

## General Description

PSoC® 4 is a scalable and reconfigurable platform architecture for a family of programmable embedded system controllers with an ARM® Cortex™-M0+ CPU. It combines programmable and reconfigurable analog and digital blocks with flexible automatic routing. The PSoC 4100S product family is a member of the PSoC 4 platform architecture. It is a combination of a microcontroller with standard communication and timing peripherals, a capacitive touch-sensing system (CapSense) with best-in-class performance, programmable general-purpose continuous-time and switched-capacitor analog blocks, and programmable connectivity. PSoC 4100S products will be upward compatible with members of the PSoC 4 platform for new applications and design needs.

## Features

### 32-bit MCU Subsystem

- 48-MHz ARM Cortex-M0+ CPU
- Up to 64 KB of flash with Read Accelerator
- Up to 8 KB of SRAM

### Programmable Analog

- Two opamps with reconfigurable high-drive external and high-bandwidth internal drive and Comparator modes and ADC input buffering capability. Opamps can operate in Deep Sleep low-power mode.
- 12-bit 1-Msps SAR ADC with differential and single-ended modes, and Channel Sequencer with signal averaging
- Single-slope 10-bit ADC function provided by a capacitance sensing block
- Two current DACs (IDACs) for general-purpose or capacitive sensing applications on any pin
- Two low-power comparators that operate in Deep Sleep low-power mode

### Programmable Digital

- Programmable logic blocks allowing Boolean operations to be performed on port inputs and outputs

### Low-Power 1.71-V to 5.5-V Operation

- Deep Sleep mode with operational analog and 2.5-μA digital system current

### Capacitive Sensing

- Cypress CapSense Sigma-Delta (CSD) provides best-in-class signal-to-noise ratio (SNR) (>5:1) and water tolerance
- Cypress-supplied software component makes capacitive sensing design easy
- Automatic hardware tuning (SmartSense™)

### LCD Drive Capability

- LCD segment drive capability on GPIOs

### Serial Communication

- Three independent run-time reconfigurable Serial Communication Blocks (SCBs) with re-configurable I<sup>2</sup>C, SPI, or UART functionality

### Timing and Pulse-Width Modulation

- Five 16-bit timer/counter/pulse-width modulator (TCPWM) blocks
- Center-aligned, Edge, and Pseudo-random modes
- Comparator-based triggering of Kill signals for motor drive and other high-reliability digital logic applications
- Quadrature decoder

### Up to 36 Programmable GPIO Pins

- 48-pin TQFP, 44-pin TQFP, 40-pin QFN, 32-pin QFN, and 35-ball WLCSP packages
- Any GPIO pin can be CapSense, analog, or digital
- Drive modes, strengths, and slew rates are programmable

### Clock Sources

- 32-kHz Watch Crystal Oscillator (WCO)
- ±2% Internal Main Oscillator (IMO)
- 32-kHz Internal Low-power Oscillator (ILO)

### PSoC Creator Design Environment

- Integrated Development Environment (IDE) provides schematic design entry and build (with analog and digital automatic routing)
- Applications Programming Interface (API) component for all fixed-function and programmable peripherals

### Industry-Standard Tool Compatibility

- After schematic entry, development can be done with ARM-based industry-standard development tools

## Development Support

Cypress provides a wealth of data at [www.cypress.com](http://www.cypress.com) to help you to select the right PSoC device for your design, and to help you to quickly and effectively integrate the device into your design. For a comprehensive list of resources, see the knowledge base article [KBA86521, How to Design with PSoC 3, PSoC 4, and PSoC 5LP](#). Following is an abbreviated list for PSoC 4:

- Overview: [PSoC Portfolio](#), [PSoC Roadmap](#)
  - Product Selectors: [PSoC 1](#), [PSoC 3](#), [PSoC 4](#), [PSoC 5LP](#)  
In addition, PSoC Creator includes a device selection tool.
  - Application notes: Cypress offers a large number of PSoC application notes covering a broad range of topics, from basic to advanced level. Recommended application notes for getting started with PSoC 4 are:
    - [AN79953](#): Getting Started With PSoC 4
    - [AN88619](#): PSoC 4 Hardware Design Considerations
    - [AN86439](#): Using PSoC 4 GPIO Pins
    - [AN57821](#): Mixed Signal Circuit Board Layout
    - [AN81623](#): Digital Design Best Practices
    - [AN73854](#): Introduction To Bootloaders
    - [AN89610](#): ARM Cortex Code Optimization
    - [AN85951](#): PSoC® 4 and PSoC Analog Coprocessor CapSense® Design Guide
  - Technical Reference Manual (TRM) is in two documents:
    - [Architecture TRM](#) details each PSoC 4 functional block.
    - [Registers TRM](#) describes each of the PSoC 4 registers.
  - Development Kits:
    - [CY8CKIT-041-41XX](#) PSoC 4100S CapSense Pioneer Kit, is an easy-to-use and inexpensive development platform. This kit includes connectors for Arduino™ compatible shields.
- The [MiniProg3](#) device provides an interface for flash programming and debug.

- **Software User Guide:**
  - A step-by-step guide for using PSoC Creator. The software user guide shows you how the PSoC Creator build process works in detail, how to use source control with PSoC Creator, and much more.
- **Component Datasheets:**
  - The flexibility of PSoC allows the creation of new peripherals (components) long after the device has gone into production. Component datasheets provide all the information needed to select and use a particular component, including a functional description, API documentation, example code, and AC/DC specifications.
- **Online:**  
In addition to print documentation, the [Cypress PSoC forums](#) connect you with fellow PSoC users and experts in PSoC from around the world, 24 hours a day, 7 days a week.

## PSoC Creator

**PSoC Creator** is a free Windows-based Integrated Design Environment (IDE). It enables concurrent hardware and firmware design of PSoC 3, PSoC 4, and PSoC 5LP based systems. Create designs using classic, familiar schematic capture supported by over 100 pre-verified, production-ready PSoC Components; see the [list of component datasheets](#). With PSoC Creator, you can:

1. Drag and drop component icons to build your hardware system design in the main design workspace
2. Codesign your application firmware with the PSoC hardware, using the PSoC Creator IDE C compiler
3. Configure components using the configuration tools
4. Explore the library of 100+ components
5. Review component datasheets

**Figure 1. Multiple-Sensor Example Project in PSoC Creator**

**Figure 2. Block Diagram**

PSoC 4100S devices include extensive support for programming, testing, debugging, and tracing both hardware and firmware.

The ARM Serial-Wire Debug (SWD) interface supports all programming and debug features of the device.

Complete debug-on-chip functionality enables full-device debugging in the final system using the standard production device. It does not require special interfaces, debugging pods, simulators, or emulators. Only the standard programming connections are required to fully support debug.

The PSoC Creator IDE provides fully integrated programming and debug support for the PSoC 4100S devices. The SWD interface is fully compatible with industry-standard third-party tools. The PSoC 4100S provides a level of security not possible with multi-chip application solutions or with microcontrollers.

It has the following advantages:

- Allows disabling of debug features
- Robust flash protection
- Allows customer-proprietary functionality to be implemented in on-chip programmable blocks

The debug circuits are enabled by default and can be disabled in firmware. If they are not enabled, the only way to re-enable them is to erase the entire device, clear flash protection, and reprogram the device with new firmware that enables debugging. Thus firmware control of debugging cannot be over-ridden without erasing the firmware thus providing security.

Additionally, all device interfaces can be permanently disabled (device security) for applications concerned about phishing attacks due to a maliciously reprogrammed device or attempts to defeat security by starting and interrupting flash programming sequences. All programming, debug, and test interfaces are disabled when maximum device security is enabled. Therefore, PSoC 4100S, with device security enabled, may not be returned for failure analysis. This is a trade-off the PSoC 4100S allows the customer to make.

## Functional Definition

### CPU and Memory Subsystem

#### CPU

The Cortex-M0+ CPU in the PSoC 4100S is part of the 32-bit MCU subsystem, which is optimized for low-power operation with extensive clock gating. Most instructions are 16 bits in length and the CPU executes a subset of the Thumb-2 instruction set. It includes a nested vectored interrupt controller (NVIC) block with eight interrupt inputs and also includes a Wakeup Interrupt Controller (WIC). The WIC can wake the processor from Deep Sleep mode, allowing power to be switched off to the main processor when the chip is in Deep Sleep mode.

The CPU also includes a debug interface, the serial wire debug (SWD) interface, which is a two-wire form of JTAG. The debug configuration used for PSoC 4100S has four breakpoint (address) comparators and two watchpoint (data) comparators.

#### Flash

The PSoC 4100S device has a flash module with a flash accelerator, tightly coupled to the CPU to improve average access times from the flash block. The low-power flash block is designed to deliver two wait-state (WS) access time at 48 MHz. The flash accelerator delivers 85% of single-cycle SRAM access performance on average.

#### SRAM

Eight KB of SRAM are provided with zero wait-state access at 48 MHz.

#### SRAM

An 8 KB supervisory ROM that contains boot and configuration routines is provided.

### System Resources

#### Power System

The power system is described in detail in the section [Power on page 13](#). It provides assurance that voltage levels are as required for each respective mode and either delays mode entry (for example, on power-on reset (POR)) until voltage levels are as required for proper functionality, or generates resets (for example, on brown-out detection). The PSoC 4100S operates with a single external supply over the range of either 1.8 V  $\pm$ 5% (externally regulated) or 1.8 to 5.5 V (internally regulated) and has three different power modes, transitions between which are managed by the power system. The PSoC 4100S provides Active, Sleep, and Deep Sleep low-power modes.

All subsystems are operational in Active mode. The CPU subsystem (CPU, flash, and SRAM) is clock-gated off in Sleep mode, while all peripherals and interrupts are active with instantaneous wake-up on a wake-up event. In Deep Sleep mode, the high-speed clock and associated circuitry is switched off; wake-up from this mode takes 35  $\mu$ s. The opamps can remain operational in Deep Sleep mode.

#### Clock System

The PSoC 4100S clock system is responsible for providing clocks to all subsystems that require clocks and for switching between different clock sources without glitching. In addition, the clock system ensures that there are no metastable conditions.

The clock system for the PSoC 4100S consists of the internal main oscillator (IMO), internal low-frequency oscillator (ILO), a 32 kHz Watch Crystal Oscillator (WCO) and provision for an external clock. Clock dividers are provided to generate clocks for peripherals on a fine-grained basis. Fractional dividers are also provided to enable clocking of higher data rates for UARTs.

**Figure 3. PSoC 4100S MCU Clocking Architecture**

The HFCLK signal can be divided down to generate synchronous clocks for the analog and digital peripherals. There are eight clock dividers for the PSoC 4100S; two of those are fractional dividers. The 16-bit capability allows flexible generation of fine-grained frequency values and is fully supported in PSoC Creator

#### IMO Clock Source

The IMO is the primary source of internal clocking in the PSoC 4100S. It is trimmed during testing to achieve the specified accuracy. The IMO default frequency is 24 MHz and it can be adjusted from 24 to 48 MHz in steps of 4 MHz. The IMO tolerance with Cypress-provided calibration settings is  $\pm$ 2%.

#### ILO Clock Source

The ILO is a very low power, nominally 40-kHz oscillator, which is primarily used to generate clocks for the watchdog timer (WDT) and peripheral operation in Deep Sleep mode. ILO-driven counters can be calibrated to the IMO to improve accuracy. Cypress provides a software component, which does the calibration.

#### Watch Crystal Oscillator (WCO)

The PSoC 4100S clock subsystem also implements a low-frequency (32-kHz watch crystal) oscillator that can be used for precision timing applications.

#### Watchdog Timer and Counters

A watchdog timer is implemented in the clock block running from the ILO; this allows watchdog operation during Deep Sleep and generates a watchdog reset if not serviced before the set timeout occurs. The watchdog reset is recorded in a Reset Cause register, which is firmware readable. The Watchdog counters can be used to implement a Real-Time clock using the 32-kHz WCO.

## Reset

The PSoC 4100S can be reset from a variety of sources including a software reset. Reset events are asynchronous and guarantee reversion to a known state. The reset cause is recorded in a register, which is sticky through reset and allows software to determine the cause of the reset. An XRES pin is reserved for external reset by asserting it active low. The XRES pin has an internal pull-up resistor that is always enabled.

## Analog Blocks

### 12-bit SAR ADC

The 12-bit, 1-MspS SAR ADC can operate at a maximum clock rate of 18 MHz and requires a minimum of 18 clocks at that frequency to do a 12-bit conversion.

The Sample-and-Hold (S/H) aperture is programmable allowing the gain bandwidth requirements of the amplifier driving the SAR inputs, which determine its settling time, to be relaxed if required. It is possible to provide an external bypass (through a fixed pin location) for the internal reference amplifier.

The SAR is connected to a fixed set of pins through an 8-input sequencer. The sequencer cycles through selected channels autonomously (sequencer scan) with zero switching overhead (that is, aggregate sampling bandwidth is equal to 1 MspS whether it is for a single channel or distributed over several channels). The sequencer switching is effected through a state machine or through firmware driven switching. A feature provided by the sequencer is buffering of each channel to reduce CPU interrupt service requirements. To accommodate signals with varying source impedance and frequency, it is possible to have different sample times programmable for each channel. Also, signal range specification through a pair of range registers (low and high range values) is implemented with a corresponding out-of-range interrupt if the digitized value exceeds the programmed range; this allows fast detection of out-of-range values without the necessity of having to wait for a sequencer scan to be completed and the CPU to read the values and check for out-of-range values in software.

The SAR is not available in Deep Sleep mode as it requires a high-speed clock (up to 18 MHz). The SAR operating range is 1.71 V to 5.5 V.

**Figure 4. SAR ADC**

### Two Opamps (Continuous-Time Block; CTB)

The PSoC 4100S has two opamps with Comparator modes which allow most common analog functions to be performed on-chip eliminating external components; PGAs, Voltage Buffers, Filters, Trans-Impedance Amplifiers, and other functions can be realized, in some cases with external passives, saving power, cost, and space. The on-chip opamps are designed with enough bandwidth to drive the Sample-and-Hold circuit of the ADC without requiring external buffering.

### Low-power Comparators (LPC)

The PSoC 4100S has a pair of low-power comparators, which can also operate in Deep Sleep modes. This allows the analog system blocks to be disabled while retaining the ability to monitor external voltage levels during low-power modes. The comparator outputs are normally synchronized to avoid metastability unless operating in an asynchronous power mode where the system wake-up circuit is activated by a comparator switch event. The LPC outputs can be routed to pins.

### Current DACs

The PSoC 4100S has two IDACs, which can drive any of the pins on the chip. These IDACs have programmable current ranges.

### Analog Multiplexed Buses

The PSoC 4100S has two concentric independent buses that go around the periphery of the chip. These buses (called amux buses) are connected to firmware-programmable analog switches that allow the chip's internal resources (IDACs, comparator) to connect to any pin on the I/O Ports.

## Programmable Digital Blocks

The Programmable I/O (Smart I/O) block is a fabric of switches and LUTs that allows Boolean functions to be performed in signals being routed to the pins of a GPIO port. The Smart I/O can perform logical operations on input pins to the chip and on signals going out as outputs.

## Fixed Function Digital

### Timer/Counter/PWM (TCPWM) Block

The TCPWM block consists of a 16-bit counter with user-programmable period length. There is a capture register to record the count value at the time of an event (which may be an I/O event), a period register that is used to either stop or auto-reload the counter when its count is equal to the period register, and compare registers to generate compare value signals that are used as PWM duty cycle outputs. The block also provides true and complementary outputs with programmable offset between them to allow use as dead-band programmable complementary PWM outputs. It also has a Kill input to force outputs to a predetermined state; for example, this is used in motor drive systems when an over-current state is indicated and the PWM driving the FETs needs to be shut off immediately with no time for software intervention. There are five TCPWM blocks in the PSoC 4100S.

### Serial Communication Block (SCB)

The PSoC 4100S has three serial communication blocks, which can be programmed to have SPI, I2C, or UART functionality.

**I<sup>2</sup>C Mode:** The hardware I<sup>2</sup>C block implements a full multi-master and slave interface (it is capable of multi-master arbitration). This block is capable of operating at speeds of up to 400 kbps (Fast Mode) and has flexible buffering options to reduce interrupt overhead and latency for the CPU. It also supports EZI<sup>2</sup>C that creates a mailbox address range in the memory of the PSoC 4100S and effectively reduces I<sup>2</sup>C communication to reading from and writing to an array in memory. In addition, the block supports an 8-deep FIFO for receive and transmit which, by increasing the time given for the CPU to read data, greatly reduces the need for clock stretching caused by the CPU not having read data on time.

The I<sup>2</sup>C peripheral is compatible with the I<sup>2</sup>C Standard-mode and Fast-mode devices as defined in the NXP I<sup>2</sup>C-bus specification and user manual (UM10204). The I<sup>2</sup>C bus I/O is implemented with GPIO in open-drain modes.

The PSoC 4100S is not completely compliant with the I<sup>2</sup>C spec in the following respect:

- GPIO cells are not overvoltage tolerant and, therefore, cannot be hot-swapped or powered up independently of the rest of the I<sup>2</sup>C system.

**UART Mode:** This is a full-feature UART operating at up to 1 Mbps. It supports automotive single-wire interface (LIN), infrared interface (IrDA), and SmartCard (ISO7816) protocols, all of which are minor variants of the basic UART protocol. In addition, it supports the 9-bit multiprocessor mode that allows addressing of peripherals connected over common RX and TX lines. Common UART functions such as parity error, break detect, and frame error are supported. An 8-deep FIFO allows much greater CPU service latencies to be tolerated.

**SPI Mode:** The SPI mode supports full Motorola SPI, TI SSP (adds a start pulse used to synchronize SPI Codecs), and National Microwire (half-duplex form of SPI). The SPI block can use the FIFO.

## GPIO

The PSoC 4100S has up to 36 GPIOs. The GPIO block implements the following:

- Eight drive modes:
  - Analog input mode (input and output buffers disabled)
  - Input only
  - Weak pull-up with strong pull-down
  - Strong pull-up with weak pull-down
  - Open drain with strong pull-down
  - Open drain with strong pull-up
  - Strong pull-up with strong pull-down
  - Weak pull-up with weak pull-down
- Input threshold select (CMOS or LVTTL).
- Individual control of input and output buffer enabling/disabling in addition to the drive strength modes
- Selectable slew rates for dV/dt related noise control to improve EMI

The pins are organized in logical entities called ports, which are 8-bit in width (less for Ports 2 and 3). During power-on and reset, the blocks are forced to the disable state so as not to crowbar any inputs and/or cause excess turn-on current. A multiplexing network known as a high-speed I/O matrix is used to multiplex between various signals that may connect to an I/O pin.

Data output and pin state registers store, respectively, the values to be driven on the pins and the states of the pins themselves.

Every I/O pin can generate an interrupt if so enabled and each I/O port has an interrupt request (IRQ) and interrupt service routine (ISR) vector associated with it (5 for PSoC 4100S).

## Special Function Peripherals

### CapSense

CapSense is supported in the PSoC 4100S through a CapSense Sigma-Delta (CSD) block that can be connected to any pins through an analog multiplex bus via analog switches. CapSense function can thus be provided on any available pin or group of pins in a system under software control. A PSoC Creator component is provided for the CapSense block to make it easy for the user.

Shield voltage can be driven on another analog multiplex bus to provide water-tolerance capability. Water tolerance is provided by driving the shield electrode in phase with the sense electrode to keep the shield capacitance from attenuating the sensed input. Proximity sensing can also be implemented.

The CapSense block has two IDACs, which can be used for general purposes if CapSense is not being used (both IDACs are available in that case) or if CapSense is used without water tolerance (one IDAC is available).

The CapSense block also provides a 10-bit Slope ADC function which can be used in conjunction with the CapSense function.

The CapSense block is an advanced, low-noise, programmable block with programmable voltage references and current source ranges for improved sensitivity and flexibility. It can also use an external reference voltage. It has a full-wave CSD mode that alternates sensing to VDDA and ground to null out power-supply related noise.

### LCD Segment Drive

The PSoC 4100S has an LCD controller, which can drive up to 4 commons and up to 32 segments. It uses full digital methods to drive the LCD segments requiring no generation of internal LCD voltages. The two methods used are referred to as Digital Correlation and PWM. Digital Correlation pertains to modulating the frequency and drive levels of the common and segment signals to generate the highest RMS voltage across a segment to light it up or to keep the RMS signal to zero. This method is good for STN displays but may result in reduced contrast with TN (cheaper) displays. PWM pertains to driving the panel with PWM signals to effectively use the capacitance of the panel to provide the integration of the modulated pulse-width to generate the desired LCD voltage. This method results in higher power consumption but can result in better results when driving TN displays. LCD operation is supported during Deep Sleep refreshing a small display buffer (4 bits; 1 32-bit register per port).

## Pinouts

Table 1 provides the pin list for PSoC 4100S for the 48-pin TQFP, 44-pin TQFP, 40-pin QFN, 32-pin QFN, and 35-ball CSP packages. All port pins support GPIO.

**Table 1. Pin List**

| 48-TQFP |           | 44-TQFP |           | 40-QFN |           | 32-QFN |           | 35-CSP |           |
|---------|-----------|---------|-----------|--------|-----------|--------|-----------|--------|-----------|
| Pin     | Name      | Pin     | Name      | Pin    | Name      | Pin    | Name      | Pin    | Name      |

**Note** Pins 11, 15, 26, and 27 are No Connects (NC) on the 48-pin TQFP.

**Descriptions of the Power pins are as follows:**

VDDD: Power supply for the digital section.

VDDA: Power supply for the analog section.

VSSD, VSSA: Ground pins for the digital and analog sections respectively.

VCCD: Regulated digital supply (1.8 V  $\pm$ 5%)

VDD: Power supply to all sections of the chip

VSS: Ground for all sections of the chip

## Alternate Pin Functions

Each Port pin has can be assigned to one of multiple functions; it can, for instance, be an analog I/O, a digital peripheral function, an LCD pin, or a CapSense pin. The pin assignments are shown in [Table 2](#).

**Table 2. Alternate Pin Functions**

| Port/Pin | Analog                                      | Smart I/O         | Alternate Function 1  | Alternate Function 2 | Alternate Function 3 | Deep Sleep 1     | Deep Sleep 2         |
|----------|---------------------------------------------|-------------------|-----------------------|----------------------|----------------------|------------------|----------------------|
| P0.0     | lpcomp.in_p[0]                              |                   |                       |                      | tcpwm.tr_in[0]       | scb[2].i2c_scl:0 | scb[0].spi_select1:0 |
| P0.1     | lpcomp.in_n[0]                              |                   |                       |                      | tcpwm.tr_in[1]       | scb[2].i2c_sda:0 | scb[0].spi_select2:0 |

## Power

The following power system diagram shows the set of power supply pins as implemented for the PSoC 4100S. The system has one regulator in Active mode for the digital circuitry. There is no analog regulator; the analog circuits run directly from the  $V_{DD}$  input.

**Figure 5. Power Supply Connections**

There are two distinct modes of operation. In Mode 1, the supply voltage range is 1.8 V to 5.5 V (unregulated externally; internal regulator operational). In Mode 2, the supply range is 1.8 V  $\pm$ 5% (externally regulated; 1.71 to 1.89, internal regulator bypassed).

### Mode 1: 1.8 V to 5.5 V External Supply

In this mode, the PSoC 4100S is powered by an external power supply that can be anywhere in the range of 1.8 to 5.5 V. This range is also designed for battery-powered operation. For example, the chip can be powered from a battery system that starts at 3.5 V and works down to 1.8 V. In this mode, the internal regulator of the PSoC 4100S supplies the internal logic and its output is connected to the  $V_{CCD}$  pin. The  $V_{CCD}$  pin must be bypassed to ground via an external capacitor (0.1  $\mu$ F; X5R ceramic or better) and must not be connected to anything else.

### Mode 2: 1.8 V $\pm$ 5% External Supply

In this mode, the PSoC 4100S is powered by an external power supply that must be within the range of 1.71 to 1.89 V; note that this range needs to include the power supply ripple too. In this mode, the  $V_{DD}$  and  $V_{CCD}$  pins are shorted together and bypassed. The internal regulator can be disabled in the firmware.

Bypass capacitors must be used from  $V_{DDD}$  to ground. The typical practice for systems in this frequency range is to use a capacitor in the 1- $\mu$ F range, in parallel with a smaller capacitor (0.1  $\mu$ F, for example). Note that these are simply rules of thumb and that, for critical applications, the PCB layout, lead inductance, and the bypass capacitor parasitic should be simulated to design and obtain optimal bypassing.

Figure 6 shows an example of a bypass scheme.

**Figure 6. External Supply Range from 1.8 V to 5.5 V with Internal Regulator Active**

| SID22 | IDD17 | I <sup>2</sup> C wakeup WDT, and Comparators on   | − | 1.7 | 2.2 | mA | 6 MHZ. Max is at 85 °C and 5.5 V.  |
| SID25 | IDD20 | I <sup>2</sup> C wakeup, WDT, and Comparators on. | − | 2.2 | 2.5 |    | 12 MHZ. Max is at 85 °C and 5.5 V. |

**Sleep Mode, V<sub>DDD</sub> = 1.71 V to 1.89 V (Regulator bypassed)**

#### Note

- Usage above the absolute maximum conditions listed in Table 3 may cause permanent damage to the device. Exposure to Absolute Maximum conditions for extended periods of time may affect device reliability. The Maximum Storage Temperature is 150 °C in compliance with JEDEC Standard JESD22-A103, High Temperature Storage Life. When used below Absolute Maximum conditions but above normal operating conditions, the device may not operate to specification.

| SID.TCPWM.4  | TPWM <sub>ENEXT</sub> | Input trigger pulse width           | 2/Fc | –   | –   | ns            | For all trigger events <sup>[6]</sup>                                                        |
| SID.TCPWM.5  | TPWM <sub>EXT</sub>   | Output trigger pulse widths         | 2/Fc | –   | –   |               | Minimum possible width of Overflow, Underflow, and CC (Counter equals Compare value) outputs |
| SID.TCPWM.5A | TC <sub>RES</sub>     | Resolution of counter               | 1/Fc | –   | –   |               | Minimum time between successive counts                                                       |
| SID.TCPWM.5B | PWM <sub>RES</sub>    | PWM resolution                      | 1/Fc | –   | –   |               | Minimum pulse width of PWM Output                                                            |
| SID.TCPWM.5C | Q <sub>RES</sub>      | Quadrature inputs resolution        | 1/Fc | –   | –   |               | Minimum pulse width between Quadrature phase inputs                                          |

## I<sup>2</sup>C

**Table 18. Fixed I<sup>2</sup>C DC Specifications<sup>[7]</sup>**

| Spec ID | Parameter         | Description                                 | Min | Typ | Max | Unit          | Details/Conditions |
|---------|-------------------|---------------------------------------------|-----|-----|-----|---------------|--------------------|
| SID149  | I <sub>I2C1</sub> | Block current consumption at 100 kHz        | –   | –   | 50  | $\mu\text{A}$ | –                  |
| SID150  | I <sub>I2C2</sub> | Block current consumption at 400 kHz        | –   | –   | 135 |               | –                  |
| SID151  | I <sub>I2C3</sub> | Block current consumption at 1 Mbps         | –   | –   | 310 |               | –                  |
| SID152  | I <sub>I2C4</sub> | I <sup>2</sup> C enabled in Deep Sleep mode | –   | –   | 1.4 |               | –                  |

**Table 19. Fixed I<sup>2</sup>C AC Specifications<sup>[7]</sup>**

| Spec ID | Parameter         | Description | Min | Typ | Max | Unit | Details/Conditions |
|---------|-------------------|-------------|-----|-----|-----|------|--------------------|
| SID153  | F <sub>I2C1</sub> | Bit rate    | –   | –   | 1   | Mbps | –                  |

**Table 20. SPI DC Specifications<sup>[7]</sup>**

| Spec ID | Parameter | Description                         | Min | Typ | Max | Unit          | Details/Conditions |
|---------|-----------|-------------------------------------|-----|-----|-----|---------------|--------------------|
| SID163  | ISPI1     | Block current consumption at 1 Mbps | –   | –   | 360 | $\mu\text{A}$ | –                  |
| SID164  | ISPI2     | Block current consumption at 4 Mbps | –   | –   | 560 |               | –                  |
| SID165  | ISPI3     | Block current consumption at 8 Mbps | –   | –   | 600 |               | –                  |

### Notes

6. Trigger events can be Stop, Start, Reload, Count, Capture, or Kill depending on which mode of operation is selected.
7. Guaranteed by characterization.

**Table 21. SPI AC Specifications<sup>[8]</sup>**

| SID190 <sup>[10]</sup> | V <sub>FALLPPOR</sub>  | BOD trip voltage in active and sleep modes | 1.48 | –   | 1.62 | V    | –                  |
| SID192 <sup>[10]</sup> | V <sub>FALLDPSLP</sub> | BOD trip voltage in Deep Sleep             | 1.11 | –   | 1.5  |      | –                  |

### Notes

9. It can take as much as 20 milliseconds to write to Flash. During this time the device should not be Reset, or Flash operations will be interrupted and cannot be relied on to have completed. Reset sources include the XRES pin, software resets, CPU lockup states and privilege violations, improper power supply levels, and watchdogs. Make certain that these are not inadvertently activated.

10. Guaranteed by characterization.

### SWD Interface

**Table 30. SWD Interface Specifications**

| Spec ID                 | Parameter    | Description                                   | Min    | Typ | Max   | Unit | Details/Conditions                |
|-------------------------|--------------|-----------------------------------------------|--------|-----|-------|------|-----------------------------------|
| SID213                  | F_SWDCCLK1   | $3.3\text{ V} \leq V_{DD} \leq 5.5\text{ V}$  | –      | –   | 14    | MHz  | SWDCCLK ≤ 1/3 CPU clock frequency |

The following is an example of a part number.

Example

## Packaging

The PSoC 4100S will be offered in 48-pin TQFP, 44-pin TQFP, 40-pin QFN, 32-pin QFN, and 35-ball WLCSP packages.

Table 39 provides the package dimensions and Cypress drawing numbers.

**Table 39. Package List**

| Spec ID | Package       | Description                                   | Package Dwg |
|---------|---------------|-----------------------------------------------|-------------|
| BID20   | 48-pin TQFP   | 7 × 7 × 1.4-mm height with 0.5-mm pitch       | 51-85135    |
| BID20A  | 44-pin TQFP   | 10 × 10 × 1.6-mm height with 0.8-mm pitch     | 51-85064    |
| BID27   | 40-pin QFN    | 6 × 6 × 0.6-mm height with 0.5-mm pitch       | 001-80659   |
| BID34A  | 32-pin QFN    | 5 × 5 × 0.6-mm height with 0.5-mm pitch       | 001-42168   |
| BID34D  | 35-ball WLCSP | 2.6 × 2.1 × 0.48-mm height with 0.35-mm pitch | 002-09958   |

**Table 40. Package Thermal Characteristics**

| Parameter       | Description                    | Package       | Min | Typ  | Max | Unit    | Details/Conditions |
|-----------------|--------------------------------|---------------|-----|------|-----|---------|--------------------|
| T <sub>A</sub>  | Operating ambient temperature  | –             | –40 | 25   | 85  | °C      | –                  |
| T <sub>J</sub>  | Operating junction temperature | –             | –40 | –    | 100 |         | –                  |
| T <sub>JA</sub> | Package θ <sub>JA</sub>        | 48-pin TQFP   | –   | 74.8 | –   | °C/Watt | –                  |
| T <sub>JC</sub> | Package θ <sub>JC</sub>        | 48-pin TQFP   | –   | 35.7 | –   |         | –                  |
| T <sub>JA</sub> | Package θ <sub>JA</sub>        | 44-pin TQFP   | –   | 57.2 | –   |         | –                  |
| T <sub>JC</sub> | Package θ <sub>JC</sub>        | 44-pin TQFP   | –   | 17.5 | –   |         | –                  |
| T <sub>JA</sub> | Package θ <sub>JA</sub>        | 40-pin QFN    | –   | 17.8 | –   |         | –                  |
| T <sub>JC</sub> | Package θ <sub>JC</sub>        | 40-pin QFN    | –   | 2.8  | –   |         | –                  |
| T <sub>JA</sub> | Package θ <sub>JA</sub>        | 32-pin QFN    | –   | 19.9 | –   |         | –                  |
| T <sub>JC</sub> | Package θ <sub>JC</sub>        | 32-pin QFN    | –   | 4.3  | –   |         | –                  |
| T <sub>JA</sub> | Package θ <sub>JA</sub>        | 35-ball WLCSP | –   | 43   | –   |         | –                  |
| T <sub>JC</sub> | Package θ <sub>JC</sub>        | 35-ball WLCSP | –   | 0.3  | –   |         | –                  |

**Table 41. Solder Reflow Peak Temperature**

| Package | Maximum Peak Temperature | Maximum Time at Peak Temperature |
|---------|--------------------------|----------------------------------|
| All     | 260 °C                   | 30 seconds                       |

**Table 42. Package Moisture Sensitivity Level (MSL), IPC/JEDEC J-STD-020**

| Package          | MSL   |
|------------------|-------|
| All except WLCSP | MSL 3 |
| 35-ball WLCSP    | MSL 1 |

**Package Diagrams**
**Figure 7. 48-pin TQFP Package Outline**

DIMENSIONS ARE IN MILLIMETERS

51-85135 °C

**Figure 8. 44-pin TQFP Package Outline**

NOTE:

1. JEDEC STD REF MS-026
2. BODY LENGTH DIMENSION DOES NOT INCLUDE MOLD PROTRUSION/END FLASH  
MOLD PROTRUSION/END FLASH SHALL NOT EXCEED 0.0098 in (0.25 mm) PER SIDE  
BODY LENGTH DIMENSIONS ARE MAX PLASTIC BODY SIZE INCLUDING MOLD MISMATCH
3. DIMENSIONS IN MILLIMETERS

51-85064 °G

**Figure 9. 40-pin QFN Package Outline**

**NOTES:**

1.  HATCH AREA IS SOLDERABLE EXPOSED PAD
2. REFERENCE JEDEC # MO-248
3. PACKAGE WEIGHT: 68 ±2 mg
4. ALL DIMENSIONS ARE IN MILLIMETERS

001-80659 \*A

**Table 43. Acronyms Used in this Document** *(continued)*

| Acronym | Description                                                  |
|---------|--------------------------------------------------------------|
| PC      | program counter                                              |
| PCB     | printed circuit board                                        |
| PGA     | programmable gain amplifier                                  |
| PHUB    | peripheral hub                                               |
| PHY     | physical layer                                               |
| PICU    | port interrupt control unit                                  |
| PLA     | programmable logic array                                     |
| PLD     | programmable logic device, see also PAL                      |
| PLL     | phase-locked loop                                            |
| PMDD    | package material declaration data sheet                      |
| POR     | power-on reset                                               |
| PRES    | precise power-on reset                                       |
| PRS     | pseudo random sequence                                       |
| PS      | port read data register                                      |
| PSoC®   | Programmable System-on-Chip™                                 |
| PSRR    | power supply rejection ratio                                 |
| PWM     | pulse-width modulator                                        |
| RAM     | random-access memory                                         |
| RISC    | reduced-instruction-set computing                            |
| RMS     | root-mean-square                                             |
| RTC     | real-time clock                                              |
| RTL     | register transfer language                                   |
| RTR     | remote transmission request                                  |
| RX      | receive                                                      |
| SAR     | successive approximation register                            |
| SC/CT   | switched capacitor/continuous time                           |
| SCL     | I <sup>2</sup> C serial clock                                |
| SDA     | I <sup>2</sup> C serial data                                 |
| S/H     | sample and hold                                              |
| SINAD   | signal to noise and distortion ratio                         |
| SIO     | special input/output, GPIO with advanced features. See GPIO. |
| SOC     | start of conversion                                          |
| SOF     | start of frame                                               |
| SPI     | Serial Peripheral Interface, a communications protocol       |
| SR      | slew rate                                                    |
| SRAM    | static random access memory                                  |
| SRES    | software reset                                               |
| SWD     | serial wire debug, a test protocol                           |

**Table 43. Acronyms Used in this Document** *(continued)*

| Acronym | Description                                                            |
|---------|------------------------------------------------------------------------|
| SWV     | single-wire viewer                                                     |
| TD      | transaction descriptor, see also DMA                                   |
| THD     | total harmonic distortion                                              |
| TIA     | transimpedance amplifier                                               |
| TRM     | technical reference manual                                             |
| TTL     | transistor-transistor logic                                            |
| TX      | transmit                                                               |
| UART    | Universal Asynchronous Transmitter Receiver, a communications protocol |
| UDB     | universal digital block                                                |
| USB     | Universal Serial Bus                                                   |
| USBIO   | USB input/output, PSoC pins used to connect to a USB port              |
| VDAC    | voltage DAC, see also DAC, IDAC                                        |
| WDT     | watchdog timer                                                         |
| WOL     | write once latch, see also NVL                                         |
| WRES    | watchdog timer reset                                                   |
| XRES    | external reset I/O pin                                                 |
| XTAL    | crystal                                                                |

### Units of Measure

**Table 44. Units of Measure**

| Symbol | Unit of Measure        |
|--------|------------------------|
| °C     | degrees Celsius        |
| dB     | decibel                |
| fF     | femto farad            |
| Hz     | hertz                  |
| KB     | 1024 bytes             |
| kbps   | kilobits per second    |
| Khr    | kilohour               |
| kHz    | kilohertz              |
| kΩ     | kilo ohm               |
| ksps   | kilosamples per second |
| LSB    | least significant bit  |
| Mbps   | megabits per second    |
| MHz    | megahertz              |
| MΩ     | mega-ohm               |
| Msps   | megasamples per second |
| μA     | microampere            |
| μF     | microfarad             |
| μH     | microhenry             |
| μs     | microsecond            |
| μV     | microvolt              |
| μW     | microwatt              |
| mA     | milliampere            |
| ms     | millisecond            |
| mV     | millivolt              |
| nA     | nanoampere             |
| ns     | nanosecond             |
| nV     | nanovolt               |
| Ω      | ohm                    |
| pF     | picofarad              |
| ppm    | parts per million      |
| ps     | picosecond             |
| s      | second                 |
| sps    | samples per second     |
| sqrtHz | square root of hertz   |
| V      | volt                   |

This document, including any software or firmware included or referenced in this document ("Software"), is owned by Cypress under the intellectual property laws and treaties of the United States and other countries worldwide. Cypress reserves all rights under such laws and treaties and does not, except as specifically stated in this paragraph, grant any license under its patents, copyrights, trademarks, or other intellectual property rights. If the Software is not accompanied by a license agreement and you do not otherwise have a written agreement with Cypress governing the use of the Software, then Cypress hereby grants you a personal, non-exclusive, nontransferable license (without the right to sublicense) (1) under its copyright rights in the Software (a) for Software provided in source code form, to modify and reproduce the Software solely for use with Cypress hardware products, only internally within your organization, and (b) to distribute the Software in binary code form externally to end users (either directly or indirectly through resellers and distributors), solely for use on Cypress hardware product units, and (2) under those claims of Cypress's patents that are infringed by the Software (as provided by Cypress, unmodified) to make, use, distribute, and import the Software solely for use with Cypress hardware products. Any other use, reproduction, modification, translation, or compilation of the Software is prohibited.

TO THE EXTENT PERMITTED BY APPLICABLE LAW, CYPRESS MAKES NO WARRANTY OF ANY KIND, EXPRESS OR IMPLIED, WITH REGARD TO THIS DOCUMENT OR ANY SOFTWARE OR ACCOMPANYING HARDWARE, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. No computing device can be absolutely secure. Therefore, despite security measures implemented in Cypress hardware or software products, Cypress does not assume any liability arising out of any security breach, such as unauthorized access to or use of a Cypress product. In addition, the products described in these materials may contain design defects or errors known as errata which may cause the product to deviate from published specifications. To the extent permitted by applicable law, Cypress reserves the right to make changes to this document without further notice. Cypress does not assume any liability arising out of the application or use of any product or circuit described in this document. Any information provided in this document, including any sample design information or programming code, is provided only for reference purposes. It is the responsibility of the user of this document to properly design, program, and test the functionality and safety of any application made of this information and any resulting product. Cypress products are not designed, intended, or authorized for use as critical components in systems designed or intended for the operation of weapons, weapons systems, nuclear installations, life-support devices or systems, other medical devices or systems (including resuscitation equipment and surgical implants), pollution control or hazardous substances management, or other uses where the failure of the device or system could cause personal injury, death, or property damage ("Unintended Uses"). A critical component is any component of a device or system whose failure to perform can be reasonably expected to cause the failure of the device or system, or to affect its safety or effectiveness. Cypress is not liable, in whole or in part, and you shall and hereby do release Cypress from any claim, damage, or other liability arising from or related to all Unintended Uses of Cypress products. You shall indemnify and hold Cypress harmless from and against all claims, costs, damages, and other liabilities, including claims for personal injury or death, arising from or related to any Unintended Uses of Cypress products.

## Данный компонент на территории Российской Федерации

**Вы можете приобрести в компании MosChip.**

Для оперативного оформления запроса Вам необходимо перейти по данной ссылке:

<http://moschip.ru/get-element>

Вы можете разместить у нас заказ для любого Вашего проекта, будь то серийное производство или разработка единичного прибора.

В нашем ассортименте представлены ведущие мировые производители активных и пассивных электронных компонентов.

Нашей специализацией является поставка электронной компонентной базы двойного назначения, продукции таких производителей как XILINX, Intel (ex.ALTERA), Vicor, Microchip, Texas Instruments, Analog Devices, Mini-Circuits, Amphenol, Glenair.

Сотрудничество с глобальными дистрибьюторами электронных компонентов, предоставляет возможность заказывать и получать с международных складов практически любой перечень компонентов в оптимальные для Вас сроки.

На всех этапах разработки и производства наши партнеры могут получить квалифицированную поддержку опытных инженеров.

Система менеджмента качества компании отвечает требованиям в соответствии с ГОСТ Р ИСО 9001, ГОСТ РВ 0015-002 и ЭС РД 009
