## Stand-alone LIN Transceiver

### Description

The NCV7321 is a fully featured local interconnect network (LIN) transceiver designed to interface between a LIN protocol controller and the physical bus. The transceiver is implemented in I3T technology enabling both high-voltage analog circuitry and digital functionality to co-exist on the same chip.

The NCV7321 LIN device is a member of the in-vehicle networking (IVN) transceiver family. It is designed to work in harsh automotive environment and is qualified following the TS16949 flow.

The LIN bus is designed to communicate low rate data from control devices such as door locks, mirrors, car seats, and sunroofs at the lowest possible cost. The bus is designed to eliminate as much wiring as possible and is implemented using a single wire in each node. Each node has a slave MCU-state machine that recognizes and translates the instructions specific to that function. The main attraction of the LIN bus is that all the functions are not time critical and usually relate to passenger comfort.

### Features

- General
  - ◆ SOIC-8 Green package (Pb-Free)
- LIN-Bus Transceiver
  - ◆ LIN Compliant to Specification Revision 2.0 and 2.1 (Backwards Compatible to Version 1.3) and J2602
  - ◆ Bus Voltage  $\pm 45$  V
  - ◆ Transmission Rate 1 kbps to 20 kbps
- Protection
  - ◆ Thermal Shutdown
  - ◆ Indefinite Short-Circuit Protection on Pins LIN and WAKE Towards Supply and Ground
  - ◆ Load Dump Protection (45 V)
  - ◆ Bus Pins Protected Against Transients in an Automotive Environment
- EMI Compatibility
  - ◆ Integrated Slope Control
- Modes
  - ◆ Normal Mode: LIN Transceiver Enabled, Communication via the LIN Bus is Possible, INH Switch is On
  - ◆ Sleep Mode: LIN Transceiver Disabled, the Consumption from  $V_{BB}$  is Minimized, INH Switch is Off
  - ◆ Standby Mode: Transition Mode reached either after Power-up or after a Wake-up Event, INH Switch is on
  - ◆ Wake-up Bringing the Component from Sleep Mode into Standby Mode is Possible either by LIN Command or a Digital Signal on WAKE Pin (e.g. External Switch)
- These are Pb-Free Devices

### ORDERING INFORMATION

See detailed ordering and shipping information in the package dimensions section on page 11 of this data sheet.

KEY TECHNICAL CHARACTERISTICS AND OPERATING RANGES

Table 1. KEY TECHNICAL CHARACTERISTICS AND OPERATING RANGES

Symbol	Parameter	Min	Typ	Max	Unit
V <sub>BB</sub>	Nominal Battery Operating Voltage (Note 1)	5	12	27	V
	Load Dump Protection			45	
I <sub>BB_SLP</sub>	Supply Current in Sleep Mode			20	μA
V <sub>LIN</sub>	LIN Bus Voltage	-45		45	V
V <sub>WAKE</sub>	Operating DC Voltage on WAKE Pin	0		V <sub>BB</sub>	V
	Maximum Rating Voltage on WAKE Pin	-35		45	V
V <sub>INH</sub>	Operating DC Voltage on INH Pin	0		V <sub>BB</sub>	V
V <sub>Dig_IO</sub>	Operating DC Voltage on Digital IO Pins (EN, RxD, TxD)	0		5.5	V
T <sub>J</sub>	Junction Thermal Shutdown Temperature		165		°C
T <sub>amb</sub>	Operating Ambient Temperature	-40		+125	°C
V <sub>ESD</sub>	Electrostatic Discharge Voltage (all pins) Human Body Model (Note 2)	-4		+4	kV
	Version NCV7321D11; no filter on LIN	-13		+13	kV
	Electrostatic Discharge Voltage (LIN) System Human Body Model (Note 3)				

- Below 5 V on V<sub>BB</sub> in normal mode, the bus will either stay recessive or comply with the voltage level specifications and transition time specifications as required by SAE J2602. It is ensured by the battery monitoring circuit. Above 27 V on V<sub>BB</sub>, LIN communication is operational (LIN pin toggling) but parameters cannot be guaranteed. For higher battery voltage operation above 27 V, LIN pull-up resistor must be selected large enough to avoid clamping of LIN pin by voltage drop over external pull-up resistor and LIN pin min current limitation.
- Equivalent to discharging a 100 pF capacitor through a 1.5 kΩ resistor conform to MIL STD 883 method 3015.7.
- Equivalent to discharging a 150 pF capacitor through a 330 Ω resistor. System HBM levels are verified by an external test-house.

	Version NCV7321D11: HBM (LIN, INH, V <sub>BB</sub> , WAKE) (Note 6) System HBM (V <sub>BB</sub> , WAKE) (Note 8) System HBM (LIN) (Note 8)	-8 -7 -13		+8 +7 +13	kV kV kV

Stresses exceeding Maximum Ratings may damage the device. Maximum Ratings are stress ratings only. Functional operation above the Recommended Operating Conditions is not implied. Extended exposure to stresses above the Recommended Operating Conditions may affect device reliability.

4. Equivalent to discharging a 100 pF capacitor through a 1.5 kΩ resistor conform to MIL STD 883 method 3015.7.

5. Charged device model test according to ESD STM5.3.1-1999.

6. Equivalent to discharging a 100 pF capacitor through a 1.5 kΩ resistor referenced to GND.

7. Equivalent to discharging a 150 pF capacitor through a 330 Ω resistor. 220 nF filter on LIN pin. System HBM levels are verified by an external test-house.

8. Equivalent to discharging a 150 pF capacitor through a 330 Ω resistor. No filter on LIN pin. System HBM levels are verified by an external test-house.

FUNCTIONAL DESCRIPTION

Overall Functional Description

LIN is a serial communication protocol that efficiently supports the control of mechatronic nodes in distributed automotive applications. The domain is class-A multiplex buses with a single master node and a set of slave nodes.

The NCV7321 contains the LIN transmitter, LIN receiver, power-on-reset (POR) circuits and thermal shutdown (TSD). The LIN transmitter is optimized for the maximum specified transmission speed of 20 kB with EMC performance due to reduced slew rate of the LIN output.

The junction temperature is monitored via a thermal shutdown circuit that switches the LIN transmitter off when temperature exceeds the TSD trigger level.

The NCV7321 has four operating states (unpowered mode, standby mode, normal mode and sleep mode) that are determined by the supply voltage  $V_{BB}$ , input signals EN and WAKE and activity on the LIN bus.

OPERATING STATES

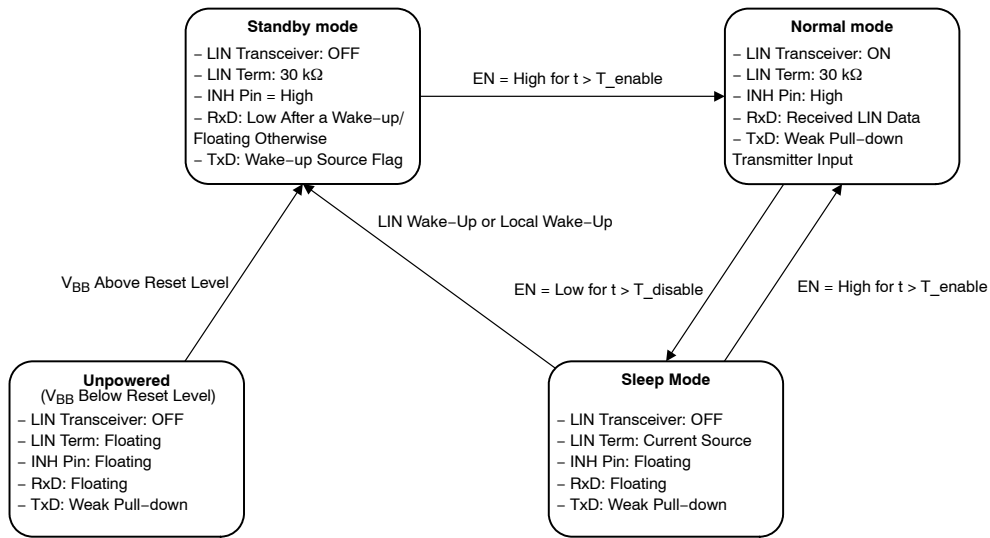

Figure 3. State Diagram

Unpowered Mode

As long as  $V_{BB}$  remains below its power-on-reset level, the chip is kept in a safe unpowered state. LIN transmitter is inactive, both LIN and INH pins are left floating and only a weak pull-down is connected on pin TxD. Pin RxD remains floating.

The unpowered state will be entered from any other state when  $V_{BB}$  falls below its power-on-reset level.

Standby Mode

Standby mode is a low-power mode, where LIN transceiver remains inactive while INH pin is driven high to activate an external voltage regulator – see Figure 2. Depending on the transition which led to the standby mode, pins RxD and TxD are configured differently during this mode. A 30 kΩ resistor in series with a reverse-protection diode is internally connected between LIN and  $V_{BB}$  Pins.

Standby mode is entered in one of the following ways:

- After the voltage level at  $V_{BB}$  pin rises above its power-on-reset level. In this case, RxD Pin remains

high-impedant and the pull-down applied on pin TxD remains weak.

- After a wake-up event is recognized while the chip was in the sleep mode. Pin RxD is pulled low while pin TxD signals the type of wake-up leading to the standby mode – its pull-up remains weak for LIN wake-up and it is switched to strong pull-down for the case of local wake-up (i.e. wake-up via Pin WAKE).

While in the standby mode, the configuration of Pins RxD and TxD remains unchanged, regardless the activity on WAKE and LIN Pins – i.e. if additional wake-ups occur during the standby mode, they have no influence on the chip configuration.

Normal Mode

In normal mode, the full functionality of the LIN transceiver is available. Data according the state of TxD input are sent to the LIN bus while pin RxD reflects the logical symbol received on the LIN bus – high-impedant for recessive and Low for dominant. A 30 kΩ resistor in series

with a reverse-protection diode is internally connected between LIN and  $V_{BB}$  pins.

To avoid that, due to a failure of the application (e.g. software error), the LIN bus is permanently driven dominant and thus blocking all subsequent communication, signal on pin TxD passes through a timer, which releases the bus in case TxD remains low for longer than  $T_{TxD\_timeout}$ . The transmission can continue once the TxD returns to High logical level.

In case the junction temperature increases above the thermal shutdown threshold, e.g. due to a short of the LIN wiring to the battery, the transmitter is disabled and releases LIN bus to recessive. Once the junction temperature decreases back below the thermal shutdown release level, the transmission can be enabled again – however, to avoid thermal oscillations, first a High logical level on TxD must be encountered before the transmitter is enabled.

As required by SAE J2602, the transceiver must behave safely below its operating range – it shall either continue to transmit correctly (according its specification) or remain silent (transmit a recessive state regardless of the TxD signal). A battery monitoring circuit in NCV7321 de-activates the transmitter in the normal mode if the  $V_{BB}$  level drops below  $MONL\_V_{BB}$ . Transmission is enabled again when  $V_{BB}$  reaches  $MONH\_V_{BB}$ . The internal logic remains in the normal mode and the reception from the LIN line is still possible even if the battery monitor disables the transmission. Although the specifications of the monitoring and power-on-reset levels are overlapping, it's ensured by the implementation that the monitoring level never falls below the power-on-reset level.

Normal mode can be entered from either standby or sleep mode when EN Pin is High for longer than  $T_{enable}$ . When the transition is made from standby mode, TxD pull-down is set to weak and RxD is put high-impedant immediately after EN becomes High (before the expiration of  $T_{enable}$  filtering time). This excludes signal conflicts between the standby mode pin settings and the signals required to control

the chip in the normal mode (e.g. strong pull-down on TxD after local wake-up vs. High logical level on TxD required to send a recessive symbol on LIN).

**Sleep Mode**

Sleep mode provides extremely low current consumption. The LIN transceiver is inactive and the battery consumption is minimized. Pin INH is put to high-impedant state to disable the external regulator and, in case of a master node, the LIN termination – see Figure 2. Only a weak pull-up current source is internally connected between LIN and  $V_{BB}$  Pins, in order to minimize current consumption even in case of LIN short to GND.

Sleep mode can be entered from normal mode by assigning Low logical level to pin EN for longer than  $T_{disable}$ . The sleep mode can be entered even if a permanent short occurs either on LIN or WAKE Pin.

If a wake-up event occurs during the transition between normal and sleep mode (during the  $T_{disable}$  filtering time), it will be regarded as valid wake-up and the chip will enter standby mode with the appropriate setting of Pins RxD and TxD.

**Wake-up**

Two types of wake-up events are recognized by NCV7321:

- Local wake-up – when a high-to-low transition on pin WAKE is encountered and WAKE pin remains Low at least during  $T_{WAKE}$  – see Figure 4.
- Remote (or LIN) wake-up – when LIN bus is externally driven dominant during longer than  $T_{LIN\_wake}$  and a rising edge on LIN occurs afterwards – see Figure 5.

Wake-up events can be exclusively detected in sleep mode or during the transition from normal mode to sleep mode. Due to timing tolerances, valid wake-up events beginning shortly before normal-to-sleep mode transition can be also sometimes regarded as valid wake-ups.

## ELECTRICAL CHARACTERISTICS

### Definitions

All voltages are referenced to GND (Pin 5). Positive currents flow into the IC.

**Table 5. DC CHARACTERISTICS** ( $V_{BB} = 5\text{ V to }27\text{ V}$ ;  $T_J = -40^\circ\text{C to }+150^\circ\text{C}$ ; Bus Load =  $500\ \Omega$  ( $V_{BB}$  to LIN); unless otherwise specified. Typical values are given at  $V_{BB} = 12\text{ V}$  and  $T_J = 25^\circ\text{C}$ , unless otherwise specified.)

### DC CHARACTERISTICS – SUPPLY

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
<b><math>V_{BB}</math></b>						
$I_{BB\_ON\_rec}$	$V_{BB}$ Consumption	Normal Mode; LIN Recessive $V_{LIN} = V_{BB} = V_{INH} = V_{WAKE}$			1.6	mA
$I_{BB\_ON\_dom}$	$V_{BB}$ Consumption	Normal Mode; LIN Dominant $V_{BB} = V_{INH} = V_{WAKE}$			8	mA
$I_{BB\_STB}$	$V_{BB}$ Consumption	Standby Mode $V_{LIN} = V_{BB} = V_{INH} = V_{WAKE}$			350	$\mu\text{A}$
$I_{BB\_SLP}$	$V_{BB}$ Consumption	Sleep Mode $V_{LIN} = V_{BB} = V_{INH} = V_{WAKE}$			30	$\mu\text{A}$
$I_{BB\_SLP\_18V}$	$V_{BB}$ Consumption	Sleep Mode, $V_{BB} < 18\text{ V}$ $V_{LIN} = V_{BB} = V_{INH} = V_{WAKE}$ (Note 9)			20	$\mu\text{A}$
$I_{BB\_SLP\_12V}$	$V_{BB}$ Consumption	Sleep Mode, $V_{BB} = 12\text{ V}$ , $T_J < 85^\circ\text{C}$ $V_{LIN} = V_{BB} = V_{INH} = V_{WAKE}$ (Note 9)			10	$\mu\text{A}$

### LIN TRANSMITTER

$V_{LIN\_dom\_LoSup}$	LIN Dominant Output Voltage	$TxD = \text{Low}$ ; $V_{BB} = 7.3\text{ V}$			1.2	V
$V_{LIN\_dom\_HiSup}$	LIN Dominant Output Voltage	$TxD = \text{Low}$ ; $V_{BB} = 18\text{ V}$			2.0	V
$V_{LIN\_REC}$	LIN Recessive Output Voltage (Note 10)	$TxD = \text{High}$ ; $I_{LIN} = 10\ \mu\text{A}$	$V_{BB} - 1.5$		$V_{BB}$	V
$I_{LIN\_lim}$	Short Circuit Current Limitation	$V_{LIN} = V_{BB\_max}$	40		200	mA
$R_{slave}$	Internal Pull-up Resistance		20	33	47	$\text{k}\Omega$
$C_{LIN}$	Capacitance on Pin LIN (Note 9)			20	30	pF

9. Values based on design and characterization. Not tested in production.

10. The voltage drop in Normal mode between LIN and  $V_{BB}$  pin is the sum of the diode drop and the drop at serial pull-up resistor. The drop at the switch is negligible. See Figure 1.

NCV7321D11G	Improved Stand-alone LIN Transceiver			96 Tube / Tray
NCV7321D11R2G				3000 / Tape & Reel

<sup>†</sup>For information on tape and reel specifications, including part orientation and tape sizes, please refer to our Tape and Reel Packaging Specifications Brochure, BRD8011/D.

# NCV7321

## PACKAGE DIMENSIONS

SOIC-8 NB  
CASE 751-07  
ISSUE AJ

**NOTES:**

1. DIMENSIONING AND TOLERANCING PER ANSI Y14.5M, 1982.
2. CONTROLLING DIMENSION: MILLIMETER.
3. DIMENSION A AND B DO NOT INCLUDE MOLD PROTRUSION.
4. MAXIMUM MOLD PROTRUSION 0.15 (0.006) PER SIDE.
5. DIMENSION D DOES NOT INCLUDE DAMBAR PROTRUSION. ALLOWABLE DAMBAR PROTRUSION SHALL BE 0.127 (0.005) TOTAL IN EXCESS OF THE D DIMENSION AT MAXIMUM MATERIAL CONDITION.
6. 751-01 THRU 751-06 ARE OBSOLETE. NEW STANDARD IS 751-07.

DIM	MILLIMETERS		INCHES	
	MIN	MAX	MIN	MAX
A	4.80	5.00	0.189	0.197
B	3.80	4.00	0.150	0.157
C	1.35	1.75	0.053	0.069
D	0.33	0.51	0.013	0.020
G	1.27 BSC		0.050 BSC	
H	0.10	0.25	0.004	0.010
J	0.19	0.25	0.007	0.010
K	0.40	1.27	0.016	0.050
M	0°	8°	0°	8°
N	0.25	0.50	0.010	0.020
S	5.80	6.20	0.228	0.244

### SOLDERING FOOTPRINT\*

\*For additional information on our Pb-Free strategy and soldering details, please download the ON Semiconductor Soldering and Mounting Techniques Reference Manual, SOLDERRM/D.

## Данный компонент на территории Российской Федерации

### Вы можете приобрести в компании MosChip.

Для оперативного оформления запроса Вам необходимо перейти по данной ссылке:

<http://moschip.ru/get-element>

Вы можете разместить у нас заказ для любого Вашего проекта, будь то серийное производство или разработка единичного прибора.

В нашем ассортименте представлены ведущие мировые производители активных и пассивных электронных компонентов.

Нашей специализацией является поставка электронной компонентной базы двойного назначения, продукции таких производителей как XILINX, Intel (ex.ALTERA), Vicor, Microchip, Texas Instruments, Analog Devices, Mini-Circuits, Amphenol, Glenair.

Сотрудничество с глобальными дистрибьюторами электронных компонентов, предоставляет возможность заказывать и получать с международных складов практически любой перечень компонентов в оптимальные для Вас сроки.

На всех этапах разработки и производства наши партнеры могут получить квалифицированную поддержку опытных инженеров.

Система менеджмента качества компании отвечает требованиям в соответствии с ГОСТ Р ИСО 9001, ГОСТ РВ 0015-002 и ЭС РД 009
