
- · DAC C is shut down.
- · LOUT is reset to 0.

Digital Inputs

The digital inputs are compatible with CMOS logic. Supply current increases slightly when toggling the logic inputs through the transition zone between $(0.3)(V_{DD})$ and $(0.7)(V_{DD})$.

Digital Output

The latched digital output (LOUT) has a 1.6mA source capability while maintaining a (V_{DD} - 0.4V) output level. With a 1.6mA sink current, the output voltage is guaranteed to be no more than 0.4V. The output can be used for digital auxiliary control. Please note that the digital output remains fully active during shutdown mode.

Microprocessor Interfacing

The MAX512/MAX513 serial interface is compatible with Microwire, SPI, and QSPI. For SPI and QSPI, clear the CPOL and CPHA bits (CPOL = 0 and CPHA = 0). CPOL = 0 sets the inactive state of clock to zero and CPHA = 0 changes data at the falling edge of SCLK. This setting allows both SPI and QSPI to run at full clock speeds (0.5MHz and 4MHz, respectively). If a serial port is not available on your μ P, three bits of a parallel port can be used to emulate a serial port by bit manipulation. Minimize digital feedthrough at the voltage outputs by operating the serial clock only when necessary.

^{*} Not shown for clarity. The functions of loading and shutting down the DACs and programming the logic can be combined in a single command.

Figure 3. MAX512/MAX513 Detailed Serial-Interface Timing Diagram

Applications Information

Power-Supply and Reference Operating Ranges

The MAX512 is fully specified to operate with $V_{DD}=5V\pm10\%$ and $V_{SS}=GND=0V$. The MAX513 is specified for single-supply operation with V_{DD} ranging from 2.7V to 3.6V, covering all commonly used supply voltages in 3V systems. The MAX512/MAX513 can also be used with a negative supply ranging from -1.5V to -5.5V. Using a negative supply typically improves zero-code error and settling time (as shown in the *Typical Operating Characteristics* graphs).

The two separate reference inputs for the DAC pair A/B and the unbuffered output C allow different full-scale output voltages and, if a negative supply is used, also allow different polarity. In dual-supply mode, REFAB can vary from V_{SS} to $(V_{DD}$ - 1.5V). In single-supply mode, the specified range for REFAB is 0V to $V_{DD}.$ REFC can range from GND to $V_{DD}.$ Do not force REFC below ground.

Power-supply sequencing is not critical. If a negative supply is used, make sure V_{SS} is never more than 0.3V above ground. Do not apply signals to the digital inputs until the device is powered-up. If this is not possible, add current-limiting resistors to the digital inputs.

Power-Supply Bypassing and Ground Management

In single-supply operation (V_{SS} = GND), GND and V_{SS} should be connected to the highest quality ground available. Bypass V_{DD} with a 0.1µF to 0.22µF capacitor to GND. For dual-supply operation, bypass V_{SS} with a 0.1µF to 0.22µF capacitor to GND. Reference inputs can be used without bypassing. For optimum line/load-transient response and noise performance, bypass the reference inputs with 0.1µF to 4.7µF to GND. Careful PC board layout minimizes crosstalk among DAC outputs, reference inputs, and digital inputs. Separate analog lines with ground traces between them. Make sure that high-frequency digital lines are not routed in parallel to analog lines.

Unipolar Output

With unipolar output, the output voltage and the reference voltage are the same polarity. The MAX512/MAX513 can be used with a single supply if the reference voltages are positive. With a negative supply, the REFAB voltage can vary from $\rm V_{SS}$ to approximately ($\rm V_{DD}$ - 1.5V), allowing two-quadrant multiplication.

Table 3. Unipolar Code Table

ANALOG OUTPUT = REF_ \times $\left(\frac{D}{256}\right)$

Bipolar Output

Using Figure 4's circuit, the MAX512/MAX13 can be configured for bipolar outputs. Table 4 lists the bipolar codes and corresponding output voltages. There are two ways to achieve rail-to-rail outputs: 1) Operate the MAX512/MAX513 with a single supply and positive reference voltages or 2) Use dual supplies with a positive or negative voltage at REFAB and a positive voltage at REFC. In either case, the op amps need dual supplies. When using the dual-supply mode, possible errors associated with the divide-by-two attenuator and gain-of-two buffer are eliminated (see the *Output Buffer Amplifier* section). For maximum output swing of all outputs in dual-supply mode, connect REFAB to V_{SS} and REFC to V_{DD}. In single-supply mode, connect REFAB, REFC, and V_{DD} together.

With dual supplies, DACs A and B can perform four-quadrant multiplication. Please note that in dual-supply mode, the REFAB input ranges from V_{SS} to (V_{DD} - 1.5V). Because REFC accepts only positive inputs, DAC C performs two-quadrant multiplication.

Figure 4 shows Maxim's ICL7612A with rail-to-rail input common-mode range and rail-to-rail output voltage swing—ideal for a high output voltage swing from low supply voltages.

Table 4. Bipolar Code Table

	ı	DAC	СО	NTE	NTS	3		ANALOG
В7	В6	В5	В4	ВЗ	B2	В1	В0	OUTPUT
1	1	1	1	1	1	1	1	$+REF_{-} \times \left(\frac{127}{128}\right)$
1	0	0	0	0	0	0	1	$+REF_{-} \times \left(\frac{1}{128}\right)$
1	0	0	0	0	0	0	0	OV
0	1	1	1	1	1	1	1	$-REF_{-} \times \left(\frac{1}{128}\right)$
0	0	0	0	0	0	0	1	$-REF_{-} \times \left(\frac{127}{128}\right)$
0	0	0	0	0	0	0	0	$-REF_{-} \times \left(\frac{128}{128}\right) = -REF_{-}$

Note:

1LSB = REF_
$$\times$$
 2^{-(8 · 1)} = REF_ \times $\left(\frac{1}{128}\right)$
ANALOG OUTPUT = REF_ \times $\left(\frac{D}{128} - 1\right)$

RF Applications

Both the MAX512 and MAX513 can bias GaAs FETs, where the gate of the FETs must be negatively biased to ensure that there is no drain current. In a typical application, power to the RF amplifiers should not be turned on until the bias voltages provided by DAC A and DAC B are fully established; likewise, the supply should be turned off before the bias voltage is switched off. Figure 5 shows how DAC B supplies the negative bias $V_{\rm GG1}$ for the driver stage and DAC A provides the negative bias $V_{\rm GG2}$ for the output stage [1].

The DAC A and DAC B outputs are also ideal for controlling VCOs in mobile radios or cellular phones. Other applications include varactor and PIN diode circuits.

The unbuffered DAC C provides a span within GND and V_{DD} and is individually set at REF C. DAC C typically adjusts offset and gain in the system.

ПОСТАВКА ЭЛЕКТРОННЫХ КОМПОНЕНТОВ

многоканальный

Общество с ограниченной ответственностью «МосЧип» ИНН 7719860671 / КПП 771901001 Адрес: 105318, г.Москва, ул.Щербаковская д.3, офис 1107

Данный компонент на территории Российской Федерации Вы можете приобрести в компании MosChip.

Для оперативного оформления запроса Вам необходимо перейти по данной ссылке:

http://moschip.ru/get-element

Вы можете разместить у нас заказ для любого Вашего проекта, будь то серийное производство или разработка единичного прибора.

В нашем ассортименте представлены ведущие мировые производители активных и пассивных электронных компонентов.

Нашей специализацией является поставка электронной компонентной базы двойного назначения, продукции таких производителей как XILINX, Intel (ex.ALTERA), Vicor, Microchip, Texas Instruments, Analog Devices, Mini-Circuits, Amphenol, Glenair.

Сотрудничество с глобальными дистрибьюторами электронных компонентов, предоставляет возможность заказывать и получать с международных складов практически любой перечень компонентов в оптимальные для Вас сроки.

На всех этапах разработки и производства наши партнеры могут получить квалифицированную поддержку опытных инженеров.

Система менеджмента качества компании отвечает требованиям в соответствии с ГОСТ Р ИСО 9001, ГОСТ РВ 0015-002 и ЭС РД 009

Офис по работе с юридическими лицами:

105318, г. Москва, ул. Щербаковская д. 3, офис 1107, 1118, ДЦ «Щербаковский»
