MAX14937

Two Channel, 5kV$_{RMS}$ I^{2}C Isolator

General Description

The MAX14937 is a two-channel, 5kV$_{RMS}$ I^{2}C digital isolator utilizing Maxim's proprietary process technology. For applications requiring 2.75kV$_{RMS}$ of isolation, see the MAX14933 data sheet. The device transfers digital signals between circuits with different power domains at ambient temperatures up to +125°C.

The device offers two bidirectional, open-drain channels for applications, such as I^{2}C, that require data to be transmitted in both directions on the same line.

The device features independent 2.25V to 5.5V supplies on each side of the isolator. The MAX14937 operates from DC to 1.7MHz and can be used in isolated I^{2}C busses with clock stretching.

The MAX14937 is available in a 16-pin, wide-body (10.3mm x 7.5mm) SOIC package, and is rated for operation at ambient temperatures of -40°C to +125°C.

Applications

- I^{2}C, SMBus, PMBus™ Interfaces
- Power Supplies
- Battery Management
- Instrumentation

Benefits and Features

- Robust Galvanic Isolation of Digital Signals
  - Withstands 5kV$_{RMS}$ for 60s (V$_{ISO}$)
  - Continuously Withstands 848V$_{RMS}$ (V$_{IOWM}$)
  - 1200V$_{PEAK}$ Repetitive Peak Voltage (V$_{IORM}$)
  - Withstands ±10kV Surge per IEC 61000-4-5
- Interfaces Directly with Most Micros and FPGAs
  - Accepts 2.25V to 5.5V Supplies
  - Bidirectional Data Transfer from DC to 1.7MHz
- Low Power Consumption
  - 5.3mA per Channel Typical at 1.7MHz

Safety Regulatory Approvals

(See *Safety Regulatory Approvals*)

- UL According to UL1577
- cUL According to CSA Bulletin 5A
- VDE 0884-10

Absolute Maximum Ratings

V_{DDA} to GNDA .....-0.3V to +6V
V_{DDB} to GNDB .....-0.3V to +6V
I/OA_ to GNDA .....-0.3V to +6V
I/OB_ to GNDB .....-0.3V to +6V
Short-Circuit Duration
(I/OA_ to GNDA, I/OB_ to GNDB) .....Continuous

Continuous Power Dissipation (T_A = +70°C)
Wide SO (derate 14.1mW/ºC above +70°C) 1126.8mW
Operating Temperature Range ..... -40°C to +125°C
Maximum Junction Temperature .....+150°C
Storage Temperature Range ..... -65°C to +150°C
Lead Temperature (soldering, 10s) .....+300°C
Soldering Temperature (reflow) .....+260°C

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Package Thermal Characteristics (Note 1)

Wide SOIC
Junction-to-Ambient Thermal Resistance (θ_{JA}).....71°C/W
Junction-to-Case Thermal Resistance (θ_{JC}) .....23°C/W

Note 1: Package thermal resistances were obtained using the method described in JEDEC specification JESD51-7, using a four-layer board. For detailed information on package thermal considerations, refer to **www.maximintegrated.com/thermal-tutorial**.

DC Electrical Characteristics

V_{DDA} - V_{GNDA} = +2.25V to +5.5V, V_{DDB} - V_{GNDB} = +2.25V to +5.5V, T_A = -40°C to +125°C, unless otherwise noted. Typical values are at V_{DDA} - V_{GNDA} = +3.3V, V_{DDB} - V_{GNDB} = +3.3V, V_{GNDA} = V_{GNDB}, T_A = +25°C, unless otherwise noted. (Note 2 and Note 3)

PARAMETER	SYMBOL	CONDITIONS		MIN	TYP	MAX	UNITS

ESD Protection

PARAMETER	SYMBOL	CONDITIONS	MIN	TYP	MAX	UNITS
ESD		Human body model, all pins		±4		kV

Note 2: All devices are 100% production tested at T_A = +125°C. Specifications over temperature are guaranteed by design.

Note 3: All currents into the device are positive; all currents out of the device are negative. All voltages are referenced to ground on the corresponding side of the device, unless otherwise noted.

Note 4: This is the minimum difference between the output logic-low level and the input logic threshold. This ensures that there is no possibility of the part latching up the bus to which it is connected.

Note 5: Not production tested. Guaranteed by design.

Note 6: CMTI is the maximum sustainable common-mode voltage slew rate while maintaining operation. CMTI applies to both rising and falling common-mode voltage edges. Tested with the transient generator connected between GNDA and GNDB (V_{CM} = 1000V).

Safety Regulatory Approvals

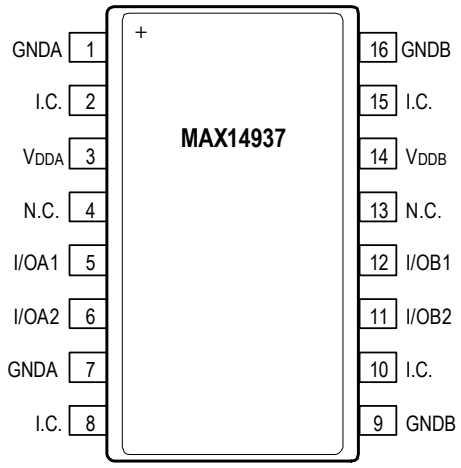
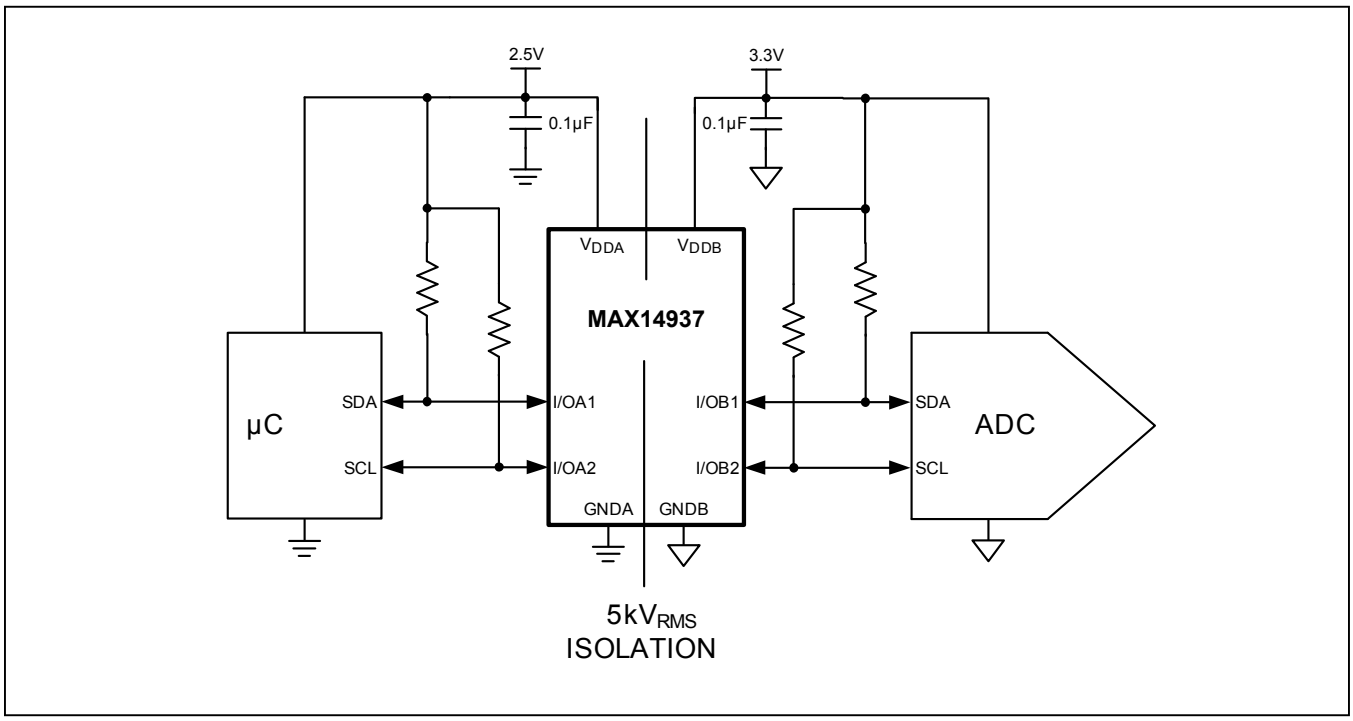
Pin Configuration



Pin Description

PIN	NAME	FUNCTION	VOLTAGE RELATIVE TO
1, 7	GNDA	Ground Reference For Side A. Ensure both pins 1 and 7 are connected to GNDA.	—
2, 8	I.C.	Internally Connected. Connect to GNDA or leave unconnected.	GNDA
3	V_{DDA}	Power Supply. Bypass V_{DDA} with a 0.1µF ceramic capacitor as close as possible to the pin.	GNDA
4, 13	N.C.	No Connection. Not internally connected.	—
5	I/OA1	Bidirectional Input/Output 1 On Side A. I/OA1 is translated to/from I/OB1 and is an open-drain output.	GNDA
6	I/OA2	Bidirectional Input/Output 2 On Side A. I/OA2 is translated to/from I/OB2 and is an open-drain output.	GNDA
9, 16	GNDB	Ground Reference For Side B.	—
10, 15	I.C.	Internally Connected. Connect to GNDB or leave unconnected.	GNDB
11	I/OB2	Bidirectional Input/Output 2 On Side B. I/OB2 is translated to/from I/OA2 and is an open-drain output.	GNDB
12	I/OB1	Bidirectional Input/Output 1 On Side B. I/OB1 is translated to/from I/OA1 and is an open-drain output.	GNDB
14	V_{DDB}	Power Supply. Bypass V_{DDB} with a 0.1µF ceramic capacitor as close as possible to the pin.	GNDB

Typical Application Circuit



Detailed Description

The MAX14937 is a two-channel, 5kV$_{RMS}$ I^{2}C isolator utilizing Maxim's proprietary process technology. For applications requiring 2.75kV$_{RMS}$ of isolation, refer to the MAX14933 data sheet. The MAX14937 transfers digital signals between circuits with different power domains at ambient temperatures up to +125°C.

The device offers two bidirectional, open-drain channels for applications, such as I^{2}C, that require data to be transmitted in both directions on the same line.

The device features independent 2.25V to 5.5V supplies on each side of the isolator. The device operates from DC to 1.7MHz and can be used in isolated I^{2}C busses with clock stretching. The wide temperature range and high isolation voltage make the device ideal for use in harsh industrial environments.

Digital Isolation

The device provides galvanic isolation for digital signals that are transmitted between two ground domains. Up to 1200V$_{PEAK}$ of continuous isolation is supported as well as transient differences of up to 5kV$_{RMS}$ for up to 60s.

Bidirectional Channels

The device features two bidirectional channels that have open-drain outputs. The bidirectional channels do not require a direction-control input. A logic-low on one side causes the corresponding pin on the other side to be pulled low while avoiding data-latching within the device. The input logic-low thresholds (V_{IL}) of I/OA1 and I/OA2 are at least 50mV lower than the output logic-low voltages of I/OA1 and I/OA2. This prevents an output logic-low on side A from being accepted as an input low and subsequently transmitted to side B, thus preventing a latching action. The I/OA1, I/OA2, I/OB1, and I/OB2 pins have open-drain outputs, requiring pullup resistors to their respective supplies for logic-high outputs. The output low voltages are guaranteed for sink currents of up to 30mA for side B, and 3mA for side A (see the *DC Electrical Characteristics* table). The device supports I^{2}C clock stretching.

Startup and Undervoltage Lockout

The V_{DDA} and V_{DDB} supplies are both internally monitored for undervoltage conditions. Undervoltage events can occur during power-up, power-down, or during normal operation due to a sagging supply voltage. When an undervoltage event is detected on either of the supplies, all bidirectional outputs become high-impedance and are pulled high by the external pullup resistor on the open-drain outputs (Table 1). Figure 2 through Figure 5 shows the behavior of the outputs during power-up and power-down.

Applications Information

Effect of Continuous Isolation on Lifetime

High-voltage conditions cause insulation to degrade over time. Higher voltages result in faster degradation. Even the high-quality insulating material used in the device can degrade over long periods of time with a constant high voltage across the isolation barrier.

Power-Supply Sequencing

The MAX14937 does not require special power-supply sequencing. The logic levels are set independently on either side by V_{DDA} and V_{DDB}. Each supply can be present over the entire specified range regardless of the level or presence of the other supply.

Power-Supply Decoupling

To reduce ripple and the chance of introducing data errors, bypass V_{DDA} and V_{DDB} with 0.1µF ceramic capacitors to GNDA and GNDB, respectively. Place the bypass capacitors as close as possible to the power-supply input.

Input/Output Capacitive Loads

For optimal performance, ensure that $C_{LA} \leq 40pF$ and $C_{LB} \leq 400pF$.

TABLE 1. Output Behavior During Undervoltage Conditions

Вы можете приобрести в компании MosChip.

Для оперативного оформления запроса Вам необходимо перейти по данной ссылке:

http://moschip.ru/get-element

Вы можете разместить у нас заказ для любого Вашего проекта, будь то серийное производство или разработка единичного прибора.

В нашем ассортименте представлены ведущие мировые производители активных и пассивных электронных компонентов.

Нашей специализацией является поставка электронной компонентной базы двойного назначения, продукции таких производителей как XILINX, Intel (ex.ALTERA), Vicor, Microchip, Texas Instruments, Analog Devices, Mini-Circuits, Amphenol, Glenair.

Сотрудничество с глобальными дистрибьюторами электронных компонентов, предоставляет возможность заказывать и получать с международных складов практически любой перечень компонентов в оптимальные для Вас сроки.

На всех этапах разработки и производства наши партнеры могут получить квалифицированную поддержку опытных инженеров.

Система менеджмента качества компании отвечает требованиям в соответствии с ГОСТ Р ИСО 9001, ГОСТ РВ 0015-002 и ЭС РД 009
