

## Output rail-to-rail 1 W audio power amplifier with standby mode

### Features

- Operating from  $V_{CC} = 2.5\text{ V}$  to  $5.5\text{ V}$
- 1 W rail-to-rail output power @  $V_{CC} = 5\text{ V}$ , THD = 1%,  $f = 1\text{ kHz}$ , with  $8\ \Omega$  load
- Ultra low consumption in standby mode (10 nA)
- 75 dB PSRR @ 217 Hz from 5 V to 2.6 V
- Ultra low pop and click
- Ultra low distortion (0.1%)
- Unity gain stable
- Available in SO8 and MiniSO8

### Applications

- Mobile phones (cellular / cordless)
- Laptop / notebook computers
- PDAs
- Portable audio devices

### Description

The **TS4871** is an audio power amplifier capable of delivering 1 W of continuous RMS output power into  $8\ \Omega$  load @ 5 V.

This audio amplifier exhibits 0.1% distortion level (THD) from a 5 V supply for a  $P_{out} = 250\text{ mW}$  RMS. An external standby mode control reduces the supply current to less than 10 nA. An internal thermal shutdown protection is also provided.

The **TS4871** has been designed for high quality audio applications such as mobile phones and to minimize the number of external components.

The unity-gain stable amplifier can be configured by external gain setting resistors.

## 2 Maximum ratings

**Table 1. Absolute maximum ratings**

Symbol	Parameter	Value	Unit
$V_{CC}$	Supply voltage <sup>(1)</sup>	6	V
$V_i$	Input voltage <sup>(2)</sup>	GND to $V_{CC}$	V
$T_{oper}$	Operating free air temperature range	-40 to + 85	°C
$T_{stg}$	Storage temperature	-65 to +150	°C
$T_j$	Maximum junction temperature	150	°C
$R_{thja}$	Thermal resistance junction-to-ambient <sup>(3)</sup> SO8	175	°C/W
	Thermal resistance junction-to-ambient <sup>(3)</sup> MiniSO8	215	
$P_d$	Power dissipation	Internally limited <sup>(4)</sup>	
ESD	Human body model	2	kV
ESD	Machine model	200	V
Latch-up	Latch-up immunity	Class A	
	Lead temperature (soldering, 10 s)	260	°C

1. All voltages values are measured with respect to the ground pin.
2. The magnitude of input signal must never exceed  $V_{CC} + 0.3\text{ V} / \text{GND} - 0.3\text{ V}$
3. The device is protected in case of overtemperature by a thermal shutdown active @ 150 °C.
4. Exceeding the power derating curves during a long period, involves abnormal operating conditions.

**Table 2. Operating conditions**

Symbol	Parameter	Value	Unit
$V_{CC}$	Supply voltage	2.5 to 5.5	V
$V_{ICM}$	Common mode Input voltage range	GND to $V_{CC} - 1.2\text{ V}$	V
$V_{STB}$	Standby voltage input: device ON	$\text{GND} \leq V_{STB} \leq 0.5\text{ V}$	V
	Standby voltage input: device OFF	$V_{CC} - 0.5\text{ V} \leq V_{STB} \leq V_{CC}$	
$R_L$	Load resistor	4 - 32	$\Omega$
$R_{thja}$	Thermal resistance junction-to-ambient <sup>(1)</sup> SO8	150	°C/W
	Thermal resistance junction-to-ambient <sup>(1)</sup> MiniSO8	190	

1. This thermal resistance can be reduced with a suitable PCB layout (see power derating curves).

### 3 Electrical characteristics

**Table 3. Electrical characteristics  $V_{CC} = +5\text{ V}$ ,  $GND = 0\text{ V}$ ,  $T_{amb} = 25\text{ °C}$  (unless otherwise specified).**

Symbol	Parameter	Min.	Typ.	Max.	Unit
$I_{CC}$	Supply current No input signal, no load		6	8	mA
$I_{STANDBY}^{(1)}$	Standby current No input signal, $V_{STDBY} = V_{CC}$ , $R_L = 8\ \Omega$		10	1000	nA
$V_{OO}$	Output offset voltage No input signal, $R_L = 8\ \Omega$		5	20	mV
$P_O$	Output power THD = 1% max., $f = 1\text{ kHz}$ , $R_L = 8\ \Omega$		1		W
THD + N	Total harmonic distortion + noise $P_O = 250\text{ mW}_{rms}$ , $G_v = 2$ , $20\text{ Hz} < f < 20\text{ kHz}$ , $R_L = 8\ \Omega$		0.15		%
PSRR <sup>(2)</sup>	Power supply rejection ratio $f = 217\text{ Hz}$ , $R_L = 8\ \Omega$ , $R_{Feed} = 22\text{ K}$ , $V_{ripple} = 200\text{ mV}_{rms}$		75		dB
$\phi_M$	Phase margin at unity gain $R_L = 8\ \Omega$ , $C_L = 500\text{ pF}$		70		Degrees
GM	Gain margin $R_L = 8\ \Omega$ , $C_L = 500\text{ pF}$		20		dB
GBP	Gain bandwidth product $R_L = 8\ \Omega$		2		MHz

1. Standby mode is activated when  $V_{stdby}$  is tied to  $V_{CC}$ .

2. Dynamic measurements -  $20 \cdot \log(rms(V_{out})/rms(V_{ripple}))$ .  $V_{ripple}$  is the surimposed sinus signal to  $V_{CC}$  @  $f = 217\text{ Hz}$ .

**Table 4. Electrical characteristics  $V_{CC} = +3.3\text{ V}$ ,  $GND = 0\text{ V}$ ,  $T_{amb} = 25\text{ °C}$  (unless otherwise specified)**

Symbol	Parameter	Min.	Typ.	Max.	Unit
$I_{CC}$	Supply current No input signal, no load		5.5	8	mA
$I_{STANDBY}^{(1)}$	Standby current No input signal, $V_{STDBY} = V_{CC}$ , $R_L = 8\ \Omega$		10	1000	nA
$V_{OO}$	Output offset voltage No input signal, $R_L = 8\ \Omega$		5	20	mV
$P_O$	Output power THD = 1% max., $f = 1\text{ kHz}$ , $R_L = 8\ \Omega$		450		mW
THD + N	Total harmonic distortion + noise $P_O = 250\text{ mW}_{rms}$ , $G_v = 2$ , $20\text{ Hz} < f < 20\text{ kHz}$ , $R_L = 8\ \Omega$		0.15		%
PSRR <sup>(2)</sup>	Power supply rejection ratio $f = 217\text{ Hz}$ , $R_L = 8\ \Omega$ , $R_{Feed} = 22\text{ k}\Omega$ , $V_{ripple} = 200\text{ mV}_{rms}$		75		dB
$\phi_M$	Phase margin at unity gain $R_L = 8\ \Omega$ , $C_L = 500\text{ pF}$		70		Degrees
GM	Gain margin $R_L = 8\ \Omega$ , $C_L = 500\text{ pF}$		20		dB
GBP	Gain bandwidth product $R_L = 8\ \Omega$		2		MHz

1. Standby mode is activated when  $V_{stbby}$  is tied to  $V_{CC}$

2. Dynamic measurements -  $20 \cdot \log(\text{rms}(V_{out})/\text{rms}(V_{ripple}))$ .  $V_{ripple}$  is the surimposed sinus signal to  $V_{CC}$  @  $f = 217\text{ Hz}$

Note: All electrical values are made by correlation between 2.6 V and 5 V measurements.

**Table 5. Electrical characteristics  $V_{CC} = +2.6\text{ V}$ ,  $GND = 0\text{ V}$ ,  $T_{amb} = 25\text{ °C}$  (unless otherwise specified).**

Symbol	Parameter	Min.	Typ.	Max.	Unit
$I_{CC}$	Supply current No input signal, no load		5.5	8	mA
$I_{STANDBY}^{(1)}$	Standby current No input signal, $V_{STDBY} = V_{CC}$ , $R_L = 8\ \Omega$		10	1000	nA
$V_{OO}$	Output offset voltage No input signal, $R_L = 8\ \Omega$		5	20	mV
$P_O$	Output power THD = 1% max., $f = 1\text{ kHz}$ , $R_L = 8\ \Omega$		260		mW
THD + N	Total harmonic distortion + noise $P_O = 250\text{ mW}_{rms}$ , $G_v = 2$ , $20\text{ Hz} < f < 20\text{ kHz}$ , $R_L = 8\ \Omega$		0.15		%
PSRR <sup>(2)</sup>	Power supply rejection ratio $f = 217\text{ Hz}$ , $R_L = 8\ \Omega$ , $R_{Feed} = 22\text{ k}\Omega$ , $V_{ripple} = 200\text{ mV}_{rms}$		75		dB

Symbol	Parameter	Min.	Typ.	Max.	Unit
$\phi_M$	Phase margin at unity gain $R_L = 8 \Omega$ , $C_L = 500 \text{ pF}$		70		Degrees
GM	Gain margin $R_L = 8 \Omega$ , $C_L = 500 \text{ pF}$		20		dB
GBP	Gain bandwidth product $R_L = 8 \Omega$		2		MHz

- Standby mode is activated when  $V_{stdby}$  is tied to  $V_{CC}$
- Dynamic measurements -  $20 \cdot \log(\text{rms}(V_{out})/\text{rms}(V_{ripple}))$ .  $V_{ripple}$  is the surimposed sinus signal to  $V_{CC}$  @  $f = 217 \text{ Hz}$

**Table 6. Bill of material**

Components	Functional description
$R_{in}$	Inverting input resistor which sets the closed loop gain in conjunction with $R_{feed}$ . This resistor also forms a high pass filter with $C_{in}$ [ $f_c = 1 / (2 \times P_i \times R_{in} \times C_{in})$ ]
$C_{in}$	Input coupling capacitor which blocks the DC voltage at the amplifier input terminal
$R_{feed}$	Feed back resistor which sets the closed loop gain in conjunction with $R_{in}$
$C_s$	Supply bypass capacitor which provides power supply filtering
$C_b$	Bypass pin capacitor which provides half supply filtering
$C_{feed}$	Low pass filter capacitor allowing to cut the high frequency [low pass filter cut-off frequency $1 / (2 \times P_i \times R_{feed} \times C_{feed})$ ]
$R_{stb}$	Pull-up resistor which fixes the right supply level on the standby pin
$G_v$	Closed loop gain in BTL configuration = $2 \times (R_{feed} / R_{in})$

**Remarks**

- All measurements, except PSRR measurements, are made with a supply bypass capacitor  $C_s = 100 \mu\text{F}$ .
- External resistors are not needed for having better stability when supply @  $V_{CC}$  down to 3 V. By the way, the quiescent current remains the same.
- The standby response time is about 1  $\mu\text{s}$ .

## 5 Application information

Figure 82. Demoboard schematic

Figure 83. SO8 & MiniSO8 demoboard components side

Figure 84. SO8 and MiniSO8 demoboard top solder layer

Figure 85. SO8 and MiniSO8 demoboard bottom solder layer

## 5.1 BTL configuration principle

The TS4871 is a monolithic power amplifier with a BTL output type. BTL (bridge tied load) means that each end of the load is connected to two single ended output amplifiers. Thus, we have:

Single ended output 1 =  $V_{out1} = V_{out}$  (V)

Single ended output 2 =  $V_{out2} = -V_{out}$  (V)

And  $V_{out1} - V_{out2} = 2V_{out}$  (V)

The output power is:

$$P_{out} = \frac{(2V_{out_{RMS}})^2}{R_L} (W) \quad (1)$$

For the same power supply voltage, the output power in BTL configuration is four times higher than the output power in single ended configuration.

## 5.2 Gain In typical application schematic

In flat region (no effect of  $C_{in}$ ), the output voltage of the first stage is:

$$V_{out1} = -V_{in} \frac{R_{feed}}{R_{in}} (V)$$

For the second stage :  $V_{out2} = -V_{out1}$  (V)

The differential output voltage is:

$$V_{out2} - V_{out1} = 2V_{in} \frac{R_{feed}}{R_{in}} (V)$$

The differential gain named gain ( $G_v$ ) for more convenient usage is:

$$G_v = \frac{V_{out2} - V_{out1}}{V_{in}} = 2 \frac{R_{feed}}{R_{in}}$$

Remark :  $V_{out2}$  is in phase with  $V_{in}$  and  $V_{out1}$  is 180 phased with  $V_{in}$ . It means that the positive terminal of the loud speaker should be connected to  $V_{out2}$  and the negative to  $V_{out1}$ .

### 5.3 Low and high frequency response

In low frequency region, the effect of  $C_{in}$  starts.  $C_{in}$  with  $R_{in}$  forms a high pass filter with a -3 dB cut-off frequency

$$F_{CL} = \frac{1}{2\pi R_{in} C_{in}} (\text{Hz})$$

In high frequency region, you can limit the bandwidth by adding a capacitor ( $C_{feed}$ ) in parallel on  $R_{feed}$ . Its form a low pass filter with a -3 dB cut-off frequency.

$$F_{CH} = \frac{1}{2\pi R_{feed} C_{feed}} (\text{Hz})$$

### 5.4 Power dissipation and efficiency

Hypothesis:

- Voltage and current in the load are sinusoidal ( $V_{out}$  and  $I_{out}$ )
- Supply voltage is a pure DC source ( $V_{cc}$ )

Regarding the load we have:

$$V_{OUT} = V_{PEAK} \sin \omega t(t)$$

and

$$I_{OUT} = \frac{V_{OUT}}{R_L} (A)$$

$$P_{OUT} = \frac{V_{PEAK}^2}{2R_L} (W)$$

Then, the average current delivered by the supply voltage is:

$$I_{CC_{AVG}} = 2 \frac{V_{PEAK}}{\pi R_L} (A)$$

The power delivered by the supply voltage is  $P_{supply} = V_{cc} I_{CC_{AVG}}$  (W)

Then, the power dissipated by the amplifier is  $P_{diss} = P_{supply} - P_{out}$  (W)

$$P_{diss} = \frac{2\sqrt{2}V_{cc}}{\pi\sqrt{R_L}} \sqrt{P_{OUT}} - P_{OUT} (W)$$

and the maximum value is obtained when:

$$\frac{\partial P_{diss}}{\partial P_{OUT}} = 0$$

and its value is:

$$P_{dissmax} = \frac{2V_{CC}^2}{\pi^2 R_L} (W)$$

Remark : This maximum value is only depending on power supply voltage and load values.

The efficiency is the ratio between the output power and the power supply

$$\eta = \frac{P_{OUT}}{P_{supply}} = \frac{\pi V_{PEAK}}{4V_{CC}}$$

The maximum theoretical value is reached when

$V_{peak} = V_{cc}$ , so

$$\frac{\pi}{4} = 78.5\%$$

### 5.5 Decoupling of the circuit

Two capacitors are needed to bypass properly the TS4871, a power supply bypass capacitor  $C_s$  and a bias voltage bypass capacitor  $C_b$ .

$C_s$  has especially an influence on the THD+N in high frequency (above 7 kHz) and indirectly on the power supply disturbances.

With 100  $\mu\text{F}$ , you can expect similar THD+N performances like shown in the datasheet.

If  $C_s$  is lower than 100  $\mu\text{F}$ , in high frequency increases, THD+N and disturbances on the power supply rail are less filtered.

To the contrary, if  $C_s$  is higher than 100  $\mu\text{F}$ , those disturbances on the power supply rail are more filtered.

**$C_b$**  has an influence on THD+N in lower frequency, but its function is critical on the final result of PSRR with input grounded in lower frequency.

If  $C_b$  is lower than 1  $\mu\text{F}$ , THD+N increase in lower frequency (see THD+N vs frequency curves) and the PSRR worsens up.

If  $C_b$  is higher than 1  $\mu\text{F}$ , the benefit on THD+N in lower frequency is small but the benefit on PSRR is substantial (see PSRR vs.  $C_b$  curve: fig.12).

Note that  $C_{in}$  has a non-negligible effect on PSRR in lower frequency. Lower is its value, higher is the PSRR (see fig. 13).

## 5.6 Pop and Click performance

Pop and click performance is intimately linked to the size of the input capacitor  $C_{in}$  and the bias voltage bypass capacitor  $C_b$ .

Size of  $C_{in}$  is due to the lower cut-off frequency and PSRR value requested. Size of  $C_b$  is due to THD+N and PSRR requested always in lower frequency.

Moreover,  $C_b$  determines the speed that the amplifier turns ON. The slower the speed is, the softer the turn ON noise is.

The charge time of  $C_b$  is directly proportional to the internal generator resistance 50  $\text{k}\Omega$ .

Then, the charge time constant for  $C_b$  is

$$\tau_b = 50 \text{ k}\Omega \times C_b \text{ (s)}$$

As  $C_b$  is directly connected to the non-inverting input (pin 2 and 3) and if we want to minimize, in amplitude and duration, the output spike on  $V_{out1}$  (pin 5),  $C_{in}$  must be charged faster than  $C_b$ . The charge time constant of  $C_{in}$  is

$$\tau_{in} = (R_{in} + R_{feed}) \times C_{in} \text{ (s)}$$

Thus we have the relation

$$\tau_{in} \ll \tau_b \text{ (s)}$$

The respect of this relation allows the pop and click noise to be minimized.

Remark : Minimize  $C_{in}$  and  $C_b$  has a benefit on pop and click phenomena but also on cost and size of the application.

Example : your target for the -3 dB cut off frequency is 100 Hz. With  $R_{in} = R_{feed} = 22 \text{ k}\Omega$ ,  $C_{in} = 72 \text{ nF}$  (in fact 82 nF or 100 nF).

With  $C_b = 1 \mu\text{F}$ , if you choose the one of the latest two values of  $C_{in}$ , the pop and click phenomena at power supply ON or standby function ON/OFF will be very small

$$50 \text{ k}\Omega \times 1 \mu\text{F} \gg 44 \text{ k}\Omega \times 100 \text{ nF} \quad (50 \text{ ms} \gg 4.4 \text{ ms}).$$

Increasing  $C_{in}$  value increases the pop and click phenomena to an unpleasant sound at power supply ON and standby function ON/OFF.

Why  $C_s$  is not important in pop and click consideration ?

Hypothesis :

$$C_s = 100 \mu\text{F}$$

$$\text{Supply voltage} = 5 \text{ V}$$

$$\text{Supply voltage internal resistor} = 0.1 \Omega$$

$$\text{Supply current of the amplifier } I_{cc} = 6 \text{ mA}$$

At power ON of the supply, the supply capacitor is charged through the internal power supply resistor. So, to reach 5 V you need about five to ten times the charging time constant of  $C_s$  ( $\tau_s = 0.1 \times C_s$  (s)).

Then, this time equal 50  $\mu\text{s}$  to 100  $\mu\text{s}$   $\ll \tau_b$  in the majority of application.

At power OFF of the supply,  $C_s$  is discharged by a constant current  $I_{cc}$ . The discharge time from 5 V to 0 V of  $C_s$  is:

$$t_{DischC_s} = \frac{5C_s}{I_{cc}} = 83 \text{ ms}$$

Now, we must consider the discharge time of  $C_b$ .

At power OFF or standby ON, Cb is discharged by a 100 kΩ resistor. So the discharge time is about

$$t_{bDisch} \approx 3 \times C_b \times 100 \text{ k}\Omega \text{ (s)}$$

In the majority of application, Cb = 1 μF, then

$$t_{bDisch} \approx 300 \text{ ms} \gg \tau_{dischC_b}$$

## 5.7 Power amplifier design examples

Given :

Load impedance : 8 Ω

Output power @ 1% THD+N : 0.5 W

Input impedance : 10 kΩ min.

Input voltage peak to peak : 1 Vpp

Bandwidth frequency : 20 Hz to 20 kHz (0, -3 dB)

Ambient temperature max = 50 °C

SO8 package

First of all, we must calculate the minimum power supply voltage to obtain 0.5 W into 8 Ω. With curves in fig. 15, we can read 3.5 V. Thus, the power supply voltage value min. is 3.5 V.

Following the maximum power dissipation equation

$$P_{dissmax} = \frac{2V_{CC}^2}{\pi^2 R_L} = \left( W \right)$$

with 3.5 V we have  $P_{dissmax} = 0.31 \text{ W}$

Refer to power derating curves (fig. 20), with 0.31 W the maximum ambient temperature is 100 °C. This last value could be higher if you follow the example layout shown on the demoboard (better dissipation).

The gain of the amplifier in flat region is:

$$G_V = \frac{V_{OUTPP}}{V_{INPP}} = \frac{2\sqrt{2R_L P_{OUT}}}{V_{INPP}} = 5.65$$

We have  $R_{in} > 10 \text{ k}\Omega$ . Let's take  $R_{in} = 10 \text{ k}\Omega$ , then  $R_{feed} = 28.25 \text{ k}\Omega$ . We could use for  $R_{feed} = 30 \text{ k}\Omega$  in normalized value and the gain is  $G_v = 6$ .

In lower frequency we want 20 Hz (-3dB cut-off frequency). Then:

So, we could use for  $C_{in}$  a 1 μF capacitor value

$$C_{IN} = \frac{1}{2\pi R_{in} F_{CL}} = 795 \text{ nF}$$

which gives 16 Hz.

In higher frequency we want 20 kHz (-3dB cut off frequency). The gain bandwidth product of the TS4871 is 2 MHz typical and does not change when the amplifier delivers power into the load.

The first amplifier has a gain of:

$$\frac{R_{feed}}{R_{in}} = 3$$

and the theoretical value of the -3 dB cut-off higher frequency is  $2 \text{ MHz}/3 = 660 \text{ kHz}$ .

We can keep this value or limit the bandwidth by adding a capacitor  $C_{feed}$ , in parallel on  $R_{feed}$ .

Then:

$$C_{FEED} = \frac{1}{2\pi R_{FEED} F_{CH}} = 265 \text{ pF}$$

So, we could use for  $C_{feed}$  a 220 pF capacitor value that gives 24 kHz.

Now, we can calculate the value of  $C_b$  with the formula  $\tau_b = 50 \text{ k}\Omega \times C_b \gg \tau_{in} = (R_{in} + R_{feed}) \times C_{in}$  which permits to reduce the pop and click effects.

Then  $C_b \gg 0.8 \mu\text{F}$ .

We can choose for  $C_b$  a normalized value of 2.2 μF that gives good results in THD+N and PSRR.

In the following tables, you could find three other examples with values required for the demoboard.

Remark : components with (\*) marking are optional.

## 5.8 Application n°1 : 20 Hz to 20 kHz bandwidth and 6 dB gain BTL power amplifier

**Table 7. Components**

Designator	Part type
R1	22 k / 0.125 W
R4	22 k / 0.125 W
R6	Short-circuit
R7	330 k / 0.125 W
R8*	(Vcc-Vf_led) / If_led
C5	470 nF
C6	100 µF
C7	100 nF
C9	Short-circuit
C10	Short-circuit
C12	1 µF
S1, S2, S6, S7	2 mm insulated plug 10.16 mm pitch
S8	3 pt connector 2.54 mm pitch
P1	PCB phono Jack
D1*	Led 3 mm
U1	TS4871ID or TS4871IS

## 5.9 Application n°2 : 20 Hz to 20 kHz bandwidth and 20 dB gain BTL power amplifier

**Table 8. Components**

Designator	Part type
R1	110 k / 0.125 W
R4	22 k / 0.125 W
R6	Short-circuit
R7	330 k / 0.125 W
R8*	$(V_{cc} - V_{f\_led}) / I_{f\_led}$
C5	470 nF
C6	100 $\mu$ F
C7	100 nF
C9	Short-circuit
C10	Short-circuit
C12	1 $\mu$ F
S1, S2, S6, S7	2 mm insulated plug 10.16 mm pitch
S8	3 pt connector 2.54 mm pitch
P1	PCB phono Jack
D1*	Led 3 mm

P1	PCB phono Jack
D1*	Led 3 mm
U1	TS4871ID or TS4871IS

## 5.11 Application n°4 : Differential inputs BTL power amplifier

In this configuration, we need to place these components : R1, R4, R5, R6, R7, C4, C5, C12.

We have also : R4 = R5, R1 = R6, C4 = C5.

The gain of the amplifier is:

$$G_{VDIFF} = 2 \frac{R1}{R4}$$

For Vcc = 5 V, a 20 Hz to 20 kHz bandwidth and 20 dB gain BTL power amplifier you could follow the bill of material below.

**Table 10. Components**

Designator	Part type
R1	110 k / 0.125 W
R4	22 k / 0.125 W
R5	22 k / 0.125 W
R6	110 k / 0.125 W
R7	330 k / 0.125 W
R8*	(Vcc-Vf_led) / If_led
C4	470 nF
C5	470 nF
C6	100 µF
C7	100 nF
C9	Short-circuit
C10	Short-circuit
C12	1 µF
D1*	Led 3 mm
S1, S2, S6, S7	2 mm insulated plug 10.16 mm pitch
S8	3 pts connector 2.54 mm pitch
P1, P2	PCB phono Jack
U1	TS4871ID or TS4871IS

## 5.12 Note on how to use the PSRR curves

We have finished a design and we have chosen the components values

- Rin=Rfeed=22 kΩ
- Cin=100 nF
- Cb=1 µF

Now, on fig. 13, we can see the PSRR (input grounded) vs. frequency curves. At 217 Hz we have a PSRR value of -36 dB.

In reality we want a value about -70 dB. So, we need a gain of 34 dB.

Now, on fig. 12 we can see the effect of Cb on the PSRR (input grounded) vs. frequency. With Cb=100 µF, we can reach the -70 dB value.

The process to obtain the final curve (Cb=100 µF, Cin=100 nF, Rin=Rfeed=22 kΩ) is a simple transfer point by point on each frequency of the curve on fig. 13 to the curve on fig. 12. The measurement result is shown on the next figure.

Figure 86. PSRR changes with Cb

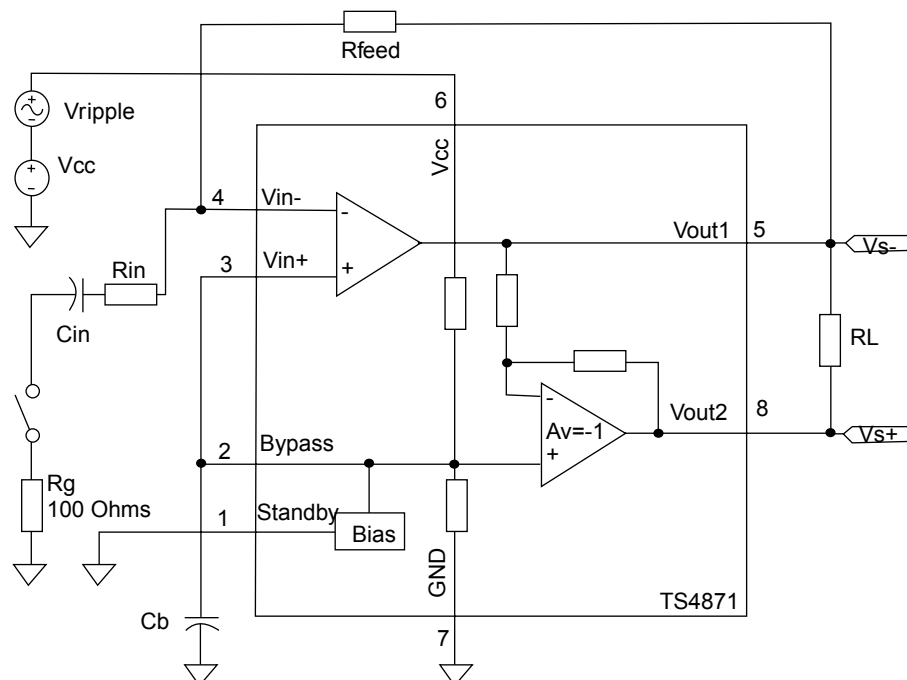

What is the PSRR?

The PSRR is the power supply rejection ratio. It is a kind of SVR in a determined frequency range.

The PSRR of a device, is the ratio between a power supply disturbance and the result on the output. We can say that the PSRR is the ability of a device to minimize the impact of power supply disturbances to the output.

How do we measure the PSRR?

Figure 87. PSRR measurement schematic

### 5.13 Principle of operation

We fixed the DC voltage supply ( $V_{cc}$ ), the AC sinusoidal ripple voltage ( $V_{ripple}$ ) and no supply capacitor  $C_s$  is used.

The PSRR value for each frequency is:

$$PSRR(dB) = 20 \times \log_{10} \left[ \frac{Rms(V_{ripple})}{Rms(V_{s+} - V_{s-})} \right]$$

Remark : The measure of the Rms voltage is not a Rms selective measure but a full range (2 Hz to 125 kHz) Rms measure.

It means that we measure the effective Rms signal + the noise.

### 5.14 High/low cut-off frequencies

For their calculation, please check the figure below:

Figure 88. Frequency response gain vs  $C_{in}$  and  $C_{feed}$

## 6 Package information

---

In order to meet environmental requirements, ST offers these devices in different grades of **ECOPACK** packages, depending on their level of environmental compliance. ECOPACK specifications, grade definitions and product status are available at: [www.st.com](http://www.st.com). ECOPACK is an ST trademark.

## Данный компонент на территории Российской Федерации

### Вы можете приобрести в компании MosChip.

Для оперативного оформления запроса Вам необходимо перейти по данной ссылке:

<http://moschip.ru/get-element>

Вы можете разместить у нас заказ для любого Вашего проекта, будь то серийное производство или разработка единичного прибора.

В нашем ассортименте представлены ведущие мировые производители активных и пассивных электронных компонентов.

Нашей специализацией является поставка электронной компонентной базы двойного назначения, продукции таких производителей как XILINX, Intel (ex.ALTERA), Vicor, Microchip, Texas Instruments, Analog Devices, Mini-Circuits, Amphenol, Glenair.

Сотрудничество с глобальными дистрибьюторами электронных компонентов, предоставляет возможность заказывать и получать с международных складов практически любой перечень компонентов в оптимальные для Вас сроки.

На всех этапах разработки и производства наши партнеры могут получить квалифицированную поддержку опытных инженеров.

Система менеджмента качества компании отвечает требованиям в соответствии с ГОСТ Р ИСО 9001, ГОСТ РВ 0015-002 и ЭС РД 009
