

1:5 Differential LVPECL/LVECL/HSTL Clock and Data Driver

MAX9315

General Description

The MAX9315 low-skew, 1-to-5 differential driver is designed for clock and data distribution. This device allows selection between two inputs. The selected input is reproduced at five differential outputs. The differential inputs can be adapted to accept a single-ended input by connecting the on-chip V_{BB} supply to one input as a reference voltage.

The MAX9315 features low output-to-output skew (20ps), making it ideal for clock and data distribution across a backplane or a board. For interfacing to differential HSTL and LVPECL signals, this device operates over a +2.375V to +3.8V supply range, allowing high-performance clock or data distribution in systems with a nominal +2.5V or +3.3V supply. For differential LVECL operation, this device operates with a -2.375V to -3.8V supply.

The MAX9315 is offered in a space-saving 20-pin TSSOP package.

Features

- ◆ +2.375V to +3.8V Supply for Differential HSTL/LVPECL Operation
- ◆ -2.375V to -3.8V Supply for Differential LVECL Operation
- ◆ Two Selectable Differential Inputs
- ◆ Synchronous Output Enable/Disable
- ◆ 20ps Output-to-Output Skew
- ◆ 360ps Propagation Delay
- ◆ Guaranteed 400mV Differential Output at 1.5GHz
- ◆ On-Chip Reference for Single-Ended Inputs
- ◆ Input Biased Low when Left Open
- ◆ Pin Compatible with MC100LVEP14

Applications

Precision Clock Distribution
Low-Jitter Data Repeater
Data and Clock Driver and Buffer
Central Office Backplane Clock Distribution
DSLAM Backplane
Base Station
ATE

Junction Temperature	+150°C
Storage Temperature Range	-65°C to +150°C
ESD Protection	
Human Body Model (Inputs and Outputs)	≥2kV
Soldering Temperature (10s)	+300°C

Stresses beyond those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Typical Operating Characteristics

($V_{CC} = +3.3V$, $V_{EE} = 0$, $V_{IHD} = V_{CC} - 1V$, $V_{ILD} = V_{CC} - 1.15V$, input transition time = 125ps (20% to 80%), $f_{IN} = 2GHz$, outputs loaded with 50Ω to $V_{CC} - 2V$, $T_A = +25^\circ C$, unless otherwise noted.)

MAX9315

1:5 Differential LVPECL/LVECL/HSTL Clock and Data Driver

Pin Description

PIN	NAME	FUNCTION
1	Q0	Noninverting Q0 Output. Typically terminate with 50Ω resistor to V _{CC} - 2V.
2	$\overline{Q0}$	Inverting Q0 Output. Typically terminate with 50Ω resistor to V _{CC} - 2V.
3	Q1	Noninverting Q1 Output. Typically terminate with 50Ω resistor to V _{CC} - 2V.
4	$\overline{Q1}$	Inverting Q1 Output. Typically terminate with 50Ω resistor to V _{CC} - 2V.
5	Q2	Noninverting Q2 Output. Typically terminate with 50Ω resistor to V _{CC} - 2V.
6	$\overline{Q2}$	Inverting Q2 Output. Typically terminate with 50Ω resistor to V _{CC} - 2V.
7	Q3	Noninverting Q3 Output. Typically terminate with 50Ω resistor to V _{CC} - 2V.
8	$\overline{Q3}$	Inverting Q3 Output. Typically terminate with 50Ω resistor to V _{CC} - 2V.
9	Q4	Noninverting Q4 Output. Typically terminate with 50Ω resistor to V _{CC} - 2V.
10	$\overline{Q4}$	Inverting Q4 Output. Typically terminate with 50Ω resistor to V _{CC} - 2V.
11	V _{EE}	Negative Supply Voltage
12	SEL	Clock Select Input (Single Ended). Drive low to select the CLK0, $\overline{CLK0}$ input. Drive high to select the CLK1, $\overline{CLK1}$ input. The SEL threshold is equal to V _{BB} .
13	CLK0	Noninverting Differential Clock Input 0. Internal 75kΩ pulldown to V _{EE} .
14	$\overline{CLK0}$	Inverting Differential Clock Input 0. Internal 75kΩ pullup to V _{CC} and 75kΩ pulldown to V _{EE} .
15	V _{BB}	Reference Output Voltage. Connect to the inverting or noninverting clock input to provide a reference for single-ended operation. When used, bypass with a 0.01μF ceramic capacitor to V _{CC} ; otherwise, leave open.
16	CLK1	Noninverting Differential Clock Input 1. Internal 75kΩ pulldown to V _{EE} .
17	$\overline{CLK1}$	Inverting Differential Clock Input 1. Internal 75kΩ pullup to V _{CC} and 75kΩ pulldown to V _{EE} .
18, 20	V _{CC}	Positive Supply Voltage. Bypass V _{CC} to V _{EE} with 0.1μF and 0.01μF ceramic capacitors. Place the capacitors as close to the device as possible with the smaller value capacitor closest to the device.
19	$\overline{EN}$	Output Enable Input. Outputs are synchronously enabled on the falling edge of the selected clock input when $\overline{EN}$ is low. Outputs are synchronously driven low on the falling edge of the selected clock input when $\overline{EN}$ is high.

Detailed Description

The MAX9315 is a low-skew, 1-to-5 differential driver designed for clock or data distribution. A 2-to-1 MUX selects one of the two differential clock inputs, CLK0, $\overline{CLK0}$ or CLK1, $\overline{CLK1}$. The MUX is switched by the single-ended SEL input. A logic low selects the CLK0, $\overline{CLK0}$ input and a logic high selects the $\overline{CLK1}$, CLK1 input. The SEL logic threshold is set by the internal voltage reference V_{BB}. SEL can be driven to V_{CC} and V_{EE} or by a single-ended LVPECL/LVECL signal. The selected input is reproduced at five differential outputs.

Synchronous Enable

The MAX9315 is synchronously enabled and disabled with outputs in the low state to eliminate shortened clock pulses. $\overline{EN}$ is connected to the input of an edge-triggered D flip-flop. After power-up, drive $\overline{EN}$ low and

toggle the selected clock input to enable the outputs. The outputs are enabled on the falling edge of the selected clock input after $\overline{EN}$ goes low. The outputs are set to a low state on the falling edge of the selected clock input after $\overline{EN}$ goes high. The threshold for $\overline{EN}$ is equal to V_{BB}.

Supply

For interfacing to differential HSTL and LVPECL signals, the V_{CC} range is from +2.375V to +3.8V (with V_{EE} grounded), allowing high-performance clock or data distribution in systems with a nominal +2.5V or +3.3V supply. For interfacing to differential LVECL, the V_{EE} range is -2.375V to -3.8V (with V_{CC} grounded). Output levels are referenced to V_{CC} and are considered LVPECL or LVECL, depending on the level of the V_{CC} supply. With V_{CC} connected to a positive supply and

1:5 Differential LVPECL/LVECL/HSTL Clock and Data Driver

V_{EE} connected to ground, the outputs are LVPECL. The outputs are LVECL when V_{CC} is connected to ground and V_{EE} is connected to a negative supply.

Input Bias Resistors

When the inputs are open, the internal bias resistors set the inputs to low state. The inverting inputs ($\overline{CLK0}$ and $\overline{CLK1}$) are each biased with a 75k Ω pullup to V_{CC} and a 75k Ω pulldown to V_{EE} . The noninverting inputs ($CLK0$ and $CLK1$) are each biased with a 75k Ω pulldown to V_{EE} .

Differential Clock Input Limits

The maximum magnitude of the differential signal applied to the clock input is 3.0V or $V_{CC} - V_{EE}$, whichever is less. This limit also applies to the difference between any reference voltage input and a single-ended input. Specifications for the high and low voltages of a differential input (V_{IHD} and V_{ILD}) and the differential input voltage ($V_{IHD} - V_{ILD}$) apply simultaneously.

Single-Ended Clock Input and V_{BB}

The differential clock inputs can be configured to accept single-ended inputs. This is accomplished by connecting the on-chip reference voltage, V_{BB} , to the inverting or noninverting input of a differential input as a reference. For example, the differential $CLK0$, $\overline{CLK0}$ input is converted to a noninverting, single-ended input by connecting V_{BB} to $\overline{CLK0}$ and connecting the single-ended input signal to $CLK0$. Similarly, an inverting configuration is obtained by connecting V_{BB} to $CLK0$ and connecting the single-ended input to $\overline{CLK0}$. With a differential input configured as single ended (using V_{BB}), the single-ended input can be driven to V_{CC} and V_{EE} or with a single-ended LVPECL/LVECL signal. Note that single-ended input must be at least $V_{BB} \pm 100\text{mV}$ or a differential input of at least 100mV to switch the outputs to the V_{OH} and V_{OL} levels specified in the *DC Electrical Characteristics* table.

If V_{BB} is used, the supply must be in the $V_{CC} - V_{EE} = +2.725\text{V}$ to $+3.8\text{V}$ range because one of the inputs must be $V_{EE} + 1.2\text{V}$ or higher for proper input stage operation. V_{BB} must be at least $V_{EE} + 1.2\text{V}$ because it becomes the high-level input when the other (single-ended) input swings below it. Therefore, minimum $V_{BB} = V_{EE} + 1.2\text{V}$. The minimum V_{BB} output of the MAX9315 is $V_{CC} - 1.525\text{V}$. Substituting the minimum V_{BB} output into $V_{BB} = V_{EE} + 1.2\text{V}$ results in a minimum supply of $+2.725\text{V}$. Rounding up to standard supplies gives the single-ended operating supply range of $V_{CC} - V_{EE} = +3.0\text{V}$ to $+3.8\text{V}$.

When using the V_{BB} reference output, bypass it with a 0.01 μF ceramic capacitor to V_{CC} . If the V_{BB} reference is not used, leave it open. The V_{BB} reference can source or sink 0.5mA, which is sufficient to drive two inputs. Use V_{BB} only for inputs that are on the same device as the V_{BB} reference.

Applications Information

Supply Bypassing

Bypass V_{CC} to V_{EE} with high-frequency surface-mount ceramic 0.1 μF and 0.01 μF capacitors in parallel as close to the device as possible, with the 0.01 μF capacitor closest to the device. Use multiple parallel vias to minimize parasitic inductance. When using the V_{BB} reference output, bypass it with a 0.01 μF ceramic capacitor to V_{CC} (if the V_{BB} reference is not used, it can be left open).

Controlled-Impedance Traces

Input and output trace characteristics affect the performance of the MAX9315. Connect high-frequency input and output signals with 50 Ω characteristic impedance traces. Minimize the number of vias to prevent impedance discontinuities. Reduce reflections by maintaining the 50 Ω characteristic impedance through cables and connectors. Reduce skew within a differential pair by matching the electrical length of the traces.

Output Termination

Terminate outputs with 50 Ω to $V_{CC} - 2\text{V}$ or use an equivalent Thevenin termination. When a single-ended signal is taken from a differential output, terminate both outputs. For example, if $Q0$ is used as a single-ended output, terminate both $Q0$ and $\overline{Q0}$.

Данный компонент на территории Российской Федерации

Вы можете приобрести в компании MosChip.

Для оперативного оформления запроса Вам необходимо перейти по данной ссылке:

<http://moschip.ru/get-element>

Вы можете разместить у нас заказ для любого Вашего проекта, будь то серийное производство или разработка единичного прибора.

В нашем ассортименте представлены ведущие мировые производители активных и пассивных электронных компонентов.

Нашей специализацией является поставка электронной компонентной базы двойного назначения, продукции таких производителей как XILINX, Intel (ex.ALTERA), Vicor, Microchip, Texas Instruments, Analog Devices, Mini-Circuits, Amphenol, Glenair.

Сотрудничество с глобальными дистрибьюторами электронных компонентов, предоставляет возможность заказывать и получать с международных складов практически любой перечень компонентов в оптимальные для Вас сроки.

На всех этапах разработки и производства наши партнеры могут получить квалифицированную поддержку опытных инженеров.

Система менеджмента качества компании отвечает требованиям в соответствии с ГОСТ Р ИСО 9001, ГОСТ РВ 0015-002 и ЭС РД 009
