

Low noise dual operational amplifier

Features

- Low voltage noise: 4.5 nV/√Hz
- High gain bandwidth product: 15 MHz
- High slew rate: 7 V/μs
- Low distortion: 0.002%
- Excellent frequency stability
- ESD protection 2 kV

Applications

- Audio systems
- Preamplification, filtering

Description

The LM833 is a monolithic dual operational amplifier particularly well-suited to audio applications.

It offers low voltage noise (4.5 nV/√Hz) and high frequency performances (15 MHz gain bandwidth product, 7 V/μs slew rate).

In addition, the LM833 has a very low distortion (0.002%) and excellent phase/gain margins.

1 Absolute maximum ratings

Table 1. Key parameters and their absolute maximum ratings

Symbol	Parameter	Value	Unit
V_{CC}	Supply voltage	± 18 or $+36$	V
V_{id}	Differential input voltage ⁽¹⁾	± 30	V
V_i	Input voltage ⁽¹⁾	± 15	V
I_{in}	Input current ⁽²⁾ : V_{in} driven negative	5 mA in DC or 50 mA in AC (duty cycle = 10%, T=1s)	mA
	Input current ⁽³⁾ : V_{in} driven positive above AMR value	0.4	
	Output short-circuit duration	Infinite	s
T_j	Junction temperature	+150	°C
T_{stg}	Storage temperature	-65 to +150	°C
P_{tot}	Maximum power dissipation ⁽⁴⁾	500	mW
ESD	HBM: human body model ⁽⁵⁾	2	kV
	MM: machine model ⁽⁶⁾	200	V
	CDM: charged device model ⁽⁷⁾	1.5	kV

1. Either or both input voltages must not exceed the magnitude of V_{CC}^+ or V_{CC}^- .
2. This input current only exists when the voltage at any of the input leads is driven negative. It is due to the collector-base junction of the input PNP transistor becoming forward-biased and thereby acting as input diode clamp. In addition to this diode action, there is NPN parasitic action on the IC chip. This transistor action can cause the output voltages of the Op-amps to go to the V_{CC} voltage level (or to ground for a large overdrive) for the time during which an input is driven negative. This is not destructive and normal output is restored for input voltages above -0.3 V.
3. The junction base/substrate of the input PNP transistor polarized in reverse must be protected by a resistor in series with the inputs to limit the input current to 400 μ A max ($R = (V_{in} - 36 V)/400 \mu$ A).
4. Power dissipation must be considered to ensure maximum junction temperature (T_j) is not exceeded.
5. Human body model: 100 pF discharged through a 1.5 k Ω resistor between two pins of the device, done for all couples of pin combinations with other pins floating.
6. Machine model: a 200 pF capacitor is charged to the specified voltage, then discharged directly between two pins of the device with no external series resistor (internal resistor < 5 Ω), done for all couples of pin combinations with other pins floating.
7. Charged device model: all pins plus package are charged together to the specified voltage and then discharged directly to the ground.

Для оперативного оформления запроса Вам необходимо перейти по данной ссылке:

<http://moschip.ru/get-element>

Вы можете разместить у нас заказ для любого Вашего проекта, будь то серийное производство или разработка единичного прибора.

В нашем ассортименте представлены ведущие мировые производители активных и пассивных электронных компонентов.

Нашей специализацией является поставка электронной компонентной базы двойного назначения, продукции таких производителей как XILINX, Intel (ex.ALTERA), Vicor, Microchip, Texas Instruments, Analog Devices, Mini-Circuits, Amphenol, Glenair.

Сотрудничество с глобальными дистрибьюторами электронных компонентов, предоставляет возможность заказывать и получать с международных складов практически любой перечень компонентов в оптимальные для Вас сроки.

На всех этапах разработки и производства наши партнеры могут получить квалифицированную поддержку опытных инженеров.

Система менеджмента качества компании отвечает требованиям в соответствии с ГОСТ Р ИСО 9001, ГОСТ РВ 0015-002 и ЭС РД 009
