

# KAI-01050

## 1024 (H) x 1024 (V) Interline CCD Image Sensor

### Description

The KAI-01050 Image Sensor is a 1-megapixel CCD in a 1/2" optical format. Based on the TRUESENSE 5.5 micron Interline Transfer CCD Platform, the sensor features broad dynamic range, excellent imaging performance, and a flexible readout architecture that enables use of 1, 2, or 4 outputs for full resolution readout up to 120 frames per second. A vertical overflow drain structure suppresses image blooming and enables electronic shuttering for precise exposure control. Other features include low dark current, negligible lag, and low smear.

The sensor shares common pin-out and electrical configurations with other devices based on the TRUESENSE 5.5 micron Interline Transfer CCD Platform, allowing a single camera design to support multiple members of this sensor family.

**Table 1. GENERAL SPECIFICATIONS**

Parameter	Typical Value
Architecture	Interline CCD, Progressive Scan
Total Number of Pixels	1084 (H) × 1064 (V)
Number of Effective Pixels	1040 (H) × 1040 (V)
Number of Active Pixels	1024 (H) × 1024 (V)
Pixel Size	5.5 μm (H) × 5.5 μm (V)
Active Image Size	5.632 mm (H) × 5.632 mm (V) 7.96 mm (diagonal), 1/2" Optical Format
Aspect Ratio	1:1
Number of Outputs	1, 2, or 4
Charge Capacity	20,000 electrons
Output Sensitivity	34 μV/e <sup>-</sup>
Quantum Efficiency	
Monochrome (-ABA)	44%
R, G, B (-FBA)	31%, 37%, 38%
R, G, B (-CBA)	29%, 37%, 39%
Read Noise (f = 40 MHz)	12 e <sup>-</sup> rms
Dark Current Photodiode / VCCD	7 / 140 e <sup>-</sup> /s
Dark Current Doubling Temp Photodiode / VCCD	7°C / 9°C
Dynamic Range	64 dB
Charge Transfer Efficiency	0.999999
Blooming Suppression	> 300 X
Smear	-100 dB
Image Lag	< 10 electrons
Maximum Pixel Clock Speed	40 MHz
Maximum Frame Rate Quad / Dual / Single Output	120 / 60 / 30 fps
Package	68 Pin PGA 64 Pin CLCC
Cover Glass	AR Coated, 2-Sides

NOTE: All Parameters are specified at T = 40°C unless otherwise noted.

**Figure 1. KAI-01050 Interline CCD Image Sensor**

### Features

- Color or Monochrome Configurations
- Progressive Scan Readout
- Flexible Readout Architecture
- High Frame Rate
- High Sensitivity
- Low Noise Architecture
- Excellent Smear Performance
- Package Pin Reserved for Device Identification

### Applications

- Industrial Imaging
- Medical Imaging
- Security

### ORDERING INFORMATION

See detailed ordering and shipping information on page 2 of this data sheet.

## ORDERING INFORMATION

### Standard Devices

See full datasheet for ordering information associated with devices no longer recommended for new designs.

**Table 2. ORDERING INFORMATION – STANDARD DEVICES**

## DEVICE DESCRIPTION

### Architecture

Figure 2. Block Diagram

#### Dark Reference Pixels

There are 12 dark reference rows at the top and 12 dark rows at the bottom of the image sensor. The dark rows are not entirely dark and so should not be used for a dark reference level. Use the 22 dark columns on the left or right side of the image sensor as a dark reference.

Under normal circumstances use only the center 20 columns of the 22 column dark reference due to potential light leakage.

#### Dummy Pixels

Within each horizontal shift register there are 11 leading additional shift phases. These pixels are designated as dummy pixels and should not be used to determine a dark reference level.

In addition, there is one dummy row of pixels at the top and bottom of the image.

#### Active Buffer Pixels

8 unshielded pixels adjacent to any leading or trailing dark reference regions are classified as active buffer pixels. These

pixels are light sensitive but are not tested for defects and non-uniformities.

#### Image Acquisition

An electronic representation of an image is formed when incident photons falling on the sensor plane create electron-hole pairs within the individual silicon photodiodes. These photoelectrons are collected locally by the formation of potential wells at each photosite. Below photodiode saturation, the number of photoelectrons collected at each pixel is linearly dependent upon light level and exposure time and non-linearly dependent on wavelength. When the photodiodes charge capacity is reached, excess electrons are discharged into the substrate to prevent blooming.

#### ESD Protection

Adherence to the power-up and power-down sequence is critical. Failure to follow the proper power-up and power-down sequences may cause damage to the sensor. See Power-Up and Power-Down Sequence section.

Output Amplifier Impedance	R <sub>OUT</sub>	–	127	–	Ω	Die	27, 40	
Output Amplifier Sensitivity	$\Delta V/\Delta N$	–	34	–	μV/e <sup>–</sup>	Design		

1. Per color
2. Value is over the range of 10% to 90% of photodiode saturation.
3. The operating value of the substrate voltage, VAB, will be marked on the shipping container for each device. The value of VAB is set such that the photodiode charge capacity is 680 mV.
4. At 40 MHz
5. Uses 20LOG (PNe/ n<sub>e-T</sub>)
6. Assumes 5 pF load.

1. This color filter set configuration (Gen1) is not recommended for new designs.

## TYPICAL PERFORMANCE CURVES

### Quantum Efficiency

*Monochrome with Microlens*

NOTE: The PGA and CLCC versions have different quantum efficiencies due to differences in the cover glass transmission. See Figure 29: Cover Glass Transmission for more details.

**Figure 5. Monochrome with Microlens Quantum Efficiency**

*Color (Bayer RGB) with Microlens (Gen2 and Gen1 CFA)*

**Figure 6. Gen2 and Gen1 Color (Bayer) with Microlens Quantum Efficiency**

### Angular Quantum Efficiency

For the curves marked “Horizontal”, the incident light angle is varied in a plane parallel to the HCCD. For the curves marked “Vertical”, the incident light angle is varied in a plane parallel to the VCCD.

*Monochrome with Microlens*

## DEFECT DEFINITIONS

Table 11. OPERATION CONDITIONS

Description	Condition	Notes
Frame Time	71.6 ms	Electronic shutter is not used. Integration time equals frame time.
Horizontal Clock Frequency	20 MHz	
Light Source	Continuous Red, Green and Blue LED Illumination centered at 450, 530 and 650 nm respectively	For monochrome sensor, only green LED is used.
Operation	Nominal operating voltages and timing	

Table 12. SPECIFICATIONS

Description	Definition	Standard Grade	Notes
Major Dark Field Defective Bright Pixel	Defect $\geq 25$ mV	10	2
Major Bright Field Defective Dark Pixel	Defect $\geq 11\%$	10	2
Minor Dark Field Defective Bright Pixel	Defect $\geq 12$ mV	100	3
Cluster Defect	A group of 2 contiguous major defective pixels.	0	1, 2
	A group of 3 to 10 contiguous major defective pixels.	0	
Column Defect	A group of more than 10 contiguous major defective pixels along a single column.	0	1, 2

1. Column and cluster defects are separated by no less than two (2) good pixels in any direction (excluding single pixel defects)
2. Tested at 27°C and 40°C.
3. Tested at 40°C.

## Defect Map

The defect map supplied with each sensor is based upon testing at an ambient (27°C) temperature. Minor point defects are not included in the defect map. All defective

pixels are reference to pixel 1, 1 in the defect maps. See Figure 11: Regions of Interest for the location of pixel 1, 1.

## TEST DEFINITIONS

### Test Regions of Interest

Image Area ROI: Pixel (1, 1) to Pixel (1040, 1040)  
 Active Area ROI: Pixel (9, 9) to Pixel (1032, 1032)  
 Center ROI: Pixel (471, 471) to Pixel (570, 570)

Only the Active Area ROI pixels are used for performance and defect tests.

### Overclocking

The test system timing is configured such that the sensor is overclocked in both the vertical and horizontal directions. See Figure 11 for a pictorial representation of the regions.

Figure 11. Regions of Interest

### Tests

#### Dark Field Global Non-Uniformity

This test is performed under dark field conditions. The sensor is partitioned into 64 sub regions of interest, each of which is 128 by 128 pixels in size. See Figure 12: Test Sub Regions of Interest. The average signal level of each of the 64 sub regions of interest is calculated. The signal level of each of the sub regions of interest is calculated using the following formula:

$$\text{Signal of ROI}[i] = (\text{ROI Average in Counts} - \text{Horizontal Overclock Average in Counts}) \cdot \text{mV per Count}$$

Units : mVpp (millivolts Peak to Peak)

Where  $i = 1$  to 64. During this calculation on the 64 sub regions of interest, the maximum and minimum signal levels are found. The dark field global uniformity is then calculated

as the maximum signal found minus the minimum signal level found.

#### Global Non-Uniformity

This test is performed with the imager illuminated to a level such that the output is at 70% of saturation (approximately 476 mV). Prior to this test being performed the substrate voltage has been set such that the charge capacity of the sensor is 680 mV. Global non-uniformity is defined as

$$\text{Global Non-Uniformity} = 100 \cdot \left( \frac{\text{Active Area Standard Deviation}}{\text{Active Area Signal}} \right)$$

Units : % rms

Active Area Signal = Active Area Average – Dark Column Average

#### Global Peak to Peak Non-Uniformity

This test is performed with the imager illuminated to a level such that the output is at 70% of saturation

(approximately 476 mV). Prior to this test being performed the substrate voltage has been set such that the charge capacity of the sensor is 680 mV. The sensor is partitioned into 64 sub regions of interest, each of which is 128 by 128 pixels in size. See Figure 12: Test Sub Regions of Interest. The average signal level of each of the 64 sub regions of interest (ROI) is calculated. The signal level of each of the sub regions of interest is calculated using the following formula:

$$\text{Signal of ROI}[i] = (\text{ROI Average in Counts} - \text{Horizontal Overclock Average in Counts}) \cdot \text{mV per Count}$$

Where  $i = 1$  to 64. During this calculation on the 64 sub regions of interest, the maximum and minimum signal levels are found. The global peak to peak uniformity is then calculated as:

$$\text{Global Uniformity} = 100 \cdot \left( \frac{\text{Max. Signal} - \text{Min. Signal}}{\text{Active Area Signal}} \right)$$

Units : % pp

#### Center Non-Uniformity

This test is performed with the imager illuminated to a level such that the output is at 70% of saturation (approximately 476 mV). Prior to this test being performed the substrate voltage has been set such that the charge capacity of the sensor is 680 mV. Defects are excluded for the calculation of this test. This test is performed on the center 100 by 100 pixels of the sensor. Center uniformity is defined as:

$$\text{Center ROI Uniformity} = 100 \cdot \left( \frac{\text{Center ROI Standard Deviation}}{\text{Center ROI Signal}} \right)$$

Units : % rms

Center ROI Signal = Center ROI Average – Dark Column Average

#### Dark Field Defect Test

This test is performed under dark field conditions. The sensor is partitioned into 64 sub regions of interest, each of which is 128 by 128 pixels in size. In each region of interest, the median value of all pixels is found. For each

region of interest, a pixel is marked defective if it is greater than or equal to the median value of that region of interest plus the defect threshold specified in the “Defect Definitions” section.

#### Bright Field Defect Test

This test is performed with the imager illuminated to a level such that the output is at approximately 476 mV. Prior to this test being performed the substrate voltage has been set such that the charge capacity of the sensor is 680 mV. The average signal level of all active pixels is found. The bright and dark thresholds are set as:

$$\text{Dark Defect Threshold} = \text{Active Area Signal} \cdot \text{Threshold}$$

$$\text{Bright Defect Threshold} = \text{Active Area Signal} \cdot \text{Threshold}$$

The sensor is then partitioned into 64 sub regions of interest, each of which is 128 by 128 pixels in size. In each region of interest, the average value of all pixels is found. For each region of interest, a pixel is marked defective if it is greater than or equal to the median value of that region of interest plus the bright threshold specified or if it is less than or equal to the median value of that region of interest minus the dark threshold specified.

Example for major bright field defective pixels:

- Average value of all active pixels is found to be 476 mV.
- Dark defect threshold:  $476 \text{ mV} \cdot 11 \% = 52 \text{ mV}$ .
- Bright defect threshold:  $476 \text{ mV} \cdot 11 \% = 52 \text{ mV}$ .
- Region of interest #1 selected. This region of interest is pixels 9, 9 to pixels 136, 136.
  - ♦ Median of this region of interest is found to be 470 mV.
  - ♦ Any pixel in this region of interest that is  $\geq (470 + 52 \text{ mV})$  522 mV in intensity will be marked defective.
  - ♦ Any pixel in this region of interest that is  $\leq (470 - 52 \text{ mV})$  418 mV in intensity will be marked defective.
- All remaining 64 sub regions of interest are analyzed for defective pixels in the same manner.

Test Sub Regions of Interest

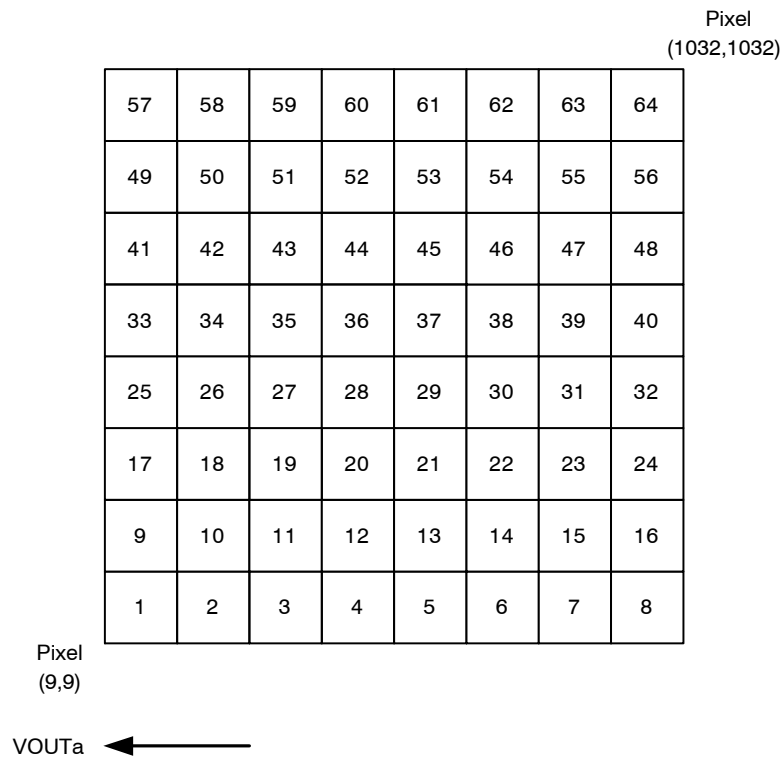

Figure 12. Test Sub Regions of Interest

## OPERATION

### Absolute Maximum Ratings

Absolute maximum rating is defined as a level or condition that should not be exceeded at any time per the

description. If the level or the condition is exceeded, the device will be degraded and may be damaged. Operation at these values will reduce MTTF.

**Table 13. ABSOLUTE MAXIMUM RATINGS**

Description	Symbol	Minimum	Maximum	Unit	Notes
Operating Temperature	T <sub>OP</sub>	-50	70	°C	1
Humidity	RH	-5	90	%	2
Output Bias Current	I <sub>OUT</sub>	-	60	mA	3
Off-Chip Load	C <sub>L</sub>	-	10	pF	

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

- Noise performance will degrade at higher temperatures.
- T = 25°C. Excessive humidity will degrade MTTF.
- Total for all outputs. Maximum current is -15 mA for each output. Avoid shorting output pins to ground or any low impedance source during operation. Amplifier bandwidth increases at higher current and lower load capacitance at the expense of reduced gain (sensitivity).

**Table 14. ABSOLUTE MAXIMUM VOLTAGE RATINGS BETWEEN PINS AND GROUND**

Description	Minimum	Maximum	Unit	Notes
VDD <sub>α</sub> , VOUT <sub>α</sub>	-0.4	17.5	V	1
RD <sub>α</sub>	-0.4	15.5	V	1
V1B, V1T	ESD - 0.4	ESD + 24.0	V	
V2B, V2T, V3B, V3T, V4B, V4T	ESD - 0.4	ESD + 14.0	V	
H1S <sub>α</sub> , H1B <sub>α</sub> , H2S <sub>α</sub> , H2B <sub>α</sub> , H2SL <sub>α</sub> , R <sub>α</sub> , OG <sub>α</sub>	ESD - 0.4	ESD + 14.0	V	1
ESD	-10.0	0.0	V	
SUB	-0.4	40.0	V	2

- α denotes a, b, c or d.
- Refer to Application Note *Using Interline CCD Image Sensors in High Intensity Visible Lighting Conditions*

### Power-Up and Power-Down Sequence

Adherence to the power-up and power-down sequence is critical. Failure to follow the proper power-up and power-down sequences may cause damage to the sensor.

#### Notes:

1. Activate all other biases when ESD is stable and SUB is above 3 V.
2. Do not pulse the electronic shutter until ESD is stable.
3. VDD cannot be +15 V when SUB is 0 V.
4. The image sensor can be protected from an accidental improper ESD voltage by current limiting the SUB current to less than 10 mA. SUB and VDD must always be greater than GND. ESD must always be less than GND. Placing diodes between SUB, VDD, ESD and ground will protect the sensor from accidental overshoots of SUB, VDD and ESD during power on and power off. See the figure below.

**Figure 13. Power-Up and Power-Down Sequence**

The VCCD clock waveform must not have a negative overshoot more than 0.4 V below the ESD voltage.

**Figure 14. VCCD Clock Waveform**

Example of external diode protection for SUB, VDD and ESD.  $\alpha$  denotes a, b, c or d.

**Figure 15. Example of External Diode Protection**

## DC Bias Operating Conditions

Table 15. DC BIAS OPERATING CONDITIONS

Description	Pins	Symbol	Min.	Nom.	Max.	Unit	Max. DC Current	Notes
Reset Drain	RD $\alpha$	RD	11.8	12.0	12.2	V	10 $\mu$ A	1
Output Gate	OG $\alpha$	OG	-2.2	-2.0	-1.8	V	10 $\mu$ A	1
Output Amplifier Supply	VDD $\alpha$	V <sub>DD</sub>	14.5	15.0	15.5	V	11.0 mA	1, 2
Ground	GND	GND	0.0	0.0	0.0	V	-1.0 mA	
Substrate	SUB	V <sub>SUB</sub>	5.0	V <sub>AB</sub>	V <sub>DD</sub>	V	50 $\mu$ A	3, 8
ESD Protection Disable	ESD	ESD	-9.5	-9.0	V <sub>X_L</sub>	V	50 $\mu$ A	6, 7, 9
Output Bias Current	VOUT $\alpha$	I <sub>OUT</sub>	-3.0	-7.0	-10.0	mA	-	1, 4, 5

1.  $\alpha$  denotes a, b, c or d.
2. The maximum DC current is for one output.  $I_{DD} = I_{OUT} + I_{SS}$ . See Figure 16.
3. The operating value of the substrate voltage, V<sub>AB</sub>, will be marked on the shipping container for each device. The value of V<sub>AB</sub> is set such that the photodiode charge capacity is the nominal P<sub>N<sub>e</sub></sub> (see Specifications).
4. An output load sink must be applied to each VOUT pin to activate each output amplifier.
5. Nominal value required for 40 MHz operation per output. May be reduced for slower data rates and lower noise.
6. Adherence to the power-up and power-down sequence is critical. See Power Up and Power Down Sequence section.
7. ESD maximum value must be less than or equal to V1\_L + 0.4 V and V2\_L + 0.4 V.
8. Refer to Application Note *Using Interline CCD Image Sensors in High Intensity Visible Lighting Conditions*.
9. Where V<sub>X\_L</sub> is the level set for V1\_L, V2\_L, V3\_L, or V4\_L in the application.

Figure 16. Output Amplifier

## AC Operating Conditions

Table 16. CLOCK LEVELS

Description	Pins (Note 1)	Symbol	Level	Min.	Nom.	Max.	Unit	Capacitance (Note 2)
Vertical CCD Clock, Phase 1	V1B, V1T	V1_L	Low	-8.2	-8.0	-7.8	V	6 nF (Note 6)
		V1_M	Mid	-0.2	0.0	0.2		
		V1_H	High	11.5	12.0	12.5		
Vertical CCD Clock, Phase 2	V2B, V2T	V2_L	Low	-8.2	-8.0	-7.8	V	6 nF (Note 6)
		V2_H	High	-0.2	0.0	0.2		
Vertical CCD Clock, Phase 3	V3B, V3T	V3_L	Low	-8.2	-8.0	-7.8	V	6 nF (Note 6)
		V3_H	High	-0.2	0.0	0.2		
Vertical CCD Clock, Phase 4	V4B, V4T	V4_L	Low	-8.2	-8.0	-7.8	V	6 nF (Note 6)
		V4_H	High	-0.2	0.0	0.2		
Horizontal CCD Clock, Phase 1 Storage	H1S $\alpha$	H1S_L	Low	-5.2 (Note 7)	-4.0	-3.8	V	90 pF (Note 6)
		H1S_A	Amplitude	3.8	4.0	5.2 (Note 7)		
Horizontal CCD Clock, Phase 1 Barrier	H1B $\alpha$	H1B_L	Low	-5.2 (Note 7)	-4.0	-3.8	V	60 pF (Note 6)
		H1B_A	Amplitude	3.8	4.0	5.2 (Note 7)		
Horizontal CCD Clock, Phase 2 Storage	H2S $\alpha$	H2S_L	Low	-5.2 (Note 7)	-4.0	-3.8	V	90 pF (Note 6)
		H2S_A	Amplitude	3.8	4.0	5.2 (Note 7)		
Horizontal CCD Clock, Phase 2 Barrier	H2B $\alpha$	H2B_L	Low	-5.2 (Note 7)	-4.0	-3.8	V	60 pF (Note 6)
		H2B_A	Amplitude	3.8	4.0	5.2 (Note 7)		
Horizontal CCD Clock, Phase 2 Last Phase (Note 3)	H2SL $\alpha$	H2SL_L	Low	-5.2	-5.0	-4.8	V	20 pF (Note 6)
		H2SL_A	Amplitude	4.8	5.0	5.2		
Reset Gate	R $\alpha$	R_L (Note 4)	Low	-3.5	-2.0	-1.5	V	16 pF (Note 6)
		R_H	High	2.5	3.0	4.0		
Electronic Shutter (Note 5)	SUB	VES	High	29.0	30.0	40.0	V	800 pF (Note 6)

1.  $\alpha$  denotes a, b, c or d.
2. Capacitance is total for all like named pins.
3. Use separate clock driver for improved speed performance.
4. Reset low should be set to -3 V for signal levels greater than 40,000 electrons.
5. Refer to Application Note *Using Interline CCD Image Sensors in High Intensity Visible Lighting Conditions*.
6. Capacitance values are estimated.
7. If the minimum horizontal clock low level is used (-5.2 V), then the maximum horizontal clock amplitude should be used (5.2 V amplitude) to create a -5.2 V to 0.0 V clock. If a 5 V clock driver is used, the horizontal low level should be set to -5.0 V and the high level should be a set to 0.0 V.

The figure below shows the DC bias (V<sub>SUB</sub>) and AC clock (V<sub>ES</sub>) applied to the SUB pin. Both the DC bias and AC clock are referenced to ground.

Figure 17. DC Bias and AC Clock Applied to the SUB Pin

#### Device Identification

The device identification pin (DevID) may be used to determine which Truesense Imaging 5.5 micron pixel interline CCD sensor is being used.

Table 17.

Description	Pins	Symbol	Min.	Nom.	Max.	Unit	Max. DC Current	Notes
Device Identification	DevID	DevID		$\infty$		$\Omega$	n/a	1, 2

1. For the KAI-01050, the DevID pin is not connected internally to the device. Thus the resistance on the pin is infinity.
2. If the Device Identification is not used, it may be left disconnected.

#### Recommended Circuit

Note that V1 must be a different value than V2.

Figure 18. Device Identification Recommended Circuit

## TIMING

Table 18. REQUIREMENTS AND CHARACTERISTICS

Description	Symbol	Min.	Nom.	Max.	Unit	Notes

Rd	P7	P7 (Note 1) or Off (Note 3)	P7 (Note 1) or Off (Note 3)	P7 (Note 1) or Off (Note 3)

#Lines/Frame (Minimum)	532	1064	532	1064
#Pixels/Line (Minimum)	553		1106	

1. For optimal performance of the sensor. May be clocked at a lower frequency. If clocked at a lower frequency, the frequency selected should be a multiple of the frequency used on the a and b register.
2. H2SLx follows the same pattern as H2Sx. For optimal speed performance, use a separate clock driver.
3. Off = +5 V. Note that there may be operating conditions (high temperature and/or very bright light sources) that will cause blooming from the unused c/d register into the image area.

### Photodiode Transfer Timing

A row of charge is transferred to the HCCD on the falling edge of V1 as indicated in the P1 pattern below. Using this timing sequence, the leading dummy row or line is combined with the first dark row in the HCCD. The “Last Line” is dependent on readout mode – either 532 or 1064 minimum counts required. It is important to note that, in

general, the rising edge of a vertical clock (patterns P1–P4) should be coincident or slightly leading a falling edge at the same time interval. This is particularly true at the point where P1 returns from the high (3<sup>rd</sup> level) state to the mid-state when P4 transitions from the low state to the high state.

Figure 19. Photodiode Transfer Timing

### Line and Pixel Timing

Each row of charge is transferred to the output, as illustrated below, on the falling edge of H2SL (indicated as

P6 pattern). The number of pixels in a row is dependent on readout mode – either 553 or 1106 minimum counts required.

Figure 20. Line and Pixel Timing

*Pixel Timing Detail*

**Figure 21. Pixel Timing Detail**

*Frame/Electronic Shutter Timing*

The SUB pin may be optionally clocked to provide electronic shuttering capability as shown below. The

resulting photodiode integration time is defined from the falling edge of SUB to the falling edge of V1 (P1 pattern).

**Figure 22. Frame/Electronic Shutter Timing**

*VCCD Clock Edge Alignment*

## STORAGE AND HANDLING

Table 20. STORAGE CONDITIONS

Description	Symbol	Minimum	Maximum	Units	Notes
Storage Temperature	T <sub>ST</sub>	-55	80	°C	1
Humidity	RH	5	90	%	2

1. Long-term storage toward the maximum temperature will accelerate color filter degradation.
2. T = 25°C. Excessive humidity will degrade MTTF.

## Данный компонент на территории Российской Федерации

**Вы можете приобрести в компании MosChip.**

Для оперативного оформления запроса Вам необходимо перейти по данной ссылке:

<http://moschip.ru/get-element>

Вы можете разместить у нас заказ для любого Вашего проекта, будь то серийное производство или разработка единичного прибора.

В нашем ассортименте представлены ведущие мировые производители активных и пассивных электронных компонентов.

Нашей специализацией является поставка электронной компонентной базы двойного назначения, продукции таких производителей как XILINX, Intel (ex.ALTERA), Vicor, Microchip, Texas Instruments, Analog Devices, Mini-Circuits, Amphenol, Glenair.

Сотрудничество с глобальными дистрибьюторами электронных компонентов, предоставляет возможность заказывать и получать с международных складов практически любой перечень компонентов в оптимальные для Вас сроки.

На всех этапах разработки и производства наши партнеры могут получить квалифицированную поддержку опытных инженеров.

Система менеджмента качества компании отвечает требованиям в соответствии с ГОСТ Р ИСО 9001, ГОСТ РВ 0015-002 и ЭС РД 009
