Please note: As part of the Fairchild Semiconductor integration, some of the Fairchild orderable part numbers will need to change in order to meet ON Semiconductor's system requirements. Since the ON Semiconductor product management systems do not have the ability to manage part nomenclature that utilizes an underscore (_), the underscore (_) in the Fairchild part numbers will be changed to a dash (-). This document may contain device numbers with an underscore (_). Please check the ON Semiconductor website to verify the updated device numbers. MM74HC125, MM74HC126
3-STATE Quad Buffers

Features

- Typical propagation delay: 13ns
- Wide operating voltage range: 2V–6V
- Low input current: 1µA maximum
- Low quiescent current: 80µA maximum (74HC)
- Fanout of 15 LS-TTL loads

General Description

The MM74HC125 and MM74HC126 are general purpose 3-STATE high speed non-inverting buffers utilizing advanced silicon-gate CMOS technology. They have high drive current outputs which enable high speed operation even when driving large bus capacitances. These circuits possess the low power dissipation of CMOS circuitry, yet have speeds comparable to low power Schottky TTL circuits. Both circuits are capable of driving up to 15 low power Schottky inputs.

The MM74HC125 require the 3-STATE control input C to be taken high to put the output into the high impedance condition, whereas the MM74HC126 require the control input to be low to put the output into high impedance.

All inputs are protected from damage due to static discharge by diodes to V_{CC} and ground.

Absolute Maximum Ratings[1]

Stresses exceeding the absolute maximum ratings may damage the device. The device may not function or be operable above the recommended operating conditions and stressing the parts to these levels is not recommended. In addition, extended exposure to stresses above the recommended operating conditions may affect device reliability. The absolute maximum ratings are stress ratings only.

Symbol	Parameter	Rating
V_{CC}	Supply Voltage	−0.5 to +7.0V
V_{IN}	DC Input Voltage	−1.5 to V_{CC}+1.5V
V_{OUT}	DC Output Voltage	−0.5 to V_{CC}+0.5V
I_{IK}, I_{OK}	Clamp Diode Current	±20mA
I_{OUT}	DC Output Current, per pin	35mA
I_{CC}	DC V_{CC} or GND Current, per pin	±70mA
T_{STG}	Storage Temperature Range	−65°C to +150°C
P_D	Power Dissipation Note 2	600mW
	S.O. Package only	500mW
T_L	Lead Temperature (Soldering 10 seconds)	260°C

Notes:

1. Unless otherwise specified all voltages are referenced to ground.

2. Power Dissipation temperature derating — plastic "N" package: −12mW/°C from 65°C to 85°C.

Recommended Operating Conditions

The Recommended Operating Conditions table defines the conditions for actual device operation. Recommended operating conditions are specified to ensure optimal performance to the datasheet specifications. Fairchild does not recommend exceeding them or designing to absolute maximum ratings.

Symbol	Parameter	Min.	Max.	Units
V_{CC}	Supply Voltage	2	6	V
V_{IN}, V_{OUT}	DC Input or Output Voltage	0	V_{CC}	V
T_A	Operating Temperature Range	−40	+85	°C

	V_{CC} = 4.5V		500	ns
	V_{CC} = 6.0V		400	ns

I$_{CC}$	Maximum Quiescent Supply Current	V$_{IN}$ = V$_{CC}$ or GND, I$_{OUT}$ = 0µA	6.0		8.0	80	160	µA

Note:

3. For a power supply of 5V ±10% the worst case output voltages (V$_{OH}$, and V$_{OL}$) occur for HC at 4.5V. Thus the 4.5V values should be used when designing with this supply. Worst case V$_{IH}$ and V$_{IL}$ occur at V$_{CC}$=5.5V and 4.5V respectively. (The V$_{IH}$ value at 5.5V is 3.85V.) The worst case leakage current (I$_{IN}$, I$_{CC}$, and I$_{OZ}$) occur for CMOS at the higher voltage and so the 6.0V values should be used.
