

## FEATURES

**Very low voltage noise:** 1 nV/ $\sqrt{\text{Hz}}$  maximum at 100 Hz

**Excellent current gain match:** 0.5% typical

**Low offset voltage ( $V_{OS}$ ):** 200  $\mu\text{V}$  maximum

**Outstanding offset voltage drift:** 0.03  $\mu\text{V}/^\circ\text{C}$  typical

**High gain bandwidth product:** 200 MHz

## PIN CONFIGURATION

**NOTE**  
1. SUBSTRATE IS CONNECTED TO CASE ON TO-78 PACKAGE.  
2. SUBSTRATE IS NORMALLY CONNECTED TO THE MOST NEGATIVE CIRCUIT POTENTIAL, BUT CAN BE FLOATED.

09044-001

Figure 1. 6-Lead TO-78

## GENERAL DESCRIPTION

The **MAT12** is a dual, NPN-matched transistor pair that is specifically designed to meet the requirements of ultralow noise audio systems.

With its extremely low input base spreading resistance ( $r_{bb'}$  is typically 28  $\Omega$ ) and high current gain ( $h_{FE}$  typically exceeds 600 at  $I_C = 1 \text{ mA}$ ), the **MAT12** can achieve outstanding signal-to-noise ratios. The high current gain results in superior performance compared to systems incorporating commercially available monolithic amplifiers.

Excellent matching of the current gain ( $\Delta h_{FE}$ ) to about 0.5% and low  $V_{OS}$  of less than 10  $\mu\text{V}$  typical make the **MAT12** ideal for symmetrically balanced designs, which reduce high-order amplifier harmonic distortion.

Stability of the matching parameters is guaranteed by protection diodes across the base emitter junction. These diodes prevent

degradation of beta and matching characteristics due to reverse biasing of the base emitter junction.

The **MAT12** is also an ideal choice for accurate and reliable current biasing and mirroring circuits. Furthermore, because the accuracy of a current mirror degrades exponentially with mismatches of  $V_{BE}$  between transistor pairs, the low  $V_{OS}$  of the **MAT12** does not need offset trimming in most circuit applications.

The **MAT12** is a good replacement for the MAT02, and its performance and characteristics are guaranteed over the extended temperature range of  $-40^\circ\text{C}$  to  $+85^\circ\text{C}$ .

## SPECIFICATIONS

## ELECTRICAL CHARACTERISTICS

$V_{CB} = 15\text{ V}$ ,  $I_O = 10\text{ }\mu\text{A}$ ,  $T_A = 25^\circ\text{C}$ , unless otherwise specified.

<sup>1</sup> Current gain is guaranteed with collector-to-base voltage ( $V_{CB}$ ) swept from 0 V to  $V_{MAX}$  at the indicated collector currents.

<sup>2</sup> Current gain match ( $\Delta h_{FE}$ ) is defined as follows:  $\Delta h_{FE} = (100(\Delta I_B)/(h_{FE\text{ min}})/I_C)$ .

<sup>3</sup> Noise voltage density is guaranteed, but not 100% tested.

<sup>4</sup> This is the maximum change in  $V_{OS}$  as  $V_{CB}$  is swept from 0 V to 40 V.

<sup>5</sup> Measured at  $I_C = 10\text{ }\mu\text{A}$  and guaranteed by design over the specified range of  $I_C$ .

<sup>6</sup> Guaranteed by design.

<sup>7</sup>  $I_{CC}$  and  $I_{CES}$  are verified by the measurement of  $I_{CBO}$ .

## ABSOLUTE MAXIMUM RATINGS

Table 2.

| Parameter                                                            | Rating          |
|----------------------------------------------------------------------|-----------------|
| Breakdown Voltage of<br>Collector-to-Base Voltage ( $BV_{CBO}$ )     | 40 V            |
| Breakdown Voltage of<br>Collector-to-Emitter Voltage ( $BV_{CEO}$ )  | 40 V            |
| Breakdown Voltage of<br>Collector-to-Collector Voltage ( $BV_{CC}$ ) | 40 V            |
| Breakdown Voltage of<br>Emitter-to-Emitter Voltage ( $BV_{EE}$ )     | 40 V            |
| Collector Current ( $I_C$ )                                          | 20 mA           |
| Emitter Current ( $I_E$ )                                            | 20 mA           |
| Storage Temperature Range                                            | –65°C to +150°C |
| Operating Temperature Range                                          | –40°C to +85°C  |
| Junction Temperature Range                                           | –65°C to +150°C |
| Lead Temperature (Soldering, 60 sec)                                 | 300°C           |

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## THERMAL RESISTANCE

$\theta_{JA}$  is specified for the worst-case conditions, that is, a device soldered in a circuit board for surface-mount packages.

Table 3. Thermal Resistance

| Package Type | $\theta_{JA}$ | $\theta_{JC}$ | Unit |
|--------------|---------------|---------------|------|
| 6-Lead TO-78 | 150           | 45            | °C/W |

## ESD CAUTION

### ESD (electrostatic discharge) sensitive device.

Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

## TYPICAL PERFORMANCE CHARACTERISTICS

$T_A = 25^\circ\text{C}$ ,  $V_{CE} = 5\text{ V}$ , unless otherwise specified.

## APPLICATIONS INFORMATION

### FAST LOGARITHMIC AMPLIFIER

The circuit of Figure 16 is a modification of a standard logarithmic amplifier configuration. Running the [MAT12](#) at 2.5 mA per side (full scale) allows for a fast response with a wide dynamic range. The circuit has a seven decade current range and a five decade voltage range, and it is capable of 2.5  $\mu$ s settling time to 1% with a 1 V to 10 V step. The output follows the equation:

$$V_O = \frac{R_3 + R_2}{R_2} \frac{kT}{q} \ln \frac{V_{REF}}{V_{IN}}$$

To compensate for the temperature dependence of the  $kT/q$  term, a resistor with a positive 0.35%/°C temperature coefficient is selected for  $R_2$ . The output is inverted with respect to the input and is nominally  $-1$  V/decade using the component values indicated.

Figure 16. Fast Logarithmic Amplifier

## LOG CONFORMANCE TESTING

The log conformance of the **MAT12** is tested using the circuit shown in Figure 18. The circuit employs a dual transdiode logarithmic converter operating at a fixed ratio of collector currents that are swept over a 10:1 range. The output of each transdiode converter is the  $V_{BE}$  of the transistor plus an error term, which is the product of the collector current and  $r_{BE}$ , the bulk emitter resistance. The difference of the  $V_{BE}$  is amplified at a gain of  $\times 100$  by the **AMP02** instrumentation amplifier. The differential emitter base voltage ( $\Delta V_{BE}$ ) consists of a temperature-dependent dc level plus an ac error voltage, which is the deviation from true log conformity as the collector currents vary.

The output of the transdiode logarithmic converter comes from the following idealized intrinsic transistor equation (for silicon)

$$V_{BE} = \frac{kT}{q} \ln \frac{I_C}{I_S} \quad (1)$$

where:

$k$  is Boltzmann's constant ( $1.38062 \times 10^{-23}$  J/K).

$q$  is the unit electron charge ( $1.60219 \times 10^{-19}$  C).

$T$  is the absolute temperature,  $K$  ( $= ^\circ C + 273.2$ ).

$I_S$  is the extrapolated current for  $V_{BE} \rightarrow 0$  ( $V_{BE}$  tending to zero).

$I_C$  is the collector current.

An error term must be added to Equation 1 to allow for the bulk resistance ( $r_{BE}$ ) of the transistor. Error due to the op amp input current is limited by use of the **AD8512** dual op amp. The resulting **AMP02** input is:

$$\Delta V_{BE} = \frac{kT}{q} = \ln \frac{I_{C1}}{I_{C2}} + I_{C1} r_{BE1} - I_{C2} r_{BE2} \quad (2)$$

A ramp function that sweeps from 1 V to 10 V is converted by the op amps to a collector current ramp through each transistor.

Because  $I_{C1}$  is made equal to 10  $I_{C2}$ , and assuming  $T_A = 25^\circ C$ , Equation 2 becomes

$$\Delta V_{BE} = 59 \text{ mV} + 0.9 I_{C1} r_{BE} (\Delta r_{BE} \sim 0)$$

As viewed on an oscilloscope, the change in  $\Delta V_{BE}$  for a 10:1 change in  $I_C$  is shown in Figure 17.

Figure 17. Emitter Base, Log Conformity

With the oscilloscope ac-coupled, the temperature dependent term becomes a dc offset and the trace represents the deviation from true log conformity. The bulk resistance can be calculated from the voltage deviation,  $\Delta V_O$ , and the change in collector current (9 mA):

$$r_{BE} = \frac{\Delta V_O}{9 \text{ mA}} \times \frac{1}{100} \quad (3)$$

This procedure solves for  $r_{BE}$  for Side A. Switching  $R_1$  and  $R_2$  provides the  $r_{BE}$  for Side B. Differential  $r_{BE}$  is found by making  $R_1 = R_2$ .

ORDERING GUIDE

| Model <sup>1</sup> | Temperature Range | Package Description                | Package Option |
|--------------------|-------------------|------------------------------------|----------------|
| MAT12AHZ           | −40°C to +85°C    | 6-Pin Metal Header Package [TO-78] | H-06           |

<sup>1</sup> Z = RoHS Compliant Part.

NOTES

**NOTES**

## Данный компонент на территории Российской Федерации

**Вы можете приобрести в компании MosChip.**

Для оперативного оформления запроса Вам необходимо перейти по данной ссылке:

<http://moschip.ru/get-element>

Вы можете разместить у нас заказ для любого Вашего проекта, будь то серийное производство или разработка единичного прибора.

В нашем ассортименте представлены ведущие мировые производители активных и пассивных электронных компонентов.

Нашей специализацией является поставка электронной компонентной базы двойного назначения, продукции таких производителей как XILINX, Intel (ex.ALTERA), Vicor, Microchip, Texas Instruments, Analog Devices, Mini-Circuits, Amphenol, Glenair.

Сотрудничество с глобальными дистрибьюторами электронных компонентов, предоставляет возможность заказывать и получать с международных складов практически любой перечень компонентов в оптимальные для Вас сроки.

На всех этапах разработки и производства наши партнеры могут получить квалифицированную поддержку опытных инженеров.

Система менеджмента качества компании отвечает требованиям в соответствии с ГОСТ Р ИСО 9001, ГОСТ РВ 0015-002 и ЭС РД 009
