## Functional Description

The A8032 is a high speed 8-bit microcontroller. The architecture consists of a core controller, four general purposes I/O ports, 256 bytes RAM internal register and a serial port. This microcontroller supports 111 opcodes and executes instructions in a 6-clock bus cycle. It can reference both a 64K program address space and a 64K data storage space.

## Timer/Counter 0, 1 and 2

Timer 0,1 and 2 each consist of two 8-bit data registers. These are called TL0 and TH0 for Timer 0. TL1 and TH1 for Timer 1, and TL2 and TH2 for Timer 2. The TMOD and TCON registers support control function for Timer 0 and Timer 1. The T2CON register provides control function for Timer 2. When operating reload/capture mode, RCAP2H and RCAP2L will be used.

## Interrupt

The A8032 provides 6 interrupt modes. These consist of 2 external interrupts, 3 internal interrupts and a serial port interrupt.

The enable/disable interrupt is controlled by IE register in SFR.

The priority of interrupts is controlled by IP register in SFR.

## Serial Port Transfer

The A8032 provides a full duplex serial transfer function. This function is controlled by SCON register in SFR. And the data is stored in SBUF register during transmitting and receiving.

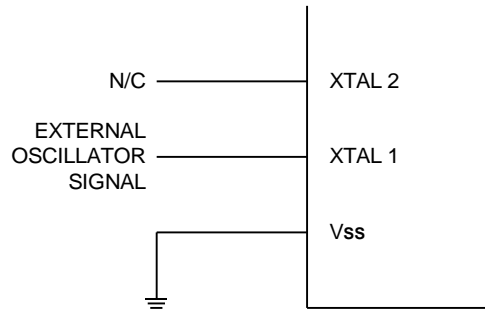

## Oscillator Characteristics

The oscillator connections are shown as Figure 1. And Figure 2. When quartz crystal is used, C1 and C2 are 30pF shown in Figure 1. When external clock is used, the internal clock will be gotten through a divide-by-two flip-flop. When starting up, the input loading for XTAL1 pin is 100pF. This is due to interaction between the amplifier and its feedback capacitance interaction. After the external signal meets the  $V_{IL}$  and  $V_{IH}$  specification the capacitance will not exceed 20pF.

$C1, C2 = 30\text{pF} \pm 10\text{pF}$  for Crystals

**Figure 1. Oscillator Connections**

**Figure 2. External Clock Drive configuration**

## RESET

The external reset signal must be held high for at least two machine cycles during the oscillator running. After reset, the ports are held high, SP register to 07H, all of the other SFR registers except SBUF to 00H, and SBUF is not reset.
