

# DS1643/DS1643P Nonvolatile Timekeeping RAMs

#### www.maxim-ic.com

#### **FEATURES**

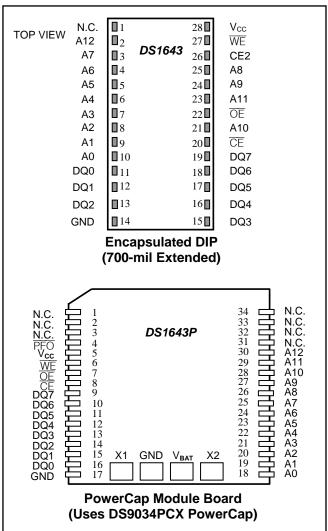

- Integrated NV SRAM, Real-Time Clock, Crystal, Power-Fail Control Circuit and Lithium Energy Source
- Clock Registers are Accessed Identically to the Static RAM. These Registers Reside in the Eight Top RAM Locations.
- Totally Nonvolatile with Over 10 Years of Operation in the Absence of Power
- Access Times of 85ns and 100ns
- BCD-Coded Year, Month, Date, Day, Hours, Minutes, and Seconds with Leap Year Compensation Valid Up to 2100
- Power-Fail Write Protection Allows for ±10%
   V<sub>CC</sub> Power Supply Tolerance
- Lithium Energy Source is Electrically Disconnected to Retain Freshness Until Power is Applied for the First Time
- DS1643 Only (DIP Module)
   Standard JEDEC Byte-Wide 8K x 8 RAM
   Pinout
- UL Recognized
- DS1643P Only (PowerCap Module Board)
   Surface Mountable Package for Direct

   Connection to PowerCap Containing
   Battery and Crystal

   Replaceable Battery (PowerCap)
   Power-Fail Output
   Pin-for-Pin Compatible with Other Densities of

DS164XP Timekeeping RAM

### PIN CONFIGURATIONS

#### ORDERING INFORMATION

| PART                | VOLTAGE RANGE<br>(V) | TEMP RANGE                       | PIN-PACKAGE     | TOP MARK    |
|---------------------|----------------------|----------------------------------|-----------------|-------------|
| <b>DS1643</b> -85+  | 5.0                  | 0°C to +70°C                     | 28 EDIP (0.740) | DS1643+85   |
| DS1643-100+         | 5.0                  | $0^{\circ}$ C to $+70^{\circ}$ C | 28 EDIP (0.740) | DS1643+100  |
| <b>DS1643P</b> -85+ | 5.0                  | $0^{\circ}$ C to $+70^{\circ}$ C | 34-PowerCap*    | DS1643P+85  |
| DS1643P-100+        | 5.0                  | 0°C to +70°C                     | 34-PowerCap*    | DS1643P+100 |

 $<sup>^{\</sup>star}$ DS9034I-PCX+ and DS9034-PCX+ required (must be ordered separately).

<sup>+</sup>Denotes a lead(Pb)-free/RoHS-compliant package. The top mark will include a "+" symbol on lead-free devices.

#### DESCRIPTION

The DS1643 is an 8K x 8 nonvolatile static RAM with a full function Real Time Clock (RTC) that are both accessible in a byte-wide format. The nonvolatile timekeeping RAM is functionally equivalent to any JEDEC standard 8K x 8 SRAM. The device can also be easily substituted in ROM, EPROM and EEPROM sockets providing read/write nonvolatility and the addition of the real time clock function. The real time clock information resides in the eight uppermost RAM locations. The RTC registers contain year, month, date, day, hours, minutes, and seconds data in 24-hour BCD format. Corrections for the day of the month and leap year are made automatically. The RTC clock registers are double-buffered to avoid access of incorrect data that can occur during clock update cycles. The double-buffered system also prevents time loss as the timekeeping countdown continues unabated by access to time register data. The DS1643 also contains its own power-fail circuitry, which deselects the device when the V<sub>CC</sub> supply is in an out of tolerance condition. This feature prevents loss of data from unpredictable system operation brought on by low V<sub>CC</sub> as errant access and update cycles are avoided.

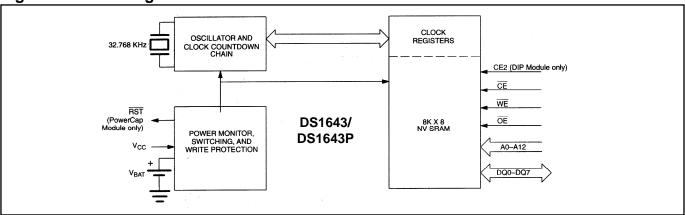

## **PACKAGES**

The DS1643 is available in two packages: 28-pin DIP module and 34-pin PowerCap module. The 28-pin DIP style module integrates the crystal, lithium energy source, and silicon all in one package. The 34-pin PowerCap Module Board is designed with contacts for connection to a separate PowerCap (DS9034PCX) that contains the crystal and battery. This design allows the PowerCap to be mounted on top of the DS1643P after the completion of the surface mount process. Mounting the PowerCap after the surface mount process prevents damage to the crystal and battery due to high temperatures required for solder reflow. The PowerCap is keyed to prevent reverse insertion. The PowerCap Module Board and PowerCap are ordered separately and shipped in separate containers. The part number for the PowerCap is DS9034PCX.

#### CLOCK OPERATIONS—READING THE CLOCK

While the double-buffered register structure reduces the chance of reading incorrect data, internal updates to the DS1643 clock registers should be halted before clock data is read to prevent reading of data in transition. However, halting the internal clock register updating process does not affect clock accuracy. Updating is halted when a one is written into the read bit, the seventh most significant bit in the control register. As long as a 1 remains in that position, updating is halted. After a halt is issued, the registers reflect the count, that is day, date, and time that was current at the moment the halt command was issued. However, the internal clock registers of the double-buffered system continue to update so that the clock accuracy is not affected by the access of data. All of the DS1643 registers are updated simultaneously after the clock status is reset. Updating is within a second after the read bit is written to 0.

| <v<sub>BAT</v<sub> | X            | X                 | X                 | X                 | Deselect | High-Z   | Data Retention Mode |

## **SETTING THE CLOCK**

The 8-bit of the control register is the write bit. Setting the write bit to a 1, like the read bit, halts updates to the DS1643 registers. The user can then load them with the correct day, date and time data in 24 hour BCD format. Resetting the write bit to a 0 then transfers those values to the actual clock counters and allows normal operation to resume.

#### STOPPING AND STARTING THE CLOCK OSCILLATOR

The clock oscillator may be stopped at any time. To increase the shelf life, the oscillator can be turned off to minimize current drain from the battery. The  $\overline{OSC}$  bit is the MSB for the seconds registers. Setting it to a 1 stops the oscillator.

#### FREQUENCY TEST BIT

Bit 6 of the day byte is the frequency test bit. When the frequency test bit is set to logic 1 and the oscillator is running, the LSB of the seconds register will toggle at 512Hz. When the seconds register is being read, the DQ0 line will toggle at the 512Hz frequency as long as conditions for access remain valid (i.e., CE low, OE low, CE2 high, and address for seconds register remain valid and stable).

## **CLOCK ACCURACY (DIP MODULE)**

The DS1643 is guaranteed to keep time accuracy to within  $\pm 1$  minute per month at 25°C.

## CLOCK ACCURACY (POWERCAP MODULE)

The DS1643P and DS9034PCX are each individually tested for accuracy. Once mounted together, the module is guaranteed to keep time accuracy to within ±1.53 minutes per month (35ppm) at 25°C.

 $\overline{\text{OSC}}$  = STOP BIT

R = READ BIT

FT = FREQUENCY TEST

W = WRITE BIT

X = UNUSED

*Note:* All indicated "X" bits are not used but must be set to "0" for proper clock operation.

## RETRIEVING DATA FROM RAM OR CLOCK

The DS1643 is in the read mode whenever WE (write enable) is high and CE (chip enable) is low. The device architecture allows ripple-through access to any of the address locations in the NV SRAM. Valid data will be available at the DQ pins within  $t_{AA}$  after the last address input is stable, providing that the CE and OE access times and states are satisfied. If CE or OE access times are not met, valid data will be available at the latter of chip enable access (t<sub>CEA</sub>) or at output enable access time (t<sub>OEA</sub>). The state of the data input/output pins (DQ) is controlled by CE and OE. If the outputs are activated before t<sub>AA</sub>, the data lines are driven to an intermediate state until tAA. If the address inputs are changed while CE and OE remain valid, output data will remain valid for output data hold time (t<sub>OH</sub>) but will then go indeterminate until the next address access.

### WRITING DATA TO RAM OR CLOCK

The DS1643 is in the write mode whenever WE and CE are in their active state. The start of a write is referenced to the latter occurring transition of WE or CE. The addresses must be held valid throughout the cycle. CE or WE must return inactive for a minimum of two prior to the initiation of another read or write cycle. Data in must be valid t<sub>DS</sub> prior to the end of write and remain valid for t<sub>DH</sub> afterward. In a typical application, the OE signal will be high during a write cycle. However, OE can be active provided that care is taken with the data bus to avoid bus contention. If OE is low prior to WE transitioning low the data bus can become active with read data defined by the address inputs. A low transition on WE will then disable the outputs twez after WE goes active.

### DATA RETENTION MODE

When  $V_{CC}$  is within nominal limits ( $V_{CC} > 4.5V$ ) the DS1643 can be accessed as described above with read or write cycles. However, when  $V_{CC}$  is below the power-fail point  $V_{PF}$  (point at which write protection occurs) the internal clock registers and RAM are blocked from access. This is accomplished internally by inhibiting access via the  $\overline{CE}$  signal. At this time the power-on reset output signal ( $\overline{RST}$ ) will be driven active low and will remain active until  $V_{CC}$  returns to nominal levels. When  $V_{CC}$  falls below the level of the internal battery supply, power input is switched from the  $V_{CC}$  pin to the internal battery and clock activity, RAM, and clock data are maintained from the battery until  $V_{CC}$  is returned to nominal level. The  $\overline{RST}$  signal is an open drain output and requires a pull up. Except for the  $\overline{RST}$ , all control, data, and address signals must be powered down when  $V_{CC}$  is powered down.

#### BATTERY LONGEVITY

The DS1643 has a lithium power source that is designed to provide energy for clock activity, and clock and RAM data retention when the  $V_{CC}$  supply is not present. The capability of this internal power supply is sufficient to power the DS1643 continuously for the life of the equipment in which it is installed. For specification purposes, the life expectancy is 10 years at 25°C with the internal clock oscillator running in the absence of  $V_{CC}$  power. Each DS1643 is shipped from Dallas Semiconductor with its lithium energy source disconnected, guaranteeing full energy capacity. When  $V_{CC}$  is first applied at a level greater than  $V_{PF}$ , the lithium energy source is enabled for battery backup operation. Actual life expectancy of the Ds1643 will be much longer than 10 years since no lithium battery energy is consumed when  $V_{CC}$  is present.

## **ABSOLUTE MAXIMUM RATINGS**

| Voltage Range on Any Pin Relative to Ground               | 0.3V to +6.0V                         |
|---|---------------------------------------|
| Operating Temperature Range                               | $0^{\circ}$ C to +70°C, Noncondensing |
| Storage Temperature (EDIP)                                | 40°C to +85°C, Noncondensing          |
| Storage Temperature (PowerCap)                            | 55°C to +125°C, Noncondensing         |
| Lead Temperature (soldering, 10 seconds)                  | +260°C                                |
| <b>Note:</b> EDIP is hand or wave-soldered only (Note 7). |                                       |
| Soldering Temperature (PowerCap reflow)                   | +260°C                                |

This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operation sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods of time may affect reliability.

## RECOMMENDED DC OPERATING CONDITIONS

## **POWER-UP/DOWN AC CHARACTERISTICS**

 $(V_{CC} = 5.0V \pm 10\%, T_A = 0^{\circ}C \text{ to } +70^{\circ}C.)$ 

| PARAMETER  | SYMBOL            | MIN | TYP | MAX | UNITS | NOTES |
|--|-------------------|-----|-----|-----|-------|-------|
| CE or WE at V <sub>IH</sub> , CE2 at V <sub>IL</sub> , Before Power-down | $t_{ m PD}$       | 0   |     |     | μs    |       |
| $V_{CC}$ Fall Time: $V_{PF(MAX)}$ to $V_{PF(MIN)}$                       | $t_{\mathrm{F}}$  | 300 |     |     | μs    |       |
| V <sub>CC</sub> Fall Time: V <sub>PF(MIN)</sub> to V <sub>BAT</sub>      | $t_{\mathrm{FB}}$ | 10  |     |     | μs    |       |
| $V_{CC}$ Rise Time: $V_{PF(MIN)}$ to $V_{PF(MAX)}$                       | $t_{R}$           | 0   |     |     | μs    |       |
| Power-Up Recover Time  | $t_{REC}$         |     |     | 35  | ms    |       |
| Expected Data Retention Time (Oscillator On)                             | t <sub>DR</sub>   | 10  |     |     | years | 5, 6  |

## **POWER-UP/POWER-DOWN TIMING**

## **CAPACITANCE**

 $(T_A = +25^{\circ}C)$ 

| PARAMETER                      | SYMBOL   | MIN | TYP | MAX | UNITS | NOTES |
|--------------------------------|----------|-----|-----|-----|-------|-------|
| Capacitance on All Pins        | $C_{IN}$ |     |     | 7   | pF    |       |
| Capacitance on All Output Pins | Co       |     |     | 10  | pF    |       |

### **AC TEST CONDITIONS**

Output Load: 100pF + 1TTL Gate Input Pulse Levels: 0 to 3.0V

Timing Measurement Reference Levels:

Input: 1.5V Output: 1.5V

Input Pulse Rise and Fall Times: 5ns

### **NOTES:**

1) Voltages are referenced to ground.

- 2) Typical values are at +25°C and nominal supplies.
- 3) Outputs are open.
- 4) The CE2 control signal functions exactly the same as the CE signal except that the logic levels for active and inactive levels are opposite.
- 5) Data retention time is at 25°C.
- 6) Each DS1643 has a built-in switch that disconnects the lithium source until  $V_{CC}$  is first applied by the user. The expected  $t_{DR}$  is defined for DIP modules as a cumulative time in the absence of  $V_{CC}$  starting from the time power is first applied by the user.
- 7) Real-Time Clock Modules (DIP) can be successfully processed through conventional wave-soldering techniques as long as temperature exposure to the lithium energy source contained within does not exceed +85°C. Post-solder cleaning with water washing techniques is acceptable, provided that ultrasonic vibration is not used.

In addition, for the PowerCap:

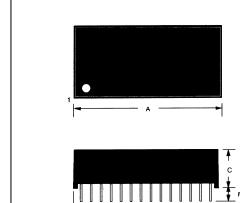

- a. Dallas Semiconductor recommends that PowerCap Module bases experience one pass through solder reflow oriented with the label side up ("live-bug").
- b. Hand soldering and touch-up: Do not touch or apply the soldering iron to leads for more than 3 seconds. To solder, apply flux to the pad, heat the lead frame pad and apply solder. To remove the part, apply flux, heat the lead frame pad until the solder reflow and use a solder wick to remove solder.

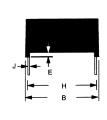

#### PACKAGE INFORMATION

For the latest package outline information and land patterns, go to <a href="www.maxim-ic.com/packages">www.maxim-ic.com/packages</a>. Note that a "+", "#", or "-" in the package code indicates RoHS status only. Package drawings may show a different suffix character, but the drawing pertains to the package regardless of RoHS status.

## **REVISION HISTORY**

| REVISION<br>DATE | DESCRIPTION   | PAGES<br>CHANGED |
|------------------|---|------------------|
| 12/09            | Corrected the lead(Pb)-free part information for the -100+ versions in the <i>Ordering Information</i> table.   | 1                |
| 5/10             | Removed TinLead and -70 (70ns) and added -85 (85ns) in the <i>Ordering Information</i> table; reduced the <i>Absolute Maximum Ratings</i> max voltage; updated the soldering information; updated AC timing to include 85ns | 1, 7, 8, 9       |

## **ПОСТАВКА** ЭЛЕКТРОННЫХ КОМПОНЕНТОВ

Общество с ограниченной ответственностью «МосЧип» ИНН 7719860671 / КПП 771901001 Адрес: 105318, г.Москва, ул.Щербаковская д.3, офис 1107

# Данный компонент на территории Российской Федерации Вы можете приобрести в компании MosChip.

Для оперативного оформления запроса Вам необходимо перейти по данной ссылке:

#### http://moschip.ru/get-element

Вы можете разместить у нас заказ для любого Вашего проекта, будь то серийное производство или разработка единичного прибора.

В нашем ассортименте представлены ведущие мировые производители активных и пассивных электронных компонентов.

Нашей специализацией является поставка электронной компонентной базы двойного назначения, продукции таких производителей как XILINX, Intel (ex.ALTERA), Vicor, Microchip, Texas Instruments, Analog Devices, Mini-Circuits, Amphenol, Glenair.

Сотрудничество с глобальными дистрибьюторами электронных компонентов, предоставляет возможность заказывать и получать с международных складов практически любой перечень компонентов в оптимальные для Вас сроки.

На всех этапах разработки и производства наши партнеры могут получить квалифицированную поддержку опытных инженеров.

Система менеджмента качества компании отвечает требованиям в соответствии с ГОСТ Р ИСО 9001, ГОСТ РВ 0015-002 и ЭС РД 009
