**36Mb SYNCHRONOUS FLOW-THROUGH**  
**STATIC RAM**

APRIL 2008

**FEATURES**

- Internal self-timed write cycle
- Individual Byte Write Control and Global Write
- Clock controlled, registered address, data and control
- Burst sequence control using MODE input
- Three chip enable option for simple depth expansion and address pipelining
- Common data inputs and data outputs
- Auto Power-down during deselect
- Single cycle deselect
- Snooze MODE for reduced-power standby
- Power Supply  
 LF:  $V_{DD} 3.3V \pm 5\%$ ,  $V_{DDQ} 3.3V/2.5V \pm 5\%$   
 VF:  $V_{DD} 2.5V \pm 5\%$ ,  $V_{DDQ} 2.5V \pm 5\%$
- JEDEC 100-Pin TQFP and 165-pin PBGA packages.
- Lead-free available

**DESCRIPTION**

The *ISSI* IS61LF/VF102436A and IS61LF/VF204818A are high-speed, low-power synchronous static RAMs designed to provide burstable, high-performance memory for communication and networking applications. The IS61LF/VF102436A is organized as 1,048,476 words by 36 bits. The IS61LF/VF204818A is organized as 2M-words by 18 bits. Fabricated with *ISSI*'s advanced CMOS technology, the device integrates a 2-bit burst counter, high-speed SRAM core, and high-drive capability outputs into a single monolithic circuit. All synchronous inputs pass through registers controlled by a positive-edge-triggered single clock input.

Write cycles are internally self-timed and are initiated by the rising edge of the clock input. Write cycles can be one to four bytes wide as controlled by the write control inputs.

Separate byte enables allow individual bytes to be written. Byte write operation is performed by using byte write enable ( $\overline{BWE}$ ) input combined with one or more individual byte write signals ( $\overline{BWx}$ ). In addition, Global Write ( $\overline{GW}$ ) is available for writing all bytes at one time, regardless of the byte write controls.

Bursts can be initiated with either  $\overline{ADSP}$  (Address Status Processor) or  $\overline{ADSC}$  (Address Status Cache Controller) input pins. Subsequent burst addresses can be generated internally and controlled by the  $\overline{ADV}$  (burst address advance) input pin.

The mode pin is used to select the burst sequence order, Linear burst is achieved when this pin is tied LOW. Interleave burst is achieved when this pin is tied HIGH or left floating.

NOTE:

1. X means "Don't Care." H means logic HIGH. L means logic LOW.
2. For  $\overline{WRITE}$ , L means one or more byte write enable signals ( $\overline{BWA-h}$ ) and  $\overline{BWE}$  are LOW or  $\overline{GW}$  is LOW.  $\overline{WRITE} = H$  for all  $\overline{BWx}$ ,  $\overline{BWE}$ ,  $\overline{GW}$  HIGH.
3.  $\overline{BWA}$  enables WRITES to DQa's and DQP<sub>a</sub>.  $\overline{BWB}$  enables WRITES to DQb's and DQP<sub>b</sub>.  $\overline{BWC}$  enables WRITES to DQc's and DQP<sub>c</sub>.  $\overline{BWD}$  enables WRITES to DQd's and DQP<sub>d</sub>.  $\overline{BWE}$  enables WRITES to DQe's and DQP<sub>e</sub>.  $\overline{BWF}$  enables WRITES to DQf's and DQP<sub>f</sub>.  $\overline{BWG}$  enables WRITES to DQg's and DQP<sub>g</sub>.  $\overline{BWH}$  enables WRITES to DQh's and DQP<sub>h</sub>. DQP<sub>a</sub>-DQP<sub>h</sub> are available on the x72 version. DQP<sub>a</sub> and DQP<sub>b</sub> are available on the x18 version. DQP<sub>a</sub>-DQP<sub>d</sub> are available on the x36 version.
4. All inputs except  $\overline{OE}$  and ZZ must meet setup and hold times around the rising edge (LOW to HIGH) of CLK.
5. Wait states are inserted by suspending burst.
6. For a WRITE operation following a READ operation,  $\overline{OE}$  must be HIGH before the input data setup time and held HIGH during the input data hold time.
7. This device contains circuitry that will ensure the outputs will be in High-Z during power-up.
8.  $\overline{ADSP}$  LOW always initiates an internal READ at the L-H edge of CLK. A WRITE is performed by setting one or more byte write enable signals and  $\overline{BWE}$  LOW or  $\overline{GW}$  LOW for the subsequent L-H edge of CLK. See WRITE timing diagram for clarification.

V <sub>DD</sub>	Voltage on V <sub>DD</sub> Supply Relative to V <sub>SS</sub>	-0.5 to 4.6	V

**Notes:**

1. Stress greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.
2. This device contains circuitry to protect the inputs against damage due to high static voltages or electric fields; however, precautions may be taken to avoid application of any voltage higher than maximum rated voltages to this high-impedance circuit.
3. This device contains circuitry that will ensure the output devices are in High-Z at power up.

### Вы можете приобрести в компании MosChip.

Для оперативного оформления запроса Вам необходимо перейти по данной ссылке:

<http://moschip.ru/get-element>

Вы можете разместить у нас заказ для любого Вашего проекта, будь то серийное производство или разработка единичного прибора.

В нашем ассортименте представлены ведущие мировые производители активных и пассивных электронных компонентов.

Нашей специализацией является поставка электронной компонентной базы двойного назначения, продукции таких производителей как XILINX, Intel (ex.ALTERA), Vicor, Microchip, Texas Instruments, Analog Devices, Mini-Circuits, Amphenol, Glenair.

Сотрудничество с глобальными дистрибьюторами электронных компонентов, предоставляет возможность заказывать и получать с международных складов практически любой перечень компонентов в оптимальные для Вас сроки.

На всех этапах разработки и производства наши партнеры могут получить квалифицированную поддержку опытных инженеров.

Система менеджмента качества компании отвечает требованиям в соответствии с ГОСТ Р ИСО 9001, ГОСТ РВ 0015-002 и ЭС РД 009
