

FEATURES

Low power

Quiescent current per amplifier: 1.0 mA at ± 5 V

Fully specified at +3 V, +5 V, and ± 5 V supplies

High speed and fast settling for ± 5 V

180 MHz, -3 dB bandwidth ($G = +1$, $V_{\text{OUT}} = 20$ mV p-p)

28 MHz, -3 dB bandwidth ($G = +1$, $V_{\text{OUT}} = 2$ V p-p)

225 V/ μs slew rate for 5 V step (rise)

47 ns settling time to 0.1% for 4 V step

Rail-to-rail input and output

Low distortion at ± 5 V (HD2/HD3)

-112 dBc/ -115 dBc at 100 kHz, $V_{\text{OUT}} = 2$ V p-p

-95 dBc/ -79 dBc at 1 MHz, $V_{\text{OUT}} = 2$ V p-p

Low noise

3.1 nV/ $\sqrt{\text{Hz}}$, $f = 100$ kHz

0.7 pA/ $\sqrt{\text{Hz}}$, $f = 100$ kHz

Low input noise voltage 1/f corner: 29 Hz

Low input bias current: -1.2 μA typical

Linear output current: 60 mA (sourcing) for ± 5 V and +5 V

Low input offset voltage: ± 125 μV maximum

Low input offset voltage drift: 3.8 $\mu\text{V}/^\circ\text{C}$ maximum

APPLICATIONS

High speed, battery operated systems

High component density systems

High resolution analog-to-digital converter (ADC) drivers

Portable test instruments

Active filters

GENERAL DESCRIPTION

The ADA4807-1/ADA4807-2 are low power, low noise, rail-to-rail voltage feedback amplifiers with exceptionally high performance. They are designed to have the lowest input noise (3.1 nV/ $\sqrt{\text{Hz}}$ and 0.7 pA/ $\sqrt{\text{Hz}}$) among high speed, rail-to-rail amplifiers in the industry while operating on only 1 mA or less of quiescent supply current, making them ideal for a wide range of applications from battery-powered, portable instrumentation to high speed systems where component density requires lower power dissipation. The ADA4807-1/ADA4807-2 operate over a wide range of supply voltages from ± 1.5 V to ± 5 V, as well as from 3 V to 10 V single supplies, and include a disable feature that allows reduction of the typical quiescent supply current to 2.4 μA or less when asserted.

For systems with high dynamic range signals, the output voltage swings to within 70 mV of each rail, maximizing the output dynamic range, and the full, rail-to-rail input stage permits input operation up to and beyond the supply rails.

PIN CONNECTION DIAGRAMS

Figure 1. 6-Lead SC70 and 6-Lead SOT-23

Figure 2. 8-Lead MSOP Pin Configuration

Figure 3. 10-Lead LFCSP Pin Configuration

The ADA4807-1/ADA4807-2 feature high speed performance of 180 MHz small signal -3 dB bandwidth, a 225 V/ μs slew rate, and a settling time of 47 ns to 0.1% (4 V step) with a low input offset voltage of ± 20 μV and 0.7 $\mu\text{V}/^\circ\text{C}$ drift. For ± 5 V supplies, the HD2 is -112 dBc and HD3 is -115 dBc for a 2 V p-p, 100 kHz output signal driving a 1 k Ω load. The low distortion and fast settling time make these amplifiers ideal for driving high speed single-supply precision ADCs with up to 18-bit resolution. The ADA4807-1/ADA4807-2 deliver this excellent performance while consuming 1 mA or less of quiescent current.

The ADA4807-1 (single) is available in space-saving 6-lead SC70 and 6-lead SOT-23 packages. The ADA4807-2 (dual) is available in 10-lead LFCSP and 8-lead MSOP packages. The ADA4807-1/ADA4807-2 operate over the -40°C to $+125^\circ\text{C}$ industrial temperature range.

Table 1. Other Rail-to-Rail Amplifiers

| Device | Bandwidth (MHz) | Slew Rate (V/ μs) | Voltage Noise (nV/ $\sqrt{\text{Hz}}$) | Max V_{OS} (mV) |
|---------------|-----------------|-------------------------------|---|--------------------------|
| AD8031/AD8032 | 80 | 35 | 15 | 1.5 |
| AD8027/AD8028 | 190 | 90 | 4.3 | 0.8 |
| AD8029/AD8030 | 125 | 62 | 16.5 | 5.0 |

ABSOLUTE MAXIMUM RATINGS

Table 5.

| Parameter | Rating |
|--|---|
| Supply Voltage | 11 V |
| Internal Power Dissipation | See Figure 4 |
| Input Voltage (Common Mode) | $\pm V_S \pm 0.2$ V |
| Differential Input Voltage | ± 1.4 V |
| Output Short-Circuit Duration | Observe power derating curves in Figure 4 |
| Storage Temperature Range (All Packages) | -65°C to $+125^{\circ}\text{C}$ |
| Lead Temperature (Soldering 10 Sec) | 300°C |

Stresses at or above those listed under Absolute Maximum Ratings may cause permanent damage to the product. This is a stress rating only; functional operation of the product at these or any other conditions above those indicated in the operational section of this specification is not implied. Operation beyond the maximum operating conditions for extended periods may affect product reliability.

MAXIMUM POWER DISSIPATION

The maximum power that can be safely dissipated by the [ADA4807-1/ADA4807-2](#) is limited by the associated rise in junction temperature. The maximum safe junction temperature for plastic encapsulated devices is determined by the glass transition temperature of the plastic, approximately 150°C . Exceeding this limit temporarily can cause a shift in parametric performance due to a change in the stresses exerted on the die by the package. Exceeding a junction temperature of 175°C for an extended period can result in device failure.

Although the [ADA4807-1/ADA4807-2](#) are internally short-circuit protected, this may not be sufficient to guarantee that the maximum junction temperature (150°C) is not exceeded under all conditions. To ensure proper operation, it is necessary to observe the power derating curves shown in Figure 4.

THERMAL RESISTANCE

θ_{JA} is specified for the worst-case conditions, that is, a device soldered in a circuit board for surface-mount packages.

Table 6. Thermal Resistance

| Package Type | θ_{JA} | Unit |
|------------------------------|---------------|-----------------------------|
| 6-Lead SC70, 4-Layer Board | 209 | $^{\circ}\text{C}/\text{W}$ |
| 6-Lead SOT-23, 4-Layer Board | 223 | $^{\circ}\text{C}/\text{W}$ |
| 8-Lead MSOP | 123 | $^{\circ}\text{C}/\text{W}$ |
| 10-Lead LFCSP | 51 | $^{\circ}\text{C}/\text{W}$ |

Figure 4. Maximum Power Dissipation vs. Ambient Temperature for a 4-Layer Board

ESD CAUTION

ESD (electrostatic discharge) sensitive device. Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

THEORY OF OPERATION

The ADA4807-1/ADA4807-2 have a rail-to-rail input stage with an input range that goes 200 mV beyond either rail. A PNP transistor input pair is active for a majority of the input range, while an NPN transistor input pair is active for the common-mode voltages within 1.3 V of the positive rail. The ADA4807-1/ADA4807-2 are fabricated in Analog Devices, Inc., third generation, extra fast complementary bipolar (XFCB) process resulting in exceptionally good distortion, noise, slew rate, and settling characteristics for 1 mA devices. Given traditional rail-to-rail input architecture performance, the input 1/f noise is surprisingly low, and the current noise is only 0.7 pA/√Hz for a 3 nV/√Hz voltage noise. Typical high slew rate devices suffer from increased current noise because of input pair degeneration and higher input stage current. The ADA4807-1/ADA4807-2 exceed current benchmark parameters given the performance of the XFCB process.

The multistage design of the ADA4807-1/ADA4807-2 has excellent precision specifications, such as input drift, offset, open-loop gain, CMRR, and PSRR. Typical harmonic distortion numbers fall in the range of -130 dBc for a 10 kHz fundamental (see Figure 40). This level of performance makes the ADA4807-1/

ADA4807-2 the best choices when driving 18-bit precision converters.

The ADA4807-1/ADA4807-2 are optimized for a low shutdown current (4 μA maximum), in the order of a few microamperes. In power sensitive applications, this can eliminate the use of a power FET and enable time interleaved power saving operation schemes.

The rail-to-rail input stage is useful in many different applications. Although the precision is reduced from input to input, many applications can tolerate this loss when the alternative is no functionality at all. The positive rail input range is indispensable for servo loops with a high-side input range

The ADA4807-1/ADA4807-2 input operates 200 mV beyond either rail. Internal protection circuitry prevents the output from phase inverting when the input range is exceeded. When the input exceeds a diode beyond either rail, internal electrostatic discharge (ESD) protection diodes source or sink current through the input.

Figure 55. Simplified Schematic

Figure 56. Differential Drive from Input Stage

DISABLE CIRCUITRY

When the **DISABLE** pin is an option, a pull-up resistor is necessary if the logic leakage currents exceed 300 nA. Pulling the **DISABLE** pin to ≥ 3.7 V below $+V_S$ turns the ADA4807-1/ADA4807-2 off, which reduces the supply current to 2.4 μ A for a 10 V voltage supply. Applying ≤ 3.4 V below $+V_S$ on the **DISABLE** pin enables the ADA4807-1/ADA4807-2 with a low quiescent current of 1 mA for a 10 V voltage supply. When the ADA4807-1/ADA4807-2 device is disabled, its output enters a high impedance state. The output impedance decreases as frequency increases. When disabled, a forward isolation of 120 dB is achieved at 100 kHz (see Figure 20). ESD clamps protect the **DISABLE** pin, as shown in Figure 58. Voltages beyond the power supplies cause these diodes to conduct. To avoid excessive current in the ESD diodes, ensure that the voltage to the **DISABLE** pin does not exceed 0.7 V above the positive supply or that it does not fall 0.7 V below the negative supply. If an overvoltage condition is expected, limit the input current to less than 10 mA with a series resistor.

Figure 57. **DISABLE** Trigger Voltage

Table 9. Threshold Voltages for Disabled and Enabled Modes

| Mode | +3 V | +5 V | +10 V | ± 5 V | +7 V/-2 V |
|----------|--------|-------|-------|-----------|-----------|
| Enabled | 1.35 V | 1.6 V | 6.6 V | 1.6 V | +3.6 V |
| Disabled | 1.05 V | 1.3 V | 6.3 V | 1.3 V | +3.3 V |

INPUT PROTECTION

The ADA4807-1/ADA4807-2 are fully protected from ESD events, withstanding human body model ESD events of ± 3 kV and charged device model events of ± 1.25 kV with no measured performance degradation. The precision input is protected with an ESD network between the power supplies and diode clamps across the input device pair, as shown in Figure 58. For differential voltages above approximately 1.2 V at room temperature and 0.8 V at 125°C, the diode clamps begin to conduct. Too much current can cause damage due to excessive heating. If large differential voltages must be sustained across the input terminals, it is recommended that the current through the input clamps be limited to less than 10 mA. Series input resistors sized appropriately for the expected differential overvoltage provide the needed protection.

Figure 58. Input Stage and Protection Diodes

NOISE CONSIDERATIONS

Figure 59 illustrates the primary noise contributors for the typical gain configurations. The total output noise (V_{N_OUT}) is the root sum square of all the noise contributions.

Figure 59. Noise Sources in Typical Gain Configurations

Calculate the output noise spectral density using Equation 1. Source resistance noise, amplifier input voltage noise, and the voltage noise from the amplifier input current noise ($I_{N+} \times R_S$) are all subject to the noise gain term $(1 + R_F/R_G)$.

$$V_{N_OUT} = \sqrt{4kTR_F + \left(1 + \frac{R_F}{R_G}\right)^2 \left[4kTR_S + I_{N+}^2 R_S^2 + V_N^2\right] + \left(\frac{R_F}{R_G}\right)^2 4kTR_G + I_{N-}^2 R_F^2} \quad (1)$$

where:

k is Boltzmann's constant.

T is the absolute temperature in degrees Kelvin.

R_F and R_G are the feedback network resistances, as shown in Figure 59.

R_S is the source resistance, as shown in Figure 59.

I_{N+} and I_{N-} represent the amplifier input current noise spectral density in pA/\sqrt{Hz} .

V_N is the amplifier input voltage noise spectral density in nV/\sqrt{Hz} .

APPLICATIONS INFORMATION

CAPACITIVE LOAD DRIVE

Figure 60 shows the schematic for driving large capacitive loads, and Figure 61 shows the frequency response for a gain of +2. Note that the bandwidth decreases with larger capacitive loads (see Figure 61).

Figure 62 shows the required series resistor (R_{SERIES}) when limiting the peaking to 3 dB for a range of load capacitors (C_{LOAD}) at a gain of 2. From Figure 62, no series resistors are necessary to maintain stability for larger capacitors.

Figure 60. Schematic for Driving Large Capacitive Loads

Figure 61. Frequency Response for Driving Large Capacitive Loads, $R_F = R_G = 249\Omega$

Figure 62. Required Series Resistor (R_{SERIES}) vs. Capacitive Load (C_{LOAD}) at 3 dB Peaking

LAYOUT, GROUNDING, AND BYPASSING

The ADA4807-1/ADA4807-2 are high speed devices. Realizing their superior performance requires attention to the details of high speed printed circuit board (PCB) design.

The first requirement is to use a multilayer PCB with solid ground and power planes that cover as much of the board area as possible.

Bypass each power supply pin directly to a nearby ground plane, as close to the device as possible. Use 0.1 μF high frequency ceramic chip capacitors.

Provide low frequency bulk bypassing using 10 μF tantalum capacitors from each supply to ground.

Stray transmission line capacitance in combination with package parasitics can potentially form a resonant circuit at high frequencies, resulting in excessive gain peaking or possible oscillation. Signal routing must be short and direct to avoid such parasitic effects. Provide symmetrical layout for complementary signals to maximize balanced performance.

Use radio frequency transmission lines to connect the driver and receiver to the amplifier.

Minimize stray capacitance at the input and output pins by clearing the underlying ground and low impedance planes near these pins.

If the driver and receiver are more than one-eighth of the wavelength from the amplifier, minimize the signal trace widths. This nontransmission line configuration requires clearing of the underlying and adjacent ground and low impedance planes near the signal lines.

Вы можете приобрести в компании MosChip.

Для оперативного оформления запроса Вам необходимо перейти по данной ссылке:

<http://moschip.ru/get-element>

Вы можете разместить у нас заказ для любого Вашего проекта, будь то серийное производство или разработка единичного прибора.

В нашем ассортименте представлены ведущие мировые производители активных и пассивных электронных компонентов.

Нашей специализацией является поставка электронной компонентной базы двойного назначения, продукции таких производителей как XILINX, Intel (ex.ALTERA), Vicor, Microchip, Texas Instruments, Analog Devices, Mini-Circuits, Amphenol, Glenair.

Сотрудничество с глобальными дистрибьюторами электронных компонентов, предоставляет возможность заказывать и получать с международных складов практически любой перечень компонентов в оптимальные для Вас сроки.

На всех этапах разработки и производства наши партнеры могут получить квалифицированную поддержку опытных инженеров.

Система менеджмента качества компании отвечает требованиям в соответствии с ГОСТ Р ИСО 9001, ГОСТ РВ 0015-002 и ЭС РД 009
