EVAL BOARD USER'S MANUAL

Description

The NCV97310 is 3-output regulator consisting of a low-Iq battery-connected 3 A 2 MHz non-synchronous switcher and two low-voltage 1.5 A 2 MHz synchronous switchers; all using integrated power transistors.

The high-voltage switcher is capable of converting a 4.1 V to 18 V battery input to a 5 V or 3.3 V output at a constant 2 MHz switching frequency, delivering up to 3 A. In overvoltage conditions up to 36 V, the switching frequency folds back to 1 MHz; in load dump conditions up to 45 V the regulator shuts down.

The output of the battery-connected buck regulator serves as the low voltage input for the 2 synchronous switchers. Each downstream output is adjustable from 1.2 V to 3.3 V, with a 1.5 A current limit and a constant 2 MHz switching frequency. Each switcher has independent enable and reset pins, giving extra power management flexibility.

For low-Iq operating mode the low-voltage switchers are disabled, and the standby rail is supplied by a low-Iq LDO (up to 150 mA) with a typical Iq of 30 μA. The LDO regulator is in parallel to the high-voltage switcher, and is activated when the switcher is forced in standby mode.

All 3 SMPS outputs use peak current mode control with internal slope compensation, internally-set soft-start, battery undervoltage lockout, battery overvoltage protection, cycle-by-cycle current limiting, hiccup mode short-circuit protection and thermal shutdown. An error flag is available for diagnostics.

Key Features

- Low Quiescent Current in Standby Mode
- 2 Microcontroller Enabled Low Voltage Synchronous Buck Converters
- Large Conversion Ratio of 18 V to 3.3 V Battery Connected Switcher
- Wide Input of 4.1 to 45 V with Undervoltage Lockout (UVLO)
- Fixed Frequency Operation Adjustable from 2.0 to 2.6 MHz
- Internal 1.5 ms Soft-starts
- Cycle-by-Cycle Current Limit Protections
- Hiccup Overcurrent Protections (OCP)
- Individual Reset Pins with Adjustable Delays
- These Devices are Pb-Free, Halogen Free/BFR Free and are RoHS Compliant

Typical Applications

- Infotainment, Body Electronics, Telematics, ECU

TYPICAL APPLICATION

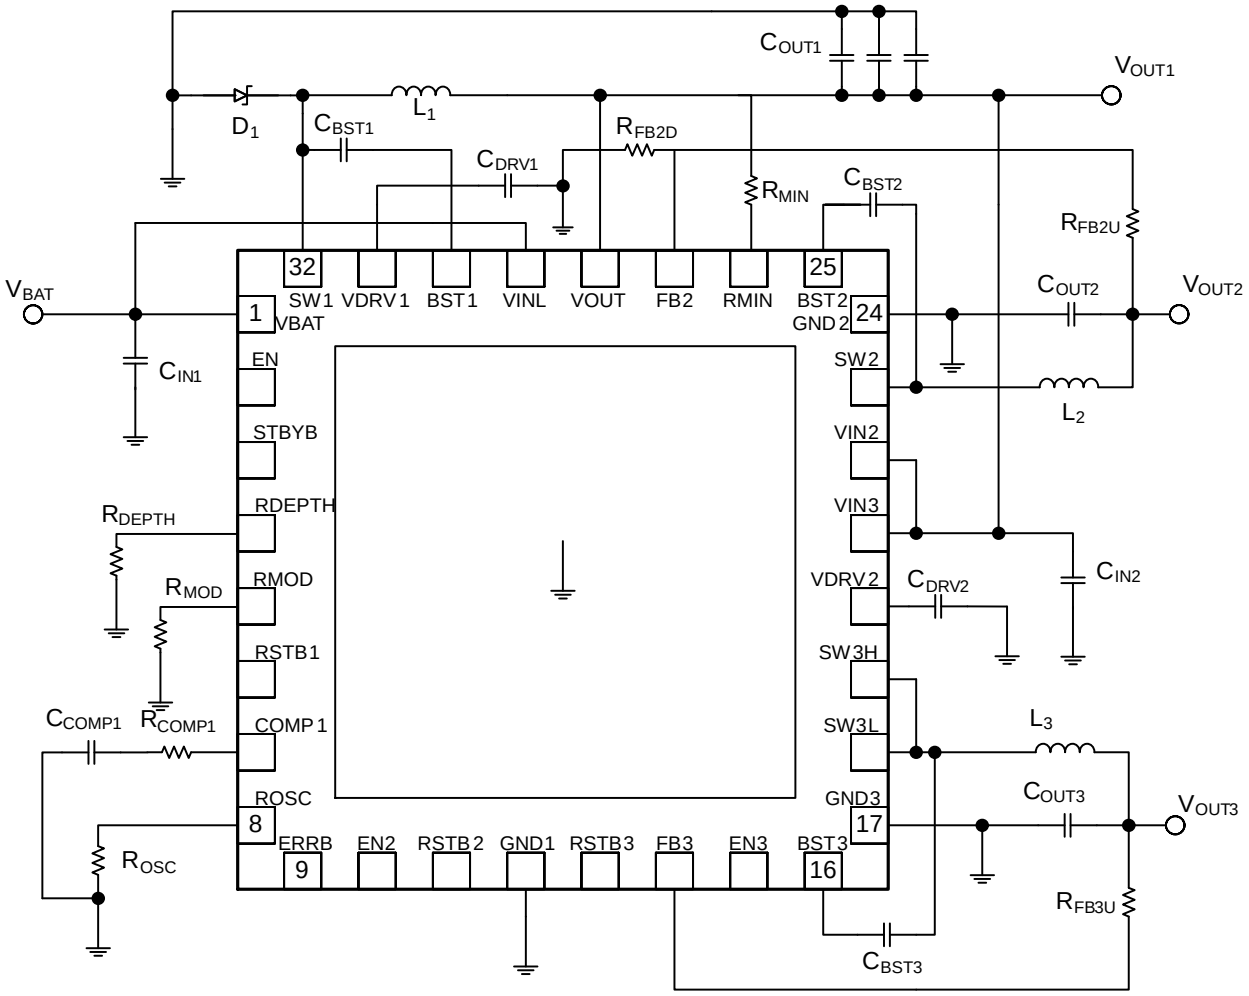

Figure 3. Typical Application

Table 1. EVALUATION BOARD TERMINALS

Pin Name	Function
VBAT	Positive dc input voltage
GND	Common dc return
VOUT1	Positive 3.3 V dc output voltage (LDO/Switcher 1)
VOUT2	Positive DC output voltage (Switcher 2)
VOUT3	Positive DC output voltage (Switcher 3)
EN	Master enable input. Includes jumper J3 to connect to VBAT.
STBYB	Standby enable input. Includes jumper J4 to connect to VBAT.
EN2	Switcher 2 enable input. Includes jumper J6 to connect to VOUT1.
EN3	Switcher 3 enable input. Includes jumper J5 to connect to VOUT1.
ERRB	Error flag combining temperature and input and output voltage sensing.
RST1B	Reset with adjustable delay. Goes low when the VOUT1 is out of regulation.
RST2B	Reset with adjustable delay. Goes low when the VOUT2 is out of regulation.
RST3B	Reset with adjustable delay. Goes low when the VOUT3 is out of regulation.

Table 2. ABSOLUTE MAXIMUM RATINGS (Voltages are with respect to GND)

Rating	Value	Unit
Dc Supply Voltage (VBAT, EN, STBYB)	−0.3 to 36	V
Dc Supply Voltage (VIN2, VIN3)	−0.3 to 12	V
Dc Supply Voltage (RSTB1, RSTB2, RSTB3, ERRB, EN2, EN3)	−0.3 to 6	V
Storage Temperature Range	−55 to 150	°C

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

Table 3. ELECTRICAL CHARACTERSITICS (TA = 25°C, 4.5 ≤ VIN ≤ 18 V, IOUT ≤ 2 A, unless otherwise specified)

Characteristic	Conditions	Typical Value	Unit
REGULATION			
Output Voltage (VOUT1)		3.3	V
Output Voltage (VOUT2)		1.8	V
Output Voltage (VOUT3)		1.2	V
Line Regulation (VOUT1)	I_{OUT1} = 1.0 A	0.03	%
Line Regulation (VOUT2)	I_{OUT2} = 1.0 A	0.01	%
Line Regulation (VOUT3)	I_{OUT3} = 1.0 A	0.001	%
Load Regulation (VOUT1)	V_{BAT} = 13.2 V	0.3	%
Load Regulation (VOUT2)	V_{BAT} = 13.2 V	0.02	%
Load Regulation (VOUT3)	V_{BAT} = 13.2 V	0.03	%
SWITCHING			
Switching Frequency		2.0	MHz
Soft-start Time		1.4	ms
R_{OSC} Frequency Range	50 kΩ ≥ R_{OSC} ≥ 10 kΩ	2.0 to 2.6	MHz
CURRENT LIMIT			
Peak Current Limit (VOUT1)	STBYB = 0 V	0.2	A
Peak Current Limit (VOUT1)	STBYB = 5 V	4.4	A
Peak Current Limit (VOUT2)		2.9	A
Peak Current Limit (VOUT3)		2.9	A
PROTECTION			
Input Undervoltage Lockout (UVLO)	V_{BAT} Decreasing	3.9	V
Input Overvoltage Protection	V_{BAT} Increasing	36	V
Thermal Warning	T_J Rising	150	°C
Thermal Shutdown	T_J Rising	170	°C

Product parametric performance is indicated in the Electrical Characteristics for the listed test conditions, unless otherwise noted. Product performance may not be indicated by the Electrical Characteristics if operated under different conditions.

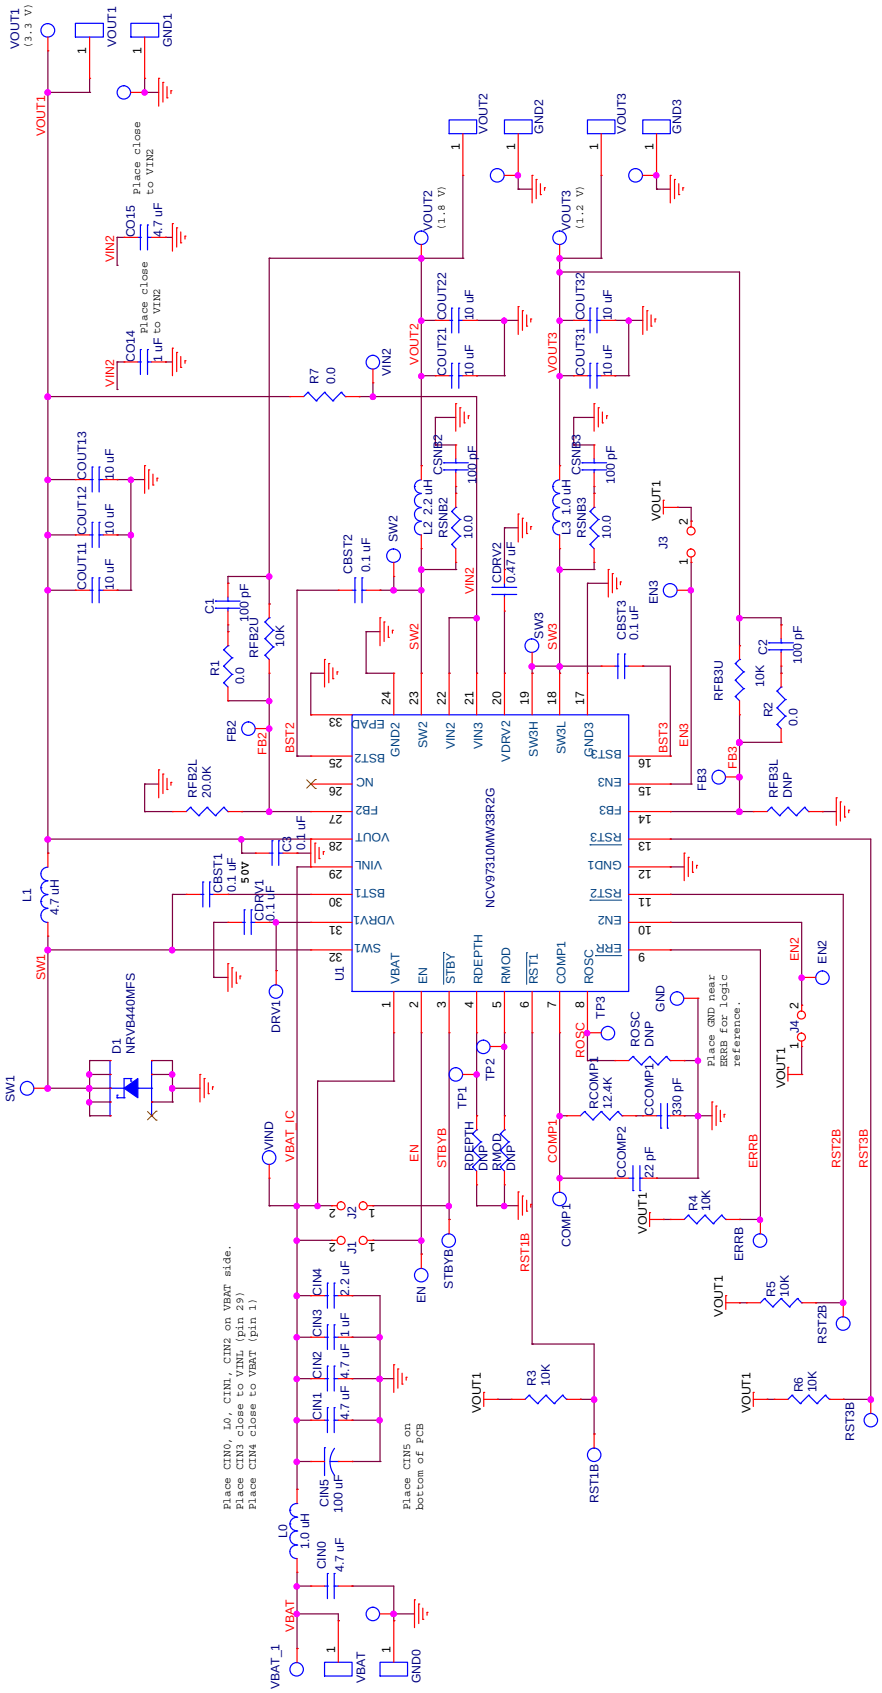

Figure 4. NCV97310GEVB 3.3 V Board Schematic

Operational Guidelines

1. Connect a dc input voltage, within the 6.0 V to 36 V range, between VBAT and GND.
2. Connect a load (< 150 mA) between VOUT1 and GND
3. Connect a dc enable voltage, within the 2.0 V to 36 V range, between EN and GND. This will enable the internal LDO for low Iq mode. You may use jumper J1 to connect EN directly to VBAT.
   a. The VOUT1 signal should be 3.3 V.
   b. The VOUT2 signal should be disabled (regardless of EN2 state) and read 0 V.
   c. The VOUT3 signal should be disabled (regardless of EN3 state) and read 0 V.
4. Connect a dc enable voltage, within the 2.0 V to 36 V range, between STBYB and GND. This will exit low Iq mode and power up switcher 1. You may use jumper J2 to connect STBYB directly to VBAT.
   The VOUT1 signal should still be 3.3 V. You may now add a higher load to VOUT1.
5. Connect a dc enable voltage, within the 2.0 V to 6 V range, between EN2 and GND. This will power up switcher 2. You may use jumper J4 to connect EN2 directly to VOUT1.
   The VOUT2 signal should be 1.8 V.
6. Connect a dc enable voltage, within the 2.0 V to 6 V range, between EN3 and GND. This will power up switcher 3. You may use jumper J3 to connect EN3 directly to VOUT1.
   The VOUT3 signal should be 1.2 V.

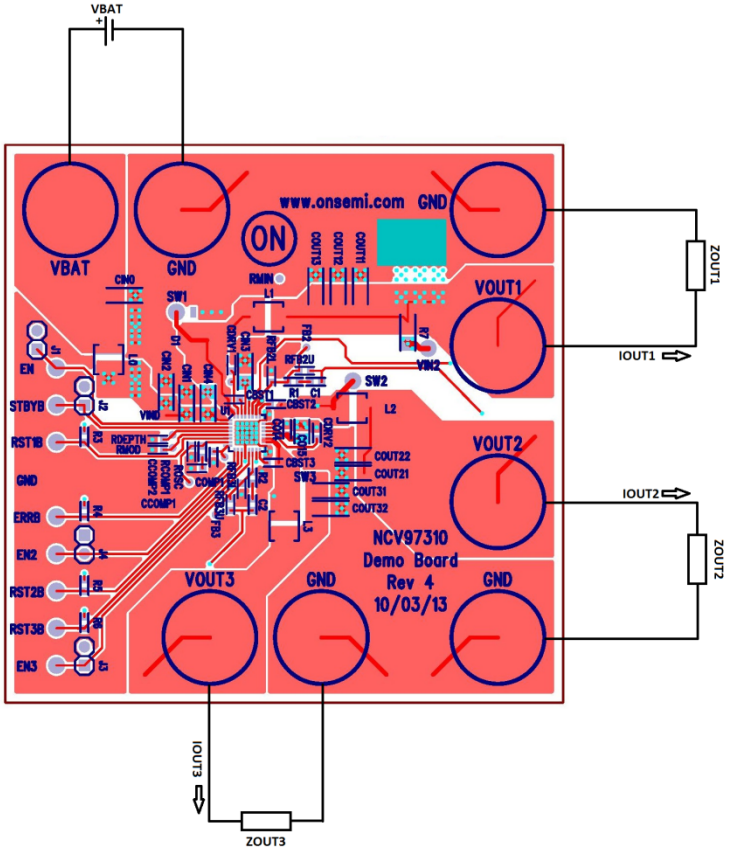

Figure 5. NCV97310 Board Connections

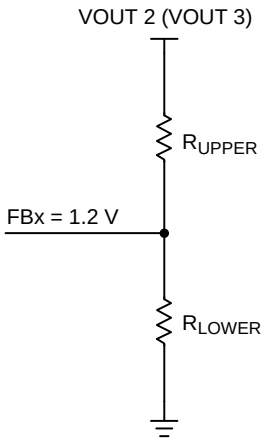
APPLICATION INFORMATION

Output Voltage Selection

The voltage outputs for switcher 2 and switcher 3 are adjustable and can be set with a resistor divider. The FB reference for both switchers is 1.2 V.



The upper resistor is set to 10 kΩ and is part of the feedback loop. To maintain stability over all conditions, it is recommended to change the only the lower feedback resistor to set the output voltage. Use the following equation:

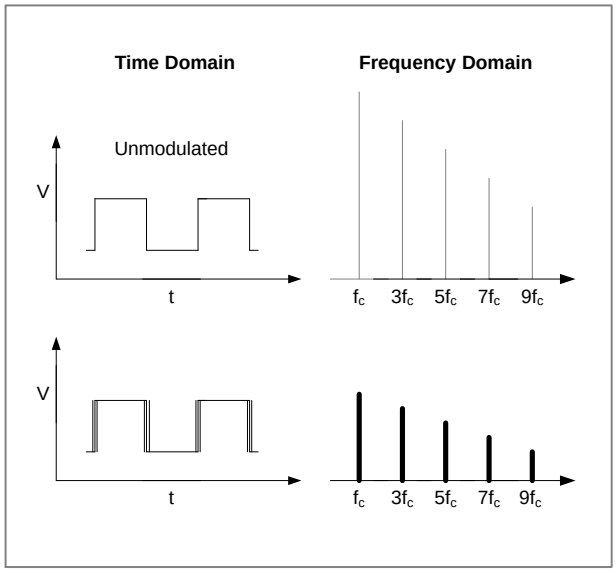
$$R_{LOWER} = R_{UPPER} \frac{V_{FB}}{V_{OUT} - V_{FB}}$$

Some common setups are listed below:

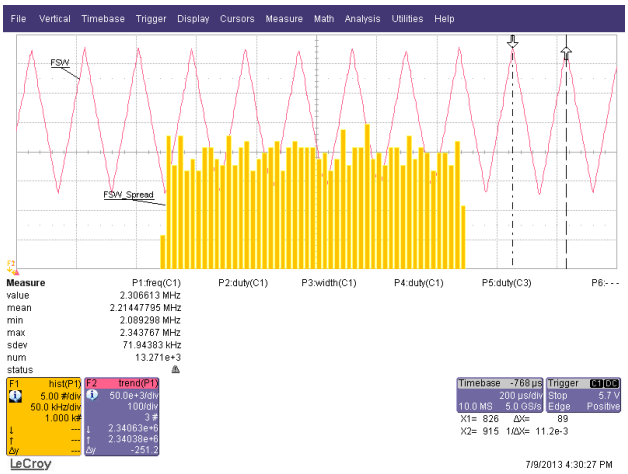
Desired Output (V)	VREF (V)	R_{UPPER} (kΩ, 1%)	R_{LOWER} (kΩ, 1%)
1.2	1.2	10.0	NP
1.5	1.2	10.0	40.0
1.8	1.2	10.0	20.0
2.5	1.2	10.0	9.31
3.3	1.2	10.0	5.76

Spread Spectrum

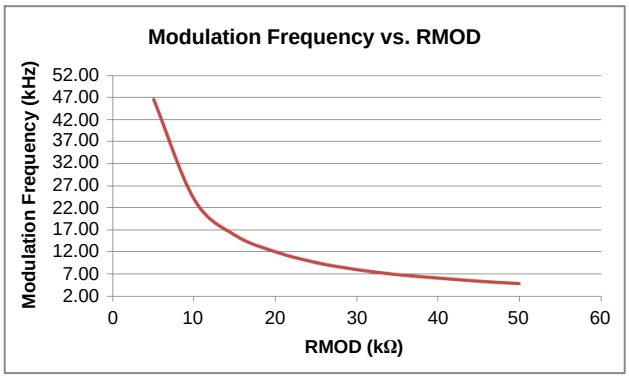
In SMPS devices, switching translates to higher efficiency. Unfortunately, the switching leads to a much noisier EMI profile. We can greatly decrease some of the radiated emissions with some spread spectrum techniques. Spread spectrum is used to reduce the peak electromagnetic emissions of a switching regulator.

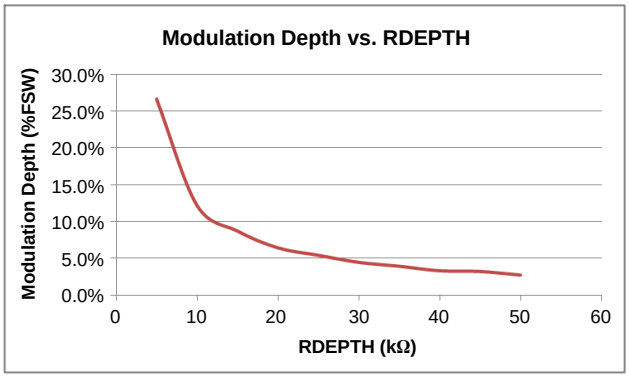


The spread spectrum used in the NCV97310 is an “up-spread” technique, meaning the switching frequency is spread upward from the 2.0 MHz base frequency. For example, a 5 % spread means that the switching frequency is swept (spread) from 2.0 MHz up to 2.1 MHz in a linear fashion – this is called the modulation depth. The rate at which this spread takes place is called the modulation frequency. For example, a 10 kHz modulation frequency means that the frequency is swept from 2.0 MHz to 2.1 MHz in 50 μs and then back down from 2.1 MHz to 2.0 MHz in 50 μs.



The modulation depth and modulation frequency are each set by 2 external resistors to GND. The modulation frequency can be set from 5 kHz up to 50 kHz using a resistor from the RMOD pin to GND. The modulation depth can be set from 3% up to 30% of the nominal switching frequency using a resistor from the RDEPTH pin to GND. Please see the curves below for typical values:





Spread spectrum is automatically turned off when there is a short to GND or an open circuit on either the RMOD pin or the RDEPTH pin. Please be sure that the ROSC pin is an open circuit when using spread spectrum.

Адрес: 105318, г.Москва, ул.Щербаковская д.3, офис 1107

Данный компонент на территории Российской Федерации

Вы можете приобрести в компании MosChip.

Для оперативного оформления запроса Вам необходимо перейти по данной ссылке:

http://moschip.ru/get-element

Вы можете разместить у нас заказ для любого Вашего проекта, будь то серийное производство или разработка единичного прибора.

В нашем ассортименте представлены ведущие мировые производители активных и пассивных электронных компонентов.

Нашей специализацией является поставка электронной компонентной базы двойного назначения, продукции таких производителей как XILINX, Intel (ex.ALTERA), Vicor, Microchip, Texas Instruments, Analog Devices, Mini-Circuits, Amphenol, Glenair.

Сотрудничество с глобальными дистрибьюторами электронных компонентов, предоставляет возможность заказывать и получать с международных складов практически любой перечень компонентов в оптимальные для Вас сроки.

На всех этапах разработки и производства наши партнеры могут получить квалифицированную поддержку опытных инженеров.

Система менеджмента качества компании отвечает требованиям в соответствии с ГОСТ Р ИСО 9001, ГОСТ РВ 0015-002 и ЭС РД 009
