

# Low-Voltage, Single 8-to-1 and Dual 4-to-1 Cal-Multiplexers

## General Description

The MAX4539/MAX4540 low-voltage, CMOS 8-channel (MAX4539) and dual 4-channel (MAX4540) multiplexers are ideal for precision ADC calibration and system self-monitoring applications. These calibration multiplexers (cal-muxes) have precision resistor-dividers to generate accurate voltage ratios from an input reference voltage. The reference ratios include 15/4096 and 4081/4096 of the external reference voltage, accurate to 15 bits, and 1/2V<sub>+</sub> and 5/8(V<sub>+</sub> - V<sub>-</sub>), accurate to 8 bits. The external reference voltage as well as ground can also be switched to the output. The MAX4539/MAX4540 have enable inputs and address latching. All digital inputs have 0.8V and 2.4V logic thresholds, ensuring both TTL- and CMOS-logic compatibility when using a  $\pm 5V$  or a single +5V supply. Protection diodes at all inputs provide an ESD rating  $>2kV$ .

The MAX4539/MAX4540 operate from a single +2.7V to +12V supply, or from dual supplies of  $\pm 2.7V$  to  $\pm 6V$ . On-resistance (100 $\Omega$  max) is matched between switches to 6 $\Omega$  max. Each switch can handle Rail-to-Rail<sup>®</sup> analog signals. The off leakage current is 0.1nA at T<sub>A</sub> = +25°C and 2nA at T<sub>A</sub> = +85°C.

The MAX4539/MAX4540 are available in small 20-pin DIP, SO, and SSOP packages.

## Applications

|                            |                      |
|----------------------------|----------------------|
| Battery-Operated Equipment | Avionics             |
| Data-Acquisition Systems   | Audio-Signal Routing |
| Test Equipment             | Networking           |

## Ordering Information

| PART               | TEMP. RANGE    | PIN-PACKAGE    |
|--------------------|----------------|----------------|
| <b>MAX4539</b> CAP | 0°C to +70°C   | 20 SSOP        |
| MAX4539CWP         | 0°C to +70°C   | 20 Wide SO     |
| MAX4539CPP         | 0°C to +70°C   | 20 Plastic DIP |
| MAX4539EAP         | -40°C to +85°C | 20 SSOP        |
| MAX4539EWP         | -40°C to +85°C | 20 Wide SO     |
| MAX4539EPP         | -40°C to +85°C | 20 Plastic DIP |
| <b>MAX4540</b> CAP | 0°C to +70°C   | 20 SSOP        |
| MAX4540CWP         | 0°C to +70°C   | 20 Wide SO     |
| MAX4540CPP         | 0°C to +70°C   | 20 Plastic DIP |
| MAX4540EAP         | -40°C to +85°C | 20 SSOP        |
| MAX4540EWP         | -40°C to +85°C | 20 Wide SO     |
| MAX4540EPP         | -40°C to +85°C | 20 Plastic DIP |

Rail-to-Rail is a registered trademark of Nippon Motorola, Ltd.

## Features

- ♦ On-Chip Gain and Offset Divider Networks Provide 15-Bit Accurate Output Ratios
- ♦ On-Chip V<sub>+</sub> to GND and V<sub>+</sub> to V<sub>-</sub> Divider Networks Provide 8-Bit Accurate Output Ratios
- ♦ R<sub>ON</sub>: 100 $\Omega$  max
- ♦ R<sub>ON</sub> Matching Between Channels: 6 $\Omega$  max
- ♦ Charge Injection: 5pC max
- ♦ Low 0.1nA Off Leakage Current
- ♦ Small 20-Pin SSOP/SO/DIP Packages

## Pin Configurations/Functional Diagrams

MAX4539/MAX4540

# Low-Voltage, Single 8-to-1 and Dual 4-to-1 Cal-Multiplexers

## ABSOLUTE MAXIMUM RATINGS

V+ to GND .....-0.3V to +13V  
 V- to GND .....-13V to +0.3V  
 V+ to V- .....-0.3V to +13V  
 CAL, LATCH, A<sub>-</sub>, EN, NO<sub>-</sub>, COM<sub>-</sub>,  
 REFHI, REFLO (Note 1) .....(V- - 0.3V) to (V+ + 0.3V)  
 Continuous Current (any terminal) .....±20mA  
 Peak Current, NO<sub>-</sub> or COM<sub>-</sub>  
 (pulsed at 1ms, 10% duty cycle max) .....±40mA

Continuous Power Dissipation (T<sub>A</sub> = +70°C)  
 SSOP (derate 8mW/°C above +70°C) .....640mW  
 Wide SO (derate 8mW/°C above +70°C) .....800mW  
 Plastic DIP (derate 10.53mW/°C above +70°C) .....842mW  
 Operating Temperature Ranges  
 MAX4539C\_P/MAX4540C\_P .....0°C to +70°C  
 MAX4539E\_P/MAX4540E\_P .....-40°C to +85°C  
 Storage Temperature Range .....-65°C to +160°C  
 Lead Temperature (soldering, 10sec) .....+300°C

**Note 1:** Signals on NO<sub>-</sub>, COM<sub>-</sub>, EN, LATCH, CAL, A<sub>-</sub> exceeding V+ or V- are clamped by internal diodes. Limit forward current to maximum current ratings.

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## ELECTRICAL CHARACTERISTICS—Dual Supplies

(V+ = +5V ±10%, V- = -5V ±10%, V<sub>IH</sub> = 2.4V, V<sub>IL</sub> = 0.8V, T<sub>A</sub> = T<sub>MIN</sub> to T<sub>MAX</sub>, unless otherwise noted. Typical values at T<sub>A</sub> = +25°C.) (Note 2)

**Note 2:** The algebraic convention, where the most negative value is a minimum and the most positive value a maximum, is used in this data sheet.

**Note 3:** Guaranteed by design.

**Note 4:**  $\Delta R_{ON} = R_{ON(MAX)} - R_{ON(MIN)}$ .

**Note 5:** Flatness is defined as the difference between the maximum and minimum value of on-resistance as measured over the specified analog signal range.

**Note 6:** Leakage parameters are 100% tested at maximum-rated hot temperature and guaranteed by correlation at T<sub>A</sub> = +25°C.

**Note 7:** If the logic inputs can float during power-on, connect a 1MΩ pull-up from LATCH to V+; see *Applications Information* section.

**Note 8:** Off Isolation = 20log<sub>10</sub> (V<sub>COM</sub>/V<sub>NO</sub>), V<sub>COM</sub> = output, V<sub>NO</sub> = input to off switch.

**Note 9:** Between any two switches.

**Note 10:** Leakage testing with a single supply is guaranteed by testing with dual supplies.

# Low-Voltage, Single 8-to-1 and Dual 4-to-1 Cal-Multiplexers

## Typical Operating Characteristics

( $T_A = +25^\circ\text{C}$ , unless otherwise noted.)

LEAKAGE CURRENT vs. TEMPERATURE

ON-RESISTANCE vs.  $V_{\text{COM}}$  AND TEMPERATURE (SINGLE SUPPLY)

ON-RESISTANCE vs.  $V_{\text{COM}}$  AND TEMPERATURE (DUAL SUPPLIES)

ON-RESISTANCE vs.  $V_{\text{COM}}$  (DUAL SUPPLIES)

ON-RESISTANCE vs.  $V_{\text{COM}}$  (SINGLE SUPPLY)

SUPPLY CURRENT vs. TEMPERATURE

ON/OFF TIME vs. SUPPLY VOLTAGE

ON/OFF TIME vs. TEMPERATURE

CHARGE INJECTION vs.  $V_{\text{COM}}$

# Low-Voltage, Single 8-to-1 and Dual 4-to-1 Cal-Multiplexers

## Detailed Description

The MAX4539/MAX4540 are multiplexers with additional calibration features. Internal resistor-dividers generate accurate voltage ratios from an external voltage reference, allowing zero- and full-scale calibration of ADC systems as well as facilitation of system self-monitoring. To access the resistor-dividers, assert the CAL pin. When CAL and ENABLE are asserted, the three address pins select one of the various resistor-divider or external reference outputs. The MAX4539/MAX4540 also contain a LATCH input that allows the state of the CAL and address signals to be captured.

### Calibration Functions

The Gain Divider, Offset Divider, REFHI and REFLO modes allow calibration of offset and gain errors in ADC systems. The Gain Divider mode outputs a voltage ratio that is 4081/4096 of  $V_{REFHI} - V_{REFLO}$ , accurate to 0.1/4096, or better than 15 bits. The Offset Divider mode outputs a voltage ratio that is 15/4096 of  $V_{REFHI} - V_{REFLO}$ , also accurate to 0.1/4096. The REFHI mode allows the voltage on the REFHI pin to be switched to the output. The REFLO mode allows the voltage on the REFLO pin to be switched to the output.

### Self-Monitoring Functions

The self-monitoring functions are intended to allow an ADC to measure its own supply voltage. The MAX4539 has an internal divide-by-two resistor string between  $V+$  and GND that is accurate to 8 bits (16/4096). It also has a 5/8 resistor string between  $V+$  and  $V-$  that is also accurate to 8 bits. This divider string allows measurement of the negative supply with a unipolar ADC. GND can also be switched to the output, eliminating the need for an additional multiplexer channel.

## Applications Information

The MAX4539/MAX4540's construction is typical of most CMOS analog switches. There are three supply pins:  $V+$ ,  $V-$ , and GND. The positive and negative power supplies provide drive to the internal CMOS switches and set the limits of the analog voltage on any switch. Reverse-biased ESD protection diodes are internally connected between each analog signal pin and both  $V+$  and  $V-$ . If the voltage on any pin exceeds  $V+$  or  $V-$ , one of these diodes will conduct. During normal operation, these reverse-biased ESD diodes leak, forming the only current drawn from  $V-$ .

Virtually all the analog-leakage current is through the ESD diodes. Although the ESD diodes on a given signal pin are identical, and therefore fairly well balanced, they are reverse-biased differently. Each is

biased by either  $V+$  or  $V-$  and the analog signal. This means their leakage varies as the signal varies. The difference in the two-diode leakage from the signal path to the  $V+$  and  $V-$  pins constitutes the analog-signal path leakage current. All analog-leakage current flows to the supply terminals, not to the other switch terminal, which explains how both sides of a given switch can show leakage currents of either the same or opposite polarity.

There is no connection between the analog-signal paths and GND. The analog-signal paths consist of an N-channel and P-channel MOSFET with their sources and drains paralleled and their gates driven out of phase with  $V+$  and  $V-$  by the logic-level translators.

$V+$  and GND power the internal logic and logic-level translators and set the input-logic thresholds. The logic-level translators convert the logic levels to switched  $V+$  and  $V-$  signals to drive the gates of the analog switches. This drive signal is the only connection between the logic supplies and the analog supplies. All pins have ESD protection to  $V+$  and to  $V-$ .

Increasing  $V-$  has no effect on the logic-level thresholds, but it does increase the drive to the P-channel switches, which reduces their on-resistance.  $V-$  also sets the negative limit of the analog-signal voltage.

The logic-level thresholds are CMOS- and TTL-compatible when  $V+$  is +5V. As  $V+$  is raised, the threshold increases slightly; when  $V+$  reaches +12V, the level threshold is about 3.2V. Although that is above the TTL output high-level minimum of 2.4V, it is still compatible with CMOS outputs.

### Bipolar-Supply Operation

The MAX4539/MAX4540 operate with bipolar supplies between  $\pm 2.7V$  and  $\pm 6V$ . The  $V+$  and  $V-$  supplies need not be symmetrical, but their sum cannot exceed the absolute maximum rating of 13V.

**Note:** Do not connect the MAX4539/MAX4540  $V+$  pin to +3V AND connect the logic-level input pins to TTL logic-level signals. TTL logic-level outputs can exceed the absolute maximum ratings, which will cause damage to the part and/or external circuits.

**Caution:** The absolute maximum  $V+$  to  $V-$  differential voltage is 13V. Typical “ $\pm 6$ -Volt” or “12-Volt” supplies with  $\pm 10\%$  tolerances can be as high as 13.2V. This voltage can damage the MAX4539/MAX4540. Even  $\pm 5\%$  tolerance supplies may have overshoot or noise spikes that exceed 13V.

# Low-Voltage, Single 8-to-1 and Dual 4-to-1 Cal-Multiplexers

## Single-Supply Operation

The MAX4539/MAX4540 operate from a single supply between +2.7V and +12V when V- is connected to GND. All of the bipolar precautions must be observed. However, these parts are optimized for  $\pm 5V$  operation, and most AC and DC characteristics are degraded significantly when departing from  $\pm 5V$ . As the overall supply voltage (V+ to V-) is lowered, switching speed, on-resistance, off isolation, and distortion will degrade. (see the *Typical Operating Characteristics* section).

Single-supply operation also limits signal levels and interferes with ground referenced signals. When V- = 0, AC signals are limited to -0.3V. Voltages below -0.3V can be clipped by the internal ESD-protection diodes, and the parts can be damaged if excessive current flows.

## Power Up

During power up, on-chip latches will strobe whatever addresses are present if EN goes high before LATCH reaches a logic high. When this condition occurs, one of

the internal dividers connected between the supplies may inadvertently turn on, causing higher supply current ( $\sim 200\mu A$  supply current) when the enable input is toggled. Avoid this condition by ensuring that EN pin stays low until the remaining logic inputs are valid. To accomplish this, connect a resistor from EN to ground or apply a low voltage to EN before the other logic inputs go high.

## Power Off

When power to the MAX4539/MAX4540 is off (i.e., V+ = V- = 0), the Absolute Maximum Ratings still apply. This means that neither logic-level inputs on NO\_ nor signals on COM\_ can exceed  $\pm 0.3V$ . Voltages beyond  $\pm 0.3V$  cause the internal ESD-protection diodes to conduct, and the parts can be damaged if excessive current flows.

## Данный компонент на территории Российской Федерации

**Вы можете приобрести в компании MosChip.**

Для оперативного оформления запроса Вам необходимо перейти по данной ссылке:

<http://moschip.ru/get-element>

Вы можете разместить у нас заказ для любого Вашего проекта, будь то серийное производство или разработка единичного прибора.

В нашем ассортименте представлены ведущие мировые производители активных и пассивных электронных компонентов.

Нашей специализацией является поставка электронной компонентной базы двойного назначения, продукции таких производителей как XILINX, Intel (ex.ALTERA), Vicor, Microchip, Texas Instruments, Analog Devices, Mini-Circuits, Amphenol, Glenair.

Сотрудничество с глобальными дистрибьюторами электронных компонентов, предоставляет возможность заказывать и получать с международных складов практически любой перечень компонентов в оптимальные для Вас сроки.

На всех этапах разработки и производства наши партнеры могут получить квалифицированную поддержку опытных инженеров.

Система менеджмента качества компании отвечает требованиям в соответствии с ГОСТ Р ИСО 9001, ГОСТ РВ 0015-002 и ЭС РД 009
