## Functional Description

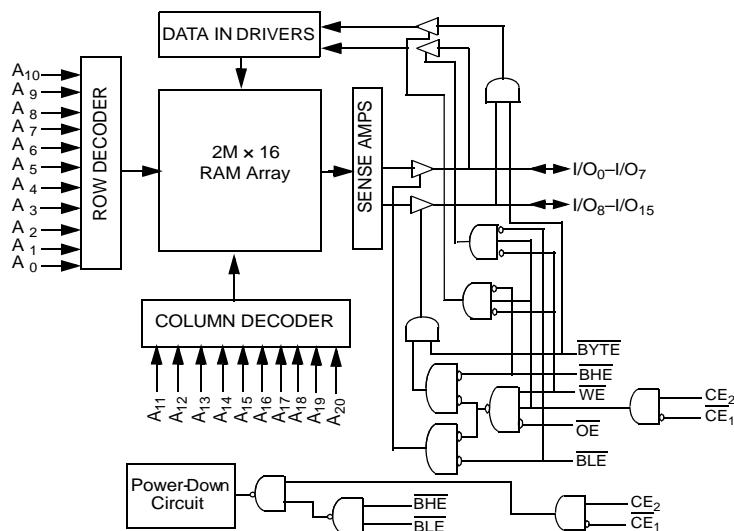

The CY62177EV18 is a high-performance CMOS static RAM organized as 2 M words by 16 bits and 4 M words by 8 bits. This device features advanced circuit design to provide ultra low active current. It is ideal for providing More Battery Life™ (MoBL®) in portable applications, such as cellular telephones. The device also has an automatic power-down feature that significantly reduces power consumption by 99 percent when addresses are not toggling. The device can also be put into standby mode when deselected ( $CE_1$  HIGH or  $CE_2$  LOW or both BHE and BLE are HIGH). The input and output pins (I/O<sub>0</sub> through I/O<sub>15</sub>) are placed in a high impedance state when: deselected ( $CE_1$  HIGH or  $CE_2$  LOW), outputs are disabled ( $OE$  HIGH), both Byte High Enable and Byte Low Enable are disabled (BHE, BLE HIGH), or during a write operation ( $CE_1$  LOW,  $CE_2$  HIGH and WE LOW).

To write to the device, take Chip Enables ( $CE_1$  LOW and  $CE_2$  HIGH) and Write Enable (WE) input LOW. If Byte Low Enable (BLE) is LOW, then data from I/O pins (I/O<sub>0</sub> through I/O<sub>7</sub>), is written into the location specified on the address pins (A<sub>0</sub> through A<sub>20</sub>). If Byte High Enable (BHE) is LOW, then data from I/O pins (I/O<sub>8</sub> through I/O<sub>15</sub>) is written to the location specified on the address pins (A<sub>0</sub> through A<sub>20</sub>). To read from the device, take Chip Enables ( $CE_1$  LOW and  $CE_2$  HIGH) and Output Enable (OE) LOW while forcing the Write Enable (WE) HIGH. If Byte Low Enable (BLE) is LOW, then data from the memory location specified by the address pins appear on I/O<sub>0</sub> to I/O<sub>7</sub>. If Byte High Enable (BHE) is LOW, then data from memory appears on I/O<sub>8</sub> to I/O<sub>15</sub>. See the [Truth Table on page 11](#) for a complete description of read and write modes.

Pin #13 of the 48 TSOP I package is an DNU pin that must be left floating at all times to ensure proper application.

### Notes

1. DNU Pin# 13 needs to be left floating to ensure proper application.
2. The BYTE pin in the 48-TSOP I package has to be tied to V<sub>CC</sub> to use the device as a 2 M<sub>x</sub>16 SRAM. The 48-pin TSOP I package can also be used as a 4 M<sub>x</sub>8 SRAM by tying the BYTE signal to V<sub>SS</sub>. In the 4 M<sub>x</sub>8 configuration, Pin 45 is A21, while BHE, BLE, and I/O<sub>8</sub> to I/O<sub>14</sub> pins are not used.
3. Typical values are included for reference only and are not guaranteed or tested. Typical values are measured at V<sub>CC</sub> = V<sub>CC</sub>(typ), T<sub>A</sub> = 25 °C.

### Notes

4.  $V_{\text{IL(min)}} = -2.0\text{ V}$  for pulse durations less than 20 ns.

5.  $V_{\text{IH(max)}} = V_{\text{CC}} + 0.75\text{ V}$  for pulse durations less than 20 ns.

6. Full Device AC operation assumes a 100  $\mu\text{s}$  ramp time from 0 to  $V_{\text{CC}}$  (min) and 200  $\mu\text{s}$  wait time after  $V_{\text{CC}}$  stabilization.

7. Typical values are included for reference only and are not guaranteed or tested. Typical values are measured at  $V_{\text{CC}} = V_{\text{CC(typl)}}$ ,  $T_A = 25^{\circ}\text{C}$ .

8. Under DC conditions the device meets a  $V_{\text{IL}}$  of 0.8 V. However, in dynamic conditions Input LOW Voltage applied to the device must not be higher than 0.7 V.

9. The BYTE pin in the 48-TSOP I package has to be tied to  $V_{\text{CC}}$  to use the device as a 2 M  $\times$  16 SRAM. The 48-TSOP I package can also be used as a 4 M  $\times$  8 SRAM by tying the BYTE signal to  $V_{\text{SS}}$ . In the 4 M  $\times$  8 configuration, Pin 45 is A21, while BHE, BLE, and  $I_{\text{O}_8}$  to  $I_{\text{O}_{14}}$  pins are not used.

10. Chip enables ( $\text{CE}_1$  and  $\text{CE}_2$ ), byte enables (BHE and BLE) and BYTE need to be tied to CMOS levels to meet the  $I_{\text{SB2}}$  /  $I_{\text{CCDR}}$  spec. Other inputs can be left floating.

12. Typical values are included for reference only and are not guaranteed or tested. Typical values are measured at  $V_{CC} = V_{CC(typ)}$ ,  $T_A = 25$  °C.
13. Chip enables ( $\overline{CE}_1$  and  $CE_2$ ), byte enables ( $\overline{BHE}$  and  $\overline{BLE}$ ) and BYTE need to be tied to CMOS levels to meet the  $I_{SB2}$  /  $I_{CCDR}$  spec. Other inputs can be left floating.

### Notes

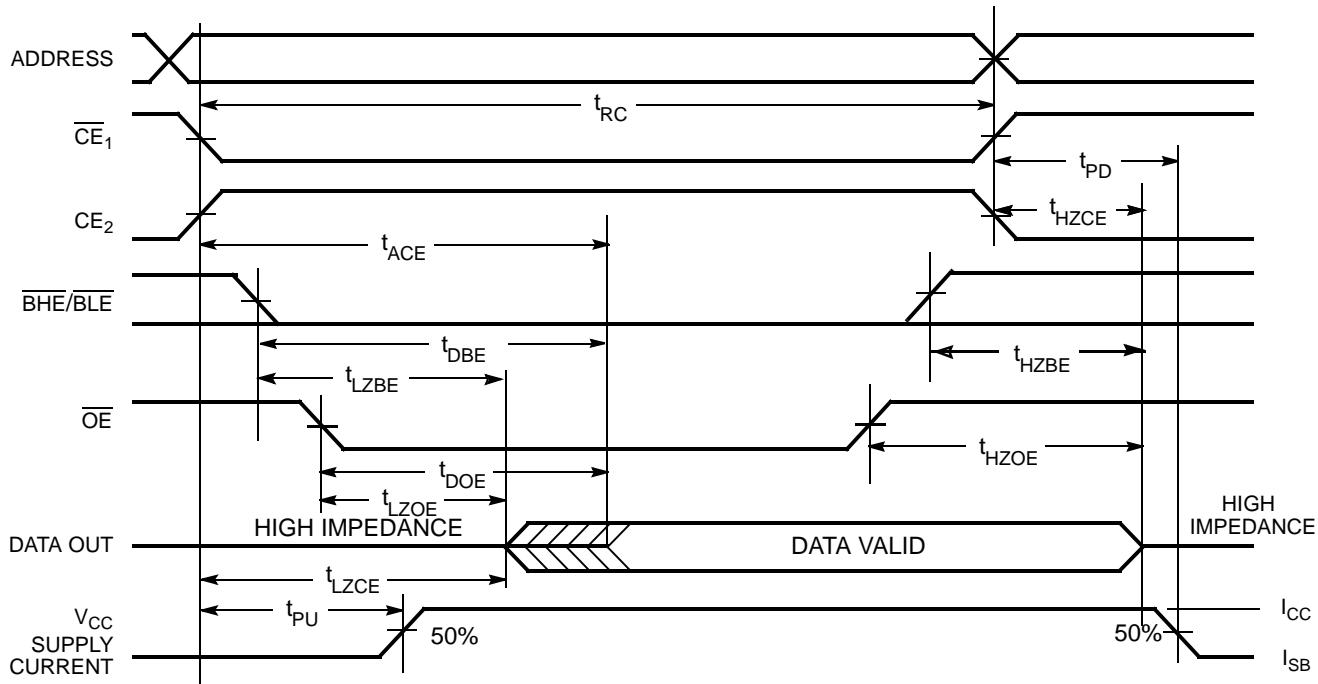

17. Test conditions for all parameters other than tristate parameters assume signal transition time of 1 V/ns, timing reference levels of  $V_{CC(\text{typ})}/2$ , input pulse levels of 0 to  $V_{CC(\text{typ})}$ , and output loading of the specified  $I_{OL}/I_{OH}$  as shown in [Table 1 on page 5](#).
18. In an earlier revision of this device, under a specific application condition, READ and WRITE operations were limited to switching of the byte enable and/or chip enable signals as described in the Application Notes [AN13842](#) and [AN66311](#). However, the issue has been fixed and in production now, and hence, these Application Notes are no longer applicable. They are available for download on our website as they contain information on the date code of the parts, beyond which the fix has been in production.
19. At any given temperature and voltage condition,  $t_{HZCE}$  is less than  $t_{LZCE}$ ,  $t_{HZBE}$  is less than  $t_{LZBE}$ ,  $t_{HZOE}$  is less than  $t_{LZOE}$ , and  $t_{HZWE}$  is less than  $t_{LZWE}$  for any given device.
20.  $t_{HZOE}$ ,  $t_{HZCE}$ ,  $t_{HZBE}$ , and  $t_{HZWE}$  transitions are measured when the outputs enter a high impedance state.
21. The internal Write time of the memory is defined by the overlap of WE,  $CE_1 = V_{IL}$ , BHE and/or BLE =  $V_{IL}$ , and  $CE_2 = V_{IH}$ . All signals must be ACTIVE to initiate a write and any of these signals can terminate a write by going INACTIVE. The data input setup and hold timing should be referenced to the edge of the signal that terminates the write.
22. The minimum write cycle pulse width for Write Cycle No. 3 (WE controlled,  $\overline{OE}$  LOW) should be equal to the sum of tsd and  $t_{HZWE}$ .

## Switching Waveforms

**Figure 5. Read Cycle 1 (Address Transition Controlled)** [23, 24]

**Figure 6. Read Cycle 2 ( $\overline{OE}$  Controlled)** [24, 25]

### Notes

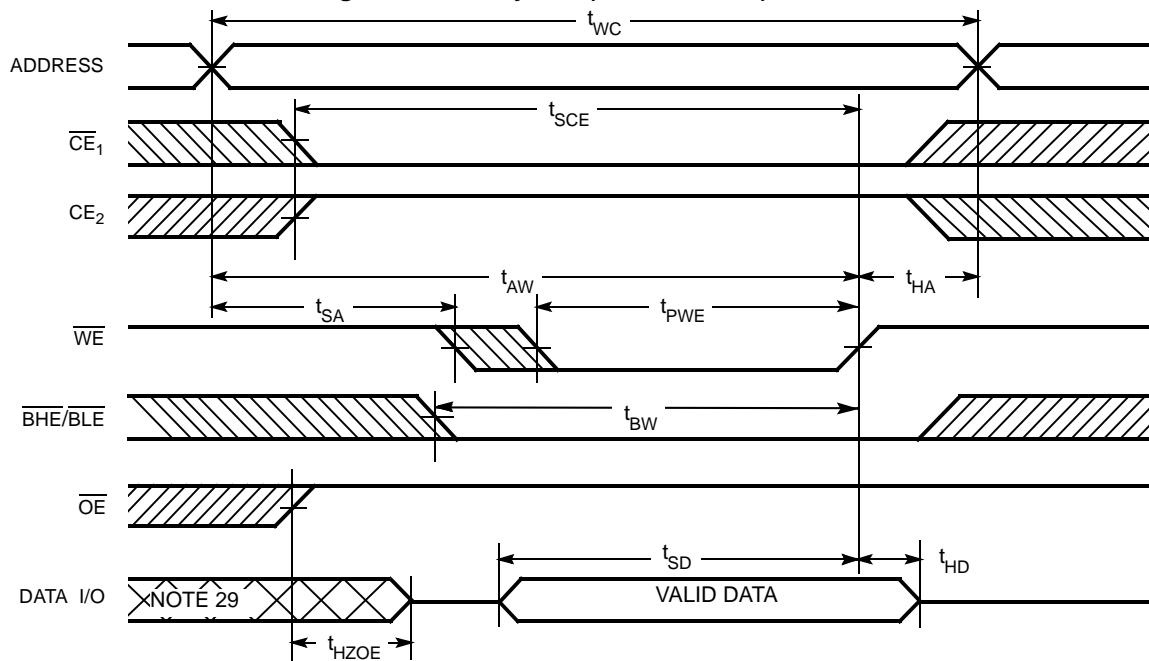

23. The device is continuously selected.  $\overline{OE}$ ,  $\overline{CE}_1 = V_{IL}$ ,  $\overline{BHE}$  and/or  $\overline{BLE} = V_{IL}$ , and  $CE_2 = V_{IH}$ .

24.  $\overline{WE}$  is HIGH for read cycle.

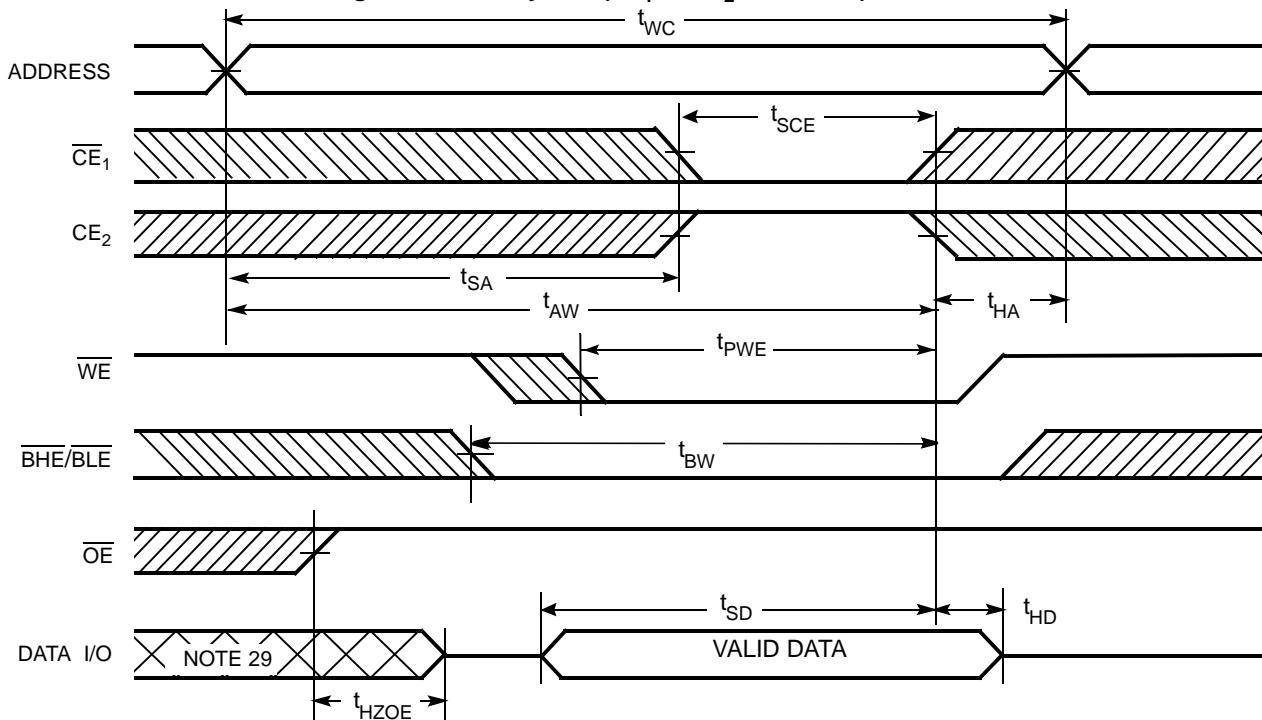

25. Address valid prior to or coincident with  $\overline{CE}_1$ ,  $\overline{BHE}$ ,  $\overline{BLE}$  transition LOW and  $CE_2$  transition HIGH.

## Switching Waveforms (continued)

**Figure 8. Write Cycle 2 ( $\overline{CE}_1$  or  $\overline{CE}_2$  Controlled)** [26, 27, 28, 29]

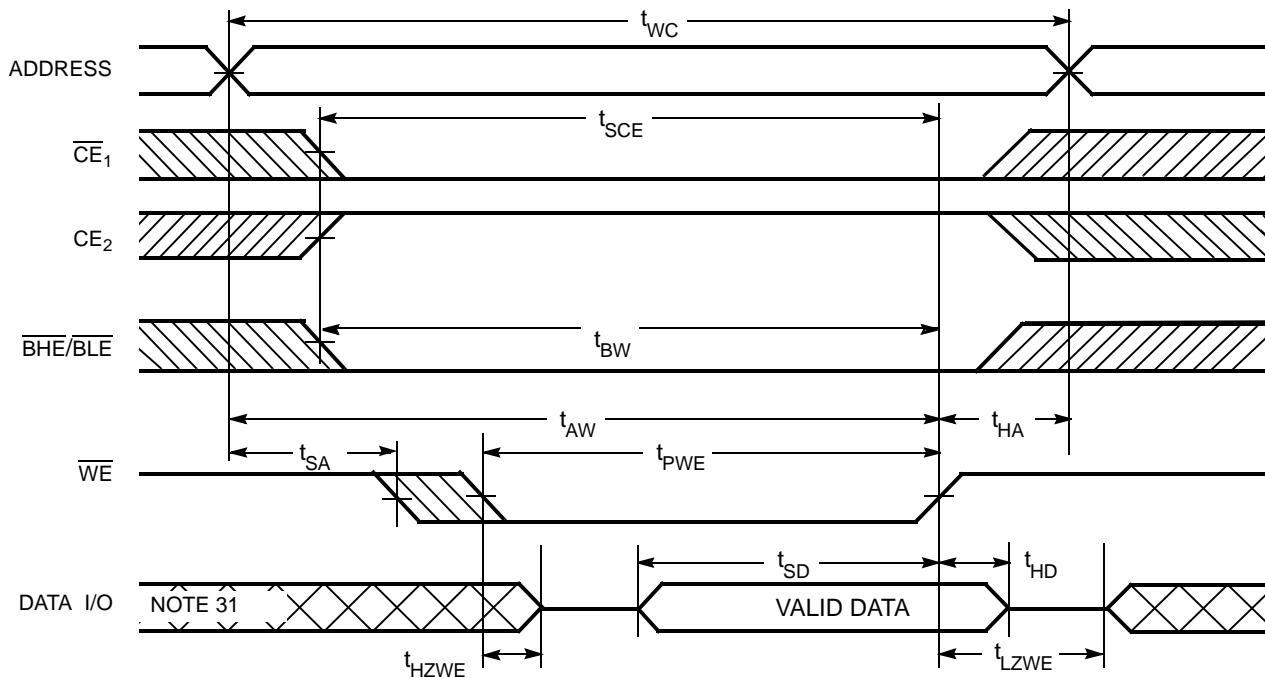

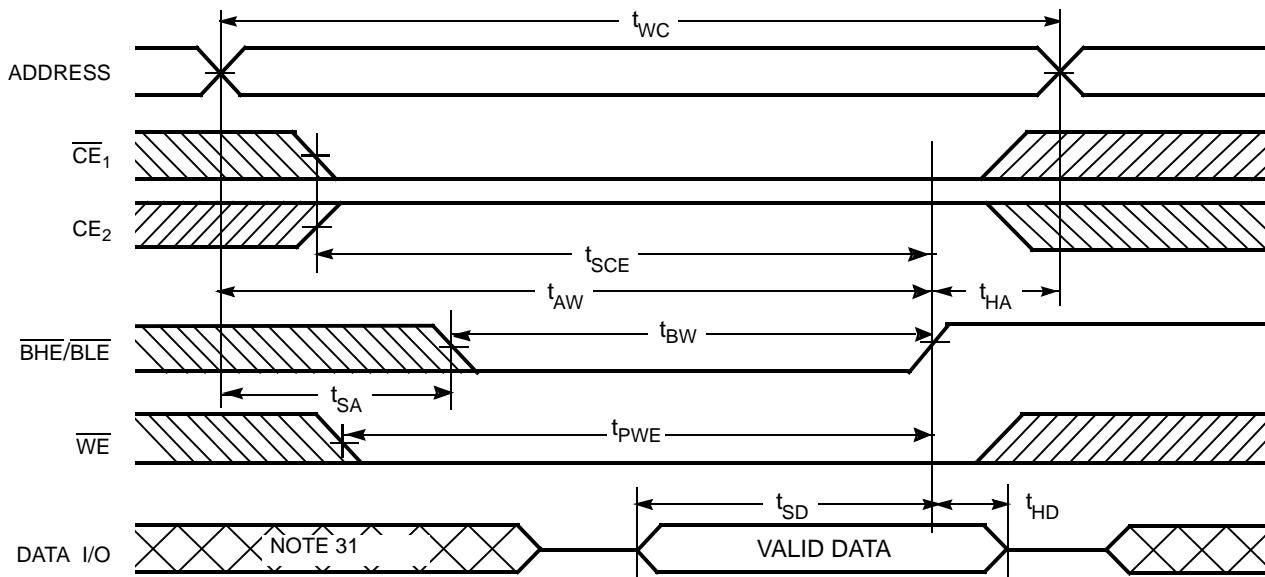

### Notes

26. The internal Write time of the memory is defined by the overlap of  $\overline{WE}$ ,  $\overline{CE}_1 = V_{IL}$ ,  $\overline{BHE} = V_{IL}$  and/or  $\overline{BLE} = V_{IL}$ , and  $CE_2 = V_{IH}$ . All signals must be ACTIVE to initiate a write and any of these signals can terminate a write by going INACTIVE. The data input setup and hold timing should be referenced to the edge of the signal that terminates the write.

27. Data I/O is high impedance if  $\overline{OE} = V_{IH}$ .

28. If  $\overline{CE}_1$  goes HIGH and  $CE_2$  goes LOW simultaneously with  $\overline{WE} = V_{IH}$ , the output remains in a high-impedance state.

29. During this period the I/Os are in output state and input signals should not be applied.

**Switching Waveforms (continued)**
**Figure 9. Write Cycle 3 ( $\overline{\text{WE}}$  Controlled,  $\overline{\text{OE}}$  LOW) [30, 31, 32]**

**Figure 10. Write Cycle 4 ( $\overline{\text{BHE/BLE}}$  Controlled,  $\overline{\text{OE}}$  LOW) [30, 32]**

**Notes**

30. If  $\overline{\text{CE}}_1$  goes HIGH and  $\overline{\text{CE}}_2$  goes LOW simultaneously with  $\overline{\text{WE}} = V_{\text{IH}}$ , the output remains in a high-impedance state.
31. During this period the I/Os are in output state and input signals should not be applied.
32. The minimum write cycle pulse width should be equal to the sum of  $t_{\text{SD}}$  and  $t_{\text{HZWE}}$ .
