

MAX17575 5V Output Evaluation Kit

Evaluates: MAX17575 in 5V Output-Voltage Application

General Description

The MAX17575 5V output evaluation kit (EV kit) provides a proven design to evaluate the MAX17575 high-voltage, high-efficiency, synchronous step-down DC-DC converter. The EV kit is preset for 5V output at load currents up to 1.5A and features a 500kHz switching frequency for optimum efficiency and component size. The EV kit features adjustable input undervoltage-lockout, adjustable soft-start, open-drain $\overline{\text{RESET}}$ signal, and external frequency synchronization.

Features

- Operates From a 6V to 60V Input Supply
- 5V Output Voltage
- Up to 1.5A Output Current
- 500kHz Switching Frequency
- Enable/UVLO Input, Resistor-Programmable UVLO Threshold
- Adjustable Soft-Start Time
- Open-Drain $\overline{\text{RESET}}$ Output
- External Frequency Synchronization
- Overcurrent and Overtemperature Protection
- Proven PCB Layout
- Fully Assembled and Tested

Ordering Information appears at end of data sheet.

Quick Start

Recommended Equipment

- MAX17575 5V output EV kit
- 6V to 60V, 2A DC input power supply
- Load capable of sinking 1.5A
- Digital voltmeter (DVM)

Procedure

The EV kit is fully assembled and tested. Follow the steps below to verify the board operation. **Caution: Do not turn on power supply until all connections are completed.**

- 1) Set the power supply at a voltage between 6V and 60V. Disable the power supply.
- 2) Connect the positive terminal of the power supply to the V_{IN} PCB pad and the negative terminal to the nearest PGND PCB pad. Connect the positive terminal of the 1.5A load to the V_{OUT} PCB pad and the negative terminal to the nearest PGND PCB pad.
- 3) Connect the DVM across the V_{OUT} PCB pad and the nearest PGND PCB pad.
- 4) Verify that shunts are installed across pins 1-2 on jumper JU1 (see [Table 1](#) for details).
- 5) Turn on the DC power supply.
- 6) Enable the load.
- 7) Verify that the DVM displays 5V

Detailed Description of Hardware

The MAX17575 5V output EV kit provides a proven design to evaluate the MAX17575 high-voltage, high efficiency, synchronous step-down DC-DC converter. The EV kit is preset for 5V output from 6V to 60V input at load currents up to 1.5A and features a 500kHz switching frequency for optimum efficiency and component size. The EV kit includes an EN/UVLO PCB pad and jumper JU1 to enable the output at a desired input voltage. An additional RESET PCB pad is available for monitoring whether the converter output is in regulation.

Soft-Start Capacitor Selection

The device implements adjustable soft-start operation to reduce inrush current. A capacitor connected from the SS pin to GND programs the soft-start time. The selected output capacitance (C_{SEL}) and the output voltage (V_{OUT}) determine the minimum required soft-start capacitor as follows:

$$C_{SS} \geq 56 \times 10^{-6} \times C_{SEL} \times V_{OUT}$$

The soft-start time (t_{SS}) is related to the capacitor connected at SS (C_{SS}) by the following equation:

$$t_{SS} = \frac{C_{SS}}{5.55 \times 10^{-6}}$$

For example, to program a 2ms soft-start time, a 12nF capacitor should be connected from the SS pin to GND.

Setting the Undervoltage-Lockout Level

The device offers an adjustable input undervoltage-lockout level. Set the voltage at which the device turns on with a resistive voltage-divider connected from V_{IN} to SGND (Figure 1).

Connect the center node of the divider to EN/UVLO. Choose R1 to be 3.3M Ω and then calculate R2 as follows:

$$R2 = \frac{1.215 \times R1}{(V_{INU} - 1.215)}$$

where V_{INU} is the voltage at which the device is required to turn on. Ensure that V_{INU} is higher than $0.8 \times V_{OUT}$.

If the EN/UVLO pin is driven from an external signal source, a series resistance of minimum 1k Ω is recommended to be placed between the signal source output and the EN/UVLO pin, to reduce voltage ringing on the line.

Adjusting Output Voltage

Set the output voltage with a resistive voltage-divider connected from the positive terminal of the output capacitor (V_{OUT}) to SGND (Figure 2). Connect the center node of the divider to the FB pin. Use the following procedure to choose the resistive voltage-divider values:

Calculate resistor R3 from the output to the FB pin as follows:

$$R3 = \frac{1850}{C_{OUT_SEL}}$$

Where C_{OUT_SEL} (in μ F) is the actual derated value of the output capacitance used and R3 is in k Ω . The minimum allowable value of R3 is $(5.6 \times V_{OUT})$, where R3 is in k Ω . If the value of R3 calculated using the above equation is less than $(5.6 \times V_{OUT})$, increase the value of R3 to at least $(5.6 \times V_{OUT})$.

$$R4 = \frac{R3 \times 0.9}{(V_{OUT} - 0.9)}$$

R4 is in k Ω .

Table 1. Regulator Enable (EN/UVLO) Description (JU1)

SHUNT POSITION	EN/UVLO PIN	MAX17575_OUTPUT
1-2*	Connected to VIN	Enabled
Not installed	Connected to the center node of resistor-divider R1 and R2	Enabled, UVLO level set through the R1 and R2 resistors
2-3	Connected to SGND	Disabled

Evaluates: MAX17575 in 5V Output-Voltage Application

The schematic illustrates a DC-DC converter circuit. The input section includes a VIN terminal connected to a 5.2V source, a PGND terminal, and a 5.2V source. The input filter consists of a 100nF capacitor (C3) and a 100nF capacitor (C10). The input voltage is then connected to the VIN pin of the MAX1722M2T+ (U1). The output section features a 5V, 1.5A output terminal (VOUT) connected to a 1.5A source. The output filter includes a 100nF capacitor (C2) and a 100nF capacitor (C7). The output voltage is then connected to the VOUT pin of the MAX1722M2T+ (U1). The feedback network consists of a 100k resistor (R1) and a 100k resistor (R2). The feedback voltage is connected to the FB pin of the MAX1722M2T+ (U1). The enable pin (EN) is connected to a 5V source. The shutdown pin (SD) is connected to a 5V source. The reset pin (RESET) is connected to a 5V source. The ground pins (PGND, ENUGND, RTSGND) are connected to a common ground. The output pin (VOUT) is connected to a 5V, 1.5A source.

Вы можете приобрести в компании MosChip.

Для оперативного оформления запроса Вам необходимо перейти по данной ссылке:

<http://moschip.ru/get-element>

Вы можете разместить у нас заказ для любого Вашего проекта, будь то серийное производство или разработка единичного прибора.

В нашем ассортименте представлены ведущие мировые производители активных и пассивных электронных компонентов.

Нашей специализацией является поставка электронной компонентной базы двойного назначения, продукции таких производителей как XILINX, Intel (ex.ALTERA), Vicor, Microchip, Texas Instruments, Analog Devices, Mini-Circuits, Amphenol, Glenair.

Сотрудничество с глобальными дистрибьюторами электронных компонентов, предоставляет возможность заказывать и получать с международных складов практически любой перечень компонентов в оптимальные для Вас сроки.

На всех этапах разработки и производства наши партнеры могут получить квалифицированную поддержку опытных инженеров.

Система менеджмента качества компании отвечает требованиям в соответствии с ГОСТ Р ИСО 9001, ГОСТ РВ 0015-002 и ЭС РД 009
