

Rugged 20Mbps, 8 Channel Multi-Protocol Transceiver with Programmable DCE/DTE and Termination Resistors

FEATURES

- 20Mbps Differential Transmission Rates
- 15kV ESD Tolerance for Analog I/Os
- Internal Transceiver Termination Resistors for V.11/V.35
- Interface Modes:
 - RS-232 (V.28) – EIA-530 (V.10 & V.11)
 - X.21 (V.11) – EIA-530A (V.10 & V.11)
 - RS-449/V.36 – V.35
 - (V.10 & V.11)
- Software Selectable Protocols with 3-Bit Word
- Eight Drivers and Eight Receivers
- V.35/V.11 Receiver Termination Network Disable Option
- Internal Line or Digital Loopback Testing
- Adheres to NET1/NET2 and TBR-2 Requirements

Now Available in Lead Free Packaging

Refer to page 7 for pinout

- Easy Flow-Through Pinout
- +5V Only Operation
- Individual Driver/Receiver Enable/Disable Controls
- Operates in DTE or DCE Mode

APPLICATIONS

- Router
- Frame Relay
- CSU
- DSU
- PBX
- Secure Communication Terminals

DESCRIPTION

The SP508E is a monolithic device that supports eight (8) popular serial interface standards for Wide Area Network (WAN) connectivity. The SP508E is fabricated using a low power BiCMOS process technology, and incorporates an Exar regulated charge pump allowing +5V only operation. Exar's patented charge pump provides a regulated output of $\pm 5.8V$, which will provide enough voltage for compliant operation in all modes. Eight (8) drivers and eight (8) receivers can be configured via software for any of the above interface modes at any time. The SP508E requires no additional external components for compliant operation for all of the eight (8) modes of operation other than four capacitors used for the internal charge pump. All necessary termination is integrated within the SP508E and is switchable when V.35 drivers and V.35 receivers, or when V.11 receivers are used. The SP508E provides the controls and transceiver availability for operating as either a DTE or DCE.

Additional features with the SP508E include internal loopback that can be initiated in any of the operating modes by use of the LOOPBACK pin. While in loopback mode, receiver outputs are internally connected to driver inputs creating an internal signal path bypassing the serial communications controller for diagnostic testing. The SP508E also includes a latch enable pin with the driver and receiver address decoder. The internal V.11 or V.35 receiver termination can be switched off using a control pin (TERM_OFF) for monitoring applications. All eight (8) drivers and receivers in the SP508E include separate enable pins for added convenience. The SP508E is ideal for WAN serial ports in networking equipment such as routers, access concentrators, network muxes, DSU/CSU's, networking test equipment, and other access devices.

Applicable U.S. Patents-5,306,954; and others patents pending

ABSOLUTE MAXIMUM RATINGS

These are stress ratings only and functional operation of the device at these ratings or any other above those indicated in the operation sections of the specifications below is not implied. Exposure to absolute maximum rating conditions for extended periods of time may affect reliability.

V_{CC}+7V

Input Voltages:

Logic -0.3V to (V_{CC}+0.5V)

Drivers..... -0.3V to (V_{CC}+0.5V)

Receivers.....±15.5V

Output Voltages:

Logic -0.3V to (V_{CC}+0.5V)

Drivers-7.5V to +12.5V

Receivers -0.3V to (V_{CC}+0.5V)

Storage Temperature.....-65°C to +150°C

Power Dissipation..... 1520mW

(derate 19.0mW/°C above +70°C)

Package Derating:

θ_{JA}52.7 °C/W

θ_{JC}6.5 °C/W

STORAGE CONSIDERATIONS

Due to the relatively large package size, storage in a low humidity environment is preferred. Large high density plastic packages are moisture sensitive and should be stored in Dry Vapor Barrier Bags. Prior to usage, the parts should remain bagged and stored below 40°C and 60%RH. If the parts are removed from the bag, they should be used within 48 hours or stored in an environment at or below 20%RH. If the above conditions cannot be followed, the parts should be baked for four hours at 125°C in order to remove moisture prior to soldering. Exar ships the 100-pin LQFP in Dry Vapor Barrier Bags with a humidity indicator card and desiccant pack. The humidity indicator should be below 30%RH.

ELECTRICAL SPECIFICATIONS

T_A = -40°C to +85°C and V_{CC} = +4.75V to +5.25V unless otherwise noted. Typical values are for T_A = 25°C and V_{CC} = 5V.

Figure 45. Functional Diagram

The SP508E contains highly integrated serial transceivers that offer programmability between interface modes through software control. The SP508E offers the hardware interface modes for RS-232 (V.28), RS-449/V.36 (V.11 and V.10), EIA-530 (V.11 and V.10), EIA-530A (V.11 and V.10), V.35 (V.35 and V.28) and X.21 (V.11). The interface mode selection is done via three control pins, which can be latched via microprocessor control.

The SP508E has eight drivers, eight receivers, and Exar's patented on-board charge pump (5,306,954) that is ideally suited for wide area network connectivity and other multi-protocol applications. Other features include digital and line loopback modes, individual enable/disable control lines for each driver and receiver, fail-safe when inputs are either open or shorted, individual termination resistor ground paths, separate driver and receiver ground outputs, enhanced ESD protection on driver outputs and receiver inputs.

THEORY OF OPERATION

The SP508E device is made up of 1) the drivers, 2) the receivers, 3) a charge pump, 4) DTE/DCE switching algorithm, and 5) control logic.

Drivers

The SP508E has eight enhanced independent drivers. Control for the mode selection is done via a three-bit control word into D0, D1, and D2. The drivers are prearranged such that for each mode of operation, the relative position and functionality of the drivers are set up to accommodate the selected interface mode. As the mode of the drivers is changed, the electrical characteristics will change to support the required signal levels. The mode of each driver in the different interface modes that can be selected is shown in Table 1.

There are four basic types of driver circuits – ITU-T-V.28 (RS-232), ITU-T-V.10 (RS-423), ITU-T-V.11 (RS-422), and CCITT-V.35.

The V.28 (RS-232) drivers output single-ended signals with a minimum of $\pm 5V$ (with $3k\Omega$ & $2500pF$ loading), and can operate over 120kbps. Since the SP508E uses a charge pump to generate the RS-232 output rails, the driver outputs will never exceed $\pm 10V$. The V.28 driver architecture is similar to Exar's standard line of RS-232 transceivers.

The RS-423 (V.10) drivers are also single-ended signals which produce open circuit V_{OL} and V_{OH} measurements of $\pm 4.0V$ to $\pm 6.0V$. When terminated with a 450Ω load to ground, the driver output will not deviate more than 10% of the open circuit value. This is in compliance of the ITU V.10 specification. The V.10 (RS-423) drivers are used in RS-449/V.36, EIA-530, and EIA-530A modes as Category II signals from each of their corresponding specifications. The V.10 drivers are guaranteed to transmit over 120kbps, but can operate at over 1Mbps if necessary.

The third type of drivers are V.11 (RS-422) differential drivers. Due to the nature of differential signaling, the drivers are more immune to noise as opposed to single-ended transmission methods. The advantage is evident over high speeds and long transmission lines. The strength of the driver outputs can produce differential signals that can maintain $\pm 2V$ differential output levels with a load of 100Ω . The signal levels and drive capability of these drivers allow the drivers to also support RS-485 requirements of $\pm 1.5V$ differential output levels with a 54Ω load. The strength allows the SP508E differential driver to drive over long cable lengths with minimal signal degradation. The V.11 drivers are used in RS-449, EIA-530, EIA-530A and V.36 modes as Category I signals which are used for clock and data. Exar's new driver design over its predecessors allow the SP508E to operate over 20Mbps for differential transmission.

The fourth type of drivers are V.35 differential drivers. There are only three available on the SP508E for data and clock (Tx_D, Tx_{CE}, and Tx_C in DCE mode). These drivers are current sources that drive loop current through a differential pair resulting in a 550mV differential voltage at the receiver. These drivers also incorporate fixed termination networks for each driver in order to set the V_{OH} and V_{OL} depending on load conditions. This termination network is basically a “Y” configuration consisting of two 51Ω resistors connected in series and a 124Ω resistor connected between the two 50Ω resistors and a V35TGND output. Each of the three drivers and its associated termination will have its own V35TGND output for grounding convenience. Filtering can be done on these pins to reduce common mode noise transmitted over the transmission line by connecting a capacitor to ground.

The drivers also have separate enable pins which simplifies half-duplex configurations for some applications, especially program-mable DTE/DCE. The enable pins will either enable or disable the output of the drivers according to the appropriate active logic illustrated on Figure 45. The enable pins have internal pull-up and pull-down devices, depending on the active polarity of the receiver, that enable the driver upon power-on if the enable lines are left floating. During disabled conditions, the driver outputs will be at a high impedance 3-state.

The driver inputs are both TTL and CMOS compatible. All driver inputs have an internal pull-up resistor so that the output will be at a defined state at logic LOW (“0”). Unused driver inputs can be left floating. The internal pull-up resistor value is approximately 500kΩ.

Receivers

The SP508E has eight enhanced independent receivers. Control for the mode selection is done via a three-bit control word that is the same as the driver control word. Therefore, the modes for the drivers and receivers are identical in the application.

Like the drivers, the receivers are prear-

ranged for the specific requirements of the synchronous serial interface. As the operating mode of the receivers is changed, the electrical characteristics will change to support the required serial interface protocols of the receivers. Table 2 shows the mode of each receiver in the different interface modes that can be selected. There are two basic types of receiver circuits—ITU-T-V.28 (RS-232) and ITU-T-V.11, (RS-422).

The RS-232 (V.28) receiver is single-ended and accepts RS-232 signals from the RS-232 driver. The RS-232 receiver has an operating input voltage range of $\pm 15V$ and can receive signals down to $\pm 3V$. The input sensitivity complies with RS-232 and V.28 at $\pm 3V$. The input impedance is 3kΩ to 7kΩ in accordance to RS-232 and V.28. The receiver output produces a TTL/CMOS signal with a +2.4V minimum for a logic “1” and a +0.4V maximum for a logic “0”. The RS-232 (V.28) protocol uses these receivers for all data, clock and control signals. They are also used in V.35 mode for control line signals: CTS, DSR, LL, and RL. The RS-232 receivers can operate over 120kbps.

The second type of receiver is a differential type that can be configured internally to support ITU-T-V.10 and CCITT-V.35 depending on its input conditions. This receiver has a typical input impedance of 10kΩ and a differential threshold of less than $\pm 200mV$, which complies with the ITU-T-V.11 (RS-422) specifications. V.11 receivers are used in RS-449/V.36, EIA-530, EIA-530A and X.21 as Category I signals for receiving clock, data, and some control line signals not covered by Category II V.10 circuits. The differential V.11 transceiver has improved architecture that allows over 20Mbps transmission rates.

Receivers dedicated for data and clock (Rx_D, Rx_C, Tx_C) incorporate internal termination for V.11. The termination resistor is typically 120Ω connected between the A and B inputs. The termination is essential for minimizing crosstalk and signal reflection over the transmission line. The minimum value is guaranteed to exceed 100Ω, thus complying with the V.11 and RS-422 specifications.

This resistor is invoked when the receiver is operating as a V.11 receiver, in modes EIA-530, EIA-530A, RS-449/V.36, and X.21. The same receivers also incorporate a termination network internally for V.35 applications. For V.35, the receiver input termination is a “Y” termination consisting of two 51Ω resistors connected in series and a 124Ω resistor connected between the two 50Ω resistors and V35RGND output. The V35RGND is usually grounded. The receiver itself is identical to the V.11 receiver.

The differential receivers can be configured to be ITU-T-V.10 single-ended receivers by internally connecting the non-inverting input to ground. This is internally done by default from the decoder. The non-inverting input is rerouted to V10GND and can be grounded separately. The ITU-T-V.10 receivers can operate over 1Mbps and are used in RS-449/V.36, E1A-530, E1A-530A and X.21 modes as Category II signals as indicated by their corresponding specifications. All receivers include an enable/disable line for disabling the receiver output allowing convenient half-duplex configurations. The enable pins will either enable or disable the output of the receivers according to the appropriate active logic illustrated on Figure 45. The receiver’s enable lines include an internal pull-up or pull-down device, depending on the active polarity of the receiver, that enables the receiver upon power up if the enable lines are left floating. During disabled conditions, the receiver outputs will be at a high impedance state. If the receiver is disabled any associated termination is also disconnected from the inputs.

All receivers include a fail-safe feature that outputs a logic high when the receiver inputs are open, terminated but open, or shorted together. For single-ended V.28 and V.10 receivers, there are internal 5kΩ pull-down resistors on the inputs which produces a logic high (“1”) at the receiver outputs. The differential receivers have a proprietary circuit that detect open or shorted inputs and if so, will produce a logic HIGH (“1”) at the receiver output.

CHARGE PUMP

The charge pump is a Exar-patented design (5,306,954) and uses a unique approach compared to older less-efficient designs. The charge pump still requires four external capacitors, but uses four-phase voltage shifting technique to attain symmetrical power supplies. The charge pump V_{DD} and V_{SS} outputs are regulated to +5.8V and -5.8V, respectively. There is a free-running oscillator that controls the four phases of the voltage shifting. A description of each phase follows.

Phase 1

V_{SS} charge storage —During this phase of the clock cycle, the positive side of capacitors C_1 and C_2 are initially charged to V_{CC} . C_1 is then switched to ground and the charge in C_1 is transferred to C_2 . Since C_2 is connected to V_{CC} , the voltage potential across capacitor C_2 is now $2 \times V_{CC}$.

Phase 2

V_{SS} transfer —Phase two of the clock connects the negative terminal of C_2 to the V_{SS} storage capacitor and the positive terminal of C_2 to ground, and transfers the negative generated voltage to C_3 . This generated voltage is regulated to -5.8V. Simultaneously, the positive side of the capacitor C_1 is switched to V_{CC} and the negative side is connected to ground.

Phase 3

V_{DD} charge storage —The third phase of the clock is identical to the first phase—the charge transferred in C_1 produces $-V_{CC}$ in the negative terminal of C_1 which is applied to the negative side of the capacitor C_2 . Since C_2 is at V_{CC} , the voltage potential across C_2 is $2 \times V_{CC}$.

Phase 4

V_{DD} transfer —The fourth phase of the clock connects the negative terminal of C_2 to ground, and transfers the generated 5.8V across C_2 to C_4 , the V_{DD} storage capacitor. This voltage is regulated to +5.8V. At the regulated voltage, the internal oscillator is disabled and simultaneously with this, the positive side of capacitor C_1 is switched to V_{CC} and the negative side is connected to ground, and the cycle begins again.

The charge pump cycle will continue as long as the operational conditions for the internal oscillator are present.

Since both V^+ and V^- are separately generated from V_{CC} ; in a no-load condition V^+ and V^- will be symmetrical. Older charge pump approaches that generate V^- from V^+ will show a decrease in the magnitude of V^- compared to V^+ due to the inherent inefficiencies in the design.

The clock rate for the charge pump typically operates at 250kHz. The external capacitors can be as low as 1 μ F with a 16V breakdown voltage rating.

TERM_OFF FUNCTION

The SP508E contains a TERM_OFF pin that disables all three receiver input termination networks regardless of mode. This allows the device to be used in monitor mode applications that are typically found in networking test equipment. The TERM_OFF pin internally contains a pull-down device with an impedance of over 500k Ω , which will default in a "ON" condition during power-up if V.35 receivers are used. The individual receiver enable line and the SHUTDOWN mode from the decoder will disable the termination regardless of TERM_OFF.

LOOPBACK FUNCTION

The SP508E contains a LOOPBACK pin that invokes a loopback path. This loopback path is illustrated in Figure 46. LOOPBACK has an internal pull-up resistor that defaults to normal mode during power up or if the pin is left floating. During loopback, the driver output and receiver input characteristics will still adhere to its appropriate specifications.

DECODER AND D_LATCH FUNCTION

The SP508E contains a D_LATCH pin that latches the data into the D0, D1, and D2 decoder inputs. If tied to a logic LOW ("0"), the latch is transparent, allowing the data at the decoder inputs to propagate through and program the SP508E accordingly. If tied to a logic HIGH("1"), the latch locks out the data and prevents the mode from changing until this pin is brought to a logic LOW.

There are internal pull-up devices on D0, D1, and D2, which allow the device to be in SHUTDOWN mode ("111") upon power up. However, if the device is powered -up with the D_LATCH at a logic HIGH, the decoder state of the SP508E will be undefined.

ESD TOLERANCE

The SP508E device incorporates ruggedized ESD cells on all driver output and receiver input pins. The ESD structure is improved over our previous family for more rugged applications and environments sensitive to electrostatic discharges and associated transients.

CTR1/CTR2 EUROPEAN COMPLIANCY

As with all of Exar's previous multi-protocol serial transceiver IC's, the drivers and receivers have been designed to meet all the requirements to NET1/NET2 and TBR2 in order to meet CTR1/CTR2 compliancy. The SP508E is also tested in-house at Exar and adheres to all the NET1/2 physical layer testing and the ITU Series V specifications before shipment. Please note that although the SP508E, as with its predecessors, adhere to CTR1/CTR2 compliancy testing, any complex or unusual configuration should be double-checked to ensure CTR1/CTR2 compliance. Consult the factory for details.

Spine drivers and receivers may be used for optional signals (Signal Quality, Rate Detect, Standby) or may be disabled using individual enable pins for each driver and receiver

Recommended Signals and Port Pin Assignments

RS-232 or V24		EIA-530		RS-449		V3.5		X.21		AppleTalk™	
Signal Type	Mnemonic	D-25 Pin/IDB	Signal Type	Mnemonic	D-25 Pin/IDB	Signal Type	Mnemonic	Signal Type	Mnemonic	Signal Type	Mnemonic
V28 BA	2	V11 BA(A)	2	V11 BA(B)	4	V35 BA	103	V11 BA	103	V11 BA	103
V28 DA	24	V11 DA(A)	24	V11 DA(B)	17	V35 DA	113	V11 DA	113	V11 DA	113
V28 CA	4	V11 CA(A)	4	V11 CA(B)	7	V28 CA	105	V11 CA	105	V11 CA	105
V28 CD	20	V11 CD(A)	20	V11 CD(B)	23	V28 CD	108	V11 CD	108	V11 CD	108
V28 RL	21	V10 RL	21	V10 RL	14	V28 RL	140	V10 RL	140	V10 RL	140
V28 LL	18	V10 LL	18	V10 LL	10	V28 LL	141	V10 LL	141	V10 LL	141
V28 BB	3	V11 BB(A)	3	V11 BB(B)	6	V35 BB	104	V11 BB	104	V11 BB	104
V28 DD	17	V11 DD(A)	17	V11 DD(B)	8	V35 DD	115	V11 DD	115	V11 DD	115
V28 DB	15	V11 DB(A)	15	V11 DB(B)	5	V35 DB	114	V11 DB	114	V11 DB	114
V28 CB	5	V11 CB(A)	5	V11 CB(B)	2	V28 CB	106	V11 CB	106	V11 CB	106
V28 CC	6	V11 CC(A)	6	V11 CC(B)	11	V28 CC	107	V11 CC	107	V11 CC	107
V28 CF	8	V11 CF(A)	8	V11 CF(B)	13	V28 CF	109	V11 CF	109	V11 CF	109
V28 CE	22	V10 CE	22	V10 CE	31	V28 CE	125	V10 CE	125	V10 CE	125
V28 TM	25	V10 TM	25	V10 TM	18	V28 TM	142	V10 TM	142	V10 TM	142

Pin assignments and signal functions are subject to national or regional variation and proprietary / non-standard implementations
 * EIA-530 uses V11 (Differential) for DSR (CC) and DTR (CD) signals; EIA-530-A uses single-ended V10 for DSR and DTR and adds RI signal on pin 22

** X.21 uses either B0 or X0, not both

ORDERING INFORMATION

Part Number	Top Mark	Temperature Range	Package Types
SP508ECF-L	SP508ECFYWW.....	0°C to +70°C	100 Lead LQFP
SP508EEF-L	SP508EEFYWW.....	-40°C to +85°C	100 Lead LQFP

Данный компонент на территории Российской Федерации

Вы можете приобрести в компании MosChip.

Для оперативного оформления запроса Вам необходимо перейти по данной ссылке:

<http://moschip.ru/get-element>

Вы можете разместить у нас заказ для любого Вашего проекта, будь то серийное производство или разработка единичного прибора.

В нашем ассортименте представлены ведущие мировые производители активных и пассивных электронных компонентов.

Нашей специализацией является поставка электронной компонентной базы двойного назначения, продукции таких производителей как XILINX, Intel (ex.ALTERA), Vicor, Microchip, Texas Instruments, Analog Devices, Mini-Circuits, Amphenol, Glenair.

Сотрудничество с глобальными дистрибьюторами электронных компонентов, предоставляет возможность заказывать и получать с международных складов практически любой перечень компонентов в оптимальные для Вас сроки.

На всех этапах разработки и производства наши партнеры могут получить квалифицированную поддержку опытных инженеров.

Система менеджмента качества компании отвечает требованиям в соответствии с ГОСТ Р ИСО 9001, ГОСТ РВ 0015-002 и ЭС РД 009
