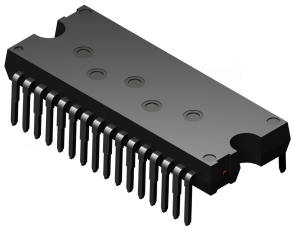
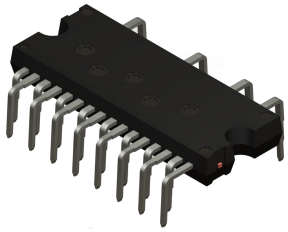
SLLIMM™ nano - 2nd series IPM, 3-phase inverter, 5 A, 600 V, short-circuit rugged IGBTs



N2DIP-26L type L



N2DIP-26L type Z

Features

- IPM 5 A, 600 V, 3-phase IGBT inverter bridge including 3 control ICs for gate driving and freewheeling diodes
- 3.3 V, 5 V, 15 V TTL/CMOS input comparators with hysteresis and pull-down/ pull-up resistors
- Internal bootstrap diode
- Optimized for low electromagnetic interference
- Undervoltage lockout
- Short-circuit rugged TFS IGBTs
- Shutdown function
- Interlocking function
- Op-amp for advanced current sensing
- Comparator for fault protection against overcurrent
- NTC (UL 1434 CA 2 and 4)
- Isolation ratings of 1500 Vrms/min.
- Up to ±2 kV ESD protection (HBM C = 100 pF, R = 1.5 kΩ)
- UL recognition: UL 1557, file E81734

Applications

- 3-phase inverters for motor drives
- Dish washers, refrigerator compressors, heating systems, air-conditioning fans, draining and recirculation pumps

Description

This second series of SLLIMM (small low-loss intelligent molded module)-nano provides a compact, high-performance AC motor drive in a simple, rugged design. It is composed of six improved short-circuit rugged trench gate fieldstop IGBTs with freewheeling diodes and three half-bridge HVICs for gate driving, providing low electromagnetic interference (EMI) characteristics with optimized switching speed. The package is designed to allow a better and more easily screwed-on heatsink, and is optimized for thermal performance and compactness in built-in motor applications or other low power applications where assembly space is limited. This IPM includes a completely uncommitted operational amplifier and a comparator that can be used to design a fast and efficient protection circuit. SLLIMM™ is a trademark of STMicroelectronics.

4 Shutdown function

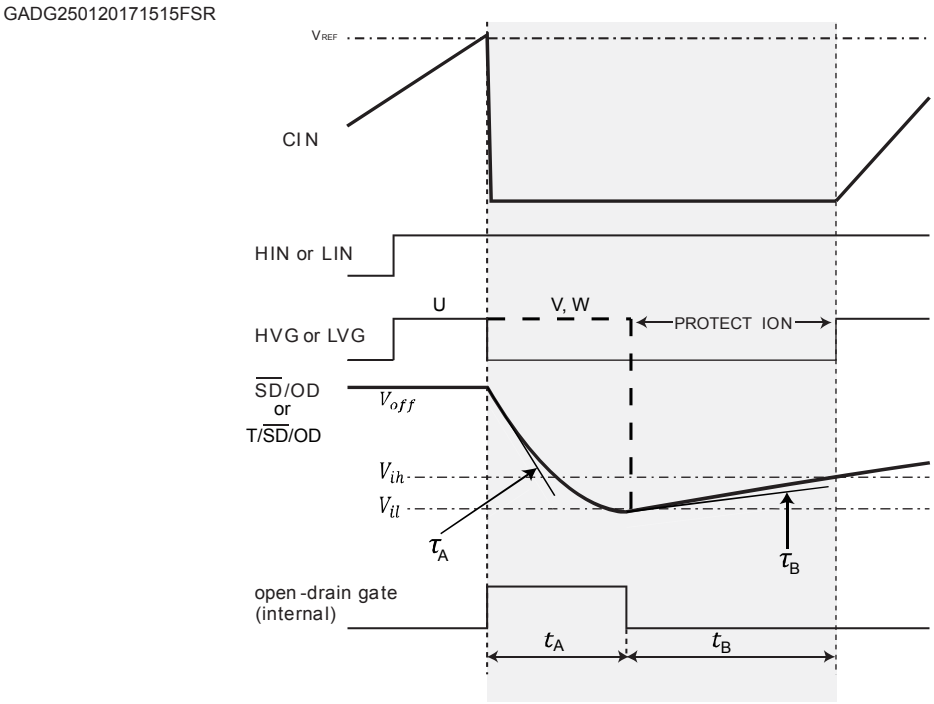
The device is equipped with three half-bridge IC gate drivers and integrates a comparator for fault detection.

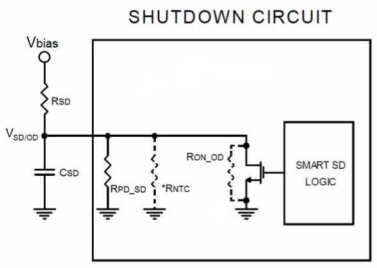
The comparator has an internal voltage reference V_{REF} connected to the inverting input, while the non-inverting input pin (CIN) can be connected to an external shunt resistor for current monitoring.

Since the comparator is embedded in the U IC gate driver, in case of fault it disables directly the U outputs, whereas the shutdown of V and W IC gate drivers depends on the RC value of the external SD circuitry, which fixes the disabling time.

For an effective design of the shutdown circuit, please refer to Application note AN4966.

Figure 11. Shutdown timing waveforms





$$t_A \cong \tau_A \cdot ln\left(\frac{V_{off} - V_{on}}{V_{il} - V_{on}}\right), \quad t_B \cong \tau_B \cdot ln\left(\frac{V_{il} - V_{off}}{V_{ih} - V_{off}}\right)$$

$$\tau_A = (R_{ON\_OD} // R_{SD} // R_{PD\_SD} // {}^*R_{NTC}) \cdot C_{SD} \cong R_{ON\_OD} \cdot C_{SD}$$

$$\tau_B = (R_{SD} // R_{PD\_SD} // {}^*R_{NTC}) \cdot C_{SD}$$

$$V_{on} = \frac{R_{ON\_OD} // R_{PD\_SD} // {}^*R_{NTC}}{(R_{ON\_OD} // R_{PD\_SD} // {}^*R_{NTC}) + R_{SD}} \cdot V_{bias} \cong \frac{R_{ON\_OD}}{R_{ON\_OD} + R_{SD}} \cdot V_{bias}$$

$$V_{off} = \frac{R_{PD\_SD} // {}^*R_{NTC}}{(R_{PD\_SD} // {}^*R_{NTC}) + R_{SD}} \cdot V_{bias}$$

R_{SD} and C_{SD} external circuitry must be designed to ensure $V_{on} < V_{il}$ & $V_{off} > V_{ih}$

Please refer to AN4966 for further details.

* R_{NTC} to be considered only when the NTC is internally connected to the T/$\overline{SD}$/OD pin.

Application designers are free to use a different scheme according to the specifications of the device.

5.1 Guidelines

- Input signals HIN, LIN are active high logic. A 375 kΩ (typ.) pull-down resistor is built-in for each input. To avoid input signal oscillation, the wiring of each input should be as short as possible, and the use of RC filters (R_1, C_1) on each input signal is suggested. The filters should be with a time constant of about 100 ns and placed as close as possible to the IPM input pins.
- The use of a bypass capacitor C_{VCC} (aluminum or tantalum) can reduce the transient circuit demand on the power supply. Also, to reduce any high-frequency switching noise distributed on the power lines, a decoupling capacitor C_2 (100 to 220 nF, with low ESR and low ESL) should be placed as close as possible to the V_{cc} pin and in parallel with the bypass capacitor.
- The use of an RC filter (R_{SF}, C_{SF}) is recommended to prevent protection circuit malfunction. The time constant (R_{SF} x C_{SF}) should be set to 1 µs and the filter must be placed as close as possible to the C_{IN} pin.
- The $\overline{SD}$ is an input/output pin (open-drain type if it is used as output). A built-in thermistor NTC is internally connected between the $\overline{SD}$ pin and GND. The voltage V_{SD}-GND decreases as the temperature increases, due to the pull-up resistor R_{SD}. In order to keep the voltage always higher than the high-level logic threshold, the pull-up resistor should be set to 1 kΩ or 2.2 kΩ for 3.3 V or 5 V MCU power supply, respectively. The capacitor C_{SD} of the filter on $\overline{SD}$ should be fixed no higher than 3.3 nF in order to assure the $\overline{SD}$ activation time $\tau_A \leq 500$ ns. Besides, the filter should be placed as close as possible to the $\overline{SD}$ pin.
- The decoupling capacitor C_3 (from 100 to 220 nF, ceramic with low ESR and low ESL), in parallel with each C_{boot}, filters high-frequency disturbance. Both C_{boot} and C_3 (if present) should be placed as close as possible to the U, V, W and V_{boot} pins. Bootstrap negative electrodes should be connected to U, V, W terminals directly and separated from the main output wires.
- To avoid overvoltage on the V_{cc} pin, a Zener diode (Dz1) can be used. Similarly on the V_{boot} pin, a Zener diode (Dz2) can be placed in parallel with each C_{boot}.
- The use of the decoupling capacitor C_4 (100 to 220 nF, with low ESR and low ESL) in parallel with the electrolytic capacitor C_{vdc} is useful to prevent surge destruction. Both capacitors C_4 and C_{vdc} should be placed as close as possible to the IPM (C_4 has priority over C_{vdc}).
- By integrating an application-specific type HVIC inside the module, direct coupling to the MCU terminals without an opto-couplers is possible.
- Low-inductance shunt resistors have to be used for phase leg current sensing.
- In order to avoid malfunctions, the wiring on N pins, the shunt resistor and P_{WR_GND} should be as short as possible.
- The connection of SGN_GND to PWR_GND on one point only (close to the shunt resistor terminal) can reduce the impact of power ground fluctuation.

These guidelines ensure the specifications of the device for application designs. For further details, please refer to the relevant application note.
