EVAl BOARD USER'S MANUAL

Description

This document describes the NBSG16M evaluation board and the appropriate lab test setups. It should be used in conjunction with the NBSG16M data sheets which contain full technical details on the device specifications and operation. The same PCB is used to evaluate the NBSG16MN and NB4L16M devices.

The evaluation board is designed to facilitate a quick evaluation of the NBSG16M GigaComm™ Differential Receiver/Driver/Translator. The NBSG16M is designed to function as a high speed receiver/driver/translator device with CML output for use in high speed signal amplification and backplane interface applications.

The board is implemented in two layers and provides a high bandwidth 50 Ω controlled impedance environment for higher performance. The first layer or primary trace layer is 5 mils thick Rogers RO6002 material, which is engineered to have equal electrical length on all signal traces from the NBSG16M device to the sense output. The second layer is 32 mils thick copper ground plane.

What measurements can you expect to make?

With this evaluation board, the following measurements could be performed in differential modes of operation:

- Jitter
- Output Skew
- Gain/Return Loss
- Eye Pattern Generation
- Frequency Performance
- Output Rise and Fall Time
- V_{CMR} (Input High Common Mode Range)

2. 50 GHz sampling head used (for effective rise, fall and jitter performance measurement)

Setup

Step 1: Connect Power

1a: Two power levels must be provided to the board for V_{CC} and V_{EE} via the surface mount clips.

Step 2: Connect Inputs

For Differential Mode (3.3 V and 2.5 V operation)

2a: Connect the differential output of the generator to the differential input of the device (D and \bar{D}).

NOTE: Device may oscillate when the input is not driven.

Table 2. NBSG16M POWER SUPPLY CONNECTIONS

3.3 V Setup	2.5 V Setup
$V_{CC} = 0 \text{ V} = \text{GND}$	$V_{CC} = 0 \text{ V} = \text{GND}$
$V_{TT} = V_{CC} = 0 \text{ V} = \text{GND}$	$V_{TT} = V_{CC} = 0 \text{ V} = \text{GND}$
$V_{EE} = -3.3 \text{ V}$	$V_{EE} = -2.5 \text{ V}$

NOTE: All differential cable pairs **must be** matched.

Setup (Continued)

Step 3: Setup Input Signals

3a: Set the signal generator amplitude to 500 mV

NOTE: The signal generator amplitude can vary from 75 mV to 900 mV to produce a 400 mV DUT output.

3b: Set the signal generator offset to -250 mV

NOTE: The V_{IHCMR} (Input High Voltage Common Mode Range) allows the signal generator offset to vary as long as V_{IH} is within the V_{IHCMR} range. Refer to the device data sheet for further information.

3c: Set the generator output for a PRBS data signal, or for a square wave clock signal with a 50% duty cycle.

Step 4: Connect Output Signals

4a: Connect the outputs of the device (Q , \bar{Q}) to the oscilloscope. The oscilloscope sampling head must have internal $50\ \Omega$ termination to ground.

NOTE: Where a single output is being used, the unconnected output for the pair **must be** terminated to V_{TT} through a $50\ \Omega$ resistor for best operation. Unused pairs may be left unconnected. Since $V_{TT} = 0\ V$, a standard $50\ \Omega$ SMA termination is recommended.

MORE INFORMATION ABOUT EVALUATION BOARD

Design Considerations for >10 GHz operation

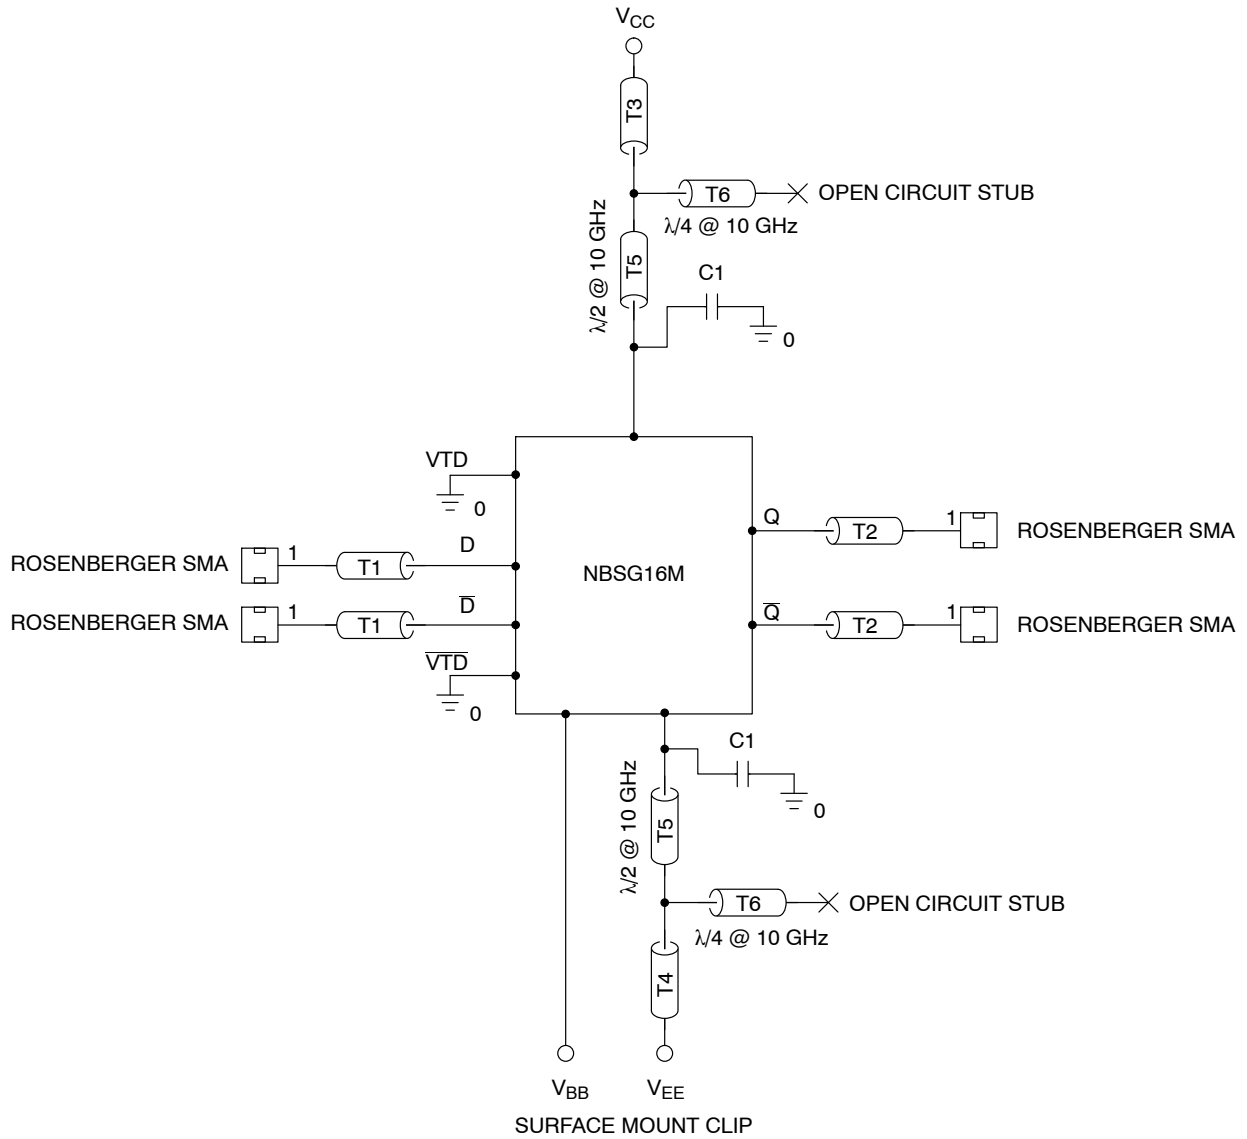

While the NBSG16M is specified to operate at 12 GHz, this evaluation board is designed to support operating frequencies up to 20 GHz.

The following considerations played a key role to ensure this evaluation board achieves high-end microwave performance:

- Optimal SMA Connector Launch
- Minimal Insertion Loss and Signal Dispersion
- Accurate Transmission Line Matching (50 Ω)
- Distributed Effects while Bypassing and Noise Filtering
