SLG59M1649V

An Ultra-small, Low-power 23 m Ω /4 A P-Channel Integrated Power Switch with Reverse-Current Blocking

General Description

The SLG59M1649V is a self-powered, high-performance, 23 m Ω pFET integrated power switch designed for 1.5 to 5 V power rail applications up to 4 A. When enabled, internal reverse-current protection will quickly open the switch in the event of a reverse-voltage condition is detected (a $V_{OUT} + 50\text{mV} > V_{IN}$ condition opens the switch). Upon the detection of a reverse condition, an open-drain $\overline{\text{FAULT}}$ output is asserted. In the event the V_{IN} voltage is too low, the power switch also contains an internal UVLO threshold monitor to keep or to turn the switch OFF.

Designed to operate over a -40°C to 85°C range, the SLG59M1649V is available in a RoHS-compliant, ultra-small 1.0 x 1.6 mm STDFN package.

Pin Configuration

Features

- Steady-state Operating Current: Up to 4 A
- Low Typical $R_{DS(ON)}$:
 - 23 m Ω at $V_{IN} = 5\text{ V}$
 - 31 m Ω at $V_{IN} = 2.5\text{ V}$
 - 42 m Ω at $V_{IN} = 1.5\text{ V}$
- Operating Voltage: 1.5 V to 5.5 V
- Reverse-voltage Detection ON or OFF
- Internal Gate Drive and V_{OUT} Discharge
- Open-drain $\overline{\text{FAULT}}$ Signaling
- Operating temperature range: -40°C to 85°C
- Low θ_{JA} , 8-pin 1.0 mm x 1.6 mm STDFN Packaging
 - Pb-Free / Halogen-Free / RoHS compliant packaging

Applications

- Power-Rail Switching:
 - Notebook/Laptop/Tablet PCs
 - Smartphones/Wireless Handsets
 - High-definition Digital Cameras
 - Set-top Boxes
- Point of Sales Pins
- GPS Navigation Devices

Pin Description

Pin #	Pin Name	Type	Pin Description
1, 4	VIN	Power/Input	With an internal 1.2V UVLO threshold, VIN supplies the power for the operation of the power switch, the internal control circuitry, and the source terminal of pFET. Bypass the VIN pin to GND with a 2.2 μ F (or larger), low-ESR capacitor.
2, 3	ON	Input	A low-to-high transition on this pin initiates the operation of the power switch. ON is an asserted-HIGH, level-sensitive CMOS input with $V_{IL} < 0.3$ V and $V_{IH} > 1$ V. As the ON input circuitry does not have an internal pull-down resistor, connect the ON pin directly to a GPIO controller – do not allow this pin to be open circuited.
5, 8	VOUT	Output	Output and drain terminal of MOSFET.
6	$\overline{\text{FAULT}}$	Output	An open drain output, $\overline{\text{FAULT}}$ is asserted within $T_{\text{FAULT_LOW}}$ when a ($V_{\text{OUT}} + V_{\text{REVERSE}} > V_{\text{IN}}$) condition is detected. The $\overline{\text{FAULT}}$ output is deasserted within $T_{\text{FAULT_HIGH}}$ when the fault condition is removed. Connect an external 10-k Ω resistor from the $\overline{\text{FAULT}}$ pin to the system's local logic supply.
7	GND	GND	Ground connection. Connect this pin to system analog or power ground plane.

V_{IN} Inrush Current Details

When the SLG59M1649V is enabled with ON ↑, the power switch closes to charge the V_{OUT} output capacitor to V_{IN}. The charging current drawn from V_{IN} is commonly referred to as “V_{IN} inrush current” and can cause the input power source to collapse if the V_{IN} inrush current is too high.

Since the V_{OUT} rise time of the SLG59M1649V is fixed, V_{IN} inrush current is then a function of the output capacitance at V_{OUT}. The expression relating V_{IN} inrush current, the SLG59M1649V V_{OUT} rise time, and C_{LOAD} is:

$$V_{IN} \text{ Inrush Current} = C_{LOAD} \times \frac{\Delta V_{OUT}}{V_{OUT} \text{ Rise Time}}$$

where in this expression ΔV_{OUT} is equivalent to V_{IN} if the initial SLG59M1649V's output voltages are zero.

In the table below are examples of V_{IN} inrush currents assuming zero initial charge on C_{LOAD} as a function of V_{IN}.

V _{IN}	V _{OUT} Rise Time	C _{LOAD}	Inrush Current
1.5 V	66 μs	0.1 μF	2.3 mA
5 V	130 μs	0.1 μF	3.8 mA

Since the relationship is linear and if C_{LOAD} were increased to 1 μF, then the V_{IN} inrush currents would be 10x higher in either example. If a large C_{LOAD} capacitor is required in the application and depending upon the strength of the input power source, it may very well be necessary to increase the C_{IN}-to-C_{LOAD} ratio to minimize V_{IN} droop during turn-on.

For other V_{OUT} rise time options, please contact Silego for additional information.

Power Dissipation

The junction temperature of the SLG59M1649V depends on factors such as board layout, ambient temperature, external air flow over the package, load current, and the R_{DS(ON)}-generated voltage drop across each power MOSFET. While the primary contributor to the increase in the junction temperature of the SLG59M1649V is the power dissipation of its power MOSFETs, its power dissipation and the junction temperature in nominal operating mode can be calculated using the following equations:

$$PD_{TOTAL} = R_{DS(ON)} \times I_{DS}^2$$

where:

PD_{TOTAL} = Total package power dissipation, in Watts (W)

R_{DS(ON)} = Power MOSFET ON resistance, in Ohms (Ω)

I_{DS} = Output current, in Amps (A)

and

$$T_J = PD_{TOTAL} \times \theta_{JA} + T_A$$

where:

T_J = Die junction temperature, in Celsius degrees (°C)

θ_{JA} = Package thermal resistance, in Celsius degrees per Watt (°C/W) – highly dependent on pcb layout

T_A = Ambient temperature, in Celsius degrees (°C)

Power Dissipation (continued)

In nominal operating mode, the SLG59M1649V's power dissipation can also be calculated by taking into account the voltage drop across each switch ($V_{IN}-V_{OUT}$) and the magnitude of that channel's output current (I_{OUT}):

$$PD_{TOTAL} = (V_{IN}-V_{OUT}) \times I_{DS} \text{ or}$$

$$PD_{TOTAL} = (V_{IN} - (R_{LOAD} \times I_{DS})) \times I_{DS}$$

where:

PD_{TOTAL} = Total package power dissipation, in Watts (W)

V_{IN} = Input Voltage, in Volts (V)

R_{LOAD} = Output Load Resistance, in Ohms (Ω)

I_{DS} = Output current, in Amps (A)

V_{OUT} = Output voltage, or $R_{LOAD} \times I_{DS}$
