

KAF-6303

3072 (H) x 2048 (V) Full Frame CCD Image Sensor

Description

The KAF-6303 Image Sensor is a high performance CCD (charge-coupled device) with 3072 (H) x 2048 (V) photo active pixels designed for a wide range of image sensing applications.

The sensor incorporates true two-phase CCD technology, simplifying the support circuits required to drive the sensor as well as reducing dark current without compromising charge capacity. The sensor also utilizes the TRUESENSE Transparent Gate Electrode to improve sensitivity compared to the use of a standard front side illuminated polysilicon electrode.

Table 1. GENERAL SPECIFICATIONS

| Parameter | Typical Value |
|---|---|
| Architecture | Full Frame CCD |
| Total Number of Pixels | 3088 (H) x 2056 (V) |
| Number of Active Pixels | 3072 (H) x 2048 (V) = approx. 6.3 Mp |
| Pixel Size | 9 μm (H) x 9 μm (V) |
| Active Image Size | 27.65 mm (H) x 18.48 mm (V) 33.4 mm (Diagonal) APS-H Optical Format |
| Chip Size | 29.0 mm (H) x 19.1 mm (V) |
| Saturation Signal | 100,000 e^- |
| Output Sensitivity | 10 $\mu\text{V}/e^-$ |
| Quantum Efficiency (450, 550, 650 nm) | 40%, 52%, 65% |
| Readout Noise (10 MHz) | 15 e^- rms |
| Dark Current (Accumulation Mode) | < 10 pA/cm ² |
| Dark Current Doubling Rate | 6°C |
| Dynamic Range (Saturation Signal/Dark Noise) | 76 dB |
| Maximum Data Rate | 10 MHz |
| Package | CERDIP Package (Sidebrazed) |
| Cover Glass | Clear or AR Coated, 2 Sides |

NOTE: Parameters above are specified at T = 25°C unless otherwise noted.

DEVICE DESCRIPTION

Architecture

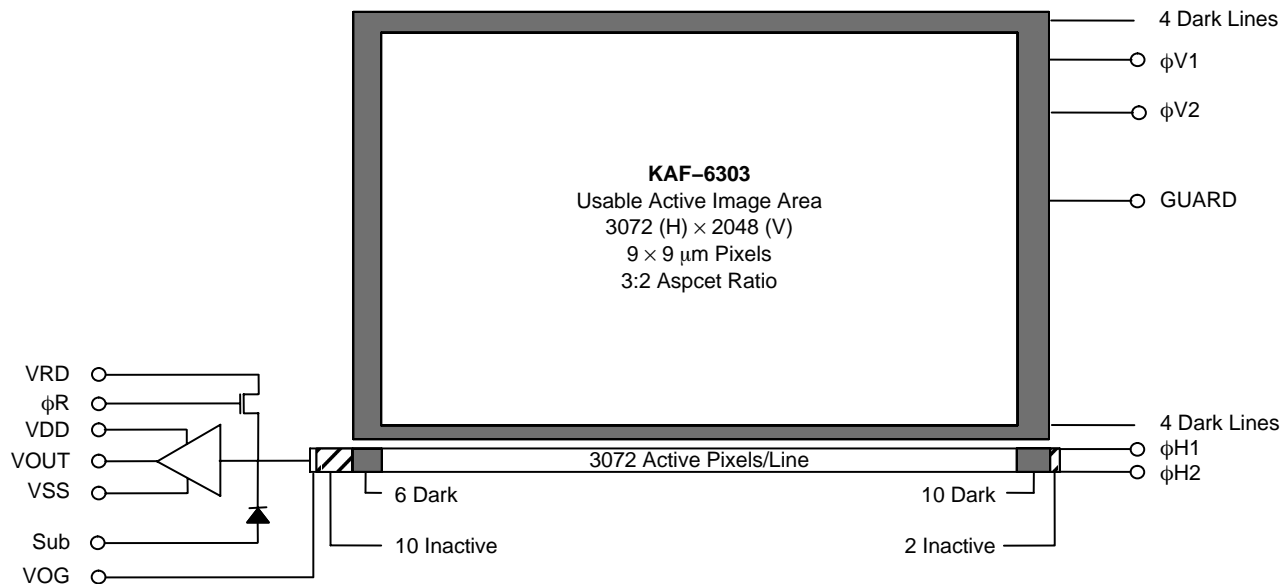

Figure 2. Block Diagram

The sensor consists of 3,088 parallel (vertical) CCD shift registers each 2,056 elements long. These registers act as both the photosensitive elements and as the transport circuits that allow the image to be sequentially read out of the sensor. The elements of these registers are arranged into a $3,072 \times 2,048$ photosensitive array surrounded by a light shielded dark reference of 16 columns and 8 rows. The parallel (vertical) CCD registers transfer the image one line at a time into a single 3,100 element (horizontal) CCD shift register. The horizontal register transfers the charge to a single output amplifier. The output amplifier is a two-stage source follower that converts the photo-generated charge to a voltage for each pixel.

Dark Reference Pixels

Surrounding the peripheral of the device is a border of light shielded pixels. This includes 6 leading and 10 trailing pixels on every line excluding dummy pixels. There are also 4 full dark lines at the start of every frame and 4 full dark lines at the end of each frame. Under normal circumstances, these pixels do not respond to light. However, dark reference pixels in close proximity to an active pixel, or the outer bounds of the chip (including the first two lines out), can scavenge signal depending on light intensity and wavelength and therefore will not represent the true dark signal.

Dummy Pixels

Within the horizontal shift register are 10 leading and 2 trailing additional shift phases that are not associated with a column of pixels from the vertical register. These pixels

contain only horizontal shift register dark current signal and do not respond to light. A few leading dummy pixels may scavenge false signal depending on operating conditions.

Image Acquisition

An electronic representation of an image is formed when incident photons falling on the sensor plane create electron-hole pairs within the sensor. These photon-induced electrons are collected locally by the formation of potential wells at each photogate or pixel site. The number of electrons collected is linearly dependent on light level and exposure time and non-linearly dependent on wavelength. When the pixel's capacity is reached, excess electrons will leak into the adjacent pixels within the same column. This is termed blooming. During the integration period, the $\phi V1$ and $\phi V2$ register clocks are held at a constant (low) level. See Figure 8.

Charge Transport

Referring again to Figure 8, the integrated charge from each photogate is transported to the output using a two-step process. Each line (row) of charge is first transported from the vertical CCD's to the horizontal CCD register using the $\phi V1$ and $\phi V2$ register clocks. The horizontal CCD is presented a new line on the falling edge of $\phi V2$ while $\phi H1$ is held high. The horizontal CCD's then transport each line, pixel by pixel, to the output structure by alternately clocking the $\phi H1$ and $\phi H2$ pins in a complementary fashion. On each falling edge of $\phi H2$, a new charge packet is transferred onto a floating diffusion and sensed by the output amplifier.

Horizontal Register*Output Structure*

Charge presented to the floating diffusion (FD) is converted into a voltage and current amplified in order to drive off-chip loads. The resulting voltage change seen at the output is linearly related to the amount of charge placed on FD. Once the signal has been sampled by the system

electronics, the reset gate (ϕ_R) is clocked to remove the signal and FD is reset to the potential applied by VRD. More signal at the floating diffusion reduces the voltage seen at the output pin. In order to activate the output structure, an off-chip load must be added to the VOUT pin of the device. See Figure 3.

NOTE: The KAF-1603 is mechanically the same and electrically identical to the KAF-0402 sensor. It is also mechanically the same as the KAF-0261 and KAF-3200 sensors. There are some electrical differences since the KAF-0261 has two outputs and two additional clock inputs. The KAF-3200 requires that pin 11 be a "No connect" and be electrically floating. Refer to their specifications for details.

1. For pixel binning applications, electron capacity up to 330,000 can be achieved with modified CCD inputs. Each sensor may have to be optimized individually for these applications. Some performance parameters may be compromised to achieve the largest signals.
2. Worst-case deviation from straight line fit, between 1% and 90% of V_{SAT} .
3. One Sigma deviation of a 128×128 sample when CCD illuminated uniformly.
4. Average of all pixels with no illumination at 25°C.
5. Average dark signal of any of 12×8 blocks within the sensor (each block is 128×128 pixels).
6. $20\text{Log}(N_{SAT} / n_{e^-})$ at nominal operating frequency and 25°C.
7. Video level offset with respect to ground.
8. Last output amplifier stage only. Assumes 10 pF off-chip load.
9. Output noise at 25°C, nominal operating frequency, and $t_{INT} = 0$.
10. A parameter that is measured on every sensor during production testing.
11. A parameter that is quantified during the design verification activity.

DEFECT DEFINITIONS

Table 6. SPECIFICATIONS (All tests performed at T = 25°C)

| Classification | Point Defect | | Cluster Defect | | Column Defect | |
|----------------|--------------|--------|----------------|--------|---------------|--------|
| | Total | Zone A | Total | Zone A | Total | Zone A |
| C2 | ≤ 90 | ≤ 45 | ≤ 36 | ≤ 18 | 0 | 0 |

Point Defects

Dark: A pixel which deviates by more than 6% from neighboring pixels when illuminated to 70% of saturation.

Bright: A pixel with a dark current greater than 10,000 e⁻/pixel/sec at 25°C.

Cluster Defect

A grouping of not more than 5 adjacent point defects.

Column Defect

A grouping of > 5 contiguous point defects along a single column.

A column containing a pixel with dark current > 30,000 e⁻/pix/sec at 25°C (Bright column).

A column that does not meet the CTE specification for all exposures less than the specified Max sat. signal level and greater than 2 ke⁻.

A column that loses > 250 e⁻ under 2 ke⁻ illumination.

Neighboring Pixels

The surrounding 128 × 128 pixels or ±64 columns/rows.

Defect Separation

Column and cluster defects are separated by no less than two (2) pixels in any direction (excluding single pixel defects).

Defect Region Exclusion

Defect region excludes the outer two (2) rows and columns at each side/end of the sensor.

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

1. Referenced to pin VSUB.
2. Includes pins: VRD, VDD, VSS, VOUT, GUARD.
3. Includes pins: $\phi V1$, $\phi V2$, $\phi H1$, $\phi H2$.
4. Includes pins: ϕR , VOG.
5. Voltage difference between overlapping gates. Includes: $\phi V1$ to $\phi V2$, $\phi H1$ to $\phi H2$, $\phi V2$ to $\phi H1$, $\phi H2$ to VOG.
6. Avoid shorting output pins to ground or any low impedance source during operation.
7. $T = 25^{\circ}\text{C}$. Excessive humidity will degrade MTTF.

1. 50% duty cycle values.
2. CTE may degrade above the nominal frequency.
3. Rise and fall times (10/90% levels) should be limited to 5–10% of clock period. Cross-over of register clocks should be between 40–60% of amplitude.
4. ϕR should be clocked continuously.
5. $t_{READOUT} = (2056 \cdot t_{LINE})$.
6. Integration time (t_{INT}) is user specified. Longer integration times will degrade noise performance.
7. $t_{LINE} = (3 \cdot t_{\phi V}) + t_{\phi HS} + 3100 + t_e$.
