MAX7360

I²C-Interfaced Key-Switch Controller and LED Driver/GPIOs with Integrated ESD Protection

General Description

The MAX7360 I²C-interfaced peripheral provides microprocessors with management of up to 64 key switches, with an additional eight LED drivers/GPIOs that feature constant-current, PWM intensity control, and rotary switch control options.

The key-switch drivers interface with metallic or resistive switches with on-resistances up to 5k Ω . Key inputs are monitored statically, not dynamically, to ensure low-EMI operation. The MAX7360 features autosleep and autowake modes to further minimize the power consumption of the device. The autosleep feature puts the device in a low-power state (1 μ A, typ) after a sleep timeout period. The autowake feature configures the MAX7360 to return to normal operating mode from sleep upon a keypress.

The key controller debounces and maintains a FIFO of keypress and release events (including autorepeat, if enabled). An interrupt (INTK) output can be configured to alert keypresses, as they occur, or at maximum rate.

There are eight open-drain I/O ports, which can be used to drive LEDs. The maximum constant-current level for each open-drain port is 20mA. The intensity of the LED on each open-drain port can be individually adjusted through a 256-step PWM control. An input port pair (PORT6, PORT7) can be configured to accept 2-bit gray code inputs from a rotary switch. In addition, if not used for key-switch control, up to six column pins can be used as general-purpose open-drain outputs (GPOs) for LED drive or logic control.

The MAX7360 is offered in a 40-pin (5mm x 5mm) thin QFN package with an exposed pad, and a small 36-bump wafer level package (WLP) for cell phones, pocket PCs, and other portable consumer electronic applications. The MAX7360 operates over the -40°C to +85°C extended temperature range.

Applications

- Cell Phones
- PDAs
- Handheld Games
- Portable Consumer Electronics
- Printers
- Instrumentation

Features

- Integrated ESD Protection
 - \pm 8kV IEC 61000-4-2 Contact Discharge
 - \pm 15kV IEC 61000-4-2 Air-Gap Discharge
- +14V Tolerant, Open-Drain I/O Ports Capable of Constant-Current LED Drive
- Rotary Switch-Capable Input Pair (PORT6, PORT7)
- 256-Step PWM Individual LED Intensity Control
- Individual LED Blink Rates and Common LED Fade In/Out Rates from 256ms to 4096ms
- FIFO Queues Up to 16 Debounced Key Events
- User-Configurable Key Debounce (9ms to 40ms)
- Keyscan Uses Static Matrix Monitoring for Low EMI Operation
- +1.62V to +3.6V Operation
- Monitors Up to 64 Keys
- Key-Switch Interrupt (INTK) on Each Debounced Event/FIFO Level, or End of Definable Time Period
- Port Interrupt (INTI) for Input Ports for Special-Key Functions
- 400kbps, +5.5V Tolerant 2-Wire Serial Interface with Selectable Bus Timeout
- Four I²C Address Choices

Ordering Information

PART	TEMP RANGE	PIN-PACKAGE
MAX7360ETL+	-40°C to +85°C	40 TQFN-EP*
MAX7360EWX+	-40°C to +85°C	36 WLP

+Denotes a lead(Pb)-free/RoHS-compliant package.

*EP = Exposed pad.

Simplified Block Diagram

Absolute Maximum Ratings

V_{CC} to GND-0.3V to +4V
 COL0–COL7, ROW0–ROW7 to GND-0.3V to +4V
 SDA, SCL, AD0, INTI, INTK to GND-0.3V to +6V
 PORT0–PORT7 to GND-0.3V to +16V
 All Other Pins to GND -0.3V to (V_{CC} + 0.3V)
 DC Current on PORT0–PORT7, COL2–COL7 25mA
 GND Current 80mA
 Continuous Power Dissipation (T_A = +70°C)
 TQFN (derate 22.2mW/NC above +70°C) 1777mW
 WLP (derate 21.7mW/NC above +70°C) 1739mW
 Operating Temperature Range -40°C to +85°C
 Junction Temperature +150°C

Storage Temperature Range -65°C to +150°C
 ESD Protection
 Human Body Model (R_D = 1.5kΩ, C_S = 100pF)
 All Pins ±2kV
 IEC 61000-4-2 (R_D = 330Ω, C_S = 150pF)
 Contact Discharge
 ROW0–ROW7, COL0–COL7, PORT0–PORT7 to GND ±8kV
 Air-Gap Discharge
 ROW0–ROW7, COL0–COL7, PORT0–PORT7 to GND ... ±15kV
 Lead Temperature (TQFN only; soldering, 10s) +300°C
 Soldering Temperature (reflow) +260°C

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Package Thermal Characteristics (Note 1)

TQFN	Junction-to-Ambient Thermal Resistance (θ _{JA}) 45°C/W	WLP	Junction-to-Ambient Thermal Resistance (θ _{JA})WLP 46°C/W
	Junction-to-Case Thermal Resistance (θ _{JC}) 2°C/W		

Note 1: Package thermal resistances were obtained using the method described in JEDEC specification JESD51-7, using a four-layer board. For detailed information on package thermal considerations, refer to www.maximintegrated.com/thermal-tutorial.

Electrical Characteristics

(V_{CC} = +1.62V to +3.6V, T_A = -40°C to +85°C, unless otherwise noted. Typical values are at V_{CC} = +3.3V, T_A = +25°C.) (Notes 2, 3)

Pulse Width of Spike Suppressed	t_{SP}	(Notes 4, 8)		50		ns
Capacitive Load for Each Bus Line	C_b	(Note 4)			400	pF

Note 2: All parameters are tested at $T_A = +25^{\circ}C$. Specifications over temperature are guaranteed by design.

Note 3: All digital inputs at V_{CC} or GND.

Note 4: Guaranteed by design.

Note 5: A master device must provide a hold time of at least 300ns for the SDA signal (referred to V_{IL} of the SCL signal) to bridge the undefined region of SCL's falling edge.

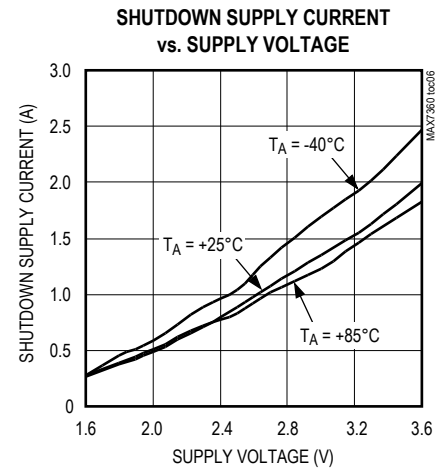

Note 6: C_b = total capacitance of one bus line in pF. t_R and t_F measured between $+0.3V_{CC}$ and $+0.7V_{CC}$.

Note 7: $I_{SINK} \leq 6mA$.

Note 8: Input filters on the SDA, SCL, and AD0 inputs suppress noise spikes less than 50ns.

Typical Operating Characteristics

(V_{CC} = +2.5V, T_A = +25°C, unless otherwise noted.)

38	A5	PORT6	GPIO Port. Open-drain I/O rated at +14V. PORT6 can be configured as a constant-current output, or a rotary switch input.
39	B5	PORT7	GPIO Port. Open-drain I/O rated at +14V. PORT7 can be configured as a constant-current output, or a rotary switch input.
—	—	EP	Exposed Pad (TQFN only). EP is internally connected to GND. Connect EP to a ground plane to increase thermal performance.

Functional Block Diagram

Detailed Description

The MAX7360 is a microprocessor peripheral low-noise key-switch controller that monitors up to 64 key switches with optional autorepeat, and key events that are presented in a 16-byte FIFO. The MAX7360 also features eight open-drain GPIOs configured for digital I/O or constant-current output for LED applications up to +14V.

The MAX7360 features an automatic sleep mode and automatic wakeup that further reduce supply current consumption. The MAX7360 can be configured to enter sleep mode after a programmable time following a key event. The FIFO content is maintained and can be read in sleep mode. The MAX7360 does not enter autosleep when a key is held down. The autowake feature takes the MAX7360 out of sleep mode following a keypress event. Enable/disable autosleep and autowake through the configuration register (Table 8).

To prevent overloading the microprocessor with too many interrupts, interrupt requests are issued on a programmable number of FIFO entries, and/or after a set period of time (Table 10). The key-switch status is checked by reading the key-switch FIFO. A 1-byte read access returns both the next key event in the FIFO (if there is one) and the FIFO status. $\overline{\text{INTK}}$ functions as an open-drain general-purpose output (GPO) capable of driving an LED if key-switch interrupts are not required.

Up to six of the key-switch outputs function as open-drain GPOs capable of driving additional LEDs when the application requires fewer keys to be scanned. For each key-switch output used as a GPO, the number of monitored key switches reduces by eight.

Initial Power-Up

On power-up, all control registers are set to power-up values and the MAX7360 is in sleep mode (Table 1).

Table 1. Register Address Map and Power-Up Condition

ADDRESS CODE (hex)	READ/ WRITE	POWER-UP VALUE (hex)	REGISTER FUNCTION	DESCRIPTION
0x00	Read only	0x3F	Keys FIFO	Read FIFO key-scan data out
0x01	R/W	0x0A	Configuration	Power-down, key-release enable, autowakeup, and I ² C timeout enable
0x02	R/W	0xFF	Debounce	Key debounce time settling and GPO enable
0x03	R/W	0x00	Interrupt	Key-switch interrupt $\overline{\text{INTK}}$ frequency setting
0x04	R/W	0xFE	GPO	COL2–COL7 and $\overline{\text{INTK}}$ GPO control

*These columns can be configured as GPOs.

Key-Scan Controller

Key inputs are scanned statically, not dynamically, to ensure low-EMI operation. As inputs only toggle in response to switch changes, the key matrix can be routed closer to sensitive circuit nodes.

The key-scan controller debounces and maintains a FIFO of keypress and release events (including autorepeated keypresses, if autorepeat is enabled). [Table 2](#) shows the key-switch order. The user-programmable key-switch debounce time, and autosleep timer, is derived from the 64kHz clock, which in turn is derived from the 128kHz oscillator. Time delay for autorepeat and key-switch interrupt is based on the key-switch debounce time.

Keys FIFO Register (0x00)

The keys FIFO register contains the information pertaining to the status of the keys FIFO, as well as the key events that have been debounced (see [Table 7](#) in the [Register Tables](#) section). Bits D0–D5 denote which of the 64 keys have been debounced and the keys are numbered as in [Table 2](#).

D7 indicates if there is more data in the FIFO, except when D5:D0 indicate key 63 or key 62. When D5:D0 indicate key 63 or key 62, the host should read one more time to determine whether there is more data in the FIFO. Use key 62 and key 63 for rarely used keys. D6 indicates if it is a keypress or release event, except when D5:D0 indicate key 63 or key 62.

Reading the key-scan FIFO clears the interrupt $\overline{\text{INTK}}$ depending on the setting of bit D5 in the configuration register (0x01).

Configuration Register (0x01)

The configuration register controls the I²C bus timeout feature, enables key-release detection, enables autowake, and

determines how $\overline{\text{INTK}}$ is deasserted. Write to bit D7 to put the MAX7360 into sleep mode or operating mode. Autosleep and autowake, when enabled, also change the status of D7 (see [Table 8](#) in the [Register Tables](#) section).

Debounce Register (0x02)

The debounce register sets the time for each debounce cycle, as well as setting whether the GPO ports are enabled or disabled. Bits D0–D4 set the debounce time in increments of 1ms starting at 9ms and ending at 40ms (see [Table 9](#) in the [Register Tables](#) section). Bits D5, D6, and D7 set which of the GPO ports is enabled. Note the GPO ports are enabled only in the combinations shown in [Table 9](#), from all disabled to all enabled.

Key-Switch Interrupt Register (0x03)

The interrupt register contains information related to the settings of the interrupt request function, as well as the status of the $\overline{\text{INTK}}$ output, which can also be configured as a GPO. If bits D0–D7 are set to 0x00, the $\overline{\text{INTK}}$ output is configured as a GPO that is controlled by bit D1 in the port register. There are two types of interrupts, the FIFO-based interrupt and time-based interrupt. Set bits D0–D4 to assert interrupts at the end of the selected number of debounce cycles following a key event (see [Table 10](#) in the [Register Tables](#) section). This number ranges from 1–31 debounce cycles. Setting bits D7, D6, and D5 set the FIFO-based interrupt when there are 2–14 key events stored in the FIFO. Both interrupts can be configured simultaneously and $\overline{\text{INTK}}$ asserts depending on which condition is met first. $\overline{\text{INTK}}$ deasserts depending on the status of bit D5 in the configuration register.

Ports Register (0x04)

The ports register sets the values of PORT2–PORT7 and the $\overline{\text{INTK}}$ port, when configured, as open-drain GPOs.

The settings in this register are ignored for ports not configured as GPOs, and a read from this register returns the values stored in the register (see [Table 11](#) in the [Register Tables](#) section).

Autorepeat Register (0x05)

The MAX7360 autorepeat feature notifies the host that at least one key has been pressed for a continuous period. The autorepeat register enables or disables this feature, sets the time delay after the last key event before the key repeat code (0x7E) is entered into the FIFO, and sets the frequency at which the key-repeat code is entered into the FIFO thereafter. Bit D7 specifies whether the autorepeat function is enabled with 0 denoting autorepeat disabled, and 1 denoting autorepeat enabled. Bits D0–D3 specify the autorepeat delay in terms of debounce cycles ranging from 8–128 debounce cycles (see [Table 12](#) in the [Register Tables](#) section). Bits D4, D5, and D6 specify the autorepeat rate or frequency ranging from 4–32 debounce cycles.

When autorepeat is enabled, holding the key pressed results in a key-repeat event that is denoted by 0x7E. The key being pressed does not show up again in the FIFO.

Only one autorepeat code is entered into the FIFO, regardless of the number of keys pressed. The autorepeat code continues to be entered in the FIFO at the frequency set by bits D[4:6] until another key event is recorded. Following the key-release event, if any keys are still pressed, the MAX7360 restarts the autorepeat sequence.

Autosleep Register (0x06)

Autosleep puts the MAX7360 in sleep mode to draw minimal current. When enabled, the MAX7360 enters sleep mode if no keys are pressed for the autosleep time (see [Table 13](#) in the [Register Tables](#) section).

Key-Switch Sleep Mode

In sleep mode, the MAX7360 draws minimal current. Switch-matrix current sources are turned off and pulled up to V_{CC}. When autosleep is enabled, key-switch inactivity for a period longer than the autosleep time puts the part into sleep mode (FIFO data is maintained). Writing a 1 to D7 in the configuration register, or a keypress, can take the MAX7360 out of sleep mode. Bit D7 in the configuration register gives the sleep-mode status and can be read any time. The FIFO data is maintained while in sleep mode.

Autowake

Keypresses initiate autowake and the MAX7360 goes into operating mode. Keypresses that autowake the MAX7360 are not lost. When a key is pressed while the MAX7360 is in sleep mode, all analog circuitry, including switch-matrix current sources, turn on in 2ms. The initial key needs to be pressed for 2ms plus the debounce time to be stored in the FIFO. Write a 0 to D1 in the configuration register (0x01) to disable autowakeup.

GPIOs

The MAX7360 has eight GPIO ports with LED control functions. The ports can be used as logic inputs, logic outputs, or constant-current PWM LED drivers. In addition, PORT7 and PORT6 can function as a rotary switch input pair. When in PWM mode, the ports are set up to start their PWM cycle in 45N phase increments. This prevents large current spikes on the LED supply voltage when driving multiple LEDs.

GPIO Global Configuration Register (0x40)

The GPIO global configuration register controls the main settings for the eight GPIOs (see [Table 14](#) in the [Register Tables](#) section).

Bit D7 enables PORT[7:6] as inputs for a rotary switch. Bit D5 enables interrupt generation for I²C timeouts. D4 is the main enable/shutdown bit for the GPIOs. D3 functions as a software reset for the GPIO registers (0x40 to 0x5F). Bits D[2:0] set the fade in/out time for the GPIOs configured as constant-current sinks.

GPIO Control Register (0x41)

The GPIO control register configures each port as either an input or an output (see [Table 15](#) in the [Register Tables](#) section). All GPIOs allow individual configurations, and power up as inputs. Enabling rotary switch mode automatically sets D7 and D6 as inputs. The ports consume additional current if their inputs are left undriven.

GPIO Debounce Configuration Register (0x42)

The GPIO debounce configuration register sets the amount of time a GPIO must be held for the MAX7360 to register a logic transition (see [Table 16](#) in the [Register Tables](#) section). The GPIO debounce setting is independent of the key-switch debounce setting. Five bits (D[4:0]) set 32 possible debounce times from 9ms up to 40ms.

GPIO Constant-Current Setting Register (0x43)

The GPIO constant-current setting register sets the global constant-current amount (see [Table 17](#) in the [Register Tables](#) section). Bits D1 and D0 set the global current values from 5mA up to 20mA.

GPIO Output Mode Register (0x44)

The GPIO output mode register sets an output as either a constant-current or non-constant-current output for PORT[7:0] (see [Table 18](#) in the [Register Tables](#) section). Outputs are configured as constant-current outputs by default to prevent accidental loading of an LED across an unregulated output. The constant-current circuits automatically turn off when not in use to reduce current consumption.

Common PWM Register (0x45)

The common PWM register stores the common constant-current output PWM duty cycle (see [Table 19](#) in the [Register Tables](#) section). The values stored in this register translate over to a PWM duty cycle in the same manner as the individual PWM registers (0x50 to 0x57). Ports can use their own individual PWM value, or the common PWM value. Write to this register to change the duty cycle of several ports at once.

Rotary Switch Configuration Register (0x46)

The rotary switch configuration register stores rotary switch settings for PORT7 and PORT6 (see [Table 20](#) in the [Register Tables](#) section). D7 determines whether switch counts or a time delay will trigger an interrupt if enabled. D[6:4] set the count or time amount to wait before sending an interrupt. Bits D[3:0] set the debounce cycle time for the rotary switch inputs. Debounce time ranges from 0 to 15ms.

I²C Timeout Flag Register (0x48) (Read Only)

The I²C timeout flag register contains a single bit (D0), which indicates if an I²C timeout has occurred (see [Table 21](#) in the [Register Tables](#) section). Read this register to clear an I²C timeout initiated interrupt.

GPIO Input Register (0x49) (Read Only)

The GPIO input register contains the input data for all of the GPIOs (see [Table 22](#) in the [Register Tables](#) section). Ports configured as outputs are read as high. There is one debounce period delay prior to detecting a transition on the input port. This prevents a false interrupt from occurring when changing a port from an output to an input. The GPIO input register reports the state of all input ports regardless of any interrupt mask settings. Ports configured as an input have a 2μA internal pullup to V_{CC} for PORT[5:0] and a 10μA internal pullup to V_{CC} for PORT[7:6].

Rotary Switch Count Register (0x4A) (Read Only)

The MAX7360 keeps a count of the rotary switch rotations in two's complement format (see [Table 23](#) in the [Register Tables](#) section). The register values wrap around as the count value switches from a positive to a negative value and back again. The count resets to zero after an I²C read to this register.

PORT0–PORT7 Individual PWM Ratio Registers (0x50 to 0x57)

Each port has an individual PWM ratio register (0x50 to 0x57, see [Table 24](#) in the [Register Tables](#) section). Use values 0x00 to 0xFE in these registers to configure the number of cycles out of 256 the output sinks current (LED is on), from 0 cycles to 254 cycles. Use 0xFF to have an output continuously sink current (always on). For applications requiring multiple ports to have the same intensity, program a particular port's configuration register (0x58 to 0x5F) to use the common PWM register (0x45). New PWM settings take place at the beginning of a PWM cycle, to allow changes from common intensity to individual intensity with no interruption in the PWM cycle.

PORT0–PORT7 Configuration Registers (0x58 to 0x5F)

Registers 0x58 to 0x5F set individual configurations for each port (see [Table 25](#) in the [Register Tables](#) section). Bits D7 and D6 determine the interrupt settings for the inputs. Interrupts can assert upon detection of a logic transition, a rising edge, or not at all. D5 sets the port's PWM setting to either the common or individual PWM setting. Bits D[4:2] enable and set the ports' individual blink period from 0 to 4096ms. Bits D1 and D0 set a port's blink duty cycle.

Fading

Set the fade cycle time in the GPIO global configuration register (0x40) to a non-zero value to enable fade in/out (see [Table 14](#) in the [Register Tables](#) section). Fade in increases an LED's PWM intensity in 16 even steps from zero to its stored value. Fade out decreases an LED's PWM intensity in 16 even steps from its current value to zero. Fading occurs automatically in any of the following scenarios:

- 1) Change the common PWM register value from any value to zero to cause all ports using the common PWM register settings to fade out. No ports using individual PWM settings are affected.
- 2) Change the common PWM register value to any value from zero to cause all ports using the common PWM register settings to fade in. No ports using individual PWM settings are affected.

- 3) Put the part out of shutdown to cause all ports to fade in. Changing an individual PWM intensity during fade in automatically cancels that port's fade and immediately output at its newly programmed intensity.
- 4) Put the part into shutdown to cause all ports to fade out. Changing an individual PWM intensity during fade out automatically cancels that port's fade and immediately turns off.

Blink

Each port has its own blink control settings through registers 0x58 to 0x5F (see Table 25 in the Register Tables section). The blink period ranges from 0 (blink disabled) to 4.096s. Settable blink duty cycles range from 6.25% to 50%. All blink periods start at the same PWM cycle for synchronized blinking between multiple ports.

When the blink setting is changed, the internal controller waits until the current blink period finishes before applying the change. As a result, the change in blink period may not always be instantaneous.

Figure 1. Rotary Switch Input Signal Timing

GPIO Port Interrupts ($\overline{\text{INTI}}$)

Three possible sources generate $\overline{\text{INTI}}$: I²C timeout, GPIOs configured as inputs, and the rotary switch (registers 0x48, 0x49, and 0x4A). Read the respective data/status registers for each type of interrupt to clear $\overline{\text{INTI}}$.

Set register 0x46 for rotary switch-based interrupts. Set registers 0x58 to 0x5F for individual GPI-based interrupts. If multiple sources generate the interrupt, all the related status registers must be read to clear $\overline{\text{INTI}}$.

Rotary Switch

The MAX7360 can accept a 2-bit rotary switch inputs on PORT6 and PORT7. Rotation of the switch in a clockwise direction increments the count. Enable rotary switch mode from the GPIO global configuration register (0x40). Several settings for PORT6 and PORT7 occur during rotary switch mode:

- 1) Each port has a 10 μ A pullup to V_{CC}.
- 2) Register 0x46 sets the debounce time.
- 3) A debounced rising edge on PORT6 while PORT7 is high decreases the count.
- 4) A debounced rising edge on PORT6 while PORT7 is low increases the count.

For more details, see Figure 1.

Serial Interface

Figure 2 shows the 2-wire serial interface timing details.

Serial Addressing

The MAX7360 operates as a slave that sends and receives data through an I²C-compatible 2-wire interface. The interface uses a serial-data line (SDA) and a serial-clock line (SCL) to achieve bidirectional communication

Figure 2. 2-Wire Serial Interface Timing Details

between master(s) and slave(s). A master (typically a microcontroller) initiates all data transfers to and from the MAX7360 and generates the SCL clock that synchronizes the data transfer.

The MAX7360's SDA line operates as both an input and an open-drain output. A pullup resistor, typically 4.7kΩ, is required on SDA. The MAX7360's SCL line operates only as an input. A pullup resistor is required on SCL if there are multiple masters on the 2-wire interface, or if the master in a single-master system has an open-drain SCL output.

Each transmission consists of a START (S) condition (Figure 3) sent by a master, followed by the MAX7360 7-bit slave address plus R/W bit, a register address byte, one or more data bytes, and finally, a STOP (P) condition.

START and STOP Conditions

Both SCL and SDA remain high when the interface is not busy. A master signals the beginning of a transmission with a START condition by transitioning SDA from high to low while SCL is high. When the master has finished communicating with the slave, it issues a STOP condition by transitioning SDA from low to high while SCL is high. The bus is then free for another transmission.

Bit Transfer

One data bit is transferred during each clock pulse (Figure 4). The data on SDA must remain stable while SCL is high.

Acknowledge

The acknowledge bit is a clocked 9th bit (Figure 5), which the recipient uses to handshake receipt of each byte of data. Thus, each byte transferred effectively requires 9 bits. The master generates the 9th clock pulse, and the recipient pulls down SDA during the acknowledge clock pulse; therefore, the SDA line is stable low during the high period of the clock pulse. When the master is transmitting to the MAX7360, the MAX7360 generates the acknowledge bit because the MAX7360 is the recipient. When the MAX7360 is transmitting to the master, the master generates the acknowledge bit because the master is the recipient.

Table 3. 2-Wire Interface Address Map

PIN ADO	DEVICE ADDRESS							
	A7	A6	A5	A4	A3	A2	A1	A0
GND	0	1	1	1	0	0	0	R/W
V _{CC}	0	1	1	1	0	1	0	R/W
SDA	0	1	1	1	1	0	0	R/W
SCL	0	1	1	1	1	1	0	R/W

Figure 3. START and STOP Conditions

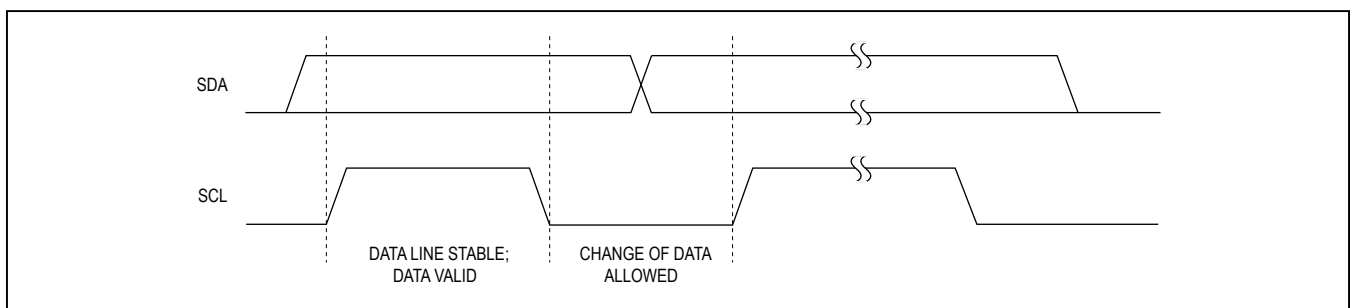

Figure 4. Bit Transfer

Figure 5. Acknowledge

Figure 6. Slave Address

Figure 7. Command Byte Received

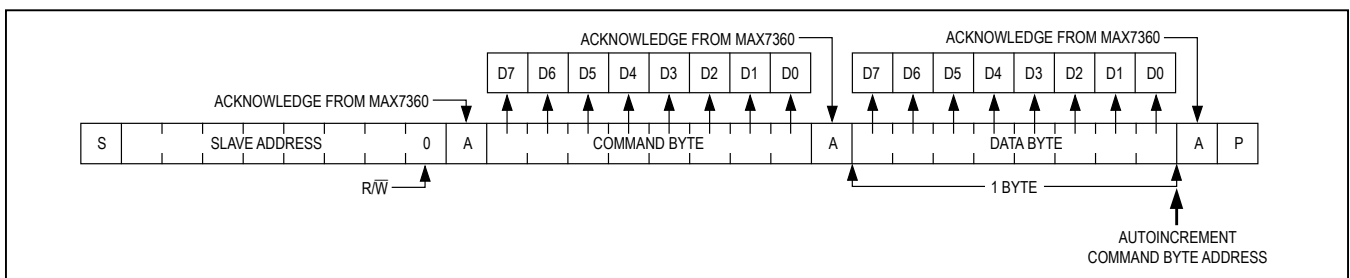

Figure 8. Command and Single Data Byte Received

Slave Addresses

The MAX7360 has a 7-bit long slave address (Figure 6). The bit following a 7-bit slave address is the R/W bit, which is low for a write command and high for a read command.

The first 4 bits (MSBs) of the MAX7360 slave address are always 0111. Slave address bits A3, A2, and A1 correspond, by the matrix in Table 3, to the states of the device address input AD0, and A0 corresponds to the R/W bit. The AD0 input can be connected to any of four signals (GND, V_{CC}, SDA, or SCL), giving four possible slave address pairs and allowing up to four MAX7360 devices to share the bus. Because SDA and SCL are dynamic

signals, care must be taken to ensure that AD0 transitions no sooner than the signals on SDA and SCL.

The MAX7360 monitors the bus continuously, waiting for a START condition, followed by its slave address. When the MAX7360 recognizes its slave address, it acknowledges and is then ready for continued communication.

Bus Timeout

The MAX7360 features a 20ms minimum bus timeout on the 2-wire serial interface, largely to prevent the MAX7360 from holding the SDA I/O low during a read transaction should the SCL lock up for any reason before a serial transaction is completed. Bus timeout operates by causing the MAX7360 to internally terminate a serial

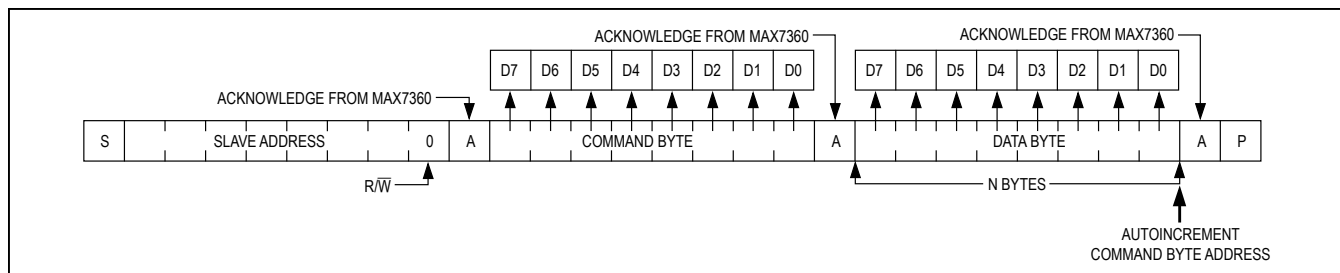

Figure 9. N Data Bytes Received

Table 4. Autoincrement Rules

REGISTER FUNCTION	ADDRESS CODE (hex)	AUTOINCREMENT ADDRESS (hex)
Keys FIFO	0x00	0x00
Autoshutdown	0x06	0x00
All other key switch	0x01 to 0x05	Addr + 0x01
All other GPIO	0x40 to 0x5F	Addr + 0x01

transaction, either read or write, if SCL low exceeds 20ms. After a bus timeout, the MAX7360 waits for a valid START condition before responding to a consecutive transmission. This feature can be enabled or disabled under user control by writing to the configuration register (Table 8 in the [Register Tables](#) section).

Message Format for Writing the Key-Scan Controller

A write to the MAX7360 comprises the transmission of the slave address with the R/W bit set to zero, followed by at least 1 byte of information. The first byte of information is the command byte. The command byte determines which register of the MAX7360 is to be written by the next byte, if received. If a STOP condition is detected after the command byte is received, the MAX7360 takes no further action (Figure 7) beyond storing the command byte.

Any bytes received after the command byte are data bytes. The first data byte goes into the internal register of the MAX7360 selected by the command byte (Figure 8).

If multiple data bytes are transmitted before a STOP condition is detected, these bytes are generally stored in subsequent MAX7360 internal registers, because the command byte address generally autoincrements (Table 4).

Message Format for Reading the Key-Scan Controller

The MAX7360 is read using the internally stored command byte as an address pointer, the same way the stored command byte is used as an address pointer for a write. The pointer generally autoincrements after each data byte

is read using the same rules as for a write (Table 4). Thus, a read is initiated by first configuring the MAX7360's command byte by performing a write (Figure 7). The master can now read n consecutive bytes from the MAX7360, with the first data byte being read from the register addressed by the initialized command byte. When performing read-after-write verification, remember to reset the command byte's address, because the stored command byte address is generally autoincremented after the write (Figure 9, Table 4).

Operation with Multiple Masters

When the MAX7360 is operated on a 2-wire interface with multiple masters, a master reading the MAX7360 uses a repeated start between the write that sets the MAX7360's address pointer, and the read(s) that takes the data from the location(s). This is because it is possible for master 2 to take over the bus after master 1 has set up the MAX7360's address pointer, but before master 1 has read the data. If master 2 subsequently resets the MAX7360's address pointer, master 1's read can be from an unexpected location.

Command Address Autoincrementing

Address autoincrementing allows the MAX7360 to be configured with fewer transmissions by minimizing the number of times the command address needs to be sent. The command address stored in the MAX7360 generally increments after each data byte is written or read (Table 4). Autoincrement only works when doing a multiburst read or write.

Applications Information

Reset from I²C

After a catastrophic event such as ESD discharge or microcontroller reset, use bit D7 of the configuration register (0x01) as a software reset for the key-switch state (the key-switch register values and FIFO remain unaffected). Use bit D4 of the GPIO global configuration register (0x40) as a software reset for the GPIOs.

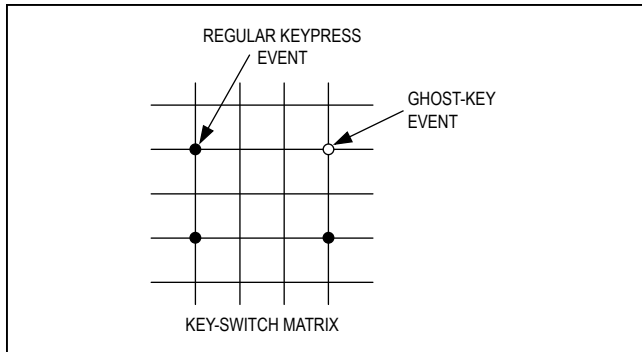

Figure 10. Ghost-Key Phenomenon

Ghost-Key Elimination

Ghost keys are a phenomenon inherent with key-switch matrices. When three switches located at the corners of a matrix rectangle are pressed simultaneously, the switch that is located at the last corner of the rectangle (the ghost key) also appears to be pressed. This occurs because the potentials at the two sides of the ghost-key switch are identical due to the other three connections—the switch is electrically shorted by the combination of the other three switches (Figure 10). Because the key appears to be pressed electrically, it is impossible to detect which of the four keys is the ghost key.

The MAX7360 employs a proprietary scheme that detects any three-key combination that generates a fourth ghost key, and does not report the third key that causes a ghost-key event. This means that although ghost keys are never reported, many combinations of three keys are effectively ignored when pressed at the same time. Applications requiring three-key combinations (such as <Ctrl><Alt>) must ensure that the three keys are not wired in positions that define the vertices of a rectangle (Figure 11). There is no limit on the number of keys that can be pressed simultaneously as long as the keys do not generate ghost-key events and FIFO is not full.

Low-EMI Operation

The MAX7360 uses two techniques to minimize EMI radiating from the key-switch wiring. First, the voltage across the switch matrix never exceeds +0.55V if not in sleep mode, independent of supply voltage V_{CC} . This reduces the voltage swing at any node when a switch is pressed to +0.55V maximum. Second, the keys are not dynamically scanned, which would cause the key-switch wiring to continuously radiate interference. Instead, the keys are monitored for current draw (only occurs when pressed), and debounce circuitry only operates when one or more keys are actually pressed.

Figure 11. Valid Three-Key Combinations

Switch On-Resistance

The MAX7360 is designed to be insensitive to resistance, either in the key switches, or the switch routing to and from the appropriate COL_ and ROW_ up to 4k Ω (max). These controllers are therefore compatible with low-cost membrane and conductive carbon switches.

Hot Insertion

The \overline{INTI} , \overline{INTK} , SCL, and AD0 inputs and SDA remain high impedance with up to +3.6V asserted on them when the MAX7360 powers down ($V_{CC} = 0$). I/O ports (PORT0–PORT7) remain high impedance with up to +14V asserted on them when not powered. Use the MAX7360 in hot-swap applications.

Staggered PWM

The LED's on-time in each PWM cycle are phase delayed 45N into eight evenly spaced start positions. Optimize phasing when using fewer than eight ports as constant-current outputs by allocating the ports with the most appropriate start positions. For example, if using four constant-current outputs, choose PORT0, PORT2, PORT4, and PORT6 because their PWM start positions are evenly spaced. In general, choose the ports that spread the PWM start positions as evenly as possible. This optimally spreads out the current demand from the ports' load supply.

$\overline{INTK}/\overline{INTI}$

There are two interrupt outputs, \overline{INTK} and \overline{INTI} . Each interrupt operates independently from the other. See the *Key-Switch Interrupt Register (0x03)* and the *GPIO Port Interrupts (\overline{INTI})* sections for additional information regarding these two interrupts.

Power-Supply Considerations

The MAX7360 operates with a +1.62V to +3.6V power-supply voltage. Bypass the power supply to GND with a 0.1 μ F or higher ceramic capacitor as close as possible to the device.

ESD Protection

All of the MAX7360 pins meet the 2kV Human Body Model ESD tolerances. Key-switch inputs and GPIOs meet IEC 61000-4-2 ESD protection. The IEC test stresses consist of 10 consecutive ESD discharges per polarity, at the maximum specified level and below (per IEC 61000-4-2). Test criteria include:

- 1) The powered device does not latch up during the ESD discharge event.
- 2) The device subsequently passes the final test used for prescreening.

Table 5 and Table 6 are from the IEC 61000-4-2: Edition 1.1 1999-05: *Electromagnetic compatibility (EMC) Testing and measurement techniques—Electrostatic discharge immunity test*.

Table 5. ESD Test Levels

1A—CONTACT DISCHARGE		1B—AIR-GAP DISCHARGE	
LEVEL	TEST VOLTAGE (kV)	LEVEL	TEST VOLTAGE (kV)
1	2	1	2
2	4	2	4
3	6	3	8
4	8	4	10
X	Special	X	Special

X = Open level. The level has to be specified in the dedicated equipment specification. If higher voltages than those shown are specified, special test equipment could be needed.

Table 6. ESD Waveform Parameters

LEVEL	INDICATED VOLTAGE (kV)	FIRST PEAK OF CURRENT DISCHARGE ±10% (A)	RISE TIME (t_r) WITH DISCHARGE SWITCH (ns)	CURRENT (±30%) AT 30ns (A)	CURRENT (±30%) AT 60ns (A)

Key-switch autorepeat frequency is 32 debounce cycles	1	1	1	1	X	X	X	X
Power-up default setting	0	0	0	0	0	0	0	0

Table 13. Autosleep Register Format (0x06)

REGISTER	REGISTER DATA							
	RESERVED				AUTOSHUTDOWN TIME			
	D7	D6	D5	D4	D3	D2	D1	D0
AUTOSLEEP REGISTER								
No Autosleep	0	0	0	0	0	0	0	0
Autosleep for (ms)								
8192	0	0	0	0	0	0	0	1
4096	0	0	0	0	0	0	1	0
2048	0	0	0	0	0	0	1	1
1024	0	0	0	0	0	1	0	0
512	0	0	0	0	0	1	0	1
256	0	0	0	0	0	1	1	0
256	0	0	0	0	0	1	1	1
Power-up default settings	0	0	0	0	0	1	1	1

Table 14. GPIO Global Configuration Register (0x40)

REGISTER BIT	DESCRIPTION	VALUE	FUNCTION	DEFAULT VALUE
D7	PORT6/PORT7 rotary switch	0	PORT6/PORT7 operate as GPIOs	0
		1	PORT6/PORT7 operate as a rotary switch input	
D6	Reserved	0	—	0
D5	I ² C timeout interrupt enable	0	Disabled	0
		1	$\overline{\text{INTI}}$ is asserted when I ² C bus times out. $\overline{\text{INTI}}$ is deasserted when a read is performed on the I ² C timeout flag register (0x48).	
D4	GPIO enable	0	PWM, constant-current circuits, and GPIs are shut down. GPO values depend on their setting. Register 0x41 to 0x5F values are stored and cannot be changed. The entire part is shut down if the key switches are in sleep mode (D7 of register 0x01).	0
		1	Normal GPIO operation. PWM, constant-current circuits, and GPIOs are enabled regardless of key-switch sleep mode state (see Table 8).	
D3	GPIO reset	0	Normal operation	0
		1	Return all GPIO registers (registers 0x40 to 0x5F) to their POR value. This bit is momentary and resets itself to 0 after the write cycle.	
D[2:0]	Fade in/out time	000	No fading	000
		XXX	PWM intensity ramps up (down) between the common PWM value and 0% duty cycle in 16 steps over the following time period: D[2:0] = 001 = 256ms D[2:0] = 010 = 512ms D[2:0] = 011 = 1024ms D[2:0] = 100 = 2048ms D[2:0] = 101 = 4096ms D[2:0] = 110/111 = Undefined	

Table 15. GPIO Control Register (0x41)

REGISTER BIT	DESCRIPTION	VALUE	FUNCTION	DEFAULT VALUE
D7	PORT7	0	Port is an input	0
		1	Port is an output	
D6	PORT6	0	Port is an input	0
		1	Port is an output	
D5	PORT5	0	Port is an input	0
		1	Port is an output	
D4	PORT4	0	Port is an input	0
		1	Port is an output	
D3	PORT3	0	Port is an input	0
		1	Port is an output	
D2	PORT2	0	Port is an input	0
		1	Port is an output	
D1	PORT1	0	Port is an input	0
		1	Port is an output	
D0	PORT0	0	Port is an input	0
		1	Port is an output	

Table 16. GPIO Debounce Configuration Register (0x42)

REGISTER DESCRIPTION	REGISTER DATA

		1	Port is input high	
D2	PORT2	0	Port is input low	1
		1	Port is input high	
D1	PORT1	0	Port is input low	1
		1	Port is input high	
D0	PORT0	0	Port is input low	1
		1	Port is input high	

Table 23. Rotary Switch Count Register (0x4A) (Read Only)

REGISTER DESCRIPTION	REGISTER DATA							
	D7	D6	D5	D4	D3	D2	D1	D0
	CYCLE COUNT							
Cycle count in two's complement (see the <i>Rotary Switch Configuration Register (0x46)</i> section)	X	X	X	X	X	X	X	X

Table 24. PORT0–PORT7 Individual PWM Ratio Registers (0x50 to 0x57)

REGISTER DESCRIPTION	REGISTER DATA							
	D7	D6	D5	D4	D3	D2	D1	D0
	PORT PWM							
Power-up default setting (port PWM ratio is 0/256)	0	0	0	0	0	0	0	0
PORT PWM ratio is 1/256	0	0	0	0	0	0	0	1
PORT PWM ratio is 2/256	0	0	0	0	0	0	1	0
PORT PWM ratio is 3/256	0	0	0	0	0	0	1	1
		·						
		·						
		·						
PORT PWM ratio is 252/256	1	1	1	1	1	1	0	0
PORT PWM ratio is 253/256	1	1	1	1	1	1	0	1
PORT PWM ratio is 254/256	1	1	1	1	1	1	1	0
PORT PWM ratio is 256/256 (100% duty cycle)	1	1	1	1	1	1	1	1

Table 25. PORT0–PORT7 Configuration Registers (0x58 to 0x5F)

REGISTER BIT	DESCRIPTION	VALUE	FUNCTION	DEFAULT VALUE
D7	Interrupt mask	0	Interrupt is not masked	0
		1	Interrupt is masked. PORT7 interrupt mask is ignored when the device is configured for rotary switch input.	
D6	Edge/level detect	0	Rising edge-triggered interrupts	0
		1	Rising or falling edge-triggered interrupts	
D5	Common PWM	0	Port uses individual PWM intensity register to set the PWM ratio	0
		1	Port uses common PWM intensity register to set the PWM ratio	
D[4:2]	Blink period	000	Port does not blink	000
		001	Port blink period is 256ms	
		010	Port blink period is 512ms	
		011	Port blink period is 1024ms	
		100	Port blink period is 2048ms	
		101	Port blink period is 4096ms	
		110/111	Undefined	
D[1:0]	Blink-on time	00	LED is on for 50% of the blink period	00
		01	LED is on for 25% of the blink period	
		10	LED is on for 12.5% of the blink period	
		11	LED is on for 6.25% of the blink period	

Typical Application Circuit

Chip Information

PROCESS: BiCMOS

Package Information

For the latest package outline information and land patterns (footprints), go to www.maximintegrated.com/packages. Note that a "+", "#", or "-" in the package code indicates RoHS status only. Package drawings may show a different suffix character, but the drawing pertains to the package regardless of RoHS status.

PACKAGE TYPE	PACKAGE CODE	DOCUMENT NO.
40 TQFN-EP	T4055+1	21-0140
36 WLP	W362A2+1	21-0301

Revision History

REVISION NUMBER	REVISION DATE	DESCRIPTION	PAGES CHANGED
0	4/09	Initial release	—
1	8/10	Updated <i>Absolute Maximum Ratings</i> and Notes 7 and 8 (now Notes 6 and 7) in <i>Electrical Characteristics</i>	2, 3, 4
2	1/13	Added the <i>Package Thermal Characteristics</i> section; updated the Δf_{OSC} min and max values in the <i>Electrical Characteristics</i>	2
3	7/19	Updated <i>Blink</i> section	13

For pricing, delivery, and ordering information, please visit Maxim Integrated's online storefront at <https://www.maximintegrated.com/en/storefront/storefront.html>.

Maxim Integrated cannot assume responsibility for use of any circuitry other than circuitry entirely embodied in a Maxim Integrated product. No circuit patent licenses are implied. Maxim Integrated reserves the right to change the circuitry and specifications without notice at any time. The parametric values (min and max limits) shown in the *Electrical Characteristics* table are guaranteed. Other parametric values quoted in this data sheet are provided for guidance.

Данный компонент на территории Российской Федерации

Вы можете приобрести в компании MosChip.

Для оперативного оформления запроса Вам необходимо перейти по данной ссылке:

<http://moschip.ru/get-element>

Вы можете разместить у нас заказ для любого Вашего проекта, будь то серийное производство или разработка единичного прибора.

В нашем ассортименте представлены ведущие мировые производители активных и пассивных электронных компонентов.

Нашей специализацией является поставка электронной компонентной базы двойного назначения, продукции таких производителей как XILINX, Intel (ex.ALTERA), Vicor, Microchip, Texas Instruments, Analog Devices, Mini-Circuits, Amphenol, Glenair.

Сотрудничество с глобальными дистрибьюторами электронных компонентов, предоставляет возможность заказывать и получать с международных складов практически любой перечень компонентов в оптимальные для Вас сроки.

На всех этапах разработки и производства наши партнеры могут получить квалифицированную поддержку опытных инженеров.

Система менеджмента качества компании отвечает требованиям в соответствии с ГОСТ Р ИСО 9001, ГОСТ РВ 0015-002 и ЭС РД 009
