1.8V / 2.5V Differential D Flip-Flop w/ Reset and CML Outputs

Multi-Level Inputs w/ Internal Termination

Description

The NB7V52M is a 10 GHz differential D flip-flop with a differential asynchronous Reset. The differential D/ \overline{D} , CLK/ $\overline{\text{CLK}}$ and R/ \overline{R} inputs incorporate dual internal 50 Ω termination resistors and will accept LVPECL, CML, LVDS logic levels.

When Clock transitions from logic Low to High, Data will be transferred to the differential CML outputs. The differential Clock inputs allow the NB7V52M to also be used as a negative edge triggered device.

The 16 mA differential CML outputs provide matching internal 50 Ω termination and produce 400 mV output swings when externally receiver terminated with a 50 Ω resistor to V_{CC} .

The NB7V52M is offered in a low profile 3 mm x 3 mm 16-pin QFN package. The NB7V52M is a member of the GigaComm™ family of high performance clock products. Application notes, models, and support documentation are available at www.onsemi.com.
