KAI-16050

4896 (H) x 3264 (V) Interline CCD Image Sensor

Description

The KAI-16050 Image Sensor is a 16-megapixel CCD in an APS-H optical format. Based on the TRUESENSE 5.5 micron Interline Transfer CCD Platform, the sensor features broad dynamic range, excellent imaging performance, and a flexible readout architecture that enables use of 1, 2, or 4 outputs for full resolution readout up to 8 frames per second. A vertical overflow drain structure suppresses image blooming and enables electronic shuttering for precise exposure control.

The sensor is available with the TRUESENSE Sparse Color Filter Pattern, a technology which provides a 2x improvement in light sensitivity compared to a standard color Bayer part.

The sensor shares common PGA pin-out and electrical configurations with other devices based on the TRUESENSE 5.5 micron Interline Transfer CCD Platform, allowing a single camera design to be leveraged to support multiple members of this sensor family.

Figure 1. KAI-16050 CCD Image Sensor

Features

- Bayer Color Pattern, TRUESENSE Sparse Color Filter Pattern, and Monochrome Configurations
- Progressive Scan Readout
- Flexible Readout Architecture
- High Frame Rate
- High Sensitivity
- Low Noise Architecture
- Excellent Smear Performance
- Package Pin Reserved for Device Identification

Applications

- Industrial Imaging and Inspection
- Traffic
- Security

ORDERING INFORMATION

See detailed ordering and shipping information on page 2 of this data sheet.

DEVICE DESCRIPTION

Architecture

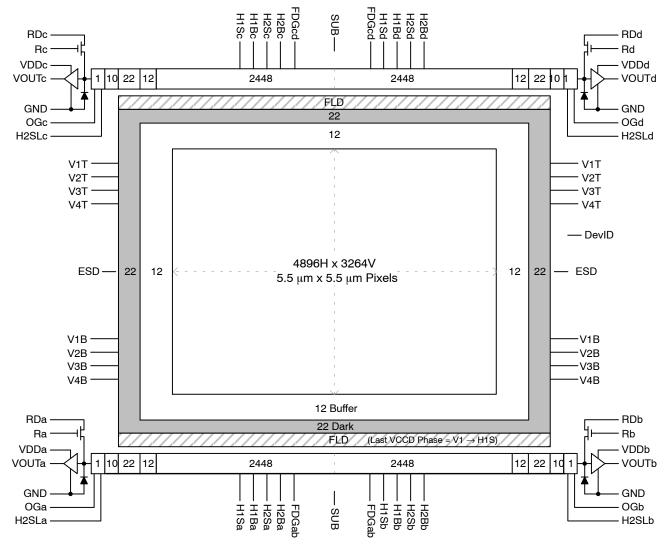

Figure 2. Block Diagram

Dark Reference Pixels

There are 22 dark reference rows at the top and 22 dark rows at the bottom of the image sensor. The dark rows are not entirely dark and so should not be used for a dark reference level. Use the 22 dark columns on the left or right side of the image sensor as a dark reference.

Under normal circumstances use only the center 20 columns of the 22 column dark reference due to potential light leakage.

Dummy Pixels

Within each horizontal shift register there are 11 leading additional shift phases. These pixels are designated as dummy pixels and should not be used to determine a dark reference level.

In addition, there is one dummy row of pixels at the top and bottom of the image.

Active Buffer Pixels

12 unshielded pixels adjacent to any leading or trailing dark reference regions are classified as active buffer pixels. These pixels are light sensitive but are not tested for defects and non–uniformities.

Image Acquisition

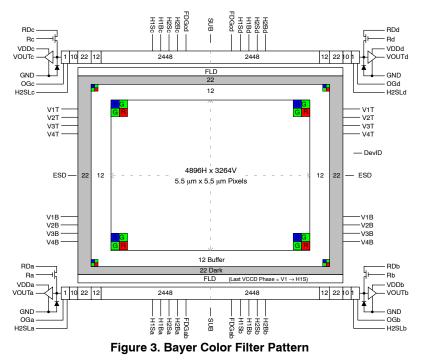

An electronic representation of an image is formed when incident photons falling on the sensor plane create electron-hole pairs within the individual silicon photodiodes. These photoelectrons are collected locally by the formation of potential wells at each photosite. Below photodiode saturation, the number of photoelectrons collected at each pixel is linearly dependent upon light level and exposure time and non-linearly dependent on wavelength. When the photodiodes charge capacity is reached, excess electrons are discharged into the substrate to prevent blooming.

ESD Protection

Adherence to the power-up and power-down sequence is critical. Failure to follow the proper power-up and

power-down sequences may cause damage to the sensor. See Power-Up and Power-Down Sequence section.

Liked named pins are internally connected and should have a common drive signal.
N/C pins (19, 55) should be left floating.

IMAGING PERFORMANCE

Table 6. TYPICAL OPERATION CONDITIONS

Unless otherwise noted, the Imaging Performance Specifications are measured using the following conditions.

| Description | Condition | Notes | | |
|--------------|---|---|--|--|
| Light Source | Continuous red, green and blue LED illumination | For monochrome sensor, only green LED used. | | |
| Operation | Nominal operating voltages and timing | | | |

| Output Amplifier Sensitivity | $\Delta V / \Delta N$ | - | 34 | _ | μV/e ⁻ | Design | | |

1. Per color

2. Value is over the range of 10% to 90% of photodiode saturation.

3. The operating value of the substrate voltage, VAB, will be marked on the shipping container for each device. The value of VAB is set such that the photodiode charge capacity is 680 mV.

4. At 40 MHz

5. Uses 20LOG (PNe/ n_{e-T})

6. Assumes 5 pF load.

DEFECT DEFINITIONS

Table 11. OPERATION CONDITIONS FOR DEFECT TESTING AT 40°C

| Description | Condition | Notes |
|--|---|-------|
| Operational Mode | Two outputs, using VOUTa and VOUTc, continuous readout | |
| HCCD Clock Frequency | 10 MHz | |
| Pixels Per Line | 5120 | 1 |
| Lines Per Frame | 1760 | 2 |
| Line Time | 547.7 μsec | |
| Frame Time | 964.0 msec | |
| Photodiode Integration Time (PD_Tint) | Mode A: PD_Tint = Frame Time = 964.0 msec, no electronic shutter used | |
| VCCD Integration Time | 912.5 msec | 3 |
| Temperature | 40°C | |
| Light Source | Continuous red, green and blue LED illumination | 4 |
| Operation | Nominal operating voltages and timing | |

1. Horizontal overclocking used.

2. Vertical overclocking used.

3. VCCD Integration Time = 1666 lines x Line Time, which is the total time a pixel will spend in the VCCD registers.

4. For monochrome sensor, only the green LED is used.

Table 12. DEFECT DEFINITIONS FOR TESTING AT 40°C

| Description | Definition | Grade 1 | Grade 2 Mono | Grade 2 Color | Notes |
|--|---|---------|-----------------|------------------|-------|
| Major dark field defective bright pixel | $PD_Tint = Mode A \to Defect \ge 328 \ mV$ | 150 | 300 | 300 | 1 |
| Major bright field defective dark pixel | Defect ≥ 12% | | | | |
| Minor dark field defective bright pixel | $PD_Tint = Mode A \rightarrow Defect \ge 164 mV$ | 1500 | 3000 | 3000 | |
| Cluster defect | A group of 2 to 19 contiguous major defective pixels, but no more than 3 adjacent defects horizontally. | 20 | n/a | n/a | 2 |
| Cluster defect A group of 2 to 38 contiguous major defective pixels, but no more than adjacent defects horizontally. | | n/a | 30 | 30 | |
| Column defect | A group of more than 10 contiguous major defective pixels along a single column | 0 | 4 | 15 | 2 |

1. For the color devices (KAI-16050-CXA and KAI-16050-PXA), a bright field defective pixel deviates by 12% with respect to pixels of the same color.

2. Column and cluster defects are separated by no less than two (2) good pixels in any direction (excluding single pixel defects).

KAI-16050

Table 13. OPERATION CONDITIONS FOR DEFECT TESTING AT 27°C

| Description | Condition | Notes |

4. For monochrome sensor, only the green LED is used.

Table 14. DEFECT DEFINITIONS FOR TESTING AT 27°C

| Description | Definition | Grade 1 | Grade 2 Mono | Grade 2 Color | Notes |
|---|---|---------|-----------------|------------------|-------|
| Major dark field defective bright pixel | $PD_Tint = Mode A \rightarrow Defect \ge 200 \text{ mV}$ | 150 | 300 | 300 | 1 |
| Major bright field defective dark pixel | Defect ≥ 12% | | | | |
| Cluster defect | A group of 2 to 19 contiguous major defective pixels, but no more than 3 adjacent defects horizontally. | 20 | n/a | n/a | 2 |
| Cluster defect | A group of 2 to 38 contiguous major defective pixels, but no more than 5 adjacent defects horizontally. | n/a | 30 | 30 | |
| Column defect | A group of more than 10 contiguous major defective pixels along a single column | 0 | 4 | 15 | 2 |

1. For the color devices (KAI-16050-CXA and KAI-16050-PXA), a bright field defective pixel deviates by 12% with respect to pixels of the same color.

2. Column and cluster defects are separated by no less than two (2) good pixels in any direction (excluding single pixel defects).

Defect Map

The defect map supplied with each sensor is based upon testing at an ambient (27°C) temperature. Minor point

defects are not included in the defect map. All defective pixels are reference to pixel 1, 1 in the defect maps. See Figure 13: Regions of interest for the location of pixel 1,1.

TEST DEFINITIONS

Test Regions of Interest

Image Area ROI:Pixel (1, 1) to Pixel (4920, 3288)Active Area ROI:Pixel (13, 13) to Pixel (4908, 3276)Center ROI:Pixel (2411, 1595) to Pixel (2510, 1694)Only the Active Area ROI pixels are used for performance and defect tests.

Overclocking

The test system timing is configured such that the sensor is overclocked in both the vertical and horizontal directions. See Figure 13 for a pictorial representation of the regions of interest.

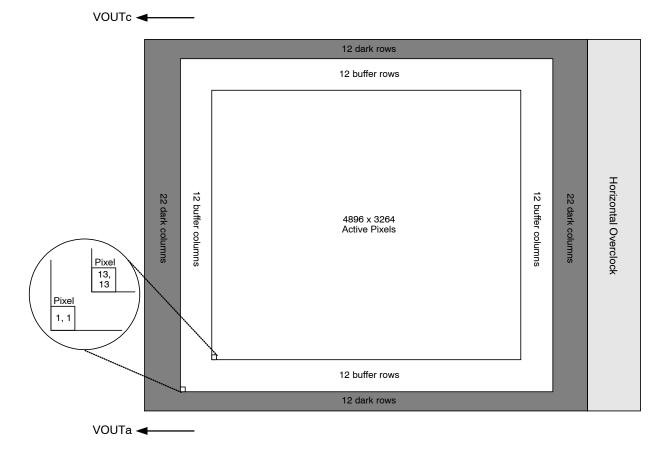

Figure 13. Regions of Interest

Tests

Dark Field Global Non–Uniformity

This test is performed under dark field conditions. The sensor is partitioned into 864 sub regions of interest, each of which is 136 by 136 pixels in size. The average signal level of each of the 864 sub regions of interest is calculated. The signal level of each of the sub regions of interest is calculated using the following formula:

Signal of ROI[i] = (ROI Average in counts – Horizontal overclock average in counts) * mV per count

Where i = 1 to 864. During this calculation on the 864 sub regions of interest, the maximum and minimum signal levels

$$GlobalNon-Uniformity = 100 \times \left(\frac{ActiveAreaStandardDeviation}{ActiveAreaSignal}\right)$$

Units: %rms.

Active Area Signal = Active Area Average - Dark Column Average

Global Peak to Peak Non-Uniformity

This test is performed with the imager illuminated to a level such that the output is at 70% of saturation (approximately 476 mV). Prior to this test being performed the substrate voltage has been set such that the charge capacity of the sensor is 680 mV. The sensor is partitioned into 864 sub regions of interest, each of which is 136 by 136

GlobalUniformity = 100 × MaximumSignal – MinimumSignal

Units: %pp

Center Non–Uniformity

This test is performed with the imager illuminated to a level such that the output is at 70% of saturation (approximately 476 mV). Prior to this test being performed

Center ROI Uniformity =
$$100 \times \left(\frac{\text{Center ROI Standard Deviation}}{\text{Center ROI Signal}}\right)$$

Units: %rms.

Center ROI Signal = Center ROI Average - Dark Column Average

Dark Field Defect Test

This test is performed under dark field conditions. The sensor is partitioned into 864 sub regions of interest, each of which is 136 by 136 pixels in size. In each region of interest, the median value of all pixels is found. For each region of interest, a pixel is marked defective if it is greater than or equal to the median value of that region of interest plus the defect threshold specified in the "Defect Definitions" section.

Bright Field Defect Test

This test is performed with the imager illuminated to a level such that the output is at approximately 476 mV. Prior are found. The dark field global uniformity is then calculated as the maximum signal found minus the minimum signal level found.

Units: mVpp (millivolts peak to peak)

Global Non–Uniformity

This test is performed with the imager illuminated to a level such that the output is at 70% of saturation (approximately 476 mV). Prior to this test being performed the substrate voltage has been set such that the charge capacity of the sensor is 680 mV. Global non-uniformity is defined as

<u>n</u>)

pixels in size. The average signal level of each of the 864 sub regions of interest (ROI) is calculated. The signal level of each of the sub regions of interest is calculated using the following formula:

Signal of ROI[i] = (ROI Average in counts - Horizontal overclock average in counts) * mV per count

Where i = 1 to 864. During this calculation on the 864 sub regions of interest, the maximum and minimum signal levels are found. The global peak to peak uniformity is then calculated as:

the substrate voltage has been set such that the charge capacity of the sensor is 680 mV. Defects are excluded for the calculation of this test. This test is performed on the center 100 by 100 pixels of the sensor. Center uniformity is defined as:

ActiveAreaSignal

to this test being performed the substrate voltage has been set such that the charge capacity of the sensor is 680 mV. The average signal level of all active pixels is found. The bright and dark thresholds are set as:

Dark defect threshold = Active Area Signal * threshold Bright defect threshold = Active Area Signal * threshold

The sensor is then partitioned into 864 sub regions of interest, each of which is 136 by 136 pixels in size. In each region of interest, the average value of all pixels is found. For each region of interest, a pixel is marked defective if it is greater than or equal to the median value of that region of interest plus the bright threshold specified or if it is less than or equal to the median value of that region of interest minus the dark threshold specified.

Example for major bright field defective pixels:

- Average value of all active pixels is found to be 476 mV
- Dark defect threshold: 476 mV * 12 % = 57 mV
- Region of interest #1 selected. This region of interest is pixels 13, 13 to pixels 148, 148.
 - Median of this region of interest is found to be 470 mV.
 - Any pixel in this region of interest that is ≤ (470 - 57 mV) 413 mV in intensity will be marked defective.
- All remaining 836 sub regions of interest are analyzed for defective pixels in the same manner.

OPERATION

Table 15. ABSOLUTE MAXIMUM RATINGS

| Description | Symbol | Minimum | Maximum | Units | Notes |
|-----------------------|------------------|---------|---------|-------|-------|
| Operating Temperature | T _{OP} | -50 | +70 | °C | 1 |
| Humidity | RH | +5 | +90 | % | 2 |
| Output Bias Current | l _{out} | | 60 | mA | 3 |
| Off-chip Load | CL | | 10 | pF | |

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

1. Noise performance will degrade at higher temperatures.

2. T = 25°C. Excessive humidity will degrade MTTF.

 Total for all outputs. Maximum current is -15 mA for each output. Avoid shorting output pins to ground or any low impedance source during operation. Amplifier bandwidth increases at higher current and lower load capacitance at the expense of reduced gain (sensitivity).

Table 16. ABSOLUTE MAXIMUM VOLTAGE RATINGS BETWEEN PINS AND GROUND

| Description | Minimum | Maximum | Units | Notes |
|--|-----------|------------|-------|-------|
| VDDα, VOUTα | -0.4 | 17.5 | V | 1 |
| RDα | -0.4 | 15.5 | V | 1 |
| V1B, V1T | ESD – 0.4 | ESD + 24.0 | V | |
| V2B, V2T, V3B, V3T, V4B, V4T | ESD – 0.4 | ESD + 14.0 | V | |
| FDGab, FDGcd | ESD – 0.4 | ESD + 15.0 | V | |
| H1Sa, H1Ba, H2Sa, H2Ba, H2SLa, Ra, OGa | ESD – 0.4 | ESD + 14.0 | V | 1 |
| ESD | -10.0 | 0.0 | V | |
| SUB | -0.4 | 40.0 | V | 2 |

1. α denotes a, b, c or d

2. Refer to Application Note Using Interline CCD Image Sensors in High Intensity Visible Lighting Conditions.

Power-Up and Power-Down Sequence

Adherence to the power-up and power-down sequence is critical. Failure to follow the proper power-up and power-down sequences may cause damage to the sensor.

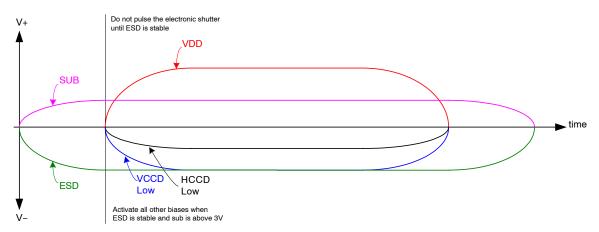

Figure 14. Power–Up and Power–Down Sequence

Notes:

- 1. Activate all other biases when ESD is stable and SUB is above 3 V
- 2. Do not pulse the electronic shutter until ESD is stable
- 3. VDD cannot be +15 V when SUB is 0 V
- 4. The image sensor can be protected from an accidental improper ESD voltage by current limiting the SUB current to less than 10 mA. SUB and VDD must always be greater than GND. ESD must always be less than GND. Placing diodes between SUB, VDD, ESD and ground will protect

the sensor from accidental overshoots of SUB, VDD and ESD during power on and power off. See the figure below.

The VCCD clock waveform must not have a negative overshoot more than 0.4 V below the ESD voltage.

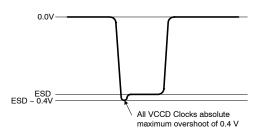

Figure 15.

Example of external diode protection for SUB, VDD and ESD. α denotes a, b, c or d

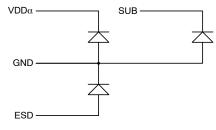

Figure 16.

Table 17. DC BIAS OPERATING CONDITIONS

| Description | Pins | Symbol | Minimum | Nominal | Maximum | Units | Maximum DC Current | Notes |
|-------------------------|-------|--------|---------|---------|---------|-------|-----------------------|---------|
| Reset Drain | RDα | RD | +11.8 | +12.0 | +12.2 | V | 10 μA | 1 |
| Output Gate | OGα | OG | -2.2 | -2.0 | -1.8 | V | 10 μA | 1 |
| Output Amplifier Supply | VDDα | VDD | +14.5 | +15.0 | +15.5 | V | 11.0 mA | 1,2 |
| Ground | GND | GND | 0.0 | 0.0 | 0.0 | V | –1.0 mA | |
| Substrate | SUB | VSUB | +5.0 | VAB | VDD | V | 50 μA | 3, 8 |
| ESD Protection Disable | ESD | ESD | -9.5 | -9.0 | Vx_L | V | 50 μA | 6, 7, 9 |
| Output Bias Current | VOUTα | lout | -3.0 | -7.0 | -10.0 | mA | | 1, 4, 5 |

1. α denotes a, b, c or d

2. The maximum DC current is for one output. Idd = lout + Iss. See Figure 17.

The operating value of the substrate voltage, VAB, will be marked on the shipping container for each device. The value of VAB is set such 3. that the photodiode charge capacity is the nominal PNe (see Specifications).

An output load sink must be applied to each VOUT pin to activate each output amplifier.
Nominal value required for 40 MHz operation per output. May be reduced for slower data rates and lower noise.

6. Adherence to the power-up and power-down sequence is critical. See Power-Up and Power-Down Sequence section.

ESD maximum value must be less than or equal to V1_L + 0.4 V and V2_L + 0.4 V 7.

8. Refer to Application Note Using Interline CCD Image Sensors in High Intensity Visible Lighting Conditions

9. Where Vx_L is the level set for V1_L, V2_L, V3_L, or V4_L in the application.

| | | FDG_H | High | +4.5 | +5.0 | +5.5 | 1 | |

1. α denotes a, b, c or d

2. Capacitance is total for all like named pins

Use separate clock driver for improved speed performance.

4. Reset low should be set to -3 volts for signal levels greater than 40,000 electrons.

5. Refer to Application Note Using Interline CCD Image Sensors in High Intensity Visible Lighting Conditions

6. Capacitance values are estimated

If the minimum horizontal clock low level is used (-5.2 V), then the maximum horizontal clock amplitude should be used (5.2 V amplitude) to create a -5.2 V to 0.0 V clock. If a 5 V clock driver is used, the horizontal low level should be set to -5.0 V and the high level should be a set to 0.0 V.

The figure below shows the DC bias (VSUB) and AC clock (VES) applied to the SUB pin. Both the DC bias and AC clock are referenced to ground.

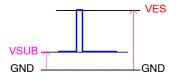

Figure 18.

Device Identification

The device identification pin (DevID) may be used to determine which ON Semiconductor 5.5 micron pixel interline CCD sensor is being used.

Table 19. DEVICE IDENTIFICATION

| Description | Pins | Symbol | Minimum | Nominal | Maximum | Units | Maximum DC Current | Notes |
|-----------------------|-------|--------|---------|---------|---------|-------|-----------------------|---------|
| Device Identification | DevID | DevID | 144,000 | 180,000 | 216,000 | Ω | 50 μA | 1, 2, 3 |

1. Nominal value subject to verification and/or change during release of preliminary specifications.

2. If the Device Identification is not used, it may be left disconnected.

 After Device Identification resistance has been read during camera initialization, it is recommended that the circuit be disabled to prevent localized heating of the sensor due to current flow through the R_DeviceID resistor.

Recommended Circuit

Note that V1 must be a different value than V2.

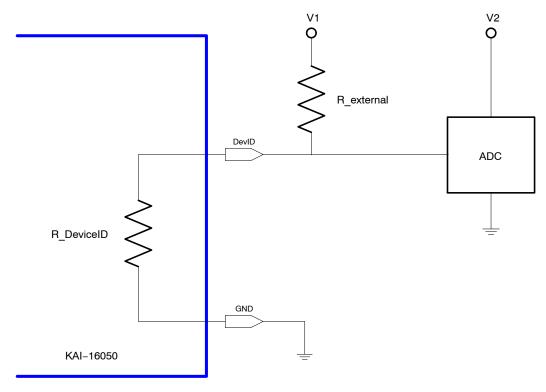

Figure 19. Device Identification Recommended Circuit

1. For optimal performance of the sensor. May be clocked at a lower frequency. If clocked at a lower frequency, the frequency selected should be a multiple of the frequency used on the a and b register.

2. H2SLx follows the same pattern as H2Sx For optimal speed performance, use a separate clock driver.

3. Off = +5 V. Note that there may be operating conditions (high temperature and/or very bright light sources) that will cause blooming from the unused c/d register into the image area.

Photodiode Transfer Timing

A row of charge is transferred to the HCCD on the falling edge of V1 as indicated in the P1 pattern below. Using this timing sequence, the leading dummy row or line is combined with the first dark row in the HCCD. The "Last Line" is dependent on readout mode – either 1666 or 3332 minimum counts required. It is important to note that, in general, the rising edge of a vertical clock (patterns P1–P4) should be coincident or slightly leading a falling edge at the same time interval. This is particularly true at the point where P1 returns from the high (3rd level) state to the mid–state when P4 transitions from the low state to the high state.

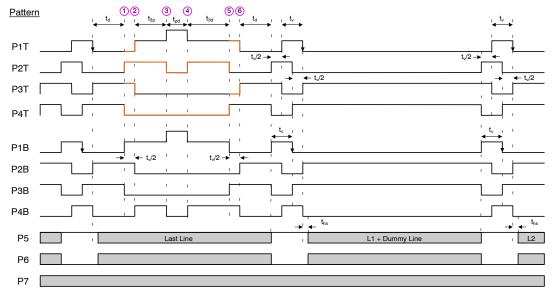

Figure 20. Photodiode Transfer Timing

Line and Pixel Timing

Each row of charge is transferred to the output, as illustrated below, on the falling edge of H2SL (indicated as P6 pattern). The number of pixels in a row is dependent on

readout mode – either 2492 or 4984 minimum counts required.

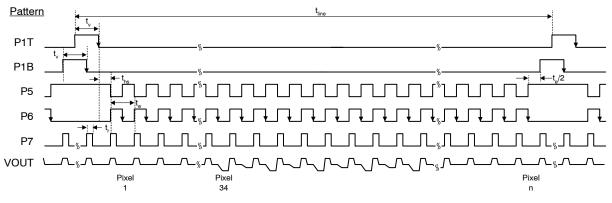

Figure 21. Line and Pixel Timing

Pixel Timing Detail

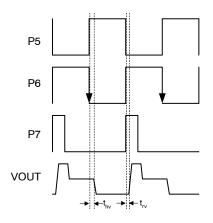

Figure 22. Pixel Timing Detail

Frame/Electronic Shutter Timing

The SUB pin may be optionally clocked to provide electronic shuttering capability as shown below.

Pattern

The resulting photodiode integration time is defined from the falling edge of SUB to the falling edge of V1 (P1 pattern).

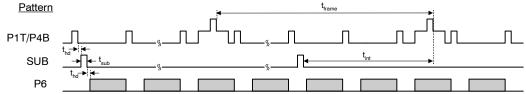

Figure 23. Frame/Electronic Shutter Timing

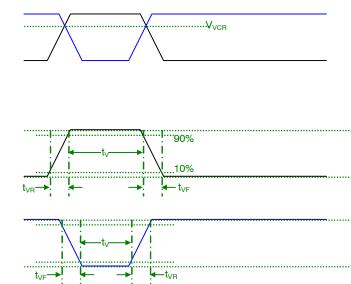

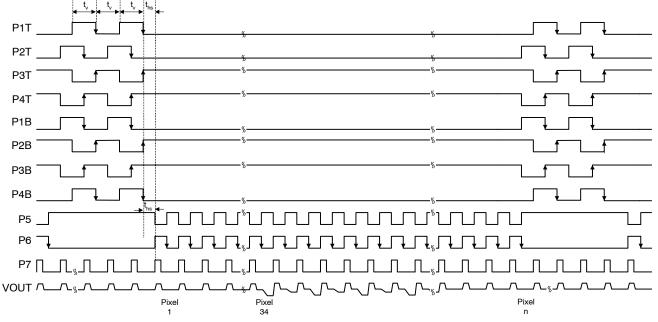

Figure 24. VCCD Clock Rise Time, Fall Time and Edge Alignment

VCCD Clock Edge Alignment

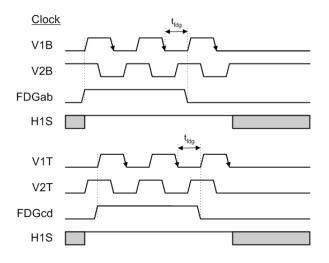

Line and Pixel Timing – Vertical Binning by 2

Fast Line Dump Timing

The FDG pins may be optionally clocked to efficiently remove unwanted lines in the image resulting for increased frame rates at the expense of resolution. Below is an example of a 2 line dump sequence followed by a normal readout line. Note that the FDG timing transitions should complete prior to the beginning of V1 timing transitions as illustrated below.

STORAGE AND HANDLING

Table 22. STORAGE CONDITIONS

| Description | Symbol | Minimum | Maximum | Units | Notes |
|---------------------|-----------------|---------|---------|-------|-------|
| Storage Temperature | T _{ST} | -55 | +80 | °C | 1 |
| Humidity | RH | 5 | 90 | % | 2 |

1. Long term storage toward the maximum temperature will accelerate color filter degradation.

2. T = 25°C. Excessive humidity will degrade MTTF.

For information on ESD and cover glass care and cleanliness, please download the *Image Sensor Handling and Best Practices* Application Note (AN52561/D) from www.onsemi.com.

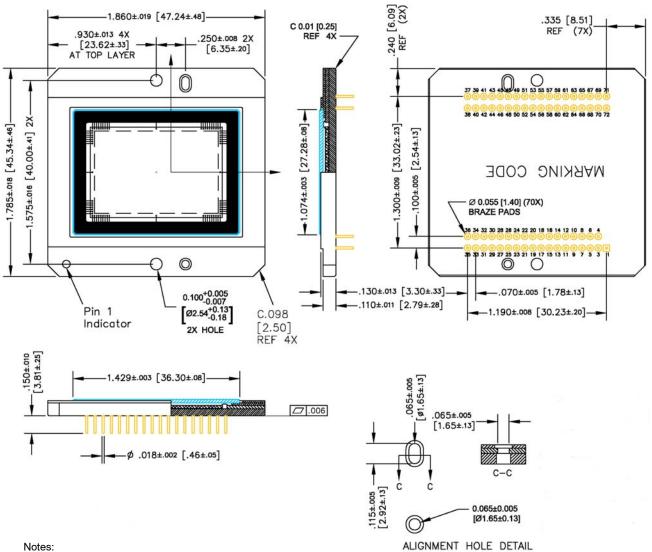

For information on soldering recommendations, please download the Soldering and Mounting Techniques Reference Manual (SOLDERRM/D) from www.onsemi.com. For quality and reliability information, please download the *Quality & Reliability* Handbook (HBD851/D) from <u>www.onsemi.com</u>.

For information on device numbering and ordering codes, please download the *Device Nomenclature* technical note (TND310/D) from <u>www.onsemi.com</u>.

For information on Standard terms and Conditions of Sale, please download <u>Terms and Conditions</u> from <u>www.onsemi.com</u>.

MECHANICAL INFORMATION

Completed Assembly

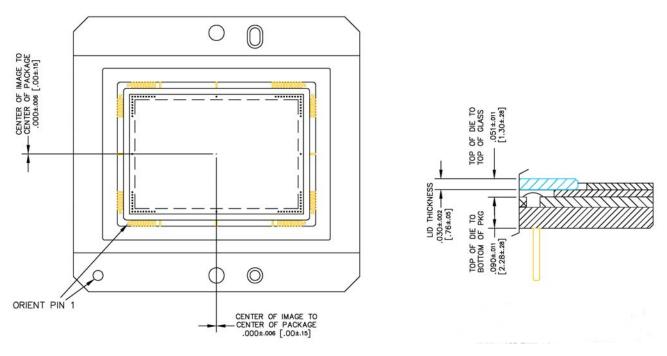

Notes:

- 1. See Ordering Information for marking code.
- 2. No materials to interfere with clearance through package holes.
- 3. Units: IN [MM]

Общество с ограниченной ответственностью «МосЧип» ИНН 7719860671 / КПП 771901001 Адрес: 105318, г.Москва, ул.Щербаковская д.З, офис 1107

Данный компонент на территории Российской Федерации

Вы можете приобрести в компании MosChip.

Для оперативного оформления запроса Вам необходимо перейти по данной ссылке:

http://moschip.ru/get-element

Вы можете разместить у нас заказ для любого Вашего проекта, будь то серийное производство или разработка единичного прибора.

В нашем ассортименте представлены ведущие мировые производители активных и пассивных электронных компонентов.

Нашей специализацией является поставка электронной компонентной базы двойного назначения, продукции таких производителей как XILINX, Intel (ex.ALTERA), Vicor, Microchip, Texas Instruments, Analog Devices, Mini-Circuits, Amphenol, Glenair.

Сотрудничество с глобальными дистрибьюторами электронных компонентов, предоставляет возможность заказывать и получать с международных складов практически любой перечень компонентов в оптимальные для Вас сроки.

На всех этапах разработки и производства наши партнеры могут получить квалифицированную поддержку опытных инженеров.

Система менеджмента качества компании отвечает требованиям в соответствии с ГОСТ Р ИСО 9001, ГОСТ РВ 0015-002 и ЭС РД 009
