

# Type EDL , Electric Double Layer Supercapacitors

## Ultra High Capacitance, Small Case Size Options

Type EDL electric double layer supercapacitors offer extremely high capacitance values (farads) in a variety of packaging options that will satisfy, low profile, surface mount, through hole and high density assembly requirements. The EDL is a cut above the standard electrolytic capacitor in that it can act as a battery without having to deal with the environmental or hazardous material issues that batteries entail.

### Highlights

- Unlimited charging and discharging capability
- Recycling is not necessary
- Long Life - 15 years
- Low ESR
- Will extend battery life up to 1.6 times
- First class performance with economy pricing

### Specifications

|                             |                    |
|-----------------------------|--------------------|
| Operating Temperature Range | -25 °C to +85 °C   |
| Rated Voltage Range         | 2.1 Vdc to 5.5 Vdc |
| Capacitance Range           | 0.022 F to 70 F    |

### How To Select an Electric Double Layer Capacitor

| Estimated Initial Backup Time                                  | Back-up time for Type EDL Electric Double Layer Supercapacitors decreases with use and over time especially when the current is large or operating at high temperature. Be sure to specify extra back-up time initially to allow for product changes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |                 |                                       |                |              |  |  |         |                 |                 |                |              |            |        |        |      |   |   |   |        |        |        |   |   |    |   |       |   |   |   |    |   |   |   |        |     |

| Back Up Time Example                                           | <p>Back-up time is the time it takes for the applied voltage to decay to the cut-off voltage set by the user after applying the application’s maximum voltage at application maximum temperature.</p> <p>Example: An F Type EDL, P/N EDLF105B5R5C (Rated at 5.5 V, 1.0 F) is charged to 5.0 Vdc. The circuit requirement is such that it must maintain a memory circuit with a current drain of 10 μA in an ambient temperature of +40 °C. The memory RTC cut-off voltage is 2.0 Vdc. Using minimum capacitance, calculate the back-up time as follows:</p> $t = C\Delta V / I = C[V_0 - (i \cdot R) - V_1] / (i + i_L)$ $C = 1.0 \text{ F} - 20\% = 0.8 \text{ F}, R = 50 \Omega, V_0 = 5 \text{ V}, V_1 = 2 \text{ V}, i = 10 \mu\text{A}$ <p>Therefore,</p> $t = 0.8 (5 - 0.0005 - 2) / ((10 + 2) \times 10^{-6}) = 55 \text{ hours}$ <p>And thus the initial back-up time is 55 hours. After 1000 hours, calculate the back-up time will drop to about 38 hours.</p> <p>t: Back-up time (s)<br/>C: Capacitance of Type EDL (F)<br/>V<sub>0</sub>: Applied voltage (V)<br/>V<sub>1</sub>: Cut-off voltage (V)<br/>i: Current during back-up (A)<br/>i<sub>L</sub>: Leakage current (A)<br/>R: Internal resistance (Ω) at 1 kHz</p> |                 |                                       |                |              |  |  |         |                 |                 |                |              |            |        |        |      |   |   |   |        |        |        |   |   |    |   |       |   |   |   |    |   |   |   |        |     |

# Type EDL , Electric Double Layer Supercapacitors

## Ultra High Capacitance, Small Case Size Options

|                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Life Design           | <p>Type EDL supercapacitors have a useful lifetime that decreases with increasing operating temperature, humidity, applied-voltage, current and backup-time requirements.</p> <p>Expected lifetime is the product of four factors:</p> <p>Expected Life = (Lifetime)•(Temperature Factor)•(Voltage Factor)•(Moisture Factor)</p>                                                                                                                                                      |
| Lifetime              | The minimum rated life at 85 °C with 5.5 Vdc applied is 1000 hours with maximum permitted end-of-life capacitance change of –30% and a 4 times increase in internal resistance.                                                                                                                                                                                                                                                                                                       |
| Temperature Factor    | To determine the effect of temperature on expected life of a supercapacitor, use the fact that expected lifetime doubles for each 10 °C that the operating temperature is reduced. As an illustration, at 85 °C and full voltage the rated lifetime is 1000 hours. So, at 40 °C the expected lifetime would be multiplied by $2^{(85-40)/10} = 2^{4.5} = 22.6$ times. The Temperature Factor is 22.6, and for 1000-h, 85 °C rated life, the expected 40 °C life would be 22600 hours. |
| Voltage Factor        | The rate of change of capacitance decreases with decreasing applied voltage. The effect on life extension is roughly proportional to the voltage derating, e.g., 5 V applied to 5.5 V rated supercapacitors extends the life 1.1 times.                                                                                                                                                                                                                                               |
| Moisture Factor       | Expected life of these supercapacitors is considerably shortened by operation in high humidity. The applications discussed here assume that the relative humidity is no more than 50%.                                                                                                                                                                                                                                                                                                |
| Expected Life Example | <p>So, for a 5.5 V supercapacitor at 40 °C charged to 5.V in less than 50% RH the expected life is:</p> <p>Expected Life = (Lifetime) (Temperature Factor) (Voltage Factor) (Moisture Factor)</p> <p>= (1000 h) (22.6) (1.1) (1)</p> <p>= 24800 hours</p> <p>= 2.8 years</p>                                                                                                                                                                                                          |
| RoHS Compliant        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

# Type EDL , Electric Double Layer Supercapacitors

## Outline Drawing and Dimensions

### Style HW 70° C\* Radial Lead

Dimensions in mm (not to scale)

| D    | P   |
|------|-----|
| 12.5 | 5   |
| 18   | 7.5 |

\* 30, 50, 70 F : +60 °C

### Style F 85° C Stacked Coin

| Case code | Size |     |
|-----------|------|-----|
|           | D    | L   |
| A         | 13.5 | 9.5 |
| B         | 21.5 | 9.5 |

### Style NF 70° C Stacked Coin

| Case code | Size |     |
|-----------|------|-----|
|           | D    | L   |
| A         | 13.5 | 7.5 |
| B         | 21.5 | 8.0 |

### Style SG 70° C Stacked Coin

Terminal V

Terminal H

# Type EDL , Electric Double Layer Supercapacitors

## Outline Drawing and Dimensions

### Style SD 70 °C Stacked Coin

### Style EN -10 to +60 °C Surface Mount

#### Notes:

- 1 - Style EN is packaged on 24 mm wide tape and a 330 mm dia. reel, with 2000 pieces per reel.
- 2 - Only Style EN is capable of reflow soldering. Peak reflow soldering temperature is 250 °C for a maximum of 5 seconds, with a maximum of 30 seconds at or above 220 °C.
- 3 - Do not reflow solder when the cell voltage is above 0.3 V.

# Type EDL , Electric Double Layer Supercapacitors

## Applications and Recommended Series

| Application                         | Function                            | Recommended Series | Component                                                                             |

# Type EDL , Electric Double Layer Supercapacitors

## Performance Data

### Self-Discharging Characteristics Versus Charging Time

Part number: EDLF105B5R5C (5.5 V 1.0 F) Charge voltage: 5V

### Charging Characteristics

Part number: EDLF105B5R5C (5.5 V 1.0 F) @ +20 °C

## Данный компонент на территории Российской Федерации

**Вы можете приобрести в компании MosChip.**

Для оперативного оформления запроса Вам необходимо перейти по данной ссылке:

<http://moschip.ru/get-element>

Вы можете разместить у нас заказ для любого Вашего проекта, будь то серийное производство или разработка единичного прибора.

В нашем ассортименте представлены ведущие мировые производители активных и пассивных электронных компонентов.

Нашей специализацией является поставка электронной компонентной базы двойного назначения, продукции таких производителей как XILINX, Intel (ex.ALTERA), Vicor, Microchip, Texas Instruments, Analog Devices, Mini-Circuits, Amphenol, Glenair.

Сотрудничество с глобальными дистрибьюторами электронных компонентов, предоставляет возможность заказывать и получать с международных складов практически любой перечень компонентов в оптимальные для Вас сроки.

На всех этапах разработки и производства наши партнеры могут получить квалифицированную поддержку опытных инженеров.

Система менеджмента качества компании отвечает требованиям в соответствии с ГОСТ Р ИСО 9001, ГОСТ РВ 0015-002 и ЭС РД 009
