

Hardware / System Setup

Jumpers are factory installed per Table 1. Jumper and testing options are described in the next section.

Header	Factory Setting	Description
J2	Jumper 1-2	Connects VL to VCC

Table 1: Factory Settings

Connect J43 and J45 per Table 2 to configure the EVB for normal mode operation.

Header	Configuration	Description
J43	Jumper 2-3	Shutdown = 1 enables normal mode
J45	Jumper 2-3	Online = 1 enables normal mode

Table 2: Normal Mode Configuration

Connect the RS232 drivers and receivers, TTL/CMOS Driver Inputs and Receiver Outputs per Table 3 and power and ground per Table 4 for immediate evaluation of the XR32220 functionality and performance.

Header	Connection	Pin
J9	RS232 receiver input	R1IN
J11	RS232 receiver input	R2IN
J19	RS232 driver output	T1OUT
J21	RS232 driver output	T2OUT
J29	TTL / CMOS driver input	T1IN
J27	TTL / CMOS driver input	T2IN
J39	TTL / CMOS receiver output	R1OUT
J37	TTL / CMOS receiver output	R2OUT

Table 3: Input and Output Connections

J1	J1-1	J1-2	J1-3	J1-4
Name	GND	NC	VCC	VCC

NOTE:

1. $V_{CC} = 3.0V$ to $5.5V$

Table 4: Power and Ground Connections

Pin J1-1 is the ground connection to the XR32220 evaluation board and is a common ground connection to the entire board. An external $3.3V \pm 10\%$ or $5.0V \pm 10\%$ supply, referenced to J1 pin 1 ground, should be connect to J1 pins 3 & 4.

Use probes summarized in Table 5 to observe operation at various points. TP1 and TP2 provide GND for probes at 2 different spots.

Header	Probe Points
J3, J4, J5, J7	C3, C4, C2 and C1 charge pump capacitors
J6	V_{CC} into XR32220 transceiver
J42	Status output

Table 5: Monitoring Probes

Jumper and Testing Options

TTL / CMOS Logic Supply, VL - J2

The XR32220 has a separate logic supply pin, VL, which controls the logic levels for the following pins: T1IN, T2IN, R1OUT, R2OUT, Shutdown, Online and Status.

With a jumper placed across J2 the logic supply is tied to VCC. To drive the VL logic supply to a lower voltage than VCC, simply remove the jumper across J2 and connect the separate external logic supply to pin 2 of J2. The logic supply voltage, VL, must always be less than or equal to VCC.

Power LED - J12

Connect Jumper J12 1-2 to illuminate the D1 LED when power is connected if desired.

RS232 Receiver Inputs - J9 and J11 (J8 and J10)

Pin 2 on both the J9 and J11 connectors is the RS232 receiver input and pin 1 is ground. There is a 3 pin jumper next to each of the test points, J8 and J10, to allow the receiver inputs to be tied to VCC or ground if desired. Normally the RS232 signal is applied to Pin 2 of J9 and J11 and J8 and J10 are unused.

RS232 Driver Outputs - J19 and J21 (J18 and J20)

Pin 2 on both the J19 and J21 connectors is the RS232 driver output and pin 1 is ground. There is a 2 pin jumper next to each of these test points, J18 and J20, to allow for any external loads to be applied if desired.

TTL/CMOS Driver Inputs - J27 and J29 (J26 and J28)

Pin 2 on both the J27 and J29 connectors is the TTL/CMOS driver input and pin 1 is ground. There is a 3 pin jumper next to each of the test points, J28 and J26 to allow the driver inputs to be tied to VL or ground if desired. Normally the signal generator would be applied to Pin 2 of J29 and/or J27 and J28 and J26 would not be used.

TTL/CMOS Receiver Outputs - J37 and J39 (J36 and J38)

Pin 2 on both connectors is the TTL/CMOS receiver output and pin 1 is ground. There is a 2 pin jumper next to each of these test points, J38 and J36, to allow for any external loads to be applied if desired.

Control and Status Connections - J42, J44, and J46

The test points for Shutdown & Online (Auto On-Line) are jumpers J44 and J46 respectively. These TTL/CMOS inputs accept VL supply logic levels. Pin 2 on both connectors is the input and pin 1 is ground. There is a 3 pin jumper next to each of the test points, J45 and J43 to allow the control inputs to be tied to VL or ground if desired.

J42 is connected to the Status pin for easy probing.

Paddle connection - R2

The XR32220 24pin QFN package has a paddle on the underside. It is recommended that the paddle be connected to ground on the PCB. The schematic of the evaluation board pcb below shows this connection to ground. If it is desired to remove the connection to ground, simply remove R2.

Table 4: Evaluation Board Bill of Material (BOM)

Power Supply Recommendations

In order to ensure reliable operation at all data rates and supply voltages, each supply should have at least 100nF ceramic capacitor located as close to the supply terminals (VL or Vcc) as possible. Additional 10uF and 100nF (C5 and C6) are recommended if the supply source is generated from a linear power supply/regulator.

Layout Recommendations

1. Apply at least 100nF bypass capacitors as close as possible to Vcc terminal and VL terminal of transceiver.
2. Use at least two vias for Vcc/VL and GROUND connections of bypass capacitors to minimize effective via-inductance.
3. When possible, use Vcc and GROUND plane to provide low-inductance traces and signal path.

Вы можете приобрести в компании MosChip.

Для оперативного оформления запроса Вам необходимо перейти по данной ссылке:

<http://moschip.ru/get-element>

Вы можете разместить у нас заказ для любого Вашего проекта, будь то серийное производство или разработка единичного прибора.

В нашем ассортименте представлены ведущие мировые производители активных и пассивных электронных компонентов.

Нашей специализацией является поставка электронной компонентной базы двойного назначения, продукции таких производителей как XILINX, Intel (ex.ALTERA), Vicor, Microchip, Texas Instruments, Analog Devices, Mini-Circuits, Amphenol, Glenair.

Сотрудничество с глобальными дистрибьюторами электронных компонентов, предоставляет возможность заказывать и получать с международных складов практически любой перечень компонентов в оптимальные для Вас сроки.

На всех этапах разработки и производства наши партнеры могут получить квалифицированную поддержку опытных инженеров.

Система менеджмента качества компании отвечает требованиям в соответствии с ГОСТ Р ИСО 9001, ГОСТ РВ 0015-002 и ЭС РД 009
