| Characteristics | Symbol | Min. | Typ. | Max. | Unit. |

| Nominal resistance @ 25°C | | | 10 | | kΩ |
| Beta value : B25/100 | B | 3600 | 3730 | 3800 | |

| Nominal Resistance Tolerance | R _n | | 2 | 3 | % |
| B value tolerance | B | | 3 | | % |
| Response Time | τ | | 10 | | s |

Typical temperature output

Depending on the needed temperature measurement range and associated accuracy, we suggest two methods to access to the NTC resistance values.

$$R_T = R_n \times e^{B \left(\frac{1}{T} - \frac{1}{T_n} \right)}$$

R_T NTC resistance in Ω at temperature T in K

R_n NTC resistance in Ω at rated temperature in K

T, T_n Temperature in K

B B value, material-specific constant of the NTC thermistor

e Base of natural logarithm (e = 2.71828)

The actual characteristic of an NTC thermistor can, however, only be roughly described by the exponential relation, as the material parameter B in reality also depends on temperature. So this approach is only suitable for describing a restricted range around the rated temperature or resistance with sufficient accuracy.

② For practical applications a more precise description of the real R/T curve may be required. Either more complicated approaches (e.g. the Steinhart-Hart equation) are used or the resistance/temperature relation as given in tabulated form. The below table has been experimentally determined with utmost accuracy for temperature increments of 1 degree.

| Temperature °C | Resistance (ohm) | Max. Deviation | Temperature °C | Resistance (ohm) | Max. Deviation | Temperature °C | Resistance (ohm) | Max. Deviation | Temperature °C | Resistance (ohm) | Max. Deviation |
