

bq76920, bq76930, bq76940

SLUSBK2E - OCTOBER 2013-REVISED NOVEMBER 2014

# bq769x0 3-Series to 15-Series Cell Battery Monitor Family for Li-lon and Phosphate Applications

# 1 Introduction

## 1.1 Features

- AFE MONITORING FEATURES
  - Pure digital interface
  - Internal ADC measures cell voltage, die temperature, and external thermistor
  - A separate, internal ADC measures pack current (coulomb counter)
  - Directly supports up to three thermistors (103AT)
- HARDWARE PROTECTION FEATURES
  - Overcurrent in discharge (OCD)
  - Short circuit in discharge (SCD)
  - Overvoltage (OV)

# 1.2 Applications

- Light Electric Vehicles (LEV): eBikes, eScooters, Pedelec, and Pedal-Assist Bicycles
- Power and Gardening Tools

- Undervoltage (UV)
- Secondary protector fault detection
- ADDITIONAL FEATURES
  - Integrated cell balancing FETs
  - Charge, discharge low-side NCH FET drivers
  - Alert interrupt to host microcontroller
  - 2.5-V or 3.3-V output voltage regulator
  - No EEPROM programming necessary
  - High supply voltage abs max (up to 108 V)
  - Simple I<sup>2</sup>C<sup>™</sup> compatible interface (CRC option)
  - Random cell connection tolerant
- Battery Backup and UPS Systems
- · Wireless Base Station Backup Systems
- 12-V, 18-V, 24-V, 36-V, and 48-V Battery Packs

# 1.3 Description

The bq769x0 family of robust analog front-end (AFE) devices serves as part of a complete pack monitoring and protection solution for next-generation, high-power systems, such as light electric vehicles, power tools, and uninterruptible power supplies. The bq769x0 is designed with low power in mind: Sub-blocks within the IC may be enabled/disabled to control the overall chip current consumption, and a SHIP mode provides a simple way to put the pack into an ultra-low power state.

# Device Information(1)

PART NUMBER	PACKAGE	BODY SIZE (NOM)
bq76920	TSSOP (20)	6.50 mm × 4.40 mm
bq76930	TSSOP (30)	7.80 mm × 4.40 mm
bq76940	TSSOP (44)	11.00 mm × 4.40 mm

<sup>(1)</sup> For all available packages, see the orderable addendum at the end of the data sheet.

Changes from Revision C (May 2014) to Revision D

Changed verbiage.....

Changed table reference

Changes from Revision B (April 2014) to Revision C	Page
Changed the documentation format Changed some devices from Product Preview to Production Data Changed a bit name in the PROTECT1 register Changed a bit name in the ADCGAIN2 register	<u>4</u> <u>36</u>
Changes from Revision A (December 2013) to Revision B	Page
<ul> <li>Changed title of the data manual</li> <li>Changed Ordering Information table to Device Comparison table</li> <li>Changed some devices to Product Preview</li> <li>Changed R<sub>f</sub> max value</li> <li>Changed verbiage in Communications Subsystem</li> <li>Changed SYS_STAT D6 bit name</li> </ul>	
Changes from Original (October 2013) to Revision A	Page
<ul> <li>Changed some devices from Product Preview to Production Data</li> <li>Changed the t<sub>INDCELL</sub> test condition</li> <li>Deleted duplicate CELLBAL3 table</li> <li>Changed bq76940 with bq783xx Companion Controller IC Schematic</li> </ul>	

# 3 Description (Continued)

The bq76920 device supports up to 5-series cells or typical 18-V packs, the bq76930 handles up to 10-series cells or typical 36-V packs, and the bq76940 works for up to 15-series cells or typical 48-V packs. A variety of battery chemistries may be managed with these AFEs, including Lithium Ion, Lithium iron phosphate, and more.

Via I<sup>2</sup>C, a host controller can use the bq769x0 to implement many battery pack management functions, such as monitoring (cell voltages, pack current, pack temperatures), protection (controlling charge/discharge FETs), and balancing. Integrated A/D converters enable a purely digital readout of critical system parameters, with calibration handled in Tl's manufacturing process.

## (1) Product Preview only

Texas Instruments pre-configures the bq769x0 devices for a specific I<sup>2</sup>C address, LDO voltage, and more. These settings are permanently stored in EEPROM and cannot be further modified.

Contact Texas Instruments for other options not listed above, as well as any options noted as "Product Preview only."

- (1) For more information about traditional and new thermal metrics, see the IC Package Thermal Metrics application report, SPRA953.
- (2) The junction-to-ambient thermal resistance under natural convection is obtained in a simulation on a JEDEC-standard, high-K board, as specified in JESD51-7, in an environment described in JESD51-2a.
- (3) The junction-to-case (top) thermal resistance is obtained by simulating a cold plate test on the package top. No specific JEDEC-standard test exists, but a close description can be found in the ANSI SEMI standard G30-88.
- (4) The junction-to-board thermal resistance is obtained by simulating in an environment with a ring cold plate fixture to control the PCB temperature, as described in JESD51-8.
- (5) The junction-to-top characterization parameter, ψ<sub>JT</sub>, estimates the junction temperature of a device in a real system and is extracted from the simulation data for obtaining R<sub>θJA</sub>, using a procedure described in JESD51-2a (sections 6 and 7).
- (6) The junction-to-board characterization parameter, ψ<sub>JB</sub>, estimates the junction temperature of a device in a real system and is extracted from the simulation data for obtaining R<sub>θJA</sub>, using a procedure described in JESD51-2a (sections 6 and 7).
- (7) The junction-to-case (bottom) thermal resistance is obtained by simulating a cold plate test on the exposed (power) pad. No specific JEDEC standard test exists, but a close description can be found in the ANSI SEMI standard G30-88.

<sup>(3)</sup> MIN specifies the threshold below which the device will never register that an external alert has occurred. MAX specifies the minimum threshold above which the device will always register that an external alert has occurred.

Typical conditions are measured at 25°C with nominal BAT voltages of 18 V (bq76920), 36 V (bq76930), or 48 V (bq76940) with  $V_{CELL} = 4$  V. Min and max values include full recommended operating condition temperature range from -40°C to +85°C. Certain characteristics may be shown at different voltage or temperature ranges, as clarified in the Test Condition sections.

# 7 Detailed Description

## 7.1 Overview

In the bq769x0 family of analog front-end (AFE) devices, the bq76920 device supports up to 5-series cells, the bq76930 device supports up to 10-series cells, and the bq76940 device supports up to 15-series cells. Via I<sup>2</sup>C, a host controller can use the bq769x0 to implement battery pack management functions, such as monitoring (cell voltages, pack current, pack temperatures), protection (controlling charge/discharge FETs), and balancing. Integrated A/D converters enable a purely digital readout of critical system parameters including cell voltages and internal or external temperature, with calibration handled in TI's manufacturing process. For an additional degree of pack reliability, the bq769x0 includes hardware protections for voltage (OV, UV) and current (OCD, SCD).

The bq769x0 provides two low-side FET drivers, charge (CHG) and discharge (DSG), which may be used to directly manipulate low-side power NCH FETs, or as signals that control an external circuit that enables high-side PCH or NCH FETs. A dedicated ALERT input/output pin serves as an interrupt signal to the host microcontroller, quickly informing the microcontroller of an updated status in the AFE. This may include a fault event or that a coulomb counter sample is available for reading. An available ALERT pin may also be driven externally by a secondary protector to provide a redundant means of disabling the CHG and DSG signals and higher system visibility.

# 7.2 Functional Block Diagram

Figure 7-1. Functional Block Diagram

www.ti.com

# 7.3 Feature Description

## 7.3.1 Subsystems

bq769x0 consists of three major subsystems: Measurement, Protection, and Control. These work together to ensure that the fundamental battery pack parameters—voltage, current and temperature—are accurately captured and easily available to a host controller, while ensuring a baseline or secondary level of hardware protection in the event that a host controller is unable or unavailable to manage certain fault conditions.

#### NOTE

The bq769x0 is intended to serve as an analog front-end (AFE) as part of a chipset system solution: A companion microcontroller is required to oversee and control this AFE.

- The Measurement subsystem's core responsibility is to digitize the cell voltages, pack current (integrated into a passed charge calculation), external thermistor temperature, and internal die temperature. It also performs an automatic calculation of the total battery stack voltage, by simply adding up all measured cell voltages.
- The Protection subsystem provides a baseline or secondary level of hardware protections to better support a battery pack's FMEA requirements in the event of a loss of host control or simply if a host is unable to respond to a certain fault event in time. Integrated protections include pack-level faults such as OV, UV, OCD, SCD, detection of an external secondary protector fault, and internal logic "watchdog"-style device fault (XREADY). Protection events will trigger toggling of the ALERT pin, as well as automatic disabling of the DSG and/or CHG FET driver (depending on the fault). Recovery from a fault event must be handled by the host microcontroller.
- The Control subsystem implements a suite of useful pack features, including direct low-side NCH FET drivers, cell balancing drivers, the ALERT digital output, an external LDO and more.

The following sections describe each subsystem in greater detail, as well as explaining the various power states that are available.

# 7.3.1.1 Measurement Subsystem Overview

The monitoring subsystem ensures that all cell voltages, temperatures, and pack current may be easily measured by the host. All ADCs are trimmed by TI.

ADC and CC data are always returned as atomic values if both high and low registers are read in the same transaction (using address auto-increment).

## 7.3.1.1.1 Data Transfer to the Host Controller

The bq769x0 has a fully digital interface: All information is transferred through I<sup>2</sup>C, simply by reading and/or writing to the appropriate register(s) storing the relevant data. Block reads and writes, buffered by an 8-bit CRC code per byte, ensure a fast and robust transmission of data.

# 7.3.1.1.2 14-Bit ADC

Each bq769x0 device measures cell voltages and temperatures using a 14-bit ADC. This ADC measures all differential cell voltages, thermistors and/or die temperature with a nominal full-scale unsigned range of 0-6.275 V and LSB of 382  $\mu$ V.

To enable the ADC, the [ADC\_EN] bit in the SYS\_CTRL1 register must be set. This bit is set automatically whenever the device enters NORMAL mode. When enabled, the ADC ensures that the integrated OV and UV protections are functional.

For each contiguous set of five cells (VC1 to VC5, VC6 to VC10), when no cells in that particular set are being balanced, each cell is measured over a 50-ms decimation window and a complete update is available every 250 ms. In the bq76930 and bq76940, every set of five cells above the primary five cells is measured in parallel. The 50-ms decimation greatly assists with removing the aliasing effects present in a noisy motor environment.

When any cells in a contiguous set of 5 cells are being balanced, those affected cells are measured in a reduced 12.5-ms decimation period, to allow the cell balancing to function properly without affecting the integrated OV and UV protections. Since cell balancing is typically only performed during pack charge or idle periods, the shortened decimation periods should not impact accuracy as the system noise during these times is greatly reduced. This reduced decimation period is only applied to sets where one of the cells is being balanced. The following summarizes this for the bq76920-bq76940 devices:

- VC1 to VC5 measurements are each taken in a 50-ms decimation period when all bits in CELLBAL1 register are 0, and a 12.5-ms decimation period when any bits in CELLBAL1 register are 1.
- VC6 to VC10 measurements are each taken in a 50-ms decimation period when all bits in CELLBAL2 register are 0, and a 12.5-ms decimation period when any bits in CELLBAL2 register are 1.
- VC11 to VC15 measurements are each taken in a 50-ms decimation period when all bits in CELLBAL3
  register are 0, and a 12.5-ms decimation period when any bits in CELLBAL3 register are 1.
- Total update interval is 250 ms.

Each differential cell input is factory-trimmed for gain and/or offset, such that the resulting reading via I<sup>2</sup>C is always consistent from part-to-part and requires no additional calibration or correction factor application.

The ADC is required to be enabled in order for the integrated OV and UV protections to be operating.

The following shows how to convert the 14-bit ADC reading into an analog voltage. Each device is factory calibrated, with a GAIN and OFFSET stored into EEPROM.

The ADC transfer function is a linear equation defined as follows:

(1)

GAIN is stored in units of µV/LSB, while OFFSET is stored in mV units.

Some example cell voltage calculations are provided in the table below. For illustration purposes, the example uses a hypothetical GAIN of 380  $\mu$ V/LSB (ADCGAIN<4:0> = 0x0F) and OFFSET of 30 mV (ADCOFFSET<7:0> = 0x1E).

14-Bit ADC Result	ADC Result in Decimal	GAIN (μV/LSB)	OFFSET (mV)	Cell Voltage (mV)
0x1800	6144	380	30	2365
0x1F10	7952	380	30	3052

#### NOTE

When entering NORMAL mode from SHIP mode, please allow for the following times before reading out initial cell voltage data:

bq76920: 250 ms bq76930: 400 ms bq76940: 800 ms

## 7.3.1.1.2.1 Optional Real-time Calibration Using the Host Microcontroller

The performance of the cell voltage values measured by the 14-bit ADC has a factory-calibrated accuracy, as follows:

- +/- 10 mV TYP, +/- 40 mV MIN and MAX from 3.6 to 4.3 V,
- +/- 15 mV TYP, +/- 40 mV MIN and MAX from 3.2 to 4.6 V, and
- +/- 50 mV MIN and MAX from 2.0 to 5.0 V

While this is suitable for the majority of pack protection and basic monitoring applications the bq769x0 AFE family is intended to support, certain systems may require a higher accuracy performance.

To achieve this, use an available ADC channel and general purpose output terminal on the host microcontroller paired with the bq769x0. A simple external circuit consisting of two precision resistors and a small-signal FET is activated by the host microcontroller to determine the total stack voltage,  $V_{STACK}$ . This is then compared against the sum of the individual cell voltages as measured by the internal ADC of the bq769x0. The resulting transfer function coefficient,  $GAIN_2$ , is simply applied to each cell voltage ADC value for improved accuracy.

Figure 7-2. External Real-Time Calibration Circuit to Host Microcontroller

The process is as follows:

- 1. Periodically measure V<sub>STACK</sub>.
  - (a)  $V_{STACK} = V_{AD} \times (R1 + R2) / R1$
- Read out all V<sub>CELL</sub> ADC readings from the bq769x0 and apply the standard GAIN and OFFSET values stored in the bq769x0.
  - (a)  $V(1) = GAIN \times ADC_1 + OFFSET$ ,  $V(2) = GAIN \times ADC_2 + OFFSET$ , and so on
- 3. Sum up all V<sub>CELL</sub> values, V<sub>SUM</sub>.
  - (a)  $V_{SUM} = V(1) + V(2) + V(3) \dots$
- 4. Calculate GAIN<sub>2</sub>.
  - (a)  $GAIN_2 = V_{STACK} / V_{SUM}$

As a general recommendation, a new GAIN<sub>2</sub> function should be generated when the cell voltages increase or decrease by more than 100 mV. With GAIN<sub>2</sub>, each cell voltage calculation becomes:

$$V(cell) = GAIN_2 \times (GAIN \times ADC(cell) + OFFSET)$$

(2)

For systems that do not require this additional in-use calibration function, GAIN2 is simply "1".

#### 7.3.1.1.3 16-Bit CC

A 16-bit integrating ADC, commonly referred to as the coulomb counter (CC), provides measurements of accumulated charge across the current sense resistor. The integration period for this reading is 250 ms.

The CC may be operated in one of two modes: ALWAYS ON and 1-SHOT.

- In ALWAYS ON mode, the CC runs at 100%, gathering a fresh reading every 250 ms. The conclusion of each reading sets the CC\_READY bit, which toggles the ALERT pin high to inform the microcontroller that a new reading is available. To enable Always On mode, set [CC\_EN] = 1.
- In 1-SHOT mode, the CC performs a single 250-ms reading, and similarly sets the CC\_READY bit when completed. This mode is intended for non-gauging usages, where the host simply desires to check the pack current.

To enable a 1-SHOT reading, ensure [CC EN] = 0 and set [CC ONESHOT] = 1.

The full scale range of the CC is  $\pm$  270 mV, with a max recommended input range of  $\pm$  200 mV, thus yielding an LSB of approximately 8.44  $\mu$ V.

The following equation shows how to convert the 16-bit CC reading into an analog voltage if no board-level calibration is performed:

CC Reading (in 
$$\mu$$
V) = [16-bit 2's Complement Value] × (8.44  $\mu$ V/LSB)

16-Bit CC Result **ADC Result in Decimal** CC Reading (in µV) 0x0001 1 8.44 0x2710 10000 84,400 0x7D00 32000 270,080 0x8300 -32000 -270,0800xC350 -15536-131,123.84 0xFFFF -1 -8.44

## 7.3.1.1.4 External Thermistor

One (bq76920), two (bq76930), or three (bq76940) 10 k $\Omega$  NTC 103AT thermistors may be measured by the device. These are measured by applying a factory-trimmed internal 10k pull-up resistance to an internal regulator value of nominally 3.3 V, the result of which can be read out from the TSx (TS1, TS2, TS3) registers.

To select thermistor measurement mode, set [TEMP SEL] = 1.

Thermistor TS1 is connected between TS1 and VSS; TS2 is connected between TS2 and VC5x (bq76930 and bq76940 only); and TS3 is connected between TS3 and VC10x (bq76940 only). These thermistors may be placed in various areas in the battery pack to measure such things as localized cell temperature, FET heating, etc.

The thermistor impedance may be calculated using the 14-bit ADC reading in the TS1/TS2/TS3 registers and 10k internal pull-up resistance as follows:

The following equations show how to use the 14-bit ADC readings in TS1, TS2, and TS3 to determine the resistance of the external 103AT thermistor:

$$V_{TSX} = (ADC \text{ in Decimal}) \times 382 \,\mu\text{V/LSB}$$
 (4)

$$R_{TS} = (10,000 \times VTSX) \div (3.3 - VTSX)$$
 (5)

To convert the thermistor resistance into temperature, please refer to the thermistor component manufacturer's datasheet.

(3)

## 7.3.1.1.5 Die Temperature Monitor

#### NOTE

When switching between external and internal temperature monitoring, a 2-s latency may be incurred due to the natural scheduler update interval.

A die temperature block generates a voltage that is proportional to the die temperature, and provides a way of reducing component count if pack thermistors are not used or ensuring that the die power dissipation requirements are observed. The die is measured using the same on-board 14-bit ADC as the cell voltages.

To select internal die temperature measurement mode, set [TEMP SEL] = 0.

For bq76930 and bq76940, multiple die temperature measurements are available. These are stored in TS2 and TS3.

To convert a DIETEMP reading into temperature, refer to the following equation box. If more accurate temperature readings are needed from DIETEMP, the DIETEMP at room temperature value should be stored during production calibration.

The following equation shows how to use the 14-bit ADC readings in TS1, TS2, and TS3 when [TEMPSEL] = 0 to determine the internal die temperature:

$$V_{25} = 1.200 \text{ V (nominal)}$$
 (6)

$$V_{TSX} = (ADC \text{ in Decimal}) \times 382 \,\mu\text{V/LSB}$$
 (7)

$$TEMP_{D|E} = 25^{\circ} - ((V_{TSX} - V_{25}) \div 0.0042)$$
 (8)

## 7.3.1.1.6 16-Bit Pack Voltage

Once converted to digital form, each cell voltage is added up and the summation result stored in the BAT registers. This 16-bit value has a nominal LSB of 1.532 mV.

The following shows how to convert the 16-bit pack voltage ADC reading into an analog voltage. This value also uses the GAIN and OFFSET stored into EEPROM.

The ADC transfer function is a linear equation defined as follows:

$$V_{(BAT)} = 4 \times GAIN \times ADC(cell) + (\#Cells \times OFFSET)$$
(9)

GAIN is stored in units of µV/LSB, while OFFSET is stored in mV units.

#### 7.3.1.1.7 System Scheduler

A master scheduler oversees the monitoring intervals, creating a full update every 250 ms. Temperature measurements are taken every 2 seconds. Pack voltage is calculated every 250 ms.

## 7.3.1.2 Protection Subsystem

#### 7.3.1.2.1 Integrated Hardware Protections

Integrated hardware protections are provided as an extra degree of safety and are meant to supplement the standard protection feature set that would be incorporated into the host controller firmware. They should not be used as the sole means of protecting a battery pack, but are useful for FMEA purposes; for example, in the event that a host microcontroller is unable to react to any of the below protection situations. All hardware protection thresholds and delays should be loaded into the AFE by the host microcontroller during system startup. The AFE will also default to pre-defined threshold and delay settings, in case the host microcontroller is unable to or does not wish to program the protection settings.

www.ti.com

Overcurrent in Discharge (OCD) and Short Circuit in Discharge (SCD) are implemented using sampled analog comparators that run at 32 kHz, and that continuously monitor the voltage across (SRP-SRN) while the device is in NORMAL mode. Upon detection of a voltage that exceeds the programmed OCD or SCD threshold, a counter begins to count up to a programmed delay setting. If the counter reaches its target value, the SYS\_STAT register is updated to indicate the fault condition, the FET state(s) are updated as shown in

Table 7-1, and the ALERT pin is driven high to interrupt the host.

The protection fault threshold and delay settings for OCD and SCD protections are configured via the PROTECT1 and PROTECT2 registers. See the Register Map section for details about supported values.

Overvoltage (OV) and Undervoltage (UV) protections are handled digitally, by comparing the cell voltage readings against the 8-bit programmed thresholds in the OV and UV registers.

The OV threshold is stored in the OV\_TRIP register and is a direct mapping of 8 bits of the 14-bit ADC reading, with the upper 2 MSB preset to "10" and lower 4 LSB preset to "1000". In other words, the corresponding OV trip level is mapped to "10-XXXX-XXXX-1000". The programmable range of OV thresholds is approximately 3.15 to 4.7 V, but this is subject to variation due to the (GAIN, OFFSET) linear equation used to map the ADC values.

The UV threshold is stored in the UV\_TRIP register and is a direct mapping of 8 bits of the 14-bit ADC reading, with the upper 2 MSB preset to "01" and lower 4 LSB preset to "0000". In other words, the corresponding OV trip level is mapped to "01-XXXX-XXXX-0000". The programmable range of UV thresholds is approximately 1.58 to 3.1 V, but this is subject to variation due to the (GAIN, OFFSET) linear equation used to map the ADC values.

Protection	Upper 2 MSB	Middle 8 Bits	Lower 4 LSB
OV	10	Set in OV_TRIP Register	1000
UV	01	Set in UV_TRIP Register	0000

#### NOTE

To support flexible cell configurations within bq76920, bq76930, and bq76940, UV is ignored on any cells that have a reading under  $UV_{MINQUAL}$ . This allows cell pins to be shorted in implementations where not all cells are needed (for example, 6-series cells using the bq76930).

Default protection thresholds and delays are shown in the register description at the end of this datasheet. These are loaded into the digital register (RAM) of the device when the device enters NORMAL mode. These RAM values may then be overwritten by the host controller to any other values, which they will retain until a POR event. It is recommended that the host controller reload these values during its standard power-up and/or re-initialization sequence.

To calculate the correct OV\_TRIP and UV\_TRIP register values for a device, use the following procedure:

- 1. Determine desired OV.
- 2. Read out [ADCGAIN] and [ADCOFFSET] from their corresponding registers. Note that ADCGAIN is stored in units of  $\mu$ V/LSB, while ADCOFFSET is stored in mV.
- 3. Calculate the full 14-bit ADC value needed to meet the desired OV and UV trip thresholds as follows:
  - (a) OV\_TRIP\_FULL = (OV ADCOFFSET) ÷ ADCGAIN
  - (b) UV\_TRIP\_FULL = (UV ADCOFFSET) ÷ ADCGAIN
- 4. Remove the upper 2 MSB and lower 4 LSB from the full 14-bit value, retaining only the remaining middle 8 bits. This can be done by shifting the OV\_TRIP\_FULL and UV\_TRIP\_FULL binary values 4 bits to the right and removing the upper 2 MSB.
- 5. Write OV TRIP and UV TRIP to their corresponding registers.

www.ti.com

Both OV and UV protections require the ADC to be enabled. Ensure that the [ADC\_EN] bit is set to 1 if OV and UV protections are needed.

## 7.3.1.2.2 Reduced Test Time

A special debug and test configuration bit is provided in the SYS\_CTRL2 register, called [DELAY\_DIS]. Setting [DELAY\_DIS] bypasses the OV/UV protection fault timers and allows a fault condition to be registered within 200 ms after application of such a fault condition.

## 7.3.1.3 Control Subsystem

## 7.3.1.3.1 FET Driving (CHG AND DSG)

Each bq769x0 device provides two low-side FET drivers, CHG and DSG, which control NCH power FETs or may be used as a signal to enable various other circuits such as a high-side NCH charge pump circuit.

Both DSG and CHG drivers have a fast pull-up to nominally 12 V when enabled. DSG uses a fast pull-down to VSS when disabled, while CHG utilizes a high impedance (nominally 1  $M\Omega$ ) pull-down path when disabled.

An additional internal clamp circuit ensures that the CHG pin does not exceed a maximum of 20 V.

Figure 7-3. CHG and DSG FET Circuit

The power path for the CHG and DSG pull-up circuit originates from the REGSRC pin, instead of BAT.

To enable the CHG fet, set the [CHG\_ON] register bit to 1; to disable, set [CHG\_ON] = 0. The discharge FET may be similarly controlled via the [DSG\_ON] register bit.

Certain fault conditions or power state transitions will clear the state of the CHG/DSG FET controls. Table 7-1 shows what action, if any, to take to [CHG\_ON] and [DSG\_ON] in response to various system events:

Table 7-1. CHG, DSG Response Under Various System Events

EVENT	[CHG_ON]	[DSG_ON]
OV Fault	Set to 0	_
UV Fault	_	Set to 0
OCD Fault	_	Set to 0

Table 7-1. CHG, DSG Response Under Various System Events (continued)

EVENT	[CHG_ON]	[DSG_ON]
SCD Fault	_	Set to 0
ALERT Override	Set to 0	Set to 0
DEVICE_XREADY is set	Set to 0	Set to 0
Enter SHIP mode from NORMAL	Set to 0	Set to 0

#### NOTE

All protection recovery must be initiated by the host microcontroller. In order to resume FET operation after a fault condition has occurred, the host microcontroller must first clear the corresponding status bit in the SYS\_STAT register, which will clear the ALERT pin, and then manually re-enable the CHG and/or DSG bit. Certain faults, such as OV or UV, may immediately re-toggle if such a condition still persists. Refer to Table 7-3 for details on clearing status bits.

There are no conditions under which the bq769x0 automatically sets either [CHG\_ON] or [DSG\_ON] to 1.

# 7.3.1.3.2 Load Detection

A load detection circuit is present on the CHG pin and activated whenever the CHG FET is disabled ([CHG\_ON] = 0). This circuit detects if the CHG pin is externally pulled high when the high impedance (approximately 1 M $\Omega$ ) pull-down path should actually be holding the CHG pin to VSS, and is useful for determining if the PACK- pin (outside of the AFE) is being held at a high voltage—for example, if the load is present while the power FETs are off. The state of the load detection circuit is read from the [LOAD\_PRESENT] bit of the SYS\_CTRL1 register.

After an OCD or SCD fault has occurred, the DSG FET will be disabled ([DSG\_ON] cleared), and the CHG FET must similarly be explicitly disabled to activate the load detection circuit. The host microcontroller may periodically poll the [LOAD\_PRESENT] bit to determine the state of the PACK- pin and determine when the load is removed ([LOAD\_PRESENT] = 0).

## 7.3.1.3.3 Cell Balancing

Both internal and external passive cell balancing options are fully supported by the bq76920, while external cell balancing is recommended for bq76930 and bq76940. It is left to the host controller to determine the exact balancing algorithm to be used in any given system. Each bq769x0 device provides the cell voltages and balancing drivers to enable this. If using the internal cell balance drivers, up to 50 mA may be balanced per cell. If using external cell balancing, much higher balancing currents may be employed.

To activate a particular cell balancing channel, simply set the corresponding bit for that cell in the CELLBAL1, CELLBAL2, or CELLBAL3 register. For example, VC1–VC0 is enabled by setting [CB1], while VC12–VC11 is set via [CB12].

Multiple cells may be simultaneously balanced. It is left to the user's discretion to determine the ideal number of cells to concurrently balance. Adjacent cells should not be balanced simultaneously. This may cause cell pins to exceed their absolute maximum conditions and is also not recommended for external balancing implementations. Additionally, if internal balancing is used, care should be taken to avoid exceeding package power dissipation ratings.

## **NOTE**

The host controller must ensure that no two adjacent cells are balanced simultaneously within each set of the following:

- VC1–VC5
- VC6-VC10
- VC11-VC15

The total duty cycle devoted to balancing is approximately 70% per 250 ms. This is because a portion of the 250 ms is allotted for normal cell voltage measurements via the ADC.

If [ADC\_EN] =1, OV and UV protections are not affected by cell balancing, since the cell balancing is temporarily suspended for a small slice of time every 250 ms during which the cell voltage readings are taken. This ensures that the OV and UV protections do not accidentally trigger, or miss an actual OV/UV condition on the cells while balancing is enabled.

#### NOTE

All cell balancing control bits in CELLBAL1, CELLBAL2, and CELLBAL3 are automatically cleared under the following events, and must be explicitly re-written by the host microcontroller following clearing of the event:

- DEVICE\_XREADY is set
- Enters NORMAL mode from SHIP mode

## 7.3.1.3.4 Alert

The ALERT pin serves as an active high digital interrupt signal that can be connected to a GPIO port of the host microcontroller. This signal is an OR of all bits in the SYS STAT register.

In order to clear the ALERT signal, the source bit in the SYS\_STAT register must first be cleared by writing a "1" to that bit. This will cause an automatic clear of the ALERT pin once all bits are cleared.

The ALERT pin may also be driven by an external source; for example, the pack may include a secondary overvoltage protector IC. When the ALERT pin is forced high externally while low, the device will recognize this as an OVRD\_ALERT fault and set the [OVRD\_ALERT] bit. This triggers automatic disabling of both CHG and DSG FET drivers. The device cannot recognize the ALERT signal input high when it is already forcing the ALERT signal high from another condition.

The ALERT pin has no internal debounce support so care should be taken to protect the pin from noise or other parasitic transients.

#### **NOTE**

It is highly recommended to place an external 500 k $\Omega$ –1 M $\Omega$  pull-down resistor from ALERT to VSS as close to the IC as possible. Additional recommendations are:

- a) To keep all traces between the IC and components connected to the ALERT pin very short.
- b) To include a guard ring around the components connected to the ALERT pin and the pin itself.

## 7.3.1.3.5 Output LDO

An adjustable output voltage regulator LDO is provided as a simple way to provide power to additional components in the battery pack, such as the host microcontroller or LEDs. The LDO is configured in EEPROM by TI during the production test process, and can support 2.5-V or 3.3-V options.

A cascode small-signal FET must be added in the external path between BAT and REGSRC with the bq76930 and bq76940. This helps drop most of the power dissipation outside of the package and cuts down on package power dissipation.

## 7.3.1.4 Communications Subsystem

The AFE implements a standard 100-kHz I<sup>2</sup>C interface and acts as a slave device. The I<sup>2</sup>C device address is 7-bits and is factory programmed. Consult the Device Comparison Table (Section 4) of this datasheet for more information.

A write transaction is shown in Figure 7-4. Block writes are allowed by sending additional data bytes before the Stop. The I<sup>2</sup>C block will auto-increment the register address after each data byte.

When enabled, the CRC is calculated as follows:

- In a single-byte write transaction, the CRC is calculated over the slave address, register address, and data.
- In a block write transaction, the CRC for the first data byte is calculated over the slave address, register address, and data. The CRC for subsequent data bytes is calculated over the data byte only.

The CRC polynomial is x8 + x2 + x + 1, and the initial value is 0.

Figure 7-5 shows a read transaction using a Repeated Start.

Figure 7-5. I<sup>2</sup>C Read with Repeated Start

Figure 7-6 shows a read transaction where a Repeated Start is not used, for example if not available in hardware. For a block read, the master ACK's each data byte except the last and continues to clock the interface. The I<sup>2</sup>C block will auto-increment the register address after each data byte.

When enabled, the CRC for a read transaction is calculated as follows:

- In a single-byte read transaction, the CRC is calculated after the second start and uses the slave address and data byte.
- In a block read transaction, the CRC for the first data byte is calculated after the second start and uses
  the slave address and data byte. The CRC for subsequent data bytes is calculated over the data byte
  only.

The CRC polynomial is x8 + x2 + x + 1, and the initial value is 0.

When detecting a bad CRC, the I<sup>2</sup>C Slave will NACK the CRC and go to an idle state.

Figure 7-6. I<sup>2</sup>C Read Without Repeated Start

## 7.4 Device Functional Modes

Each bq769x0 device supports the following modes of operation.

**Table 7-2. Supported Power Modes** 

Mode	Description
NORMAL	Fully operational state. Both ADC and CC may be on, or disabled by host microcontroller. OV and UV protection enabled if ADC is on. OCD and SCD enabled. ADC and CC may be disabled to reduce power consumption, and CC may be operated in a "1-SHOT" mode for flexible power savings.
SHIP	Lowest possible power state, intended for pack assembly and/or long term pack storage. Must see a BOOT signal (> 1 VBOOT) on TS1 pin to boot from SHIP → NORMAL. Note that the device always enters SHIP mode upon POR.

## 7.4.1 NORMAL Mode

NORMAL mode represents the fully operational mode where all blocks are enabled and the device sees its highest current consumption. In this mode, certain blocks/functions may be disabled to save power—these include the ADC and CC. OV and UV are running continuously as long as the ADC is enabled. The OCD and SCD comparators may not be disabled in this mode.

Transitioning from NORMAL to SHIP mode is also initiated by the host, and requires consecutive writes to two bits in the SYS\_CTRL1 register.

## 7.4.2 SHIP Mode

SHIP mode is the basic and lowest power mode that bq769x0 supports. SHIP mode is automatically entered during initial pack assembly and after every POR event. When the device is in NORMAL mode, it may enter SHIP by the host controller via a specific sequence of I<sup>2</sup>C commands.

In SHIP mode, only a minimum of blocks are turned on, including the VSTUP power supply and primal boot detector. Waking from SHIP mode to NORMAL mode requires pulling the TS1 pin greater than VBOOT, which triggers the device boot-up sequence.

To enter SHIP mode from NORMAL mode, the [SHUTA] and [SHUTB] bits in the SYS\_CTRL1 register must be written with specific patterns across two consecutive writes:

- Write #1: [SHUTA] = 0, [SHUTB] = 1
- Write #2: [SHUTA] = 1, [SHUTB] = 0

Note that [SHUTA] and [SHUTB] should each be in a 0 state prior to executing the shutdown command above. If this specific sequence is entered into the device, the device transitions into SHIP mode. If any other sequence is written to the [SHUTA] and [SHUTB] bits or if either of the two patterns is not correctly entered, the device will not enter SHIP mode.

#### CAUTION

DO NOT OPERATE THE DEVICE BELOW POR. When designing with the bq76940, the intermediate voltages (BAT–VC10x), (VC10x–VC5x) and (VC5x–VSS) must each never fall below VSHUT. When this occurs, a full device reset must be initiated by powering down all three intermediate voltages (BAT–VC10x), (VC10x–VC5x) and (VC5x–VSS) below VSHUT and rebooting by applying the appropriate VBOOT signal to the TS1 pin. When designing with the bq76930, the intermediate voltages (BAT–VC5x) and (VC5x–VSS) must each never fall below VSHUT. When this occurs, a full device reset must be initiated by powering down both intermediate voltages (BAT–VC5x) and (VC5x–VSS) below VSHUT and rebooting by applying the appropriate VBOOT signal to the TS1 pin.

The device will also enter SHIP mode during a POR event; however, this is not a recommended method of SHIP mode entry. If any of the supply-side voltages below fall below  $V_{SHUT}$  and then back up above VPORA, the device defaults into the SHIP mode state. This is similar to an initial pack assembly condition. In order to exit SHIP mode into NORMAL mode, the device must follow the standard boot sequence by applying a voltage greater than the VBOOT threshold on the TS1 pin.

# 7.5.1 Register Details

## Table 7-3. SYS STAT (0x00)

BIT	7	6	5	4	3	2	1	0
NAME	CC_READY	RSVD	DEVICE_ XREADY	OVRD_ ALERT	UV	OV	SCD	OCD
RESET	0	0	0	0	0	0	0	0
ACCESS	RW	RW	RW	RW	RW	RW	RW	RW

#### NOTE

Bits in SYS\_STAT may be cleared by writing a "1" to the corresponding bit.

Writing a "0" does not change the state of the corresponding bit.

CC\_READY (Bit 7): Indicates that a fresh coulomb counter reading is available. Note that if this bit is not cleared between two adjacent CC readings becoming available, the bit remains latched to 1. This bit may only be cleared (and not set) by the host.

- 0 = Fresh CC reading not yet available or bit is cleared by host microcontroller.
- 1 = Fresh CC reading is available. Remains latched high until cleared by host.

RSVD (Bit 6): Reserved. Do not use.

**DEVICE\_XREADY (Bit 5)**: Internal chip fault indicator. When this bit is set to 1, it should be cleared by the host. May be set due to excessive system transients. This bit may only be cleared (and not set) by the host.

- 0 = Device is OK.
- 1 = Internal chip fault detected, recommend that host microcontroller clear this bit after waiting a few seconds. Remains latched high until cleared by the host.

**OVRD\_ALERT (Bit 4)**: External pull-up on the ALERT pin indicator. Only active when ALERT pin is not already being driven high by the AFE itself.

- 0 = No external override detected
- 1 = External override detected. Remains latched high until cleared by the host.

**UV** (Bit 3): Undervoltage fault event indicator.

- 0 = No UV fault is detected.
- 1 = UV fault is detected. Remains latched high until cleared by the host.

OV (Bit 2): Overvoltage fault event indicator.

- 0 = No OV fault is detected.
- 1 = OV fault is detected. Remains latched high until cleared by the host.

SCD (Bit 1): Short circuit in discharge fault event indicator.

0 = No SCD fault is detected.

1 = SCD fault is detected. Remains latched high until cleared by the host.

OCD (Bit 0): Over current in discharge fault event indicator.

0 = No OCD fault is detected.

1 = OCD fault is detected. Remains latched high until cleared by the host.

Table 7-4. CELLBAL1 (0x01) for bq76920, bq76930, and bq76940

BIT	7	6	5	4	3	2	1	0
NAME	_	_	_	CB5	CB4	CB3	CB2	CB1
RESET	0	0	0	0	0	0	0	0
ACCESS	R	R	R	RW	RW	RW	RW	RW

## CBx (Bits 4-0):

0 = Cell balancing on Cell "x" is disabled.

1 = Cell balancing on Cell "x" is enabled.

Table 7-5. CELLBAL2 (0x02) for bq76930 and bq76940

BIT	7	6	5	4	3	2	1	0
NAME	_	_	_	CB10	CB9	CB8	CB7	CB6
RESET	0	0	0	0	0	0	0	0
ACCESS	R	R	R	RW	RW	RW	RW	RW

# CBx (Bits 4-0):

0 = Cell balancing on Cell "x" is disabled.

1 = Cell balancing on Cell "x" is enabled.

# Table 7-6. CELLBAL3 (0x03) for bq76940

BIT	7	6	5	4	3	2	1	0
NAME	_	_	_	CB15	CB14	CB13	CB12	CB11
RESET	0	0	0	0	0	0	0	0
ACCESS	R	R	R	RW	RW	RW	RW	RW

## CBx (Bits 4-0):

0 = Cell balancing on Cell "x" is disabled.

1 = Cell balancing on Cell "x" is enabled.

# **Table 7-7. SYS\_CTRL1 (0x04)**

BIT	7	6	5	4	3	2	1	0
NAME	LOAD_ PRESENT	_	ĺ	ADC_EN	TEMP_SEL	RSVD	SHUT_A	SHUT_B
RESET	0	0	0	0	0	0	0	0
ACCESS	R	R	R	RW	RW	RW	RW	RW

**LOAD\_PRESENT (Bit 7)**: Valid only when [CHG\_ON] = 0. Is high if CHG pin is detected to exceed VLOAD\_DETECT while CHG\_ON = 0, which suggests that external load is present. Note this bit is read-only and automatically clears when load is removed.

- 0 = CHG pin < VLOAD\_DETECT or [CHG\_ON] = 1.
- 1 = CHG pin >VLOAD\_DETECT, while [CHG\_ON] = 0.

## ADC EN (Bit 4): ADC enable command

- 0 = Disable voltage and temperature ADC readings (also disables OV protection)
- 1 = Enable voltage and temperature ADC readings (also enables OV protection)

# TEMP\_SEL (Bit 3): TSx\_HI and TSx\_LO temperature source

- 0 = Store internal die temperature voltage reading in TSx\_HI and TSx\_LO
- 1 = Store thermistor reading in TSx\_HI and TSx\_LO (all thermistor ports)

RSVD (Bit 2): Reserved, do not set to 1.

**SHUT\_A, SHUT\_B (Bits 1–0)**: Shutdown command from host microcontroller. Must be written in a specific sequence, shown below.

Non 01 (for example, 00)

then 01 Device powers down and enters SHIP mode.

then 10 =

Other = Device ignores the command.

Table 7-8. SYS\_CTRL2 (0x05)

BIT	7	6	5	4	3	2	1	0
NAME	DELAY_DIS	CC_EN	CC_ ONESHOT	RSVD	RSVD	RSVD	DSG_ON	CHG_ON
RESET	0	0	0	0	0	0	0	0
ACCESS	RW	RW	RW	RW	RW	RW	RW	RW

DELAY\_DIS (Bit 7): Disable OV, UV, OCD, and SCD delays for faster customer production testing.

- 0 = Normal delay settings
- 1 = OV, UV, OCD, and SCD delay circuit is bypassed, creating zero delay (approximately 250 ms).

**CC\_EN (Bit 6)**: Coulomb counter continuous operation enable command. If set high, [CC\_ONESHOT] bit is ignored.

- 0 = Disable CC continuous readings
- 1 = Enable CC continuous readings and ignore [CC\_ONESHOT] state

**CC\_ONESHOT (Bit 5)**: Coulomb counter single 250-ms reading trigger command. If set to 1, the coulomb counter will be activated for a single 250-ms reading, and then turned back off. [CC\_ONESHOT] will also be cleared at the conclusion of this reading, while [CC\_READY] bit will be set to 1.

- 0 = No action
- 1 = Enable single CC reading (only valid if [CC\_EN] = 0), and [CC\_READY] = 0)

RSVD (Bit 4-2): Reserved. Do not use.

DSG\_ON (Bit 1): Discharge FET driver (low side NCH) or discharge signal control

0 = DSG is off.

1 = DSG is on.

CHG\_ON (Bit 0): Discharge FET driver (low side NCH) or discharge signal control

0 = CHG is off.

1 = CHG is on.

Table 7-9. PROTECT1 (0x06)

NAME	RSNS	_	RSVD	SCD_D1	SCD_D0	SCD_T2	SCD_T1	SCD_T0
RESET	0	0	0	0	0	0	0	0
ACCESS	RW	R	RW	RW	RW	RW	RW	RW

RSNS (Bit 7): Allows for doubling the OCD and SCD thresholds simultaneously

0 = OCD and SCD thresholds at lower input range

1 = OCD and SCD thresholds at upper input range

RSVD (Bit 5): Reserved, do not set to 1.

# SCD\_D1:0 (Bits 4-3):

Short circuit in discharge delay setting. A 400- $\mu$ s setting is recommended only in systems using maximum cell measurement input resistance, Rc, of 1 k $\Omega$  (which corresponds to minimum internal cell balancing current or external cell balancing configuration).

Code	(in µs)

#### OV\_D1:0 (Bits 5-4): Overvoltage delay setting

Code	(in s)
0x0	1
0x1	2
0x2	4
0x3	8

**RSVD (Bits 3–0)**: These bits are for TI internal debug use only and must be configured to the default settings indicated.

Table 7-12. OV\_TRIP (0x09)

BIT	7	6	5	4	3	2	1	0
NAME	OV_T7	OV_T6	OV_T5	OV_T4	OV_T3	OV_T2	OV_T1	OV_T0
RESET	1	0	1	0	1	1	0	0
ACCESS	RW							

**OV\_T7:0** (Bits 7–0): Middle 8 bits of the direct ADC mapping of the desired OV protection threshold, with upper 2 MSB set to 10 and lower 2 LSB set to 1000. The equivalent OV threshold is mapped to: 10-OV\_T<7:0>1000.

By default, OV\_TRIP is configured to a 0xAC setting.

Note that OV\_TRIP is based on the ADC voltage, which requires back-calculation using the GAIN and OFFSET values stored in ADCGAIN<4:0>and ADCOFFSET<7:0>.

Table 7-13. UV\_TRIP (0x0A)

ADCGAIN4:3 (Bits 3-2, address 0x50):

ADC GAIN offset upper 2 MSB

#### www.ti.com

#### ADCGAIN2:0 (Bits 7-5, address 0x59):

ADC GAIN offset lower 3 LSB

ADCGAIN<4:0> is a production-trimmed value for the ADC transfer function, in units of  $\mu$ V/LSB. The range is 365  $\mu$ V/LSB to 396  $\mu$ V/LSB, in steps of 1  $\mu$ V/LSB, and may be calculated as follows:

GAIN = 365  $\mu$ V/LSB + (ADCGAIN<4:0>in decimal) × (1  $\mu$ V/LSB)

Alternately, a conversion table is provided below:

ADC GAIN	Gain (µV/LSB)	ADC GAIN	Gain (µV/LSB)
0x00	365	0x10	381
0x01	366	0x11	382
0x02	367	0x12	383
0x03	368	0x13	384
0x04	369	0x14	385
0x05	370	0x15	386
0x06	371	0x16	387
0x07	372	0x17	388
0x08	373	0x18	389
0x09	374	0x19	390

RESET	_	_	_	_	_	_	_	_
ACCESS	R	R	R	R	R	R	R	R

### ADCOFFSET7:0 (Bits 7-0):

ADC offset, stored in 2's complement format in mV units. Positive full-scale range corresponds to 0x7F and negative full-scale corresponds to 0x80. The full-scale input range is -128 mV to 127 mV, with an LSB of 1 mV.

The table below shows example offsets.

ADCOFFSET	Offset (mV)
0x00	0
0x01	1
0x7F	127
0x80	-128
0x81	-127
0xFF	-1

## 8 Application and Implementation

#### NOTE

Information in the following application section is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

## 8.1 Application Information

The bq769x0 family of battery monitoring AFEs enabling cell parametric measurement and protection is a variety of 3-series to 15-series Li-Ion/Li Polymer battery packs.

To evaluate the performance and configurations of the device users need the bq76940/bq76930/bq76920 Evaluation Software, (SLUCC539) tool to configure the internal registers for a specific battery pack and application. The Evaluation Software tool is a graphical user-interface tool installed on a PC during development. This can be used in conjunction with the bq76920EVM, bq76930EVM or bq76940EVM.

The bq769x0 devices are expected to be implemented in a system with a microcontroller that can perform additional functions based on the data made collected. The bq78350 is one example of a companion to the bq769x0 family.

#### 8.1.1 Configuring Alternative Cell Counts

Each bq769x0 family of IC's support a variety of cell counts. The following tables provide guidance on which device and which input pins to use, depending on the number of cells in the pack.

**Cell Input** 3 Cells 4 Cells 5 Cells VC5-VC4 CELL 3 CELL 4 CELL 5 VC4-VC3 short short CELL 4 VC3-VC2 short CELL 3 CELL 3 VC2-VC1 CELL 2 CELL 2 CELL 2 VC1-VC0 CELL 1 CELL 1 CELL 1

### 8.2 Typical Applications

#### **CAUTION**

The external circuitries in the following schematics show minimum requirements to ensure device robustness during cell connection to the PCB and normal operation.

Figure 8-1. bq76920 with bq78350 Companion Controller IC

Figure 8-2. bq76930 with bq78350 Companion Controller IC

Figure 8-3. bq76940 with bq78350 Companion Controller IC

### 8.2.1 Design Requirements

Table 8-4. bq769x0 Design Requirements

DESIGN PARAMETER	EXAMPLE VALUE at TA = 25°C
Minimum system operating voltage	24 V
Cell minimum operating voltage	3.0 V
Series Cell Count	8
Charge Voltage	33.6 V
Maximum Charge Current	3.0 A
Peak Discharge Current	10.0 A
OV Protection Threshold	4.30 V
OV Protection Delay	2s
UV Protection Threshold	2.5 V

DESIGN PARAMETER	EXAMPLE VALUE at TA = 25°C		
UV Protection Delay	4s		
OCD Protection Threshold Max	15 A		
OCD Protection Delay Time	320 ms		
SCD Protection Threshold Max	25 A		
SCD Protection Delay Time	100 μs		

#### 8.2.2 Detailed Design Procedure

To begin the design process, there are some key steps required for component selection and protection configuration.

#### 8.2.2.1 Step-by-Step Design Procedure

- · Determine the number of series cells.
  - This value depends on the cell chemistry and the load requirements of the system. For example, to support a minimum battery voltage of 24 V using Li-CO2 type cells with a cell minimum voltage of 3.0 V, there needs to be at least 8-series cells.
- Select the correct bq769x0 device.
  - For 8-series cells, the bq76930 is needed.
  - For the correct cell connections, see Table 8-2.
- Select the correct protection FETs.
  - The bq76930 uses a low-side drive suitable for N-CH FETs.
  - These FETs should be rated for the maximum:
    - Voltage, which should be approximately 5 V (DC) 10 V (peak) per series cell: for example, 40 V.
    - Current, which should be calculated based on both the maximum DC current and the maximum transient current with some margin: for example, 30 A.
    - Power Dissipation, which can be a factor of the RDS(ON) rating of the FET, the FET package, and the PCB design: for example, 5 W, assuming 5 mΩ RDS(ON).
- · Select the correct sense resistor.
  - The resistance value should be selected to maximize the input bandwidth use of the coulomb counter range, CC<sub>RANGE</sub>, but not exceed the absolute maximum ratings.
    - Using the normal max discharge current, RSNS = 200 mV / 10.0 A = 20 m $\Omega$ .
    - However, considering  $I_{SCD}$  of 25 A and Abs Max SRP–SRN input of –300 mV, RSNS = 300 mV / 25 A = 7.5 m $\Omega$
    - The maximum operating current of the system should also be considered as this should be below the maximum OCD Threshold, which with a RSNS of 7.5 m $\Omega$  gives a max OCD current setting of 13.3 A.
  - Further tolerance analysis (value tolerance, temperature variation, and so on) and PCB design margin should also be considered, so RSNS of 5 m $\Omega$  would be suitable with a 75-ppm temperature coefficient and power rating of 5 W.
- The bq76930 is chosen, and so the REGSRC pin needs to be powered through a source follower circuit where the FET is used to provide current for REGSRC from the battery positive terminal while reducing the voltage to a suitable value for the IC.
  - The FET also dissipates the power resulting from the load current and dropped voltage external to the IC and care should be taken to ensure the correct dissipation ratings are specified by the chosen FET.

- Configure the Current-based protection settings through PROTECT1 and PROTECT2:
  - Ideal SCD Threshold = 25 A  $\times$  5 m $\Omega$  = 125 mV.
    - However, the closest options are 111 mV (0x03) and 133 mV (0x04) providing 22.2 A and 26.6 A, respectively. Both options have the RSNS bit = 1.
    - 0x03 (22.2 A) will be used in this example.
  - The SCD delay threshold setting for a 100 μs delay is 0x01.
  - Therefore, PROTECT1 should be programmed with 0x8C.
  - Ideal OCD Threshold = 15 A  $\times$  5 m $\Omega$  = 75 mV.
    - However, the closest options are 72 mV (0x0A) and 78 mV (0x0B), providing 14.4 A and 15.6 A, respectively. Both options have the RSNS bit = 1.
    - 0x0A (14,4A) will be used in this example.
  - The OCD delay threshold setting for a 320-ms delay is 0x05.
  - Therefore, PROTECT2 should be programmed with 0x5B.

#### NOTE

Care should be taken when determining the setting of OV\_TRIP and UV\_TRIP as these are ADC value outputs and correlation to cell voltage also requires consideration of the ADC GAIN and ADC OFFSET registers. More specific details can be found in Section 7.3.1.2.

- Configure the Voltage-based protection settings through OV\_TRIP, UV\_TRIP and PROTECT3:
  - The selected OV Threshold is 4.30 V.
    - Therefore, OV\_TRIP should be programmed with 0xC9.
  - The selected UV Threshold is 2.5 V.
    - Therefore, UV\_TRIP should be programmed with 0x1A.
  - The selected OV Delay is 2 s and the selected UV Delay is 4 s.
    - Therefore, PROTECT3 should be programmed with 0x50.

## 8.2.3 Application Curves

www.ti.com

### 9 Power Supply Recommendations

The bq769x0 devices are powered through the BAT and REGSRC pins but the bq76930 and bq76940 have additional 'Power' pins to provide the power to the entire device in the higher cell configurations.

The use of Rf and Cf connected to the BAT pin, noted in the typical application diagrams, are required to filter system transients from disturbing the device power supply. These components should be placed as close as to the IC as possible.

Additionally, for the bq76930 and bq76940 there are additional requirements to ensure a stable power supply to the device. The REGSRC pin is powered through a source follower circuit where the FET is used to provide current for REGSRC from the battery positive terminal while reducing the voltage to a suitable value for the IC. The FET also dissipates the power resulting from the load current and dropped voltage external to the IC and care should be taken to ensure the correct dissipation ratings are specified by the chosen FET.

The bq76920 does not use a FET because the battery voltage is within the REGSRC range.

# 10 Layout

#### 10.1 Layout Guidelines

It is strongly recommended for best measurement performance to keep high current signals from interfering with the measurement system inputs and ground.

A second key recommendation is to ensure that the bq769x0 input filtering capacitors and power capacitors are connected to a common ground with as little parasitic resistance between the connections as possible.

### 10.2 Layout Example

Figure 10-1 shows a guideline of how to place key components compared to respective ground zones, based on the bq76920/30/40 EVMs.

Figure 10-1. System Component Placement Layout vs. Ground Zone Guide

#### **CAUTION**

Care should be taken when placing key power pin capacitors to minimize PCB trace impedances. These impedances could result in device resets or other unexpected operations when the device is at peak power consumption.

Although not shown in the diagrams, this caution also applies to the resistor and capacitor network surrounding the current sense resistor.

#### 11.3 Trademarks

I<sup>2</sup>C is a trademark of NXP B.V. Corporation.

All other trademarks are the property of their respective owners.

#### 11.4 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

#### 11.5 Glossary

SLYZ022 — TI Glossary.

This glossary lists and explains terms, acronyms, and definitions.

### 12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

23-Nov-2014

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check http://www.ti.com/productcontent for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

- (3) MSL, Peak Temp. The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.
- (4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.
- (5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

# **PACKAGE OPTION ADDENDUM**

23-Nov-2014

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. #### IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have *not* been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
