

General Description

The MAX44284 evaluation kit (EV kit) provides a proven design to evaluate the MAX44284 high-precision, low-power, current-sense amplifier. This EV kit demonstrates the MAX44284 in an ultra-small, 1.3mm x 0.9mm, 6-bump WLP package.

The EV kit PCB comes with a MAX44284HAWT+ installed, which is the 100V/V gain version. Other gain options are available. Contact the factory for the pin-compatible MAX44284FAWT+ (G = 50V/V), MAX44284WAWT+ (200V/V), and MAX44284EAWT+ (G = 500V/V).

EV Kit Contents

- MAX44284 EV Kit Board

Features and Benefits

- Precision Real-Time Current Monitoring
- -0.1V to +36V Input Common-Mode Range
- Proven PCB Layout
- Fully Assembled and Tested

[Ordering Information](#) appears at end of data sheet.

Quick Start

Required Equipment

The following items are required for operation:

- MAX44284 EV kit
- +3.3V, 1.5A DC power supply
- +2.7, 1A DC power supply
- An electronic load capable of sinking 1A (i.e., HP6060B)
- Two digital voltmeters

Procedure

The MAX44284 EV kit is fully assembled and tested. Follow the steps below to verify the board operation.

Caution: Do not turn on power supply or the electronic load until all connections are made.

- 1) Connect the positive terminal of the +3.3V supply to the VDD test point and the negative terminal of the supply to the nearest GND test point.
- 2) Connect the positive terminal of the +2.7V supply to the VBATT test point and the negative terminal of the supply to the nearest GND test point.
- 3) Set the electronic load to sink 650mA.
- 4) Connect the positive terminal of the electronic load to the LOAD test point and the negative terminal of the supply to the nearest GND test point.
- 5) Connect the first voltmeter between test points RS+ and RS- to measure V_{SENSE} .
- 6) Connect the second voltmeter between VOUT and the nearest GND test points.
- 7) Turn on the power supplies.
- 8) Enable the electronic load.
- 9) Verify that the first voltmeter displays 33mV and the second voltmeter displays 3.3V.

Detailed Description of Hardware

The MAX44284 EV kit provides a proven design to evaluate the MAX44284 high-side, current-sense amplifier, which offers precision accuracy specifications of input offset voltage (V_{OS}) less than $2\mu V$ (max) and gain error less than 0.05% (max).

Applying the V_{RS+} Supply and the Load

The EV kit is installed with a MAX44284H, which has a 100V/V gain. The current-sense resistors (R_{SENSE}) value is 0.05Ω with $\pm 0.5\%$ tolerance. The V_{OUT} for each channel given by:

$$V_{OUT} = I_{LOAD} \times R_{SENSE} \times A_V$$

where A_V is the gain and I_{LOAD} is the current load applied to the device. Normal operating V_{RS+} and V_{RS-} range is -0.1V to +36V.

Measuring the Load Current

The load current is measured as a voltage drop (V_{SENSE}) across an external sense resistor. This voltage is then amplified by the current-sense amplifier and presented at

its $V_{OUT_}$ pin. Like all differential amplifiers, the output voltage has two components of error (an offset error and a gain error). The offset error affects accuracy at low currents and a gain error affects accuracy at large currents—both errors affect accuracy at intermediate currents. By minimizing both offset and gain errors, accuracy can be optimized over a wide dynamic range.

\overline{SHDN}

To place the device into shutdown mode, install a shunt in the 2-3 position on jumper JU1. See Table 1 for shunt positions.

Table 1. \overline{SHDN} Jumper Description (JU1)

JUMPER	SHUNT POSITION	DESCRIPTION
JU1	1-2*	Normal operation
	2-3	\overline{SHDN} , MAX44284 is in shutdown mode

*Default position.

Вы можете приобрести в компании MosChip.

Для оперативного оформления запроса Вам необходимо перейти по данной ссылке:

<http://moschip.ru/get-element>

Вы можете разместить у нас заказ для любого Вашего проекта, будь то серийное производство или разработка единичного прибора.

В нашем ассортименте представлены ведущие мировые производители активных и пассивных электронных компонентов.

Нашей специализацией является поставка электронной компонентной базы двойного назначения, продукции таких производителей как XILINX, Intel (ex.ALTERA), Vicor, Microchip, Texas Instruments, Analog Devices, Mini-Circuits, Amphenol, Glenair.

Сотрудничество с глобальными дистрибьюторами электронных компонентов, предоставляет возможность заказывать и получать с международных складов практически любой перечень компонентов в оптимальные для Вас сроки.

На всех этапах разработки и производства наши партнеры могут получить квалифицированную поддержку опытных инженеров.

Система менеджмента качества компании отвечает требованиям в соответствии с ГОСТ Р ИСО 9001, ГОСТ РВ 0015-002 и ЭС РД 009
