

---

The following document contains information on Cypress products. Although the document is marked with the name "Spansion" and "Fujitsu", the company that originally developed the specification, Cypress will continue to offer these products to new and existing customers.

#### **Continuity of Specifications**

There is no change to this document as a result of offering the device as a Cypress product. Any changes that have been made are the result of normal document improvements and are noted in the document history page, where supported. Future revisions will occur when appropriate, and changes will be noted in a document history page.

#### **Continuity of Ordering Part Numbers**

Cypress continues to support existing part numbers. To order these products, please use only the Ordering Part Numbers listed in this document.

#### **For More Information**

Please contact your local sales office for additional information about Cypress products and solutions.

#### **About Cypress**

Cypress (NASDAQ: CY) delivers high-performance, high-quality solutions at the heart of today's most advanced embedded systems, from automotive, industrial and networking platforms to highly interactive consumer and mobile devices. With a broad, differentiated product portfolio that includes NOR flash memories, F-RAM™ and SRAM, Traveo™ microcontrollers, the industry's only PSoC® programmable system-on-chip solutions, analog and PMIC Power Management ICs, CapSense® capacitive touch-sensing controllers, and Wireless BLE Bluetooth® Low-Energy and USB connectivity solutions, Cypress is committed to providing its customers worldwide with consistent innovation, best-in-class support and exceptional system value.

## F<sup>2</sup>MC-16LX MB90920 Series

**MB90F922NC/F922NCS/922NCS/F923NC/F923NCS/  
MB90F924NC/F924NCS/V920-101/V920-102**

### ■ DESCRIPTION

The MB90920 series is a family of general-purpose FUJITSU SEMICONDUCTOR 16-bit microcontrollers designed for applications such as vehicle instrument panel control.

The instruction set retains the AT architecture from the F<sup>2</sup>MC-8L and F<sup>2</sup>MC-16LX families, with further refinements including high-level language instructions, extended addressing modes, improved multiplication and division operations (signed), and bit processing. In addition, long word processing is made possible by the inclusion of a built-in 32-bit accumulator.

Note : F<sup>2</sup>MC is the abbreviation of FUJITSU Flexible Microcontroller.

### ■ FEATURES

- Clock  
Built-in PLL clock frequency multiplication circuit.  
Selection of machine clocks (PLL clocks) is allowed among frequency division by two on oscillation clock, and multiplication of 1 to 8 times of oscillation clock (for 4 MHz oscillation clock, 4 MHz to 32 MHz).  
Operation by sub clock (up to 50 kHz : 100 kHz oscillation clock divided by two) is allowed.
- 16-bit input capture (8 channels)  
Detects rising, falling, or both edges.  
16-bit capture register × 8  
The value of a 16-bit free-run timer counter is latched upon detection of an edge input to pin and an interrupt request is generated.

# MB90920 Series

(Continued)

- 16-bit reload timer (4 channels)  
16-bit reload timer operation (select toggle output or one-shot output)  
Selectable event count function
- Real time watch timer (main clock)  
Operates directly from oscillator clock.  
Interrupt can be generated by second/minute/hour/date counter overflow.
- PPG timer (6 channels)  
Output pins (3 channels), external trigger input pin (1 channel)  
Operation clock frequencies :  $f_{CP}$ ,  $f_{CP}/2^2$ ,  $f_{CP}/2^4$ ,  $f_{CP}/2^6$
- Delay interrupt  
Generates interrupt for task switching.  
Interrupts to CPU can be generated/cleared by software setting.
- External interrupts (8 channels)  
8-channel independent operation  
Interrupt source setting available : “L” to “H” edge/ “H” to “L” edge/ “L” level/ “H” level.
- 8/10-bit A/D converter (8 channels)  
Conversion time : 3  $\mu$ s (at  $f_{CP} = 32$  MHz)  
External trigger activation available (P50/INT0/ADTG)  
Internal timer activation available (16-bit reload timer 1)
- UART(LIN/SCI) (4 channels)  
Equipped with full duplex double buffer  
Clock-asynchronous or clock-synchronous serial transfer is available
- CAN interface (4 channels : CAN0 and CAN2, and CAN1 and CAN3 share transmission and reception pins, and interrupt control registers).  
Conforms to CAN specifications version 2.0 Part A and B.  
Automatic resend in case of error.  
Automatic transfer in response to remote frame.  
16 prioritized message buffers for data and ID  
Multiple message support  
Flexible configuration for receive filter : Full bit compare/full bit mask/two partial bit masks  
Supports up to 1 Mbps  
CAN wakeup function (RX connected to INT0 internally)
- LCD controller/driver (32 segment x 4 common)  
Segment driver and command driver with direct LCD panel (display) drive capability
- Reset on detection of low voltage/program loop  
Automatic reset when low voltage is detected  
Program looping detection function
- Stepping motor controller (4 channels)  
High current output for each channel  $\times 4$   
Synchronized 8/10-bit PWM for each channel  $\times 2$
- Sound generator (2 channels)  
8-bit PWM signal mixed with tone frequency from 8-bit reload counter.  
PWM frequencies : 125 kHz, 62.5 kHz, 31.2 kHz, 15.6 kHz (at  $f_{CP} = 32$  MHz)  
Tone frequencies : PWM frequency /2/ , divided by (reload frequency +1)
- Input/output ports  
General-purpose input/output port (CMOS output) 93 ports
- Function for port input level selection  
Automotive/CMOS-Schmitt
- Flash memory security function  
Protects the contents of Flash memory (Flash memory product only)

## ■ HANDLING DEVICES

- **Strictly observe maximum rated voltages (preventing latch-up)**

In CMOS IC devices, a condition known as latch-up may occur if voltages higher than  $V_{CC}$  or lower than  $V_{SS}$  are applied to input or output pins other than medium or high withstand voltage pins, or if the voltage applied between  $V_{CC}$  and  $V_{SS}$  pins exceeds the rated voltage level. If a latch-up occurs, the power supply current may increase dramatically and may destroy semiconductor elements. When using semiconductor devices, always take sufficient care to avoid exceeding maximum ratings.

When the analog system power supply is switched on or off, be careful not to apply the analog power supply ( $AV_{CC}$ ,  $AV_{RH}$ ), the analog input voltages and the power supply voltage for the high current output buffer pins ( $DV_{CC}$ ) in excess of the digital power supply voltage ( $V_{CC}$ ).

Once the digital power supply voltage ( $V_{CC}$ ) has been disconnected, the analog power supply ( $AV_{CC}$ ,  $AV_{RH}$ ) and the power supply voltage for the high current output buffer pins ( $DV_{CC}$ ) may be turned on in any sequence.

- **Supply voltage stabilization**

Rapid fluctuations in the power supply voltage can cause malfunctions even if the  $V_{CC}$  power supply voltage remains within the warranted operating range. It is recommended that the power supply be stabilized such that ripple fluctuations (P-P value) at commercial frequencies (50 Hz/60 Hz) be limited to within 10% of the standard  $V_{CC}$  value, and that transient fluctuations due to power supply switching, etc. be limited to a rate of 0.1 V/ms or less.

- **Precautions when turning the power on**

In order to prevent the built-in step-down circuits from malfunctioning, the time taken for the voltage to rise (0.2 V to 2.7 V) during power-on should be less than 50  $\mu$ s.

- **Handling unused pins**

If unused input pins are left open, they may cause malfunctions or latch-up which may lead to permanent damage to the semiconductor. Unused input pins should therefore be pulled up or pulled down through a resistor of at least 2 k $\Omega$ .

Unused input/output pins may be set to the output state and left open, or set to the input state and connected to a pull-up or pull-down resistance of 2 k $\Omega$  or more.

- **Handling A/D converter power supply pins**

Even if the A/D converter is not used, the power supply pins should be connected such as  $AV_{CC} = V_{CC}$ , and  $AV_{SS} = AVR_{H} = V_{SS}$ .

- **Notes on using an external clock**

Even when an external clock is used, an oscillation stabilization wait time is required following power-on reset or release from sub clock mode or stop mode. Furthermore, only the X0A pin should be driven when an external clock is used, with the X1A pin open as shown in the following diagram. Do not use high-speed oscillation pins (X0 and X1) for external clock input.

Sample external clock connection

## • Notes on operating in PLL clock mode

On this microcontroller, if in case the crystal oscillator breaks off or an external reference clock input stops while the PLL clock mode is selected, a self-oscillator circuit contained in the PLL may continue its operation at its self-running frequency. However, FUJITSU SEMICONDUCTOR will not guarantee results of operations if such failure occurs.

## • Crystal oscillator circuit

Noise around the X0/X1, or X0A/X1A pins may cause this device to operate abnormally. In the interest of stable operation it is strongly recommended that printed circuit artwork places ground bypass capacitors as close as possible to the X0/X1, X0A/X1A and crystal oscillator (or ceramic oscillator) and that oscillator lines do not cross the lines of other circuits.

Please ask each crystal maker to evaluate the oscillational characteristics of the crystal and this device.

## • Power supply pins

Devices including multiple VCC or VSS pins are designed such that pins that need to be at the same potential are interconnected internally to prevent malfunctions such as latch-up. To reduce unnecessary radiation, prevent malfunctioning of the strobe signal due to the rise of ground level, and observe the standard for total output current, be sure to connect the VCC and VSS pins to the power supply and ground externally.

Always connect all of the VCC pins to the same potential and all of the VSS pins to ground as shown in the following diagram. The device will not operate correctly if multiple VCC or VSS pins are connected to different voltages, even if those voltages are within the guaranteed operating ranges.

In addition, care must be given to connecting the VCC and VSS pins of this device to the current supply source with as low impedance as possible. It is recommended that a 1.0  $\mu\text{F}$  bypass capacitor be connected between the VCC and VSS pins as close to the pins as possible.

## • Sequence for connecting the A/D converter power supply and analog inputs

The A/D converter power supply ( $AV_{CC}$ ,  $AVRH$ ) and analog inputs ( $AN0$  to  $AN7$ ) must be applied after the digital power supply ( $V_{CC}$ ) is switched on. When turning the power off, the A/D converter power supply and analog inputs must be disconnected before the digital power supply is switched off ( $V_{CC}$ ). Ensure that  $AVRH$  does not exceed  $AV_{CC}$  during either power-on or power-off. Even when pins which double as analog input pins are used as input ports, be sure that the input voltage does not exceed  $AV_{CC}$  (turning on/off the analog and digital power supplies simultaneously is acceptable).

- **Handling the power supply for high-current output buffer pins ( $DV_{CC}$ ,  $DV_{SS}$ )**

- **Flash memory products and MASK ROM products (MB90F922NC/F922NCS/922NCS/F923NC/F923NCS/F924NC/F924NCS)**

In the Flash memory products and MASK ROM products, the power supply for the high-current output buffer pins ( $DV_{CC}$ ,  $DV_{SS}$ ) is isolated from the digital power supply ( $V_{CC}$ ).

Therefore,  $DV_{CC}$  can therefore be set to a higher voltage than  $V_{CC}$ . If the power supply for the high-current output buffer pins ( $DV_{CC}$ ,  $DV_{SS}$ ) is supplied before the digital power supply ( $V_{CC}$ ), however, care needs to be taken because it is possible that the port 7 or port 8 stepping motor outputs may momentarily output an “H” or “L” level. In order to prevent this, connect the digital power supply ( $V_{CC}$ ) prior to connecting the power supply for the high-current output buffer pins. Even when the high-current output buffer pins are used as general-purpose ports, power should be supplied to the power supply pins for the high-current output buffer pins ( $DV_{CC}$ ,  $DV_{SS}$ ).

- **Evaluation product (MB90V920-101/MB90V920-102)**

In the evaluation products, the power supply for the high-current output buffer pins ( $DV_{CC}$ ,  $DV_{SS}$ ) is not isolated from the digital power supply ( $V_{CC}$ ). Therefore,  $DV_{CC}$  must therefore be set to a lower voltage than  $V_{CC}$ . The power supply for the high-current output buffer pins ( $DV_{CC}$ ,  $DV_{SS}$ ) must always be applied after the digital power supply ( $V_{CC}$ ) has been connected, and disconnected before the digital power supply ( $V_{CC}$ ) is disconnected (the power supply for the high-current output buffer pins may also be connected and disconnected simultaneously with the digital power supply).

Even when the high-current output buffer pins are used as general-purpose ports, power should be supplied to the power supply pins for the high-current output buffer pins ( $DV_{CC}$ ,  $DV_{SS}$ ).

- **Pull-up/pull-down resistors**

MB90920 series does not support internal pull-up/pull-down resistors. Use external components as necessary.

- **Precautions when not using a sub clock signal**

If the X0A and X1A pins are not connected to an oscillator, apply a pull-down resistance to the X0A pin and leave the X1A pin open.

- **Notes on operating when the external clock is stopped**

The MB90920 series is not guaranteed to operate correctly using the internal oscillator circuit when there is no external oscillator or the external clock input is stopped.

- **Flash memory security function**

A security bit is located within the Flash memory region. The security function is activated by writing the protection code 01<sub>H</sub> to the security bit.

Do not write the value 01<sub>H</sub> to this address if you are not using the security function.

Please refer to following table for the address of the security bit.

|                           | Flash memory size             | Address for security bit |
|---------------------------|-------------------------------|--------------------------|
| MB90F922NC<br>MB90F922NCS | Built-in 2 Mbits Flash Memory | FC0001 <sub>H</sub>      |
| MB90F923NCS               | Built-in 3 Mbits Flash Memory | F80001 <sub>H</sub>      |
| MB90F924NCS               | Built-in 4 Mbits Flash Memory | F80001 <sub>H</sub>      |

- **Serial communication**

In serial communication, reception of wrong data may occur due to noise or other causes. Therefore, design a printed circuit board to prevent noise from occurring. Taking account of the reception of wrong data, detect errors by measures such as adding a checksum to the end of data. If an error is detected, retransmit the data.

- **Characteristic difference between flash device and MASK ROM device**

In the flash device and the MASK ROM device, the electrical characteristic including current consumption, ESD, latch-up, the noise characteristic, and oscillation characteristic, etc. is different according to the difference between the chip layout and the memory structure.

Reconfirm the electrical characteristic when the product is replaced by another product of the same series.

# MB90920 Series

## MEMORY MAP

| Parts No.                 | ROM (Flash) capacitance | RAM capacitance | Address #1 | Address #2 | Address #3 |
|---------------------------|-------------------------|-----------------|------------|------------|------------|
| MB90F922NC/F922NCS/922NCS | 256 Kbytes              | 10 Kbytes       | FC000H     | 00400H     | 002900H    |
| MB90F923NC/F923NCS        | 384 Kbytes              | 16 Kbytes       | FA000H     | 004A0H     | 003700H    |
| MB90F924NC/F924NCS        | 512 Kbytes              | 24 Kbytes       | F8000H     | 006A0H     | 003700H    |

\* : Evaluation products do not contain internal ROM. Treat this address as the ROM decode area used by the tools.

Note: To select models without the ROM mirror function, refer to the “ROM Mirror Function Selection Module” in Hardware Manual. The image of the ROM data in the FF bank appears at the top of the 00 bank, in order to enable efficient use of small C compiler models. The lower 16-bits of the FF bank addresses are allocated to the same addresses as the lower 16-bits of the 00 bank, making it possible to reference tables in ROM without declaring the “far” modifier with the pointers. For example, when an access is made to the address 00C00H, the actual address to be accessed is FFC00H in ROM. Because the size of the FF bank ROM area exceeds 32 Kbytes, it is not possible to view the entire region in the 00 bank image. Therefore because the ROM data from FF800H to FFFFFFFH appears in the image from 00800H to 00FFFFH, it is recommended that ROM data tables be stored in the area from FF800H to FFFFFFFH.

## ■ I/O MAP

| Address           | Register name                      | Symbol | Read/write | Resource name | Initial value           |

## ■ CAN CONTROLLERS

The CAN controller has the following features :

- Conforms to CAN Specification Version 2.0 Part A and B
  - Supports transmission/reception in standard frame and extended frame formats
- Supports transmission of data frames by receiving remote frames
- 16 transmission/reception message buffers
  - 29-bit ID and 8-byte data
  - Multi-level message buffer configuration
- Provides full-bit comparison, full-bit mask, acceptance register 0/acceptance register 1 for each message buffer as ID acceptance mask
  - 2 acceptance mask registers in either standard frame format or extended frame formats
- Bit rate programmable from 10 kbps to 2 Mbps (when input clock is at 16 MHz)

◎ : Usable, and has expanded intelligent I/O services (EI<sup>2</sup>OS) stop function

○ : Usable

△ : Usable when interrupt sources sharing ICR are not in use

×

\*1 : • Peripheral functions that share the ICR register have the same interrupt level.

• If the expanded intelligent I/O service (EI<sup>2</sup>OS) is used with peripheral functions that share the ICR register, only one of the peripheral functions that share the register can be used.

• When the expanded intelligent I/O service (EI<sup>2</sup>OS) is specified for one of the peripheral functions that shares the ICR register, interrupts cannot be used from the other peripheral functions that share the register.

\*2 : Priority applies when interrupts of the same level are generated.

| Power consumption                      | P <sub>D</sub>         | —                     | 625                   | mW   |                                       |
| Operating temperature                  | T <sub>A</sub>         | - 40                  | + 105                 | °C   |                                       |
| Storage temperature                    | T <sub>STG</sub>       | - 55                  | + 150                 | °C   |                                       |

\*1 : The parameter is based on V<sub>SS</sub> = AV<sub>SS</sub> = DV<sub>SS</sub> = 0.0 V.

\*2 : AV<sub>CC</sub>, AVRH must not exceed V<sub>CC</sub>, and AVRH must not exceed AV<sub>CC</sub>.

When using an evaluation product, DV<sub>CC</sub> must not exceed V<sub>CC</sub> (however, DV<sub>CC</sub> can be set to a higher voltage than V<sub>CC</sub> when using a Flash memory product).

\*3 : If the input current or the maximum input current is limited using external components, I<sub>CLAMP</sub> is the applicable rating instead of V<sub>I</sub>.

\*4 : Maximum output current is defined as the peak value of current through any one of the corresponding pins.

(Continued)

# MB90920 Series

(Continued)

- \*5 : Average output current is defined as the average value of the current flowing through any one of the corresponding pins within a period of 100 ms. The “average value” can be calculated by multiplying the “operating current” by the “operating factor”.
- \*6 : Average total output current is defined as the average value of the current flowing through all of the corresponding pins within a period of 100 ms. The “average value” can be calculated by multiplying the “operating current” by the “operating factor”.
- \*7 :
  - Applicable to pins: P10 to P15, P50 to P57, P60 to P67, P70 to P77, P80 to P87, PC0 to PC7, PD0 to PD6, PE0 to PE2
  - Use within recommended operating conditions.
  - Use at DC voltage (current) .
  - The +B signal should always be applied with a limiting resistance placed between the +B signal and the microcontroller.
  - The value of the limiting resistance should be set so that when the +B signal is applied, the input current to the microcontroller pin does not exceed rated values, either instantaneously or for prolonged periods.
  - Note that when the microcontroller drive current is low, such as in the power saving modes, the +B input potential may pass through the protective diode and increase the potential at the V<sub>CC</sub> pin, and this may affect other devices.
  - Note that if a +B signal is input when the microcontroller power supply is off (not fixed at 0 V) , the microcontroller may partially malfunction on power supplied through the +B signal pin.
  - Note that if the +B input is applied during power-on, the power supply voltage may reach a level such that the power-on reset does not function due to the power supplied from the +B signal.
  - Care must be taken not to leave +B input pins open.
  - Note that analog system input/output pins (LCD drive pins, comparator input pins, etc.) cannot accept +B signal inputs.
  - Sample recommended circuit :

**WARNING:** Semiconductor devices can be permanently damaged by application of stress (voltage, current, temperature, etc.) in excess of absolute maximum ratings. Do not exceed these ratings.

## 2. Recommended Operating Conditions

( $V_{SS} = DV_{SS} = AV_{SS} = 0.0\text{ V}$ )

| Parameter             | Symbol                 | Value |      | Unit               | Remarks  |
|-----------------------|------------------------|-------|------|--------------------|--|
|                       |                        | Min   | Max  |                    |  |
| Power supply voltage  | $V_{CC}$               | 4.0   | 5.5  | V                  | The low voltage detection reset operates when the power supply voltage reaches $4.2\text{ V} \pm 0.2\text{ V}$ .   |
|                       | $AV_{CC}$<br>$DV_{CC}$ | 4.4   | 5.5  | V                  | Maintain stop operation status<br>The low voltage detection reset operates when the power supply voltage reaches $4.2\text{ V} \pm 0.2\text{ V}$ .   |
| Smoothing capacitor*  | $C_s$                  | 0.1   | 1.0  | $\mu\text{F}$      | Use a ceramic capacitor or other capacitor of equivalent frequency characteristics. Use a capacitor with a capacitance greater than this capacitor as the bypass capacitor for the $V_{CC}$ pin. |
| Operating temperature | $T_A$                  | -40   | +105 | $^{\circ}\text{C}$ |  |

\* : Refer to the following diagram for details on the connection of the smoothing capacitor  $C_s$ .

**WARNING:** The recommended operating conditions are required in order to ensure the normal operation of the semiconductor device. All of the device's electrical characteristics are warranted when the device is operated within these ranges.

Always use semiconductor devices within their recommended operating condition ranges.

Operation outside these ranges may adversely affect reliability and could result in device failure.

No warranty is made with respect to uses, operating conditions, or combinations not represented on the data sheet. Users considering application outside the listed conditions are advised to contact their representatives beforehand.

- X0, X1 clock timing

- X0A, X1A clock timing

## • Guaranteed PLL Operation Range

- Notes :
- For PLL 1 × only, use with  $t_{CP} = 4$  MHz or greater.
  - Refer to “5. A/D Converter (1) Electrical Characteristics” for details on the A/D converter operating frequency.

(Continued)

(Continued)

\*1 : When the PLL multiplier is  $\times 1$ ,  $\times 2$ ,  $\times 3$  or  $\times 4$  and the internal clock is  $20 \text{ MHz} < f_{CP} \leq 32 \text{ MHz}$ , set DIV2 bit = "1"\*4, CS2 bit = "1" in the PSCCR register.

[Example] When using a base oscillator frequency of 24 MHz at PLL  $\times 1$  :

CKSCR register : CS1 bit = "0", CS0 bit = "0"

PSCCR register : DIV2 bit = "1"\*4, CS2 bit = "1"

[Example] When using a base oscillator frequency of 6 MHz at PLL  $\times 3$  :

CKSCR register : CS1 bit = "1", CS0 bit = "0"

PSCCR register : DIV2 bit = "1"\*4, CS2 bit = "1"

\*2 : When the PLL multiplier is  $\times 2$  or  $\times 4$  and the internal clock is  $20 \text{ MHz} < f_{CP} \leq 32 \text{ MHz}$ , the following settings are also supported.

PLL  $\times 2$  : CKSCR register : CS1 bit = "0", CS0 bit = "0"

PSCCR register : DIV2 bit = "0"\*4, CS2 bit = "0"

PLL  $\times 4$  : CKSCR register : CS1 bit = "0", CS0 bit = "1"

PSCCR register : DIV2 bit = "0"\*4, CS2 bit = "0"

\*3 : When the PLL multiplier is set to  $\times 6$  or  $\times 8$  set "DIV2 bit = "0"\*4 CS2 bit = "1" and "PLL2 bit = 1" in the PSCCR register.

[Example] When using a base oscillator frequency of 4 MHz at PLL  $\times 6$  :

CKSCR register : CS1 bit = "1", CS0 bit = "0"

PLLOS register : DIV2 bit = "0"\*4, CS2 bit = "1"

[Example] When using a base oscillator frequency of 3 MHz at PLL  $\times 8$  :

CKSCR register : CS1 bit = "1", CS0 bit = "1"

PLLOS register : DIV2 bit = "0"\*4, CS2 bit = "1"

\*4 : The DIV2 bit is assigned to bit 9 of the PSCCR register and the CS2 bit is assigned to bit 8 of the PSCCR register. Both bits have a default value of "0".

## (2) Reset input

( $V_{CC} = 5.0\text{ V} \pm 10\%$ ,  $V_{SS} = AV_{SS} = 0.0\text{ V}$ ,  $T_A = -40\text{ }^\circ\text{C}$  to  $+105\text{ }^\circ\text{C}$ )

| Parameter        | Symbol     | Pin name         | Value                                      |     | Unit          | Remarks  |
|------------------|------------|------------------|--|-----|---------------|--|
|                  |            |                  | Min  | Max |               |  |
| Reset input time | $t_{RSTL}$ | $\overline{RST}$ | 500  | —   | ns            | During normal operation                                      |
|                  |            |                  | Oscillator oscillation time* + 16 $t_{CP}$ | —   | ms            | In stop mode, sub clock mode, sub sleep mode, and watch mode |
|                  |            |                  | 100  | —   | $\mu\text{s}$ | In time-base timer mode                                      |

\*: The oscillation time of the oscillator is the time taken to reach 90% of the amplitude. The oscillation time of a crystal oscillator is between several ms and tens of ms. The oscillation time of a ceramic oscillator is between hundreds of  $\mu\text{s}$  and several ms. The oscillation time of an external clock is 0 ms.

Note :  $t_{CP}$  is the internal operating clock cycle time. (Unit : ns)

- During normal operation

- In stop mode, sub clock mode, sub sleep mode, watch mode, and power-on

# MB90920 Series

## (3) Power-on reset

( $V_{CC} = 2.7 \text{ V to } 3.6 \text{ V}$ ,  $V_{SS} = 0.0 \text{ V}$ ,  $T_A = -40 \text{ }^\circ\text{C to } +105 \text{ }^\circ\text{C}$ )

| Parameter              | Symbol    | Pin name | Conditions | Value |     | Unit | Remarks                     |
|------------------------|-----------|----------|------------|-------|-----|------|-----------------------------|
|                        |           |          |            | Min   | Max |      |                             |
| Power supply rise time | $t_R$     | VCC      | —          | 0.05  | 30  | ms   |                             |
| Power off time         | $t_{OFF}$ |          |            | 1     | —   | ms   | Waiting time until power-on |

Note : Extreme variations in power supply voltage may trigger a power-on reset. When the power supply voltage is changed during operation, it is recommended that increases in the voltage smoothed out as shown in the following diagram. The PLL clock of the device should not be in use when varying the voltage. However, the PLL clock may continue to be used if the rate of the voltage drop is 1 V/s or less.

## (4) UART0/1/2/3 (LIN/SCI)

- Bit setting: ESCR0/1/2/3:SCES=0, ECCR0/1/2/3:SCDE=0

\*1 : The time per channel (4.5 V  $\leq$   $AV_{CC} \leq$  5.5 V, and internal operating frequency = 32 MHz) .

\*2 : Defined as supply current (when  $V_{CC} = AV_{CC} = AVRH = 5.0\text{ V}$ ) with A/D converter not operating, and CPU in stop mode.

- **Notes on the external impedance and sampling time of analog inputs**

A/D converter with sample and hold circuit. If the external impedance is too high to keep sufficient sampling time, the analog voltage charged to the internal sample and hold capacitor is insufficient, adversely affecting A/D conversion precision. Therefore, to satisfy the A/D conversion precision standard, consider the relationship between the external impedance and minimum sampling time and either adjust the register value and operating frequency or decrease the external impedance so that the sampling time is longer than the minimum value. If the sampling time is still not sufficient, connect a capacitor of about 0.1  $\mu\text{F}$  to the analog input pin.

- Analog input equivalent circuit

Note : The values are reference values.

# MB90920 Series

- The relationship between the external impedance and minimum sampling time
- At  $4.5\text{ V} \leq AV_{CC} \leq 5.5\text{ V}$

(External impedance = 0 kΩ to 100 kΩ)

(External impedance = 0 kΩ to 20 kΩ)

- At  $4.0\text{ V} \leq AV_{CC} \leq 4.5\text{ V}$

(External impedance = 0 kΩ to 100 kΩ)

(External impedance = 0 kΩ to 20 kΩ)

- About errors  
As  $|AV_{RH} - AV_{SS}|$  becomes smaller, the relative errors grow larger.

## (2) Definition of terms

- Resolution : Analog changes that are identifiable by the A/D converter.
- Non-Linear error : The deviation of the straight line connecting the zero transition point (“00 0000 0000” ↔ “00 0000 0001”) with the full-scale transition point (“11 1111 1110” ↔ “11 1111 1111”) from actual conversion characteristics.
- Differential linear error : The deviation from the ideal value of the input voltage needed to change the output code by 1 LSB.
- Total error : The total error is the difference between the actual value and the theoretical value, and includes zero-transition error/full-scale transition error and linear error.

$$\text{Total error for digital output } N = \frac{V_{NT} - \{1 \text{ LSB} \times (N - 1) + 0.5 \text{ LSB}\}}{1 \text{ LSB}} \quad [\text{LSB}]$$

$$1 \text{ LSB (Ideal)} = \frac{AVRH - AVSS}{1024} \quad [\text{V}]$$

N : A/D converter digital output value

$$V_{OT} \text{ (Ideal)} = AVSS + 0.5 \text{ LSB} \quad [\text{V}]$$

$$V_{FST} \text{ (Ideal)} = AVRH - 1.5 \text{ LSB} \quad [\text{V}]$$

$V_{NT}$  : Voltage when the digital output changes from (N - 1) to N

(Continued)

(Continued)

$$\text{Non-linear error of digital output } N = \frac{V_{NT} - \{1 \text{ LSB} \times (N - 1) + V_{OT}\}}{1 \text{ LSB}} \text{ [LSB]}$$

$$\text{Differential linear error of digital output } N = \frac{V_{(N+1)T} - V_{NT}}{1 \text{ LSB}} - 1 \text{ [LSB]}$$

$$1 \text{ LSB} = \frac{V_{FST} - V_{OT}}{1022} \text{ [V]}$$

N : A/D converter digital output value

V<sub>OT</sub> : Voltage when digital output changes from 000<sub>H</sub> to 001<sub>H</sub>

V<sub>FST</sub> : Voltage when digital output changes from 3FE<sub>H</sub> to 3FF<sub>H</sub>

## 6. Flash Memory Program/Erase Characteristics

The contents of this document are subject to change without notice.

Customers are advised to consult with sales representatives before ordering.

The information, such as descriptions of function and application circuit examples, in this document are presented solely for the purpose of reference to show examples of operations and uses of FUJITSU SEMICONDUCTOR device; FUJITSU SEMICONDUCTOR does not warrant proper operation of the device with respect to use based on such information. When you develop equipment incorporating the device based on such information, you must assume any responsibility arising out of such use of the information.

FUJITSU SEMICONDUCTOR assumes no liability for any damages whatsoever arising out of the use of the information.

Any information in this document, including descriptions of function and schematic diagrams, shall not be construed as license of the use or exercise of any intellectual property right, such as patent right or copyright, or any other right of FUJITSU SEMICONDUCTOR or any third party or does FUJITSU SEMICONDUCTOR warrant non-infringement of any third-party's intellectual property right or other right by using such information. FUJITSU SEMICONDUCTOR assumes no liability for any infringement of the intellectual property rights or other rights of third parties which would result from the use of information contained herein.

The products described in this document are designed, developed and manufactured as contemplated for general use, including without limitation, ordinary industrial use, general office use, personal use, and household use, but are not designed, developed and manufactured as contemplated (1) for use accompanying fatal risks or dangers that, unless extremely high safety is secured, could have a serious effect to the public, and could lead directly to death, personal injury, severe physical damage or other loss (i.e., nuclear reaction control in nuclear facility, aircraft flight control, air traffic control, mass transport control, medical life support system, missile launch control in weapon system), or (2) for use requiring extremely high reliability (i.e., submersible repeater and artificial satellite).

Please note that FUJITSU SEMICONDUCTOR will not be liable against you and/or any third party for any claims or damages arising in connection with above-mentioned uses of the products.

Any semiconductor devices have an inherent chance of failure. You must protect against injury, damage or loss from such failures by incorporating safety design measures into your facility and equipment such as redundancy, fire protection, and prevention of over-current levels and other abnormal operating conditions.

Exportation/release of any products described in this document may require necessary procedures in accordance with the regulations of the Foreign Exchange and Foreign Trade Control Law of Japan and/or US export control laws.

## Данный компонент на территории Российской Федерации

### Вы можете приобрести в компании MosChip.

Для оперативного оформления запроса Вам необходимо перейти по данной ссылке:

<http://moschip.ru/get-element>

Вы можете разместить у нас заказ для любого Вашего проекта, будь то серийное производство или разработка единичного прибора.

В нашем ассортименте представлены ведущие мировые производители активных и пассивных электронных компонентов.

Нашей специализацией является поставка электронной компонентной базы двойного назначения, продукции таких производителей как XILINX, Intel (ex.ALTERA), Vicor, Microchip, Texas Instruments, Analog Devices, Mini-Circuits, Amphenol, Glenair.

Сотрудничество с глобальными дистрибьюторами электронных компонентов, предоставляет возможность заказывать и получать с международных складов практически любой перечень компонентов в оптимальные для Вас сроки.

На всех этапах разработки и производства наши партнеры могут получить квалифицированную поддержку опытных инженеров.

Система менеджмента качества компании отвечает требованиям в соответствии с ГОСТ Р ИСО 9001, ГОСТ РВ 0015-002 и ЭС РД 009
