

14A Active EMI Filter SIP for 48 Vdc Bus

Description:

The QPI-21 active EMI filter attenuates conducted common-mode (CM) and differential-mode (DM) noise over the CISPR22 frequency range of 150 kHz to 30 MHz. The product is designed for use in 48 Vdc bus (36 – 76 Vdc) systems, with 100 Vdc surge capability. The QPI-21's 14A rating supports multiple DC-DC converter loads up to an ambient temperature of 65°C without de-rating. Designed for the telecom and ITE bus range, the QPI-21 supports the PICMG® 3.0 specification for filtering system boards to the EN55022 Class B limits.

In comparison to passive solutions, the use of active filtering reduces component size and therefore reduces the overall package size. The Picor QPI-21 smaller size saves valuable board real estate and the reduced height enhances airflow in blade applications.

The QPI-21 is available as a lidded or an open-frame SiP (System-in-Package) with LGA mounting. Evaluation boards are available to allow for quick in-circuit testing of the QPI-21LZ within an existing system design.

Figure 1 - QPI-21LZ
(~1 in² area)

Features:

- 45 dB CM attenuation at 250 KHz (50Ω)
- 80 dB DM attenuation at 250 KHz (50Ω)
- 80 Vdc (max input)
- 100 Vdc surge 100 ms
- 1,500 Vdc hipot hold off to shield plane
- 14 A rating
- 25.3 x 25.3 x 5.0 mm Lidded SiP (System-in-Package)
- 24.9 x 24.9 x 4.4 mm Open-frame SiP
- Low profile LGA package
- -40° to +125°C Ambient temperature (see Figure 11)
- Efficiency >99%
- Connect in series for higher attenuation
- Pads for additional X filtering capacitance
- TÜV Certification ⁽¹⁾

Note 1: Certification is in process. Use of the CE mark for graphical purposes only in Figure 1

Applications

- ATCA blades
- Telecom base stations
- IBA & distributed power
- Network switches and routers
- Optical line-cards
- TD-SCMA wireless infrastructure
-

Typical Application:

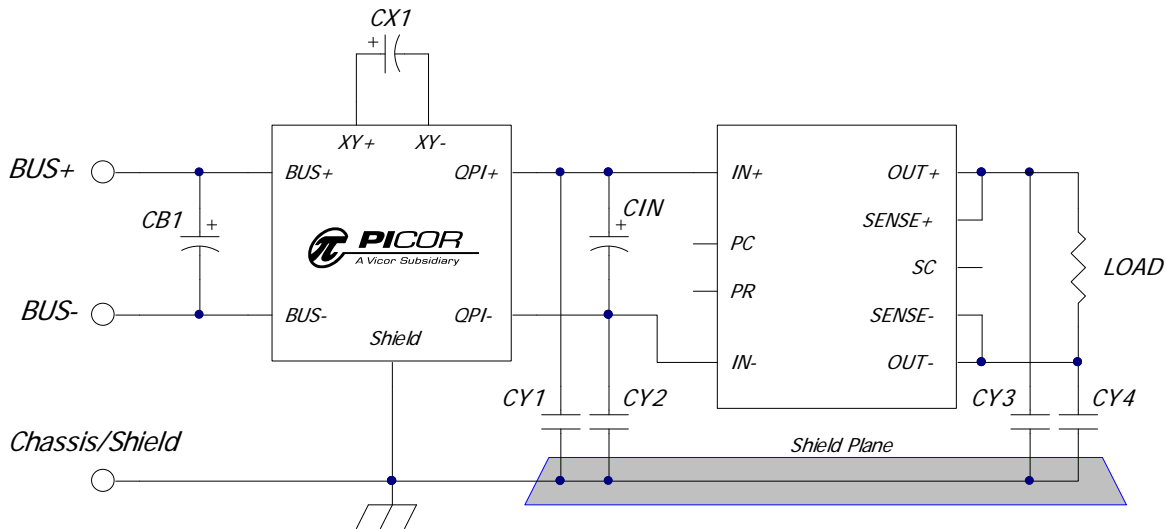

Figure 2 – Typical QPI-21 circuit with a Vicor brick converter. Optional X (CX1) filter capacitor shown. ⁽²⁾

Note 2: CB1, CX1 capacitors, referenced in all schematics, are a 47µF electrolytic; United Chemi-Con EMVE101ARA470MKE0S or equivalent.
CY1 to CY4, referenced in all schematics, are 4.7nF hi-voltage safety capacitors; Vishay VY1472M63Y5UQ63V0 or equivalent.
CIN is the converter manufacturer's recommended value for input capacitor.

Absolute Maximum Ratings – Exceeding these parameters may result in permanent damage to the product.

Input Voltage, BUS+ to BUS-, continuous	-80 to 80 Vdc
Input Voltage, BUS+ to BUS-, 100ms transient	-100 to 100 Vdc
BUS+/BUS- to Shield pads, hi-pot	-1500 to 1500 Vdc
Input to output current, continuous @ 25°C T _A	14 Adc
Input to output current, 10 seconds @ 25°C T _A	20 Adc
Power dissipation, @ 65°C T _A , 14 A ⁽³⁾	2.9 W
Operating temperature - T _A	-40 to 125 °C
Thermal resistance ⁽³⁾ - R _{θ-Av} using PCB layout in Figure 21	20 °C/W
Thermal resistance ⁽³⁾ - R _{θ-PCB}	8 °C/W
Storage temperature, JEDEC Standard J-STD-033B	-55 to 125 °C
Reflow temperature, 20 s exposure	245 °C
ESD, Human body model (HBM)	-2000 to 2000 V

Electrical Characteristics – Parameter limits apply over the operating temp. range, unless otherwise noted.

Parameter	Notes	Min	Typ	Max	Units
BUS+ to BUS- input range	Measured at 14 A, 65°C ambient temperature ⁽³⁾	30		80	Vdc
BUS+ to QPI+ voltage drop	Measured at 14 A, 65°C ambient temperature ⁽³⁾			156	mVdc
BUS- to QPI- voltage drop	Measured at 14 A, 65°C ambient temperature ⁽³⁾			50	mVdc
Common mode attenuation	VBUS = 48 V, Frequency = 250 KHz, line impedance = 50Ω		45		dB
Differential mode attenuation	VBUS = 48 V, Frequency = 250 KHz, line impedance = 50Ω		80		dB
Input bias current at 80 V	Input current from BUS+ to BUS-		8		mA

Note 3: See Figure 11 for the current de-rating curve.

Pad Descriptions

Pad Number	Name	Description	LGA Pattern (Top View)
12, 13, 14	BUS+	Positive bus potential	
1, 15, 16	BUS-	Negative bus potential	
7, 8, 9	QPI+	Positive input to the converter	
4, 5, 6	QPI-	Negative input to the converter	
2, 3	Shield	Shield connects to the system chassis or to a safety ground.	
10	XY-	Negative rail node for additional X filtering capacitance. Adding Y capacitors from this pin to ground is not recommended	
11	XY+	Positive rail node for additional X capacitance. Adding Y capacitors from this pin to ground is not recommended	

Ordering Information

Part Number	Description
QPI-21LZ ⁽⁴⁾	QPI-21 LGA Package, RoHS Compliant
QPI-21LZ-01	QPI-21 LGA Package, RoHS Compliant, Open Frame Package

Note 4: QPI-21LZ is a non-hermetically sealed package. Please read the “Post Solder Cleaning” section on page 12.

QPI-21 Evaluation Boards

Part #	Description:
QPI-21-CB1	A QPI-21LZ mounted on a carrier board designed for use with DOSA compliant footprint dc-dc converters. Screw terminal blocks to allow for easy connection into an existing system.

EMI Management

The more effectively EMI is managed at the source, namely the power converter, the less EMI attenuation will be required to meet a given standard. The addition of “Y” capacitors to the input and output power nodes of the converter will help to limit the amount of common mode EMI that will propagate to the input source.

“base-plate”. Figure 3 illustrates how a converters total conducted noise profile can vary with one topology versus another. The EMI generated by the “base-plate” configuration is much greater than that generated by the “open-frame” in this example. Selecting the right topology will greatly reduce the amount of EMI signal that needs to be filtered.

Figure 3 – An unfiltered converter’s response to “open-frame” (light blue) and “base-plate” (purple) EMI configurations.

Figure 2 shows the base-plate topology of re-circulating “Y” capacitors. Here, CY1 to CY4 are connected to each power node of the dc-dc converter, and then are connected together on a copper shield plane created under the converter. The addition of the copper shield plane helps in the containment of the radiated EMI, converting it back to conducted EMI and shunting it back to its source.

In Figure 4, the open-frame topology is shown where the “Y” capacitors (CY1 and CY2) re-circulate the EMI signals between the positive input and output, and the negative input and output nodes of the power conversion stage. Safety and system requirements may dictate that some converters must have the output return (-) directly connected to earth ground. This connection can impact performance of some filter solutions, where the QPI-21 works well in this configuration.

There are two basic topologies for the connection of the re-circulating “Y” capacitors, referred to as “open-frame” and

Figure 4 - Typical “open-frame” application with an optional connection of the chassis to OUT- of the converter.

Applications Information

EMI Sources

Many of the components in today's power conversion modules are sources of high-frequency EMI noise generation. Diodes, high-frequency switching devices, transformers and inductors, and circuit layouts passing high dv/dt or di/dt signals are all potential sources of EMI.

EMI is propagated either by radiated or conductive means. Radiated EMI can be sourced from these components as well as by circuit loops that act like antennas and broadcast the noise signals to neighboring circuit paths. This also means that these loops can act as receivers of a broadcasted signal. This radiated EMI noise can be reduced by proper circuit layout and by shielding potential sources of EMI transmission.

There are two basic forms of conducted EMI that typically need to be filtered; namely common-mode (CM) and differential-mode (DM) EMI. Differential-mode resides in the normal power loop of a power source and its load; where the signal travels from the source to the load and then returns to the source. Common-mode is a signal that travels through both leads of the source and is returned to earth via parasitic pathways, either capacitively or inductively coupled.

Figure 3 to Figure 6 are the resulting EMI plots, after filtering by the QPI-21, of the total noise, both common and differential mode, of a DOSA (Distributed-power Open Standards Alliance) compliant converter. These converters are mounted on a QPI-21 evaluation board and tested under various loads. The red and blue traces represent the positive and negative branches of total noise, as measured using an industry standard LISN setup, as is shown in Figures 11 to 13.

Differential-mode EMI is typically larger in magnitude than common-mode, since common-mode is produced by the physical imbalances in the differential loop path. Reducing differential EMI will cause a reduction in common-mode EMI.

Passive EMI Filtering

The basic premise of filtering EMI is to insert a high-impedance, at the EMI's base frequency, in both the differential and common-mode paths as it returns to the power source.

Passive filters use common-mode chokes and "Y" capacitors to filter out common-mode EMI. These chokes are designed to present a high-impedance at the EMI frequency in series with the return path, and a low impedance path to the earth signal via the "Y" caps. This network will force the EMI signals to re-circulate within a confined area and not to propagate to the outside world. Often two common-mode networks are required to filter EMI within the frequency span required to

pass the EN55022 class B limits.

The other component of the passive filter is the differential LC network. Again, the inductor is chosen such that it will present a high-impedance in the differential EMI loop at the EMI's base frequency. The differential capacitor will then shunt the EMI back to its source. The QPI-21 was specifically designed to work with conventional switching frequency converters that are typically more difficult to filter using passive techniques.

Active EMI Filtering

PICOR's QPI-21 active EMI filter uses the same basic principles for filtering as the passive approach, but its active common-mode filter can perform as well as a passive filter, when filtering lower frequencies, in much less board area and power dissipation.

Figure 5 – Simplified Active EMI filter circuit.

Typically, the lower the frequency the greater the needed inductance would be to properly filter the EMI signal. This means either a larger core or a greater number of turns on a smaller core. A larger core requires more board space, where a smaller core with more turns has a greater amount of unwanted parasitics that can affect the filters ability to attenuate EMI signals.

Figure 5 is a simplified schematic of the QPI-21's active and passive circuitry used for EMI filtering. The QPI-21's active filter uses a small high-frequency common-mode transformer to filter the higher frequencies and adds a sensing element to it so that the lower frequency common mode signal can be sensed and a correction signal can be generated and inserted into the shield connection. By this means, the QPI-21 is capable of providing EMI filtering of converters in far less space than standard passive filters and can provide filtering over the entire EN55022 class B range.

Attenuation Plots: All converters have their output ground connected to chassis/earth ground.

Figure 3 – Ericsson PKM 4402NG using open-frame “Y” capacitors on QPI-21-CB1 evaluation board, 414W load.

Figure 4 - Ericsson PKM 4402NG using open-frame “Y” capacitors on QPI-21-CB1 evaluation board, 414W load, converter’s output ground connected to earth.

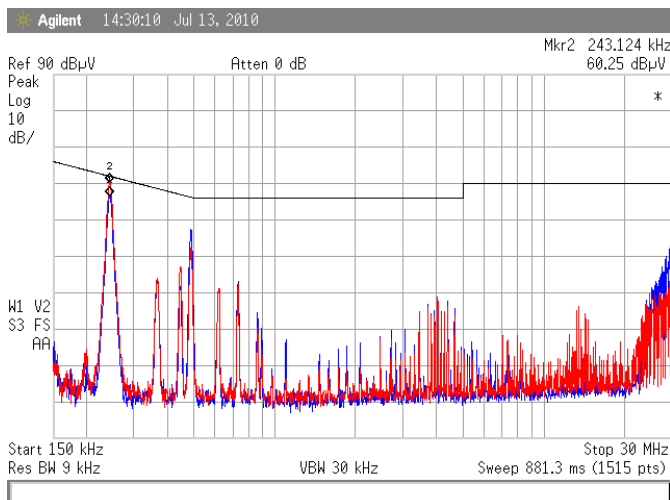

Figure 5 - Ericsson PKM4304B PI using base-plate “Y” capacitors with a 360W load.

Figure 6 – Ericsson PKM4304B PI using base-plate “Y” capacitors with a 360W load, CX1 = 47µF (see Figure 2).

The EMI results in Figures 6 and 7 are of the total noise measured using the QPI-21. There are no additional filtering components (as shown in Figure 2) with and without the converter’s output ground connected to chassis/earth, in an open-frame “Y” capacitor topology (as shown in Figure 2).

The EMI results in Figures 8 and 9 are of the total noise measured using a QPI-21, without additional filtering components (Figure 5) and with a CX1 capacitor of 47µF (Figure 6). Through the use of EMI splitters, the EMI peak at the fundamental switching frequency was determined to be mostly differential mode current. The addition of a 47µF capacitor reduced the total peak by about 6dBµV (Figure 7, trace 2 to trace 3).

Figure 7 – CM Peak Measurements with a 10uF and 47uF CX1 capacitor.

Attenuation Test Setups:

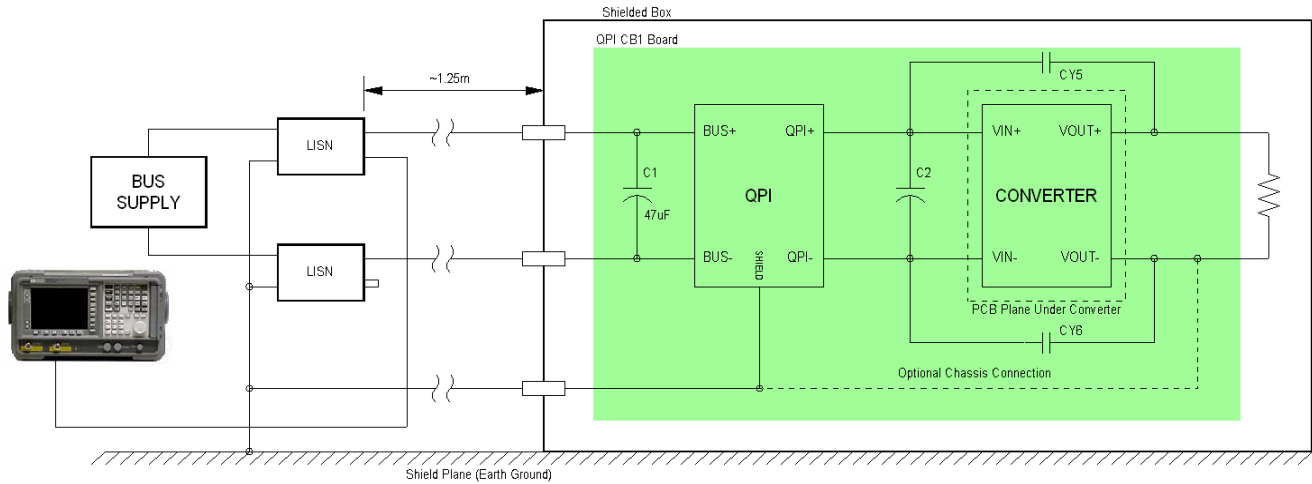

Figure 8 - Open-frame EMI test setup using the QPI-21-CB1 carrier board with 48V converter.

Figure 9 - Base-plate EMI test setup using the QPI-21-CB1 carrier board with 48V converter.

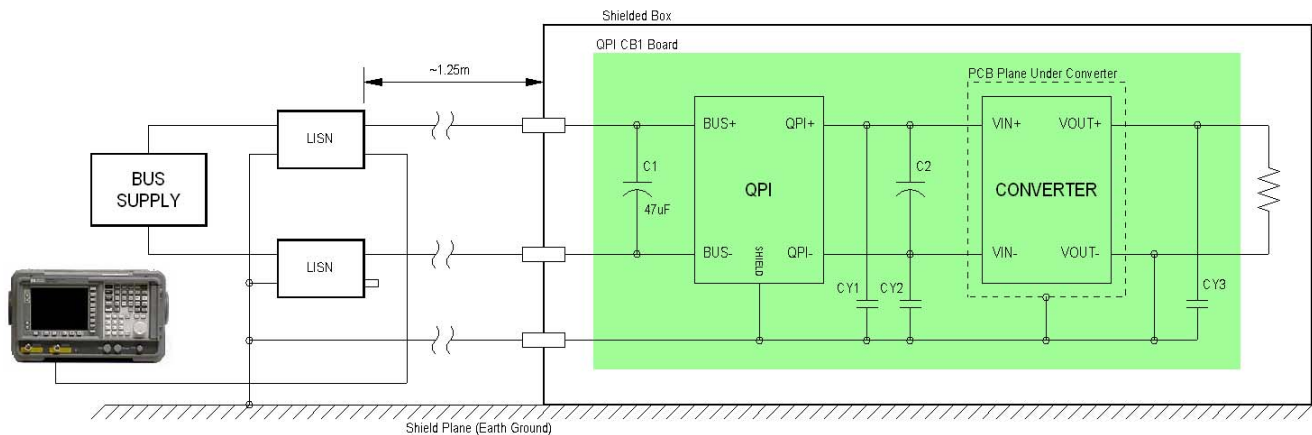

Figure 10 - Base-plate EMI test setup using the QPI-21-CB1 carrier board with 48V converter.

In Figures 10, 11 and 12, C1 is the required 47uF capacitor (United Chemi-Con EMVE101ARA470MKE0S or equivalent), C2 is a converter input cap (value dependent on converter),

and the CY capacitors are high-voltage, 4.7nF ceramics (Murata's GRM31BR73A472KW01L or equivalent).

Current De-Rating: mounted to QPI-21-EVAL1 evaluation board.

Figure 11 - Current de-rating and power dissipation over ambient temperature range.

The de-rating curve in Figure 11 is based on the maximum allowable internal component temperature and the 14A maximum rating of the QPI-21. The power dissipation curve is based on the current squared multiplied by the internal resistance between the inputs and outputs of the filter. The

internal resistance temperature coefficient is compensated for in the power dissipation curve. The left Y axis is in amps for the solid trace, the right Y axis is in watts for the dashed trace.

QPI Application Circuits:
Filtering Dual Converters

Figure 12 – The QPI-21 filtering dual supplies.⁽⁴⁾

The shield plane under the two converters in Figure 12 should be one contiguous plane under both. The circuit in Figure 12 is capable of filtering more converters than shown, up to the maximum current limit of the QPI-21. In Figure 13, the QPI+ and QPI- outputs of each filter should not be connected in

parallel. The QPI-21 is not designed to be used in parallel with another QPI-21 to achieve a higher current rating, but it can be used multiple times within a system design.

Filtering Parallel Converters

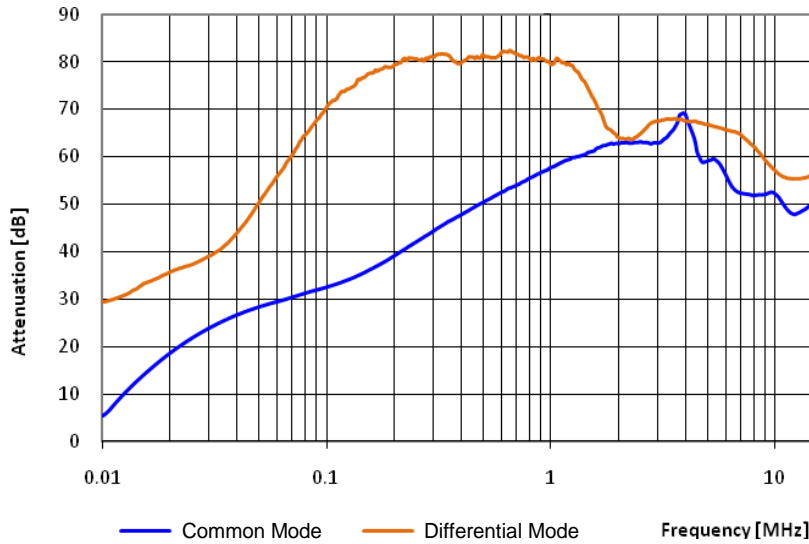

Figure 13 – Dual QPI-21's filtering paralleled converters feeding a common load.⁽⁵⁾

Note 5: In Figures 15 and 16; CIN1 and CIN2, CY1 through CY8, should be the value and voltage rating recommended by the converter's manufacturer.

QPI Insertion Loss Measurements

QPI Insertion Loss Equation:

$$\text{Insertion}_{\text{Loss}} = 20 \cdot \log \left(\frac{I_{\text{INA}}}{I_{\text{INB}}} \right)$$

Figure 14 - Attenuation curves into a 50Ω line impedance, bias from a 48V bus.

QPI Insertion Loss Test Circuits

Figure 16 - Test Set-up to measure Common Mode EMI currents in Figure 14.

Mechanicals

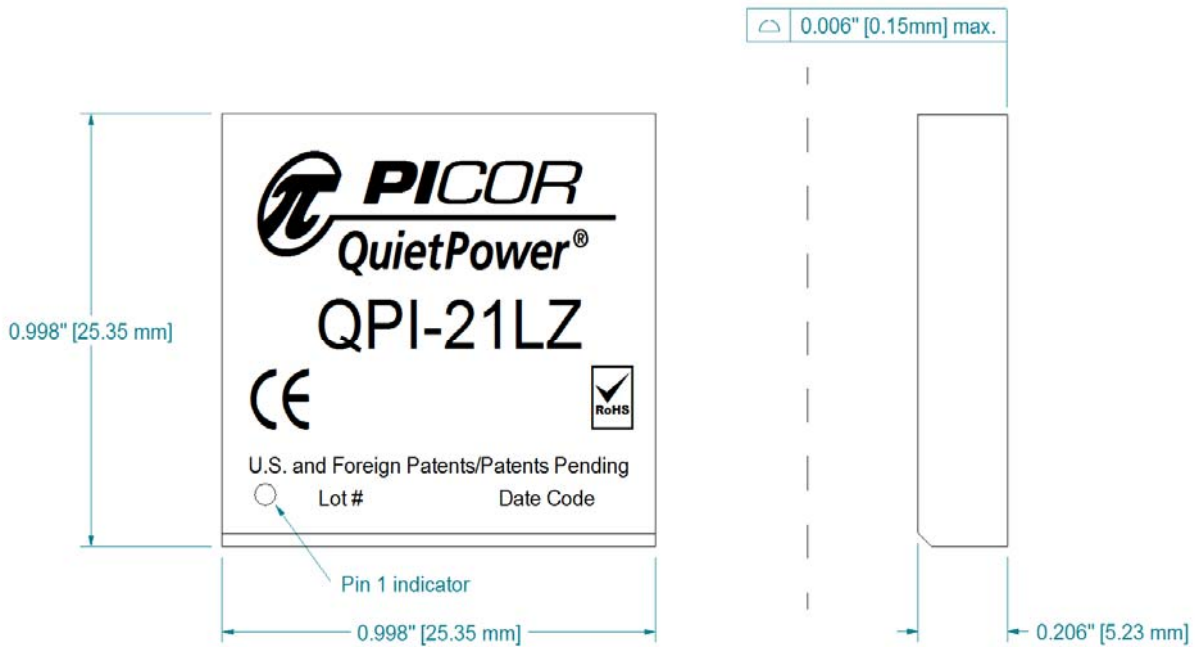

Figure 17 - Lidded Package Dimensions, tolerance of ± 0.004 "

Figure 18 - Open-frame Package dimensions, tolerance of ± 0.004 ". Pick and Place from label center.

Pad and Stencil Definitions:

Figure 19 - Bottom view of open-frame (OF) and lidded (LID) products. (All dimensions are in inches.)

Figure 20 - Recommended receptor and stencil patterns. (All dimensions are in inches.)

Stencil definition is based on a 6mil stencil thickness, 80% of LGA pad area coverage. LGA Package dimensions are for both the Open-Frame and Lidded versions of the QPI-21.

QPI-21 PCB Layout Recommendations:

Figure 21 - 3D view of paralleling planes underneath the QPI-21.

PCB Layout

When laying out the QPI-21 EMI filter it is important for the designer to be aware of the radiated EMI field that all converters emit and to place the QPI-21 outside of this field area. It is also recommended that the bus lines feeding into the QPI filter are not routed such that they lie between the QPI and the converter, or that their copper planes over-lap on inner layers. This can cause EMI noise to be coupled from input to output via the parasitic capacitance between the planes.

When using converters that have a large field of radiated EMI surrounding them, the QPI-21 must be located outside of this area of radiation, with the BUS voltage pins located on the side farthest away from the converter. This is to keep the radiated EMI from by-passing the filter and coupling directly to the BUS feeds.

Post Solder Cleaning

Picor's LZ version QP SIPs are not hermetically sealed and must not be exposed to liquid, including but not limited to cleaning solvents, aqueous washing solutions or pressurized sprays. When soldering, it is recommended that no-clean flux solder be used, as this will ensure that potentially corrosive mobile ions will not remain on, around, or under the module following the soldering process. For applications where the end product must be cleaned in a liquid solvent, Picor recommends using the QPI-21LZ-01, open-frame version of the EMI filter.

QPI-21 Mechanical Data

Datum	Units	QPI-21LZ	QPI-21LZ-01	Notes

Warranty

Vicor products are guaranteed for two years from date of shipment against defects in material or workmanship when in normal use and service. This warranty does not extend to products subjected to misuse, accident, or improper application or maintenance. Vicor shall not be liable for collateral or consequential damage. This warranty is extended to the original purchaser only.

EXCEPT FOR THE FOREGOING EXPRESS WARRANTY, VICOR MAKES NO WARRANTY, EXPRESS OR LIMITED, INCLUDING, BUT NOT LIMITED TO, THE WARRANTY OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE.

Vicor will repair or replace defective products in accordance with its own best judgment. For service under this warranty, the buyer must contact Vicor to obtain a Return Material Authorization (RMA) number and shipping instructions. Products returned without prior authorization will be returned to the buyer. The buyer will pay all charges incurred in returning the product to the factory. Vicor will pay all reshipment charges if the product was defective within the terms of this warranty.

Information published by Vicor has been carefully checked and is believed to be accurate; however, no responsibility is assumed for inaccuracies. Vicor reserves the right to make changes to any products without further notice to improve reliability, function, or design. Vicor does not assume any liability arising out of the application or use of any product or circuit; neither does it convey any license under its patent rights nor the rights of others. Vicor general policy does not recommend the use of its components in life support applications wherein a failure or malfunction may directly threaten life or injury. Per Vicor Terms and Conditions of Sale, the user of Vicor components in life support applications assumes all risks of such use and indemnifies Vicor against all damages.

Vicor's comprehensive line of power solutions includes high density AC-DC and DC-DC modules and accessory components, fully configurable AC-DC and DC-DC power supplies, and complete custom power systems.

Information furnished by Vicor is believed to be accurate and reliable. However, no responsibility is assumed by Vicor for its use. Vicor components are not designed to be used in applications, such as life support systems, wherein a failure or malfunction could result in injury or death. All sales are subject to Vicor's Terms and Conditions of Sale, which are available upon request.

Specifications are subject to change without notice.

Intellectual Property Notice

Vicor and its subsidiaries own Intellectual Property (including U.S. and Foreign Patents and pending patent applications) related to the products described in this data sheet. Interested parties should contact Vicor's Intellectual Property Department.

Вы можете приобрести в компании MosChip.

Для оперативного оформления запроса Вам необходимо перейти по данной ссылке:

<http://moschip.ru/get-element>

Вы можете разместить у нас заказ для любого Вашего проекта, будь то серийное производство или разработка единичного прибора.

В нашем ассортименте представлены ведущие мировые производители активных и пассивных электронных компонентов.

Нашей специализацией является поставка электронной компонентной базы двойного назначения, продукции таких производителей как XILINX, Intel (ex.ALTERA), Vicor, Microchip, Texas Instruments, Analog Devices, Mini-Circuits, Amphenol, Glenair.

Сотрудничество с глобальными дистрибьюторами электронных компонентов, предоставляет возможность заказывать и получать с международных складов практически любой перечень компонентов в оптимальные для Вас сроки.

На всех этапах разработки и производства наши партнеры могут получить квалифицированную поддержку опытных инженеров.

Система менеджмента качества компании отвечает требованиям в соответствии с ГОСТ Р ИСО 9001, ГОСТ РВ 0015-002 и ЭС РД 009
