

1.0625Gbps to 10.32Gbps, Integrated, Low-Power SFP+ Limiting Amplifier and VCSEL Driver

MAX3798

General Description

The MAX3798 is a highly integrated limiting amplifier and VCSEL driver designed for 1x/2x/4x/8x Fibre Channel transmission systems at data rates up to 8.5Gbps as well as for 10GBASE-SR transmission systems at a data rate of 10.3125Gbps. Operating from a single +3.3V supply, this low-power integrated limiting amplifier and VCSEL driver IC enables a platform design for SFP MSA as well as for SFP+ MSA-based optical transceivers. The high-sensitivity limiting amplifier limits the differential input signal generated by a transimpedance amplifier into a CML-level differential output signal. The compact VCSEL driver provides a modulation and a bias current for a VCSEL diode. The optical average power is controlled by an average power control (APC) loop implemented by a controller that interfaces to the VCSEL driver through a 3-wire digital interface. All differential I/Os are optimally back-terminated for a 50Ω transmission line PCB design.

The use of a 3-wire digital interface reduces the pin count while enabling advanced Rx (mode selection, LOS threshold, LOS squelch, LOS polarity, CML output level, signal path polarity, slew-rate control, deemphasis, and fast mode-select change time) and Tx settings (modulation current, bias current, polarity, programmable deemphasis, eye-crossing adjustment, and eye safety control) without the need for external components. The MAX3798 provides multiple current and voltage DACs to allow the use of low-cost controller ICs.

The MAX3798 is packaged in a lead-free, 5mm x 5mm, 32-pin TQFN package.

Applications

- 10GBASE-SR SFP+ Optical Transceiver
- 1x/2x/4x/8x SFF/SFP/SFP+ MSA Fibre Channel (FC) Optical Transceiver
- 10GBASE-LR SFP+ Optical Transceiver (1310nm VCSEL)
- 10GBASE-LRM SFP+ Optical Transceiver (1310nm VCSEL)

Features

- ◆ Low Power Dissipation of 320mW at 3.3V Power Supply
- ◆ Up to 10.32Gbps (NRZ) Operation
- ◆ 3mVp-p Receiver Sensitivity at 10.32Gbps
- ◆ 4psp-p DJ at Receiver Output at 8.5Gbps 8B/10B
- ◆ 4psp-p DJ at Receiver Output at 10.32Gbps 2³¹ - 1 PRBS
- ◆ 26ps Rise and Fall Time at Rx/Tx Output
- ◆ Mode Select for High-Gain Mode and High-Bandwidth Mode
- ◆ CML Output Slew-Rate Adjustment for High-Gain Mode
- ◆ CML Output with Continuous Level Adjustment
- ◆ CML Output Squelch
- ◆ Polarity Select for Rx and Tx
- ◆ LOS Assert Level Adjustment
- ◆ LOS Polarity Select
- ◆ Modulation Current Up to 12mA Into 100Ω Differential Load
- ◆ Bias Current Up to 15mA
- ◆ Integrated Eye Safety Features
- ◆ Selectable Deemphasis at Rx Output
- ◆ 3-Wire Digital Interface
- ◆ Eye-Crossing Adjustment of Modulation Output
- ◆ Programmable Deemphasis at Tx Output
- ◆ Fast Mode-Select Change Time of 10μs

Ordering Information

| PART | TEMP RANGE | PIN-PACKAGE |
|-------------|----------------|-------------|
| MAX3798ETJ+ | -40°C to +85°C | 32 TQFN-EP* |

+Denotes a lead-free/RoHS-compliant package.

*EP = Exposed pad.

Typical Application Circuit and Pin Configuration appear at end of data sheet.

1.0625Gbps to 10.32Gbps, Integrated, Low-Power SFP+ Limiting Amplifier and VCSEL Driver

ABSOLUTE MAXIMUM RATINGS

| | | | |
|---|--|--|-----------------|
| V _{CC} , V _{CT} , V _{CD} | -0.3V to +4.0V | Current Range into FAULT, LOS..... | -1mA to +5mA |
| Voltage Range at DISABLE, SDA, SCL, CSEL, MSEL, FAULT, BMON, LOS, BMAX, MMAX, CAZ2..... | -0.3V to (V _{CC} + 0.3V) | Current Range into SDA..... | -1mA to +1mA |
| Voltage Range at ROUT+, ROUT- | (V _{CC} - 1V) to (V _{CC} + 0.3V) | Current into ROUT+, ROUT- | 40mA |
| Voltage at TIN+, TIN-..... | (V _{CC} - 2.5V) to (V _{CC} - 0.5V) | Current into TOUT+, TOUT- | 60mA |
| Voltage Range at TOUT+, TOUT- | (V _{CC} - 2V) to (V _{CC} + 0.3V) | Continuous Power Dissipation (T _A = +70°C) 32-Pin TQFN (derate 34.5W/°C above +70°C) | 2759mW |
| Voltage at BIAS..... | 0 to V _{CC} | Operating Junction Temperature Range | -55°C to +150°C |
| Voltage at RIN+, RIN-..... | (V _{CC} - 2V) to (V _{CC} - 0.2V) | Storage Temperature Range | -65°C to +160°C |

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

ELECTRICAL CHARACTERISTICS

(V_{CC} = 2.85V to 3.63V, T_A = -40°C to +85°C, CML receiver output load is AC-coupled to differential 100Ω, CAZ = 1nF, transmitter output load is AC-coupled to differential 100Ω (see Figure 1), typical values are at +25°C, V_{CC} = 3.3V, I_{BIAS} = 6mA, I_{MOD} = 6mA, unless otherwise specified. Registers are set to default values unless otherwise noted, and the 3-wire interface is static during measurements. For testing, the MODE_SEL bit was used and the MSEL pin was left open.)

Note 1: Supply current is measured with unterminated receiver CML output or with AC-coupled Rx output termination. The Tx output and the bias current output must be connected to a separate supply in order to remove the modulation/bias current portion from the supply current. BIAS must be connected to 2.0V. TOUT+/- must be connected through 50Ω load resistors to a separate supply voltage.

Note 2: Guaranteed by design and characterization, $T_A = -40^{\circ}C$ to $+95^{\circ}C$.

Note 3: The data input transition time is controlled by a 4th-order Bessel filter with $-3dB$ frequency = $0.75 \times$ data rate. The deterministic jitter caused by this filter is not included in the DJ generation specifications.

Note 4: Test pattern is 00001111 at 4.25Gbps for MODE_SEL = 0. Test pattern is 00001111 at 8.5Gbps for MODE_SEL = 1.

1.0625Gbps to 10.32Gbps, Integrated, Low-Power SFP+ Limiting Amplifier and VCSEL Driver

- Note 5:** Receiver deterministic jitter is measured with a repeating $2^{31} - 1$ PRBS equivalent pattern at 10.32Gbps. For 1.0625Gbps to 8.5Gbps, a repeating K28.5 pattern [0011111010110000101] is used. Deterministic jitter is defined as the arithmetic sum of pulse-width distortion (PWD) and pattern-dependent jitter (PDJ).
- Note 6:** Measured with a k28.5 pattern from 1.0625Gbps to 8.5Gbps. Measured with $2^{31} - 1$ PRBS at 10.32Gbps.
- Note 7:** Measurement includes an input AC-coupling capacitor of 100nF and C_{CAZ} of 100nF. The signal at the input is switched between two amplitudes: Signal_ON and Signal_OFF.
- 1) Receiver operates at sensitivity level plus 1dB power penalty.
 - a) Signal_OFF = 0
Signal_ON = (+8dB) + 10log(min_assert_level)
 - b) Signal_ON = (+1dB) + 10log(max_deassert_level)
Signal_OFF = 0
 - 2) Receiver operates at overload.
Signal_OFF = 0
Signal_ON = 1.2V_{p-p}
- max_deassert_level and the min_assert_level are measured for one LOS_THRESHOLD setting.
- Note 8:** Gain stability is defined as $[(I_{\text{measured}}) - (I_{\text{reference}})] / (I_{\text{reference}})$ over the listed current range, temperature, and V_{CC} from +2.95V to +3.63V. Reference current measured at $V_{CC} = +3.2V$, $T_A = +25^{\circ}C$.
- Note 9:** Transmitter deterministic jitter is measured with a repeating $2^7 - 1$ PRBS, 72 0s, $2^7 - 1$ PRBS, and 72 1s pattern at 10.32Gbps. For 1.0625Gbps to 8.5Gbps, a repeating K28.5 pattern [0011111010110000101] is used. Deterministic jitter is defined as the arithmetic sum of PWD and PDJ.
- Note 10:** Gain stability is defined as $[(I_{\text{measured}}) - (I_{\text{reference}})] / (I_{\text{reference}})$ over the listed current range, temperature, and V_{CC} from +2.85V to +3.63V. Reference current measured at $V_{CC} = +3.3V$, $T_A = +25^{\circ}C$.

Pin Description

| PIN | NAME | FUNCTION |
|----------------|-------------------|---|
| 1 | LOS | Loss-of-Signal Output, Open Drain. The default polarity of LOS is high when the level of the input signal is below the preset threshold set by the SET_LOS DAC. Polarity of the LOS function can be inverted by setting LOS_POL = 0. The LOS circuitry can be disabled by setting the bit LOS_EN = 0. |
| 2 | MSEL | Mode-Select Input, TTL/CMOS. Set the MSEL pin or MODE_SEL bit (set by the 3-wire digital interface) to logic-high for high-bandwidth mode. Setting MSEL and MODE_SEL logic-low for high-gain mode. The MSEL pin is internally pulled down by a 75kΩ resistor to ground. |
| 3, 6, 27, 30 | V _{CCR} | Power Supply. Provides supply voltage to the receiver block. |
| 4 | ROUT+ | Noninverted Receive Data Output, CML. Back-terminated for 50Ω load. |
| 5 | ROUT- | Inverted Receive Data Output, CML. Back-terminated for 50Ω load. |
| 7 | V _{CCD} | Power Supply. Provides supply voltage for the digital block. |
| 8 | DISABLE | Transmitter Disable Input, TTL/CMOS. Set to logic-low for normal operation. Logic-high or open disables both the modulation and bias current. Internally pulled up by an 8kΩ resistor to V _{CC} T. |
| 9 | SCL | Serial Clock Input, TTL/CMOS. This pin has a 75kΩ internal pulldown. |
| 10 | SDA | Serial Data Bidirectional Input, TTL/CMOS. Open-drain output. This pin has a 75kΩ internal pullup, but it requires an external 4.7kΩ pullup resistor to meet the 3-wire digital timing specification. (Data line collision protection is implemented.) |
| 11 | CSEL | Chip-Select Input, TTL/CMOS. Setting CSEL to logic-high starts a cycle. Setting CSEL to logic-low ends the cycle and resets the control state machine. Internally pulled down by a 75kΩ resistor to ground. |
| 12, 15, 18, 21 | V _{CC} T | Power Supply. Provides supply voltage to the transmitter block. |
| 13 | TIN+ | Noninverted Transmit Data Input, CML |

1.0625Gbps to 10.32Gbps, Integrated, Low-Power SFP+ Limiting Amplifier and VCSEL Driver

Pin Description (continued)

| PIN | NAME | FUNCTION |
|-----|-------|--|
| 14 | TIN- | Inverted Transmit Data Input, CML |
| 16 | BMON | Bias Current Monitor Output. Current out of this pin develops a ground-referenced voltage across an external resistor that is proportional to the laser bias current. |
| 17 | VEET | Ground. Provides ground for the transmitter block. |
| 19 | TOUT- | Inverted Modulation Current Output. Back-termination of 50Ω to V _{CC} T. |
| 20 | TOUT+ | Noninverted Modulation Current Output. Back-termination of 50Ω to V _{CC} T. |
| 22 | BIAS | VCSEL Bias Current Output |
| 23 | FAULT | Transmitter Fault Output, Open Drain. Logic-high indicates a fault condition. FAULT remains high even after the fault condition has been removed. A logic-low occurs when the fault condition has been removed and the fault latch has been cleared by the DISABLE signal. |
| 24 | BMAX | Analog VCSEL Bias Current Limit. A resistor connected between BMAX and V _{CC} T sets the maximum allowed VCSEL bias current. |
| 25 | MMAX | Analog VCSEL Modulation Current Limit. A resistor connected between MMAX and V _{CC} T sets the maximum allowed VCSEL modulation current. |
| 26 | VEER | Ground. Provides ground for the receiver block. |
| 28 | RIN- | Inverted Receive Data Input, CML |
| 29 | RIN+ | Noninverted Receive Data Input, CML |
| 31 | CAZ2 | Offset Correction Loop Capacitor. A capacitor connected between this pin and CAZ1 sets the time constant of the offset correction loop. The offset correction can be disabled through the digital interface by setting the bit AZ_EN = 0. |
| 32 | CAZ1 | Offset Correction Loop Capacitor. Counterpart to CAZ2, internally connected to VEER. |
| — | EP | Exposed Pad. Ground. Must be soldered to circuit board ground for proper thermal and electrical performance (see the <i>Exposed-Pad Package</i> section). |

Detailed Description

The MAX3798 SFP+ transceiver combines a limiting amplifier receiver with loss-of-signal detection and a VCSEL laser driver transmitter with fault protection. Configuration of the advanced Rx and Tx settings of the MAX3798 is performed by a controller through the 3-wire interface. The MAX3798 provides multiple current and voltage DACs to allow the use of low-cost controller ICs.

Limiting Amplifier Receiver

The limiting amplifier receiver inside the MAX3798 is designed to operate from 1.0625Gbps to 10.32Gbps. The receiver includes a dual path limiter, offset correction circuitry, CML output stage with deemphasis, and loss-of-signal circuitry. The functions of the receiver can be controlled through the on-chip 3-wire interface. The registers that control the receiver functionality are RXCTRL1, RXCTRL2, RXSTAT, MODECTRL, SET_CML, and SET_LOS.

1.0625Gbps to 10.32Gbps, Integrated, Low-Power SFP+ Limiting Amplifier and VCSEL Driver

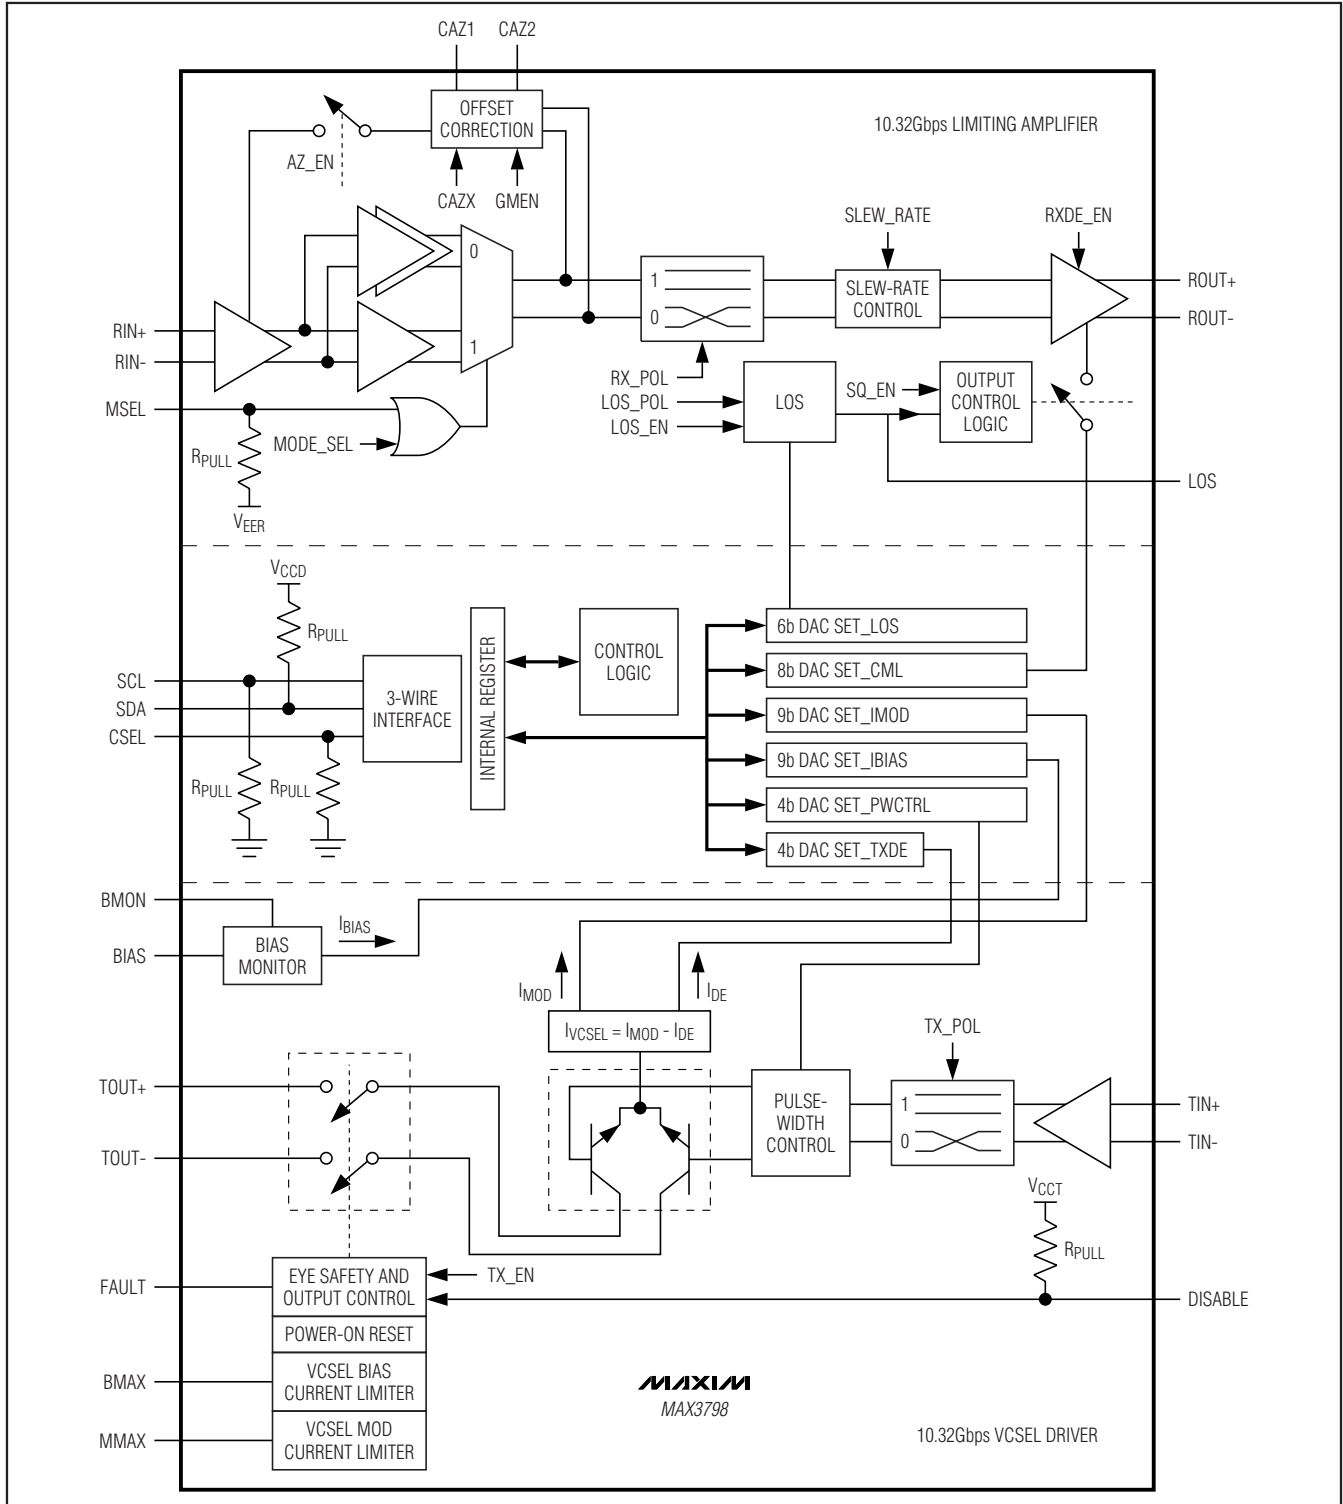

Figure 2. Functional Diagram

1.0625Gbps to 10.32Gbps, Integrated, Low-Power SFP+ Limiting Amplifier and VCSEL Driver

Dual Path Limiter

The limiting amplifier features a high-gain mode and a high-bandwidth mode allowing for overall system optimization. Either the MSEL pin or the MODE_SEL bit can perform the mode selection. For operating up to 4.25Gbps, the high-gain mode (MODE_SEL = 0) is recommended. For operating above 8.5Gbps, the high-bandwidth mode (MODE_SEL = 1) is recommended. For operations at 8.5Gbps, the mode selection is dependent on the performance of the receiver optical subassembly. The polarity of ROUT+/ROUT- relative to RIN+/RIN- is programmed by the RX_POL bit.

Offset Correction Circuitry

The offset correction circuit is enabled to remove pulse-width distortion caused by intrinsic offset voltages within the differential amplifier stages. An external capacitor (CAZ) connected between the CAZ1 and CAZ2 pins is used to set the offset correction loop cutoff frequency. The offset loop can be disabled using the AZ_EN bit. The MAX3798 contains a feature that allows the part to meet a 10 μ s mode-select switching time. The mode-select switching time can be adjusted using the GMEN and CAZX bits.

CML Output Stage with Deemphasis and Slew-Rate Control

The CML output stage is optimized for differential 100 Ω loads. The RXDE_EN bit adds analog deemphasis compensation to the limited differential output signal for SFP connector losses. The output stage is controlled by a combination of the RX_EN and SQ_EN bits and the LOS pin. See Table 1.

Amplitude of the CML output stage is controlled by an 8-bit DAC register (SET_CML). The differential output amplitude range is from 40mV_{P-P} up to 1200mV_{P-P} with

4.6mV_{P-P} resolution (assuming an ideal 100 Ω differential load).

The lower bandwidth data path allows for reduction of output edge speed in order to enhance EMI performance. The SLEW_RATE bit controls the slew rate of the output stage (see Table 2).

Loss-of-Signal (LOS) Circuitry

The input data amplitude is compared to a preset threshold controlled by the 6-bit DAC register SET_LOS. The LOS assert level can be programmed from 14mV_{P-P} up to 77mV_{P-P} with 1.5mV_{P-P} resolution (assuming an ideal 100 Ω differential source). LOS is enabled through the LOS_EN bit and the polarity of the LOS is controlled with the LOS_POL bit.

VCSEL Driver

The VCSEL driver inside the MAX3798 is designed to operate from 1.0625Gbps to 10.32Gbps. The transmitter contains a differential data path with pulse-width adjustment, bias current and modulation current DACs, output driver with programmable deemphasis, power-on reset circuitry, BIAS monitor, VCSEL current limiter, and eye safety circuitry. A 3-wire digital interface is used to control the transmitter functions. The registers that control the transmitter functionality are TXCTRL, TXSTAT1, TXSTAT2, SET_IBIAS, SET_IMOD, IMODMAX, IBIASMAX, MODINC, BIASINC, MODECTRL, SET_PWCTRL, and SET_TXDE.

Differential Data Path

The CML input buffer is optimized for AC-coupled signals and is internally terminated with a differential 100 Ω . Differential input data is equalized for high-frequency losses due to SFP connectors. The TX_POL bit in the TXCTRL register controls the polarity of TOUT+ and TOUT- vs. TIN+ and TIN-. The SET_PWCTRL register

Table 1. CML Output Stage Operation Mode

| RX_EN | SQ_EN | LOS | OPERATION MODE DESCRIPTION |
|-------|-------|-----|----------------------------|

Table 2. Slew-Rate Control for CML Output Stage

| MODE_SEL | SLEW_RATE | OPERATION MODE DESCRIPTION |
|----------|-----------|--|
| 0 | 0 | 4.25Gbps operation with reduced output edge speed. |
| 0 | 1 | 4.25Gbps operation with full edge speed; 8.5Gbps operation with high bandwidth ROSA. |
| 1 | X | 8.5Gbps with lower bandwidth ROSA; 10.32Gbps operation. |

1.0625Gbps to 10.32Gbps, Integrated, Low-Power SFP+ Limiting Amplifier and VCSEL Driver

controls the output eye-crossing adjustment. A status indicator bit (TXED) monitors the presence of an AC input signal.

Bias Current DAC

The bias current from the MAX3798 is optimized to provide up to 15mA of bias current into a 50Ω to 75Ω VCSEL load with 40μA resolution. The bias current is controlled through the 3-wire digital interface using the SET_IBIAS, IBIASMAX, and BIASINC registers.

For VCSEL operation, the IBIASMAX register is first programmed to a desired maximum bias current value (up to 15mA). The bias current to the VCSEL then can range from zero to the value programmed into the IBIASMAX register. The bias current level is stored in the 9-bit SET_IBIAS register. Only bits 1 to 8 are written to. The LSB (bit 0) of SET_IBIAS is initialized to zero and is updated through the BIASINC register.

The value of the SET_IBIAS DAC register is updated when the BIASINC register is addressed through the 3-wire interface. The BIASINC register is an 8-bit register where the first 5 bits contain the increment information in two's complement notation. Increment values range from -8 to +7 LSBs. If the updated value of SET_IBIAS[8:1] exceeds IBIASMAX[7:0], the IBIASERR warning flag is set and SET_IBIAS[8:0] remains unchanged.

Modulation Current DAC

The modulation current from the MAX3798 is optimized to provide up to 12mA of modulation current into a 100Ω differential load with 40μA resolution. The modulation current is controlled through the 3-wire digital interface using the SET_IMOD, IMODMAX, MODINC, and SET_TXDE registers.

For VCSEL operation, the IMODMAX register is first programmed to a desired maximum modulation current value (up to 12mA into a 100Ω differential load). The modulation current to the VCSEL then can range from zero to the value programmed into the IMODMAX register. The modulation current level is stored in the 9-bit SET_IMOD register. Only bits 1 to 8 are written to. The LSB (bit 0) of SET_IMOD is initialized to zero and is updated through the MODINC register.

The value of the SET_IMOD DAC register is updated when the MODINC register is addressed through the 3-wire interface. The MODINC register is an 8-bit register where the first 5 bits contain the increment information in two's complement notation. Increment values range from -8 to +7 LSBs. If the updated value of SET_IMOD[8:1] exceeds IMODMAX[7:0], the IMODERR

warning flag is set and SET_IMOD[8:0] remains unchanged.

Output Driver

The output driver is optimized for an AC-coupled 100Ω differential load. The output stage also features programmable deemphasis that allows the deemphasis amplitude to be set as a percentage of the modulation current. The deemphasis function is enabled by the TXDE_EN bit. At initial setup the required amount of deemphasis can be set using the SET_TXDE register. During the system operation, it is advised to use the incremental mode that updates the deemphasis (SET_TXDE) and the modulation current DAC (SET_IMOD) simultaneously through the MODINC register.

Power-On Reset (POR)

Power-on reset ensures that the laser is off until supply voltage has reached a specified threshold (2.55V). After power-on reset, bias current and modulation current ramp up slowly to avoid an overshoot. In the case of a POR, all registers are reset to their default values.

Bias Current Monitor

Current out of the BMON pin is typically 1/16th the value of IBIAS. A resistor to ground at BMON sets the voltage gain. An internal comparator latches a SOFT FAULT if the voltage on BMON exceeds the value of VCC - 0.55V.

VCSEL Current Limiter

To ensure an enhanced eye safety, an external analog VCSEL current limitation can be used in addition to the digital one. An external resistor at BMAX and MMAX limits the maximum bias and modulation currents, respectively. A HARD FAULT condition is latched if the VCSEL current exceeds this threshold.

Eye Safety and Output Control Circuitry

The safety and output control circuitry contains a disable pin (DISABLE) and disable bit (TX_EN), along with a FAULT indicator and fault detectors (Figure 3). The MAX3798 has two types of faults, HARD FAULT and SOFT FAULT. A HARD FAULT triggers the FAULT pin and the output to the VCSEL is disabled. A SOFT FAULT operates more like a warning and the outputs are not disabled. Both types of faults are stored in the TXSTAT1 and TXSTAT2 registers.

The FAULT pin is a latched output that can be cleared by toggling the DISABLE pin. Toggling the DISABLE pin also clears the TXSTAT1 and TXSTAT2 registers. A single-point fault can be a short to VCC or GND. Table 3 shows the circuit response to various single-point failures.

Note 1: Normal—Does not affect laser power.

Note 2: Supply-shortened current is assumed to be primarily on the circuit board (outside this device) and the main supply is collapsed by the short.

Note 3: Normal in functionality, but performance could be affected.

Warning: Shorted to V_{CC} or shorted to ground on some pins can violate the *Absolute Maximum Ratings*.

3-Wire Digital Communication

The MAX3798 implements a proprietary 3-wire digital interface. An external controller generates the clock. The 3-wire interface consists of an SDA bidirectional data line, an SCL clock signal input, and a CSEL chip-select input (active high). The external master initiates a data transfer by asserting the CSEL pin. The master starts to generate a clock signal after the CSEL pin has been set to 1. All data transfers are most significant bit (MSB) first.

Protocol

Each operation consists of 16-bit transfers (15-bit address/data, 1-bit RWN). The bus master generates 16 clock cycles to SCL. All operations transfer 8 bits to the MAX3798. The RWN bit determines if the cycle is read or write. See Table 4.

Register Addresses

The MAX3798 contains 17 registers available for programming. Table 5 shows the registers and addresses.

Write Mode (RWN = 0)

The master generates 16 clock cycles at SCL in total. The master outputs a total of 16 bits (MSB first) to the SDA line at the falling edge of the clock. The master closes the transmission by setting CSEL to 0. Figure 4 shows the interface timing.

Read Mode (RWN = 1)

The master generates 16 clock cycles at SCL in total. The master outputs a total of 8 bits (MSB first) to the SDA line at the falling edge of the clock. The SDA line is released after the RWN bit has been transmitted. The slave outputs 8 bits of data (MSB first) at the rising edge of the clock. The master closes the transmission by setting CSEL to 0. Figure 4 shows the interface timing.

Mode Control

Normal mode allows read-only instruction for all registers except MODINC and BIASINC. The MODINC and BIASINC registers can be updated during normal mode. Doing so speeds up the laser control update through the 3-wire interface by a factor of two. The normal mode is the default mode.

Setup mode allows the master to write unrestricted data into any register except the status (TXSTAT1, TXSTAT2, and RXSTAT) registers. To enter the setup mode, the MODECTRL register (address = H0x0E) must be set to H0x12. After the MODECTRL register has been set to H0x12, the next operation is unrestricted. The setup mode is automatically exited after the next operation is finished. This sequence must be repeated if further unrestricted settings are necessary.

Figure 4. Timing for 3-Wire Digital Interface

1.0625Gbps to 10.32Gbps, Integrated, Low-Power SFP+ Limiting Amplifier and VCSEL Driver

Register Descriptions

Receiver Control Register 1 (RXCTRL1)

| Bit # | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | ADDRESS |
|---------------|---|---|---|---|------|------|----------|-----------|---------|
| Name | X | X | X | X | CAZX | GMEN | MODE_SEL | SLEW_RATE | H0x00 |
| Default Value | X | X | X | X | 1 | 1 | 0 | 0 | |

Bit 3: CAZX. When CAZX is set to 0, no external capacitor is required (CAZ1 and CAZ2). When CAZX is set to 1, an external capacitor with a minimum value of 2nF is required between CAZ1 and CAZ2.

0 = no capacitor

1 = capacitor connected

Bit 2: GMEN. Allows faster switching between data paths.

0 = disabled

1 = enabled

Bit 1: MODE_SEL. MODE_SEL combined with the MSEL pin through a logic-OR function selects between the high-gain mode (1.0625Gbps to 8.5Gbps) or high-bandwidth mode (1.0625Gbps to 10.32Gbps).

Logic-OR output 0 = high-gain mode

Logic-OR output 1 = high-bandwidth mode

Bit 0: SLEW_RATE. Controls the slew rate of the output stage to reduce the effects of EMI at slower data rates. Effective when MODE_SEL = 0 and MSEL = GND only.

0 = 50ps

1 = 30ps

Receiver Control Register 2 (RXCTRL2)

| Bit # | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | ADDRESS |
|---------------|---|--------|---------|--------|-------|-------|---------|-------|---------|
| Name | X | LOS_EN | LOS_POL | RX_POL | SQ_EN | RX_EN | RXDE_EN | AZ_EN | H0x01 |
| Default Value | X | 1 | 1 | 1 | 0 | 1 | 0 | 1 | |

Bit 6: LOS_EN. Controls the LOS circuitry. When RX_EN is set to 0 the LOS detector is also disabled.

0 = disabled

1 = enabled

Bit 5: LOS_POL. Controls the output polarity of the LOS pin.

0 = inverse

1 = normal

Bit 4: RX_POL. Controls the polarity of the receiver signal path.

0 = inverse

1 = normal

Bit 3: SQ_EN. When SQ_EN = 1, the LOS controls the output circuitry.

0 = disabled

1 = enabled

1.0625Gbps to 10.32Gbps, Integrated, Low-Power SFP+ Limiting Amplifier and VCSEL Driver

Bit 2: RX_EN. Enables or disables the receive circuitry.

- 0 = disabled
- 1 = enabled

Bit 1: RXDE_EN. Enables or disables the deemphasis on the receiver output.

- 0 = disabled
- 1 = enabled

Bit 0: AZ_EN. Enables or disables the autozero circuitry. When RX_EN is set to 0, the autozero circuitry is also disabled.

- 0 = disabled
- 1 = enabled

Receiver Status Register (RXSTAT)

| Bit # | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 (STICKY) | ADDRESS |
|---------------|---|---|---|---|---|---|---|---------------|---------|
| Name | X | X | X | X | X | X | X | LOS | H0x02 |
| Default Value | X | X | X | X | X | X | X | X | |

Bit 0: LOS. Copy of the LOS output circuitry. This is a sticky bit, which means that it is cleared on a read. The first 0-to-1 transition gets latched until the bit is read by the master or POR occurs.

Output CML Level Setting Register (SET_CML)

| Bit # | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | ADDRESS |
|---------------|---------------------|------------|------------|------------|------------|------------|------------|---------------------|---------|
| Name | SET_CML[7] (MSB) | SET_CML[6] | SET_CML[5] | SET_CML[4] | SET_CML[3] | SET_CML[2] | SET_CML[1] | SET_CML[0] (LSB) | H0x03 |
| Default Value | 0 | 1 | 0 | 1 | 0 | 0 | 1 | 1 | |

Bits 7 to 0: SET_CML[7:0]. The SET_CML register is an 8-bit register that can be set to range from 0 to 255, corresponding from 40mV_{P-P} to 1200mV_{P-P}. See the *Typical Operating Characteristics* section for a typical CML output voltage vs. DAC code graph.

LOS Threshold Level Setting Register (SET_LOS)

| Bit # | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | ADDRESS |
|---------------|---|---|---------------------|------------|------------|------------|------------|---------------------|---------|
| Name | X | X | SET_LOS[5] (MSB) | SET_LOS[4] | SET_LOS[3] | SET_LOS[2] | SET_LOS[1] | SET_LOS[0] (LSB) | H0x04 |
| Default Value | X | X | 0 | 0 | 1 | 1 | 0 | 0 | |

Bits 5 to 0: SET_LOS[5:0]. The SET_LOS register is a 6-bit register used to program the LOS threshold. See the *Typical Operating Characteristics* section for a typical LOS threshold voltage vs. DAC code graph.

1.0625Gbps to 10.32Gbps, Integrated, Low-Power SFP+ Limiting Amplifier and VCSEL Driver

Transmitter Control Register (TXCTRL)

| Bit # | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | ADDRESS |
|---------------|---|---|---|---|---------|---------|--------|-------|---------|
| Name | X | X | X | X | TXDE_EN | SOFTRES | TX_POL | TX_EN | H0x05 |
| Default Value | X | X | X | X | 0 | 0 | 1 | 1 | |

Bit 3: TXDE_EN. Enables or disables the transmit output deemphasis circuitry.

0 = disabled

1 = enabled

Bit 2: SOFTRES. Resets all registers to their default values.

0 = normal

1 = reset

Bit 1: TX_POL. Controls the polarity of the transmit signal path.

0 = inverse

1 = normal

Bit 0: TX_EN. Enables or disables the transmit circuitry.

0 = disabled

1 = enabled

Transmitter Status Register 1 (TXSTAT1)

| Bit # | 7 (STICKY) | 6 (STICKY) | 5 (STICKY) | 4 (STICKY) | 3 (STICKY) | 2 (STICKY) | 1 (STICKY) | 0 (STICKY) | ADDRESS |
|---------------|---------------|---------------|---------------|---------------|---------------|---------------|---------------|---------------|---------|
| Name | FST[7] | FST[6] | FST[5] | FST[4] | FST[3] | FST[2] | FST[1] | TX_FAULT | H0x06 |
| Default Value | X | X | X | X | X | X | X | X | |

Bit 7: FST[7]. When the V_{CC1} supply voltage is below 2.45V, the POR circuitry reports a FAULT. Once the V_{CC1} supply voltage is above 2.55V, the POR resets all registers to their default values and the FAULT is cleared.

Bit 6: FST[6]. When the voltage at BMON is above $V_{CC} - 0.55V$, a SOFT FAULT is reported.

Bit 5: FST[5]. When the voltage at MMAX goes below $V_{CC} - 0.65V$, a HARD FAULT is reported.

Bit 4: FST[4]. When the voltage at BMAX goes below $V_{CC} - 0.65V$, a HARD FAULT is reported.

Bit 3: FST[3]. When the common-mode voltage at $V_{TOUT+/-}$ goes below 1.5V, a SOFT FAULT is reported.

Bit 2: FST[2]. When the voltage at $V_{TOUT+/-}$ goes below 0.8V, a HARD FAULT is reported.

Bit 1: FST[1]. When the BIAS voltage goes below 0.44V, a HARD FAULT is reported.

Bit 0: TX_FAULT. Copy of a FAULT signal in FST[7] to FST[1]. A POR resets FST[7:1] to 0.

Transmitter Status Register 2 (TXSTAT2)

| Bit # | 7 | 6 | 5 | 4 | 3 (STICKY) | 2 (STICKY) | 1 (STICKY) | 0 (STICKY) | ADDRESS |
|---------------|---|---|---|---|---------------|---------------|---------------|---------------|---------|
| Name | X | X | X | X | IMODERR | IBIASERR | TXED | X | H0x07 |
| Default Value | X | X | X | X | X | X | X | X | |

Bit 3: IMODERR. When the modulation-incremented result is greater than IMODMAX, a SOFT FAULT is reported. (See the *Programming Modulation Current* section.)

1.0625Gbps to 10.32Gbps, Integrated, Low-Power SFP+ Limiting Amplifier and VCSEL Driver

Bit 2: IBIASERR. When the bias incremented result is greater than IBIASMAX, then a SOFT FAULT is reported. (See the *Programming Bias Current* section.)

Bit 1: TXED. This only indicates the absence of an AC signal at the transmit input. This is not an LOS indicator.

Bias Current Setting Register (SET_IBIAS)

| Bit # | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | ADDRESS |
|---------------|---------------------|---------------|---------------|---------------|---------------|---------------|---------------|---------------|---------|
| Name | SET_IBIAS [8] (MSB) | SET_IBIAS [7] | SET_IBIAS [6] | SET_IBIAS [5] | SET_IBIAS [4] | SET_IBIAS [3] | SET_IBIAS [2] | SET_IBIAS [1] | H0x08 |
| Default Value | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | |

Bits 7 to 0: SET_IBIAS[8:1]. The bias current DAC is controlled by a total of 9 bits. The SET_IBIAS[8:1] bits are used to set the bias current with even denominations from 0 to 510 bits. The LSB (SET_IBIAS[0]) bit is controlled by the BIASINC register and is used to set the odd denominations in the SET_IBIAS[8:0].

Modulation Current Setting Register (SET_IMOD)

| Bit # | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | ADDRESS |
|---------------|--------------------|--------------|--------------|--------------|--------------|--------------|--------------|--------------|---------|
| Name | SET_IMOD [8] (MSB) | SET_IMOD [7] | SET_IMOD [6] | SET_IMOD [5] | SET_IMOD [4] | SET_IMOD [3] | SET_IMOD [2] | SET_IMOD [1] | H0x09 |
| Default Value | 0 | 0 | 0 | 1 | 0 | 0 | 1 | 0 | |

Bits 7 to 0: SET_IMOD[8:1]. The modulation current DAC is controlled by a total of 9 bits. The SET_IMOD[8:1] bits are used to set the modulation current with even denominations from 0 to 510 bits. The LSB (SET_IMOD[0]) bit is controlled by the MODINC register and is used to set the odd denominations in the SET_IMOD[8:0].

Maximum Modulation Current Setting Register (IMODMAX)

| Bit # | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | ADDRESS |
|---------------|-------------------|-------------|-------------|-------------|-------------|-------------|-------------|-------------------|---------|
| Name | IMODMAX [7] (MSB) | IMODMAX [6] | IMODMAX [5] | IMODMAX [4] | IMODMAX [3] | IMODMAX [2] | IMODMAX [1] | IMODMAX [0] (LSB) | H0x0A |
| Default Value | 0 | 0 | 1 | 1 | 0 | 0 | 0 | 0 | |

Bits 7 to 0: IMODMAX[7:0]. The IMODMAX register is an 8-bit register that can be used to limit the maximum modulation current. IMODMAX[7:0] is continuously compared to the SET_IMOD[8:1].

Maximum Bias Current Setting Register (IBIASMAX)

| Bit # | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | ADDRESS |
|---------------|--------------------|--------------|--------------|--------------|--------------|--------------|--------------|--------------------|---------|
| Name | IBIASMAX [7] (MSB) | IBIASMAX [6] | IBIASMAX [5] | IBIASMAX [4] | IBIASMAX [3] | IBIASMAX [2] | IBIASMAX [1] | IBIASMAX [0] (LSB) | H0x0B |
| Default Value | 0 | 0 | 0 | 1 | 0 | 0 | 1 | 0 | |

Bits 7 to 0: IBIASMAX[7:0]. The IBIASMAX register is an 8-bit register that can be used to limit the maximum bias current. IBIASMAX[7:0] is continuously compared to the SET_IBIAS[8:1].

1.0625Gbps to 10.32Gbps, Integrated, Low-Power SFP+ Limiting Amplifier and VCSEL Driver

Modulation Current Increment Setting Register (MODINC)

| Bit # | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | ADDRESS |
|---------------|-------------|---|--------|-----------------|-----------|-----------|-----------|-----------------|---------|
| Name | SET_IMOD[0] | X | DE_INC | MODINC[4] (MSB) | MODINC[3] | MODINC[2] | MODINC[1] | MODINC[0] (LSB) | H0x0C |
| Default Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | |

Bit 7: SET_IMOD[0]. This is the LSB of the SET_IMOD[8:0] bits. This bit can only be updated by the use of MODINC[4:0].

Bit 5: DE_INC. When this bit is set to 1 and the deemphasis on the transmit output is enabled, the SET_TXDE[3:0] is incremented or decremented by 1 LSB. The increment or decrement is determined by the sign bit of the MODINC[4:0] string of bits.

Bits 4 to 0: MODINC[4:0]. This string of bits is used to increment or decrement the modulation current. When written to, the SET_IMOD[8:0] bits are updated. MODINC[4:0] are a two's complement string.

Bias Current Increment Setting Register (BIASINC)

| Bit # | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | ADDRESS |
|---------------|--------------|---|---|------------------|------------|------------|------------|------------------|---------|
| Name | SET_IBIAS[0] | X | X | BIASINC[4] (MSB) | BIASINC[3] | BIASINC[2] | BIASINC[1] | BIASINC[0] (LSB) | H0x0D |
| Default Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | |

Bit 7: SET_IBIAS[0]. This is the LSB of the SET_IBIAS[8:0] bits. This bit can only be updated by the use of BIASINC[4:0].

Bits 4 to 0: BIASINC[4:0]. This string of bits is used to increment or decrement the bias current. When written to, the SET_IBIAS[8:0] bits are updated. BIASINC[4:0] are a two's complement string.

Mode Control Register (MODECTRL)

| Bit # | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | ADDRESS |
|---------------|-------------------|-------------|-------------|-------------|-------------|-------------|-------------|-------------------|---------|
| Name | MODECTRL[7] (MSB) | MODECTRL[6] | MODECTRL[5] | MODECTRL[4] | MODECTRL[3] | MODECTRL[2] | MODECTRL[1] | MODECTRL[0] (LSB) | H0x0E |
| Default Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | |

Bits 7 to 0: MODECTRL[7:0]. The MODECTRL register enables a switch between normal and setup modes. The setup mode is achieved by setting this register to H0x12. MODECTRL must be updated before each write operation. Exceptions are MODINC and BIASINC, which can be updated in normal mode.

Transmitter Pulse-Width Control Register (SET_PWCTRL)

| Bit # | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | ADDRESS |
|---------------|---|---|---|---|---------------------|---------------|---------------|---------------------|---------|
| Name | X | X | X | X | SET_PWCTRL[3] (MSB) | SET_PWCTRL[2] | SET_PWCTRL[1] | SET_PWCTRL[0] (LSB) | H0x0F |
| Default Value | X | X | X | X | 0 | 0 | 0 | 0 | |

Bits 3 to 0: SET_PWCTRL[3:0]. This is a 4-bit register used to control the eye crossing by adjusting the pulse width.

1.0625Gbps to 10.32Gbps, Integrated, Low-Power SFP+ Limiting Amplifier and VCSEL Driver

Transmitter Deemphasis Control Register (SET_TXDE)

| Bit # | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | ADDRESS |
|---------------|---|---|---|---|--------------------|--------------|--------------|--------------------|---------|
| Name | X | X | X | X | SET_TXDE [3] (MSB) | SET_TXDE [2] | SET_TXDE [1] | SET_TXDE [0] (LSB) | H0x10 |
| Default Value | X | X | X | X | 0 | 0 | 0 | 0 | |

Bits 3 to 0: SET_TXDE[3:0]. This is a 4-bit register used to control the amount of deemphasis on the transmitter output. When calculating the total modulation current, the amount of deemphasis must be taken into account. The deemphasis is set as a percentage of modulation current.

Design Procedure

Programming Bias Current

- 1) IBIASMAX[7:0] = Maximum_Bias_Current_Value
- 2) SET_IBIASi[8:1] = Initial_Bias_Current_Value

Note: The total bias current value is calculated using the SET_IBIAS[8:0] register. SET_IBIAS[8:1] are the bits that can be manually written. SET_IBIAS[0] can only be updated using the BIASINC[4:0] register.

When implementing an APC loop it is recommended to use the BIASINC[4:0] register, which guarantees the fastest bias current update.

- 3) BIASINCi[4:0] = New_Increment_Value
- 4) If (SET_IBIASi[8:1] ≤ IBIASMAX[7:0]),
then (SET_IBIASi[8:0] = SET_IBIASi-1[8:0] + BIASINCi[4:0])
- 5) Else (SET_IBIASi[8:0] = SET_IBIASi-1[8:0])

The total bias current can be calculated as follows:

$$6) I_{BIAS} = [SET_IBIAS_i[8:0] + 20] \times 40\mu A$$

Programming Modulation Current

- 1) IMODMAX[7:0] = Maximum_Modulation_Current_Value
- 2) SET_IMODi[8:1] = Initial_Modulation_Current_Value

Note: The total modulation current value is calculated using the SET_IMOD[8:0] register. SET_IMOD[8:1] are the bits that can be manually written. SET_IMOD[0] can only be updated using the MODINC[4:0] register.

When implementing modulation compensation, it is recommended to use the MODINC[4:0] register, which guarantees the fastest modulation current update.

- 3) MODINCi[4:0] = New_Increment_Value
- 4) If (SET_IMODi[8:1] ≤ IMODMAX[7:0]),
then (SET_IMODi[8:0] = SET_IMODi-1[8:0] + MODINCi[4:0])
- 5) Else (SET_IMODi[8:0] = SET_IMODi-1[8:0])

The following equation is valid with assumption of 100Ω on-chip and 100Ω external differential load (Rextd). The maximum value that can be set for SET_TXDE[3:0] = 11.

$$6) I_{MOD}(R_{extd}=100\Omega) = [(20 + SET_IMOD_i[8:0]) \times 40\mu A] \times \left[1 - \frac{2 + SET_TXDE[3:0]}{64} \right]$$

For general Rextd, the modulation current that is achieved using the same setting of SET_IMODi[8:0] as for Rextd = 100Ω is shown below. It can be written as a function of I_{MOD}(R_{extd}=100Ω), still assuming a 100Ω on-chip load.

$$7) I_{MOD}(R_{extd}) = 2 \times I_{MOD}(R_{extd}=100\Omega) \left[\frac{R_{ext}}{R_{ext} + 100} \right]$$

Programming LOS Threshold

$$LOSTH = (SET_LOS[5:0] \times 1.5mV_{P-P})$$

Programming Transmit Output Deemphasis

The TXDE_EN bit must be set to 1 to enable the deemphasis function. The SET_TXDE register value is used to set the amount of deemphasis, which is a percentage of the modulation current. Deemphasis percentage is determined as:

$$DE(\%) = \frac{100 \times (2 + SET_TXDE[3:0])}{64}$$

Where the maximum SET_TXDE[3:0] = 11.

For an I_{MOD} value of 10mA, the maximum achievable deemphasis value is approximately 20%. Maximum deemphasis achievable for full I_{MOD} range of 12mA is limited to 15%.

With deemphasis enabled, the value of the modulation current amplitude is reduced by the calculated deemphasis percentage. To maintain the modulation current amplitude constant, the SET_IMOD[8:0] register must be increased by the deemphasis percentage. If the system conditions like temperature, required I_{MOD} value, etc., change during the transmit operation, the deemphasis setting might need to be readjusted. For such an

1.0625Gbps to 10.32Gbps, Integrated, Low-Power SFP+ Limiting Amplifier and VCSEL Driver

impromptu deemphasis adjustment, it is recommended that the DE_INC (MODINC[5]) bit is used. Use of this bit increments or decrements the deemphasis code setting by 1 LSB based on the sign of increment in the MODINC[4:0] and, hence, the SET_IMOD[8:0] setting. This helps maintain the BER while having the flexibility to improve signal quality by adjusting deemphasis while the transmit operation continues. This feature enables glitchless deemphasis adjustment while maintaining excellent BER performance.

Programming Pulse-Width Control

The eye crossing at the Tx output can be adjusted using the SET_PWCTRL register. Table 6 shows these settings.

The sign of the number specifies the direction of pulse-width distortion. The code of 1111 corresponds to a balanced state for differential output. The pulse-width distortion is bidirectional around the balanced state (see the *Typical Operating Characteristics* section).

Table 6. Eye-Crossing Settings for SET_PWCTRL

| SET_PWCTRL[3:0] | PWD | SET_PWCTRL[3:0] | PWD |
|-----------------|-----|-----------------|-----|
| 1000 | -7 | 0111 | 8 |
| 1001 | -6 | 0110 | 7 |
| 1010 | -5 | 0101 | 6 |
| 1011 | -4 | 0100 | 5 |
| 1100 | -3 | 0011 | 4 |
| 1101 | -2 | 0010 | 3 |
| 1110 | -1 | 0001 | 2 |
| 1111 | 0 | 0000 | 1 |

Programming CML Output Settings

Amplitude of the CML output stage is controlled by an 8-bit DAC register (SET_CML). The differential output amplitude range is from 40mV_{P-P} up to 1200mV_{P-P} with 4.6mV_{P-P} resolution (assuming an ideal 100Ω differential load).

$$\text{Output Voltage } R_{OUT} \text{ (mV}_{P-P}\text{)} = 40 + 4.55 (\text{SET_CML})$$

Select the Coupling Capacitor

For AC-coupling, the coupling capacitors C_{IN} and C_{OUT} should be selected to minimize the receiver's

deterministic jitter. Jitter is decreased as the input low-frequency cutoff (f_{IN}) is decreased.

$$f_{IN} = 1/[2\pi(50)(C_{IN})]$$

The recommended C_{IN} and C_{OUT} is 0.1μF for the MAX3798.

Select the Offset-Correction Capacitor

The capacitor between CAZ1 and CAZ2 determines the time constant of the signal path DC-offset cancellation loop. To maintain stability, it is important to keep at least a one-decade separation between f_{IN} and the low-frequency cutoff (f_{OC}) associated with the DC-offset cancellation circuit. A 1nF capacitor between CAZ1 and CAZ2 is recommended for the MAX3798.

Applications Information

Layout Considerations

To minimize inductance, keep the connections between the MAX3798 output pins and laser diode as close as possible. Optimize the laser diode performance by placing a bypass capacitor as close as possible to the laser anode. Use good high-frequency layout techniques and multiple-layer boards with uninterrupted ground planes to minimize EMI and crosstalk.

Exposed-Pad Package

The exposed pad on the 32-pin TQFN provides a very low-thermal resistance path for heat removal from the IC. The pad is also electrical ground on the MAX3798 and must be soldered to the circuit board ground for proper thermal and electrical performance. Refer to Application Note 862: *HFAN-08.1: Thermal Considerations of QFN and Other Exposed-Paddle Packages* for additional information.

Laser Safety and IEC 825

Using the MAX3798 laser driver alone does not ensure that a transmitter design is compliant with IEC 825. The entire transmitter circuit and component selections must be considered. Each user must determine the level of fault tolerance required by the application, recognizing that Maxim products are neither designed nor authorized for use as components in systems intended for surgical implant into the body, for applications intended to support or sustain life, or for any other application in which the failure of a Maxim product could create a situation where personal injury or death could occur.

1.0625Gbps to 10.32Gbps, Integrated, Low-Power SFP+ Limiting Amplifier and VCSEL Driver

MAX3798

Table 7. Register Summary

| REGISTER FUNCTION/ ADDRESS | REGISTER NAME | NORMAL MODE | SETUP MODE | BIT NUMBER /TYPE | BIT NAME | DEFAULT VALUE | NOTES |
|--|---------------|-------------|------------|------------------|------------|---------------|---|
| Receiver Control Register 1 Address = H0x00 | RXCTRL1 | R | RW | 3 | CAZX | 1 | External autozero capacitor 0: disconnected, 1: connected |
| | | R | RW | 2 | GMEN | 1 | Mode-select switching time boost 0: off, 1: on |
| | | R | RW | 1 | MODE_SEL | 0 | Mode-select 0: high-gain mode, 1: high-bandwidth mode |
| | | R | RW | 0 | SLEW_RATE | 0 | Slew-rate select 0: slow mode, 1: fast mode |
| Receiver Control Register 2 Address = H0x01 | RXCTRL2 | R | RW | 6 | LOS_EN | 1 | LOS control 0: disable, 1: enable (always 0 when RX_EN = 0) |
| | | R | RW | 5 | LOS_POL | 1 | LOS polarity 0: inverse, 1: normal |
| | | R | RW | 4 | RX_POL | 1 | Rx polarity 0: inverse, 1: normal |

| | | R | RW | 1 | RXDE_EN | 0 | Rx deemphasis 0: disable, 1: enable |
| | | R | RW | 0 | AZ_EN | 1 | Rx autozero control 0: disable, 1: enable (always 0 when RX_EN = 0) |
| Receiver Status Register Address = H0x02 | RXSTAT | R | R | 0 (sticky) | LOS | X | Copy of LOS output signal |
| Output CML Level Setting Register Address = H0x03 | SET_CML | R | RW | 7 | SET_CML[7] | 0 | MSB output level DAC |
| | | R | RW | 6 | SET_CML[6] | 1 | |
| | | R | RW | 5 | SET_CML[5] | 0 | |
| | | R | RW | 4 | SET_CML[4] | 1 | |
| | | R | RW | 3 | SET_CML[3] | 0 | |
| | | R | RW | 2 | SET_CML[2] | 0 | |
| | | R | RW | 1 | SET_CML[1] | 1 | |
| | | R | RW | 0 | SET_CML[0] | 1 | LSB output level DAC |

1.0625Gbps to 10.32Gbps, Integrated, Low-Power SFP+ Limiting Amplifier and VCSEL Driver

Table 7. Register Summary (continued)

| REGISTER FUNCTION/ ADDRESS | REGISTER NAME | NORMAL MODE | SETUP MODE | BIT NUMBER /TYPE | BIT NAME | DEFAULT VALUE | NOTES |
|--|---------------|-------------|------------|------------------|------------|---------------|---|
| LOS Threshold Level Setting Register Address = H0x04 | SET_LOS | R | RW | 5 | SET_LOS[5] | 0 | MSB LOS threshold DAC |
| | | R | RW | 4 | SET_LOS[4] | 0 | |
| | | R | RW | 3 | SET_LOS[3] | 1 | |
| | | R | RW | 2 | SET_LOS[2] | 1 | |
| | | R | RW | 1 | SET_LOS[1] | 0 | |
| | | R | RW | 0 | SET_LOS[0] | 0 | LSB LOS threshold DAC |
| Transmitter Control Register Address = H0x05 | TXCTRL | R | RW | 3 | TXDE_EN | 0 | Tx deemphasis 0: disable, 1: enable |
| | | R | RW | 2 | SOFTRES | 0 | Global digital reset |
| | | R | RW | 1 | TX_POL | 1 | Tx polarity 0: inverse, 1: normal |
| | | R | RW | 0 | TX_EN | 1 | Tx control 0: disable, 1: enable |
| Transmitter Status Register 1 Address = H0x06 | TXSTAT1 | R | R | 7 (sticky) | FST[7] | X | TX_POR → TX_VCC low-limit violation |
| | | R | R | 6 (sticky) | FST[6] | X | BMON open/shorted to VCC |
| | | R | R | 5 (sticky) | FST[5] | X | MMA current exceeded or open/shorted to GND |
| | | R | R | 4 (sticky) | FST[4] | X | BMA current exceeded or open/shorted to GND |
| | | R | R | 3 (sticky) | FST[3] | X | V _{TOUT+/-} common-mode low-limit violation |
| | | R | R | 2 (sticky) | FST[2] | X | V _{TOUT+/-} low-limit violation |
| | | R | R | 1 (sticky) | FST[1] | X | BIAS open or shorted to GND |
| | | R | R | 0 (sticky) | TX_FAULT | X | Copy of FAULT signal in case POR bits 6 to 1 reset to 0 |
| Transmitter Status Register 2 Address = H0x07 | TXSTAT2 | R | R | 3 (sticky) | IMODERR | X | Warning increment result > IMODMAX |
| | | R | R | 2 (sticky) | IBIASERR | X | Warning increment result > IBIASMAX |
| | | R | R | 1 (sticky) | TXED | X | Tx edge detection |
| | | R | R | 0 (sticky) | Unused | X | Unused |

1.0625Gbps to 10.32Gbps, Integrated, Low-Power SFP+ Limiting Amplifier and VCSEL Driver

Table 7. Register Summary (continued)

| REGISTER FUNCTION/ ADDRESS | REGISTER NAME | NORMAL MODE | SETUP MODE | BIT NUMBER /TYPE | BIT NAME | DEFAULT VALUE | NOTES |
|---|---------------|----------------------------------|------------|------------------|--------------|---------------|----------------------|
| Bias Current Setting Register Address = H0x08 | SET_IBIAS | R | RW | 8 | SET_IBIAS[8] | 0 | MSB bias DAC |
| | | R | RW | 7 | SET_IBIAS[7] | 0 | |
| | | R | RW | 6 | SET_IBIAS[6] | 0 | |
| | | R | RW | 5 | SET_IBIAS[5] | 0 | |

| | | R | RW | 3 | SET_IBIAS[3] | 1 | |
| | | R | RW | 2 | SET_IBIAS[2] | 0 | |
| | | R | RW | 1 | SET_IBIAS[1] | 0 | |
| | | Accessible through REG_ADDR = 13 | | 0 | SET_IBIAS[0] | 0 | LSB bias DAC |
| Modulation Current Setting Register Address = H0x09 | SET_IMOD | R | RW | 8 | SET_IMOD[8] | 0 | MSB modulation DAC |
| | | R | RW | 7 | SET_IMOD[7] | 0 | |
| | | R | RW | 6 | SET_IMOD[6] | 0 | |
| | | R | RW | 5 | SET_IMOD[5] | 1 | |
| | | R | RW | 4 | SET_IMOD[4] | 0 | |
| | | R | RW | 3 | SET_IMOD[3] | 0 | |
| | | R | RW | 2 | SET_IMOD[2] | 1 | |
| | | R | RW | 1 | SET_IMOD[1] | 0 | |
| | | Accessible through REG_ADDR = 12 | | 0 | SET_IMOD[0] | 0 | LSB modulation DAC |
| Maximum Modulation Current Setting Register Address = H0x0A | IMODMAX | R | RW | 7 | IMODMAX[7] | 0 | MSB modulation limit |
| | | R | RW | 6 | IMODMAX[6] | 0 | |
| | | R | RW | 5 | IMODMAX[5] | 1 | |
| | | R | RW | 4 | IMODMAX[4] | 1 | |
| | | R | RW | 3 | IMODMAX[3] | 0 | |
| | | R | RW | 2 | IMODMAX[2] | 0 | |
| | | R | RW | 1 | IMODMAX[1] | 0 | |
| | | R | RW | 0 | IMODMAX[0] | 0 | LSB modulation limit |
| Maximum Bias Current Setting Register Address = H0x0B | IBIASMAX | R | RW | 7 | IBIASMAX[7] | 0 | MSB bias limit |
| | | R | RW | 6 | IBIASMAX[6] | 0 | |
| | | R | RW | 5 | IBIASMAX[5] | 0 | |
| | | R | RW | 4 | IBIASMAX[4] | 1 | |
| | | R | RW | 3 | IBIASMAX[3] | 0 | |
| | | R | RW | 2 | IBIASMAX[2] | 0 | |
| | | R | RW | 1 | IBIASMAX[1] | 1 | |
| | | R | RW | 0 | IBIASMAX[0] | 0 | LSB bias limit |

1.0625Gbps to 10.32Gbps, Integrated, Low-Power SFP+ Limiting Amplifier and VCSEL Driver

Table 7. Register Summary (continued)

| REGISTER FUNCTION/ ADDRESS | REGISTER NAME | NORMAL MODE | SETUP MODE | BIT NUMBER /TYPE | BIT NAME | DEFAULT VALUE | NOTES |
|---|---------------|-------------|------------|------------------|---------------|---------------|---|
| Modulation Current Increment Setting Register Address = H0x0C | MODINC | R | R | 7 | SET_IMOD[0] | 0 | LSB of SET_IMOD DAC register address = H0x09 |
| | | R | R | 6 | X | 0 | |
| | | R | R | 5 | DE_INC | 0 | Deemphasis increment 0: no update, 1: SET_TXDE updates ± 1 LSB |
| | | RW | RW | 4 | MODINC[4] | 0 | MSB MOD DAC two's complement |
| | | RW | RW | 3 | MODINC[3] | 0 | |
| | | RW | RW | 2 | MODINC[2] | 0 | |
| | | RW | RW | 1 | MODINC[1] | 0 | |
| Bias Current Increment Setting Register Address = H0x0D | BIASINC | R | R | 7 | SET_IBIAS[0] | 0 | LSB of SET_IBIAS DAC register address = H0x08 |
| | | R | R | 6 | X | 0 | |
| | | R | R | 5 | X | 0 | |
| | | RW | RW | 4 | BIASINC[4] | 0 | MSB bias DAC two's complement |
| | | RW | RW | 3 | BIASINC[3] | 0 | |
| | | RW | RW | 2 | BIASINC[2] | 0 | |
| | | RW | RW | 1 | BIASINC[1] | 0 | |
| Mode Control Register Address = H0x0E | MODECTRL | RW | RW | 7 | MODECTRL[7] | 0 | MSB mode control |
| | | RW | RW | 6 | MODECTRL[6] | 0 | |
| | | RW | RW | 5 | MODECTRL[5] | 0 | |
| | | RW | RW | 4 | MODECTRL[4] | 0 | |
| | | RW | RW | 3 | MODECTRL[3] | 0 | |
| | | RW | RW | 2 | MODECTRL[2] | 0 | |
| | | RW | RW | 1 | MODECTRL[1] | 0 | |
| Transmitter Pulse-Width Control Register Address = H0x0F | SET_PWCTRL | R | RW | 3 | SET_PWCTRL[3] | 0 | MSB Tx pulse-width control |
| | | R | RW | 2 | SET_PWCTRL[2] | 0 | |
| | | R | RW | 1 | SET_PWCTRL[1] | 0 | |
| | | R | RW | 0 | SET_PWCTRL[0] | 0 | LSB Tx pulse-width control |
| Transmitter Deemphasis Control Register Address = H0x10 | SET_TXDE | R | RW | 3 | SET_TXDE[3] | 0 | MSB Tx deemphasis |
| | | R | RW | 2 | SET_TXDE[2] | 0 | |
| | | R | RW | 1 | SET_TXDE[1] | 0 | |
| | | R | RW | 0 | SET_TXDE[0] | 0 | LSB Tx deemphasis |

1.0625Gbps to 10.32Gbps, Integrated, Low-Power SFP+ Limiting Amplifier and VCSEL Driver

Figure 5. Simplified I/O Structures

1.0625Gbps to 10.32Gbps, Integrated, Low-Power SFP+ Limiting Amplifier and VCSEL Driver

Typical Application Circuit

1.0625Gbps to 10.32Gbps, Integrated, Low-Power SFP+ Limiting Amplifier and VCSEL Driver

MAX3798

Pin Configuration

Chip Information

PROCESS: SiGe BiPOLAR

Package Information

For the latest package outline information and land patterns, go to www.maxim-ic.com/packages.

| PACKAGE TYPE | PACKAGE CODE | DOCUMENT NO. |
|--------------|--------------|-------------------------|
| 32 TQFN-EP | T3255+3 | 21-0140 |

Maxim cannot assume responsibility for use of any circuitry other than circuitry entirely embodied in a Maxim product. No circuit patent licenses are implied. Maxim reserves the right to change the circuitry and specifications without notice at any time.

Maxim Integrated Products, 120 San Gabriel Drive, Sunnyvale, CA 94086 408-737-7600 35

Данный компонент на территории Российской Федерации

Вы можете приобрести в компании MosChip.

Для оперативного оформления запроса Вам необходимо перейти по данной ссылке:

<http://moschip.ru/get-element>

Вы можете разместить у нас заказ для любого Вашего проекта, будь то серийное производство или разработка единичного прибора.

В нашем ассортименте представлены ведущие мировые производители активных и пассивных электронных компонентов.

Нашей специализацией является поставка электронной компонентной базы двойного назначения, продукции таких производителей как XILINX, Intel (ex.ALTERA), Vicor, Microchip, Texas Instruments, Analog Devices, Mini-Circuits, Amphenol, Glenair.

Сотрудничество с глобальными дистрибьюторами электронных компонентов, предоставляет возможность заказывать и получать с международных складов практически любой перечень компонентов в оптимальные для Вас сроки.

На всех этапах разработки и производства наши партнеры могут получить квалифицированную поддержку опытных инженеров.

Система менеджмента качества компании отвечает требованиям в соответствии с ГОСТ Р ИСО 9001, ГОСТ РВ 0015-002 и ЭС РД 009

Офис по работе с юридическими лицами:
